ITEM 19 Continued: NFRS-St Louis, Radiation Exposure, Dosimetry, Armed Forces Special Weapons Project (AFSWP), Defense Atomic Support Agency (DASA), NARS-5, Washington National Records Center, Sixth US Army, Presidio of California, Fort Ord, Fort McClelland, US Army Chemical Corps School, Defense Nuclear Agency Field Command, VIP Personnel File, Disposal Standards, Installation and Troop Lists.

*(Also cont)*  
ITEM 20 Continued: *↳* the Army's tasking for the Department of Defense Nuclear Test personnel Review Project (NTPR). The specific data sought consisted of identification of the US Army personnel -- military, contractor, civilian, guests and official observers -- who participated in the DESERT ROCK EXERCISES. Also sought

was any possible evidence of radiation exposure and dosimetry history.  
*The report's nine parts include -----*

This report has been prepared in nine parts, i. e., a summary statement followed by individual annexes for each geographical target of the field search. Where appropriate, supporting documentation has been appended to the summary statement and the individual annexes.

In one instance, the report ranges beyond the narrow confines of the primary target of the field search. It expands upon the personnel aspects of record keeping and considers the VIP Personnel Files maintained by the National Personnel Records Center, St Louis. Rationales are presented for a formal appraisal of these files with a view toward establishment of a government-wide standard for maintenance and preservation.

The author concludes that the search was generally successful in locating the still existant documentation, files and records.

## F O R E W O R D

The following after action report constitutes the official record of the field search for Exercise Desert Rock I through VIII, 1950-58, documentation conducted by representatives of The Adjutant General at the direction of the Chief of Staff (DACS-DMC) during the period 18 June 1978 through 14 July 1978.

This search was undertaken when the normal holdings of the National Archives, Federal Records Center System, and Army retired records holding areas and other repositories failed to produce documentation required to meet Department of the Army's tasking for the Department of Defense Nuclear Test Personnel Review Project (NTPR). Specific data required consisted of identification of the US Army troops who participated in the Desert Rock Exercises along with any possible evidence of radiation exposure and dosimetry history.

This report has been prepared in nine parts, i. e., a summary statement followed by individual annexes for each geographical point of the field search. Where appropriate, supporting documentation has been appended to the summary statement and the individual annexes. In some instances, the report ranges beyond the narrow confines of the field search to touch on later aspects of the Nuclear Test Personnel Review Project and the Army Records Management System.

DEPARTMENT OF THE ARMY  
OFFICE OF THE ADJUTANT GENERAL AND THE ADJUTANT GENERAL CENTER  
WASHINGTON, D.C. 20314

4 August 1978

DAAG-AMR-D

MEMORANDUM FOR: CHIEF, RECORDS MANAGEMENT DIVISION, ADMINISTRATIVE MANAGEMENT  
DIRECTORATE, THE ADJUTANT GENERAL CENTER

SUBJECT: Trip Report of Field Search for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General by Direction  
of the Chief of Staff, 18 June 1978 to 14 July 1978

1. Failure to locate retired records of troop participation in the nuclear test Desert Rock Exercises, 1951-58, in pursuit of the Nuclear Test Personnel Review Project in normal retired records channels prompted an extraordinary field search during the period 18 June through 14 July 1978.
2. Tasking for this operation was issued by the Chief of Staff's office on 1 June 1978. Itinerary planning, travel arrangements, official notification of planned visits and clearance requirements were completed by the HQDA Records Management Division, Access and Release Branch, Admin Management Dir, 14 June 1978. Army archivists Dr. John H. Hatcher and Dr Robert P. Smith were selected to conduct the field search commencing with the Army's Lexington-Bluegrass Depot Activity on 18 June 1978.
3. The rationale for the field search sought to duplicate rough geographical patterns of installation complexes involved in the atmospheric nuclear test series of the 1950's. The continuing series of Desert Rock Exercises, 1951-58, were to be the primary focus of the search with specific attention to the AEC Exercises Tumbler-Snapper (1952) and Upshot-Knothole (1953) which provided the basis of the Army Exercises Desert Rock IV and Desert Rock V. Concentration on DR IV and DR V was prompted by the paucity of troop participation data generally available for them in the normal records repositories. Since HQDA resources had failed to produce the required data up until this date, the decision was taken to seek it in non-Army and non-DOD repositories as well as in certain field Army commands and repositories.
4. For a wide variety of reasons, the following geographical areas, installations, commands and agencies were included in the original itinerary:
  - a. US Army Lexington-Bluegrass Depot Activity at Lexington, Kentucky, center for collection of Army generated radiation exposure dosimetry data since 1954 to the present.
  - b. Las Vegas, Nevada; Nevada Operations Office, Department of Energy; Liaison Office, Defense Nuclear Agency; Home Office, Reynolds Electrical and Engineering Company, Inc.

c. Mercury, Nevada; Nuclear Test Site (Camp Desert Rock, 1951-58) operated by the Reynold Electrical and Engineering Company, Inc.

d. Kirtland Air Force Base, Albuquerque, New Mexico; Field Command, Defense Nuclear Agency; United States Air Force Special Weapons Laboratory; Combined Technical Library; Base/Installation Records Staging Area.

e. Los Alamos, New Mexico; Los Alamos Scientific Laboratory operated as a GOCO (government-owned, contractor-operated) activity and non-profit quasi-public corporation by the University of California for nuclear device development and testing.

f. San Francisco, California; Federal Archives and Records Center-San Francisco (at San Bruno); Headquarters Sixth United States Army and Post Records Holding Area of the Predidio of California; Letterman Army Medical Center.

g. Sacramento, California; Sacramento Army Depot for dosimetry collection Western US and Pacific 1958-77. This was dropped from the itinerary after the visit to Lexington as no longer required since Sacramento's dosimetry function and data collection had been transferred to Lexington.

h. Monterey, California; Fort Ord and the 7th Infantry Division Headquarters; for tracing a records management audit trail from Camp Irwin to Fort MacArthur and finally Fort Ord as installations were closed and functions were consolidated and transferred.

i. Los Angeles, California; Federal Archives and Records Center-Los Angeles (at Laguna Niguel, California) for the retired nuclear testing records (GOCO) of Narver and Holmes, Inc., and the Reynolds Electrical and Engineering Company.

j. Seattle, Washington; Fort Lewis to trace a records management audit trail from Fort Worden (and the 369th Amphibious Engineer Regiment). This point on the itinerary was cancelled after the data sought for the 369th Engineers was located in the REECO Archives at Mercury, Nevada. (The 369th Engineers provided primary support and troop participation elements for Desert Rock V. Personnel lists for them had not been located until the visit to Mercury.)

k. St Louis, Missouri; Organizational Military Records Division, National Personnel Records Center to follow-up on leads developed during the field search and to screen the retired collection of US Army field command records, 1950-64 held by the National Personnel Records Center.

l. Washington, DC and Suitland, Maryland; Washington National Records Center and the National Archives to follow-up on leads developed during the field search for missing AFSWP and Hq 6th US Army retired records.

5. The results of the field search for Army-generated documentation dealing with the Desert Rock Exercise series were generally disappointing. While the field search sought any and all Desert Rock documentation, particular focus was on the 1952 and 1953 exercises (DR IV and DR V). Efforts until the field search had been moderately successful in producing troop participation lists for all other Desert Rock Exercises except for IV and V. Most of this data had come from non-Army files, the National Archives and the Lexington-Bluegrass

Army Depot Activity dosimetry data collection.

6. The most fruitful collection of material dealing with the atmospheric nuclear tests of the 1950's was found to be held by the Reynolds Electrical and Engineering Company, Incorporated, of Las Vegas, Nevada. REECC has been associated with the Nevada tests since 1952 and has operated the Mercury Test Site as a prime contractor since 1954. Camp Desert Rock was located in close proximity to the Mercury Test Site during the Desert Rock Exercises. REECC's collection of Desert Rock documentation is limited primarily to dosimetry data and seems to have come into REECC's custody over the years from DOD creators. It is highly probable that much of the missing Army created Desert Rock documentation makes up the core of the REECC collection.

7. One question not satisfactorily answered by the field search is "What happened to the Army's retired files from the Desert Rock Exercise series?" There is strong suspicion after the field search that exercise files per se from the Desert Rock series were never retired. The continuing nature of the exercises over an eight-year period plus a rotating and constantly changing staff along certain administrative practices developed and followed during the exercises tend to support this conclusion. Adequate procedures existed during the 1950's to collect and preserve the records of operational exercises. And they were successful. All other Army exercises of Departmental interest are accounted for in the retired collection of field command records held by the National Personnel Records Center in St Louis. There was one unique condition peculiar to the Desert Rock Exercises which set them apart from other Army exercises of the 1950's.

8. The Desert Rock Exercises were a continuing series running some 8-10 years considering planning periods beginning and ending them. Individually none of the executed exercises (DR I through DR VIII) had a clearly defined stopping date. By the time one exercise was completed and the after action reports had been written on-site, planning was far advanced for the next. The early imposed requirement for writing the after action reports in the field tended to keep documentation in the field -- especially the requirement for an approved draft before releasing the present exercise staff to make place for the next. Action officer reluctance to part with records under any pretext probably accounted for more accumulation in the field. Older materials of less and less utility were disposed of in the field as the years wore on. This disposal probably took two forms: destruction or donation to the test site operators. The net result of the Army's preferred mode of operation with rotating staffers and composite forces was retirement of very few records into normal records management channels. The Air Force practice of committing TO&E Line organizations to the exercises tended to avoid this situation. These wings moved into the exercises as units, executed their exercise missions, created their records, brought them "home" with them after the exercises, and, eventually retired them.

9. One of the most promising lines of inquiry opened by the field search centered on location of approximately 600 linear feet of records pertaining to the decade of the 1950's which had been created by the Armed Forces Special Weapons Project and its successor agencies. From inventory descriptions published by the National Archives, it was generally inferred that records of the Armed Forces Special Weapons Project for the years 1947-71 had been accessioned into the National Archives. Examination of these records indicated many missing gaps.

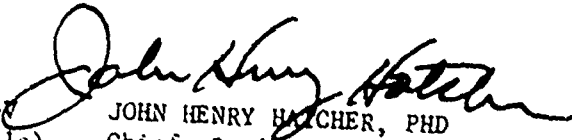

Following certain leads developed in St Louis, it was discovered that some 600 linear feet of AFSWP/DASA records were still stored in retired status in the Washington National Records Center and had never been formally accessioned into the National Archives. Arrangements were made immediately for Army researchers to examine this collection for documentation central to current Army NTPR Project requirements. More discussion on this is found in Annex H following.

10. The arrangement of this report consists of the foregoing brief summary statement followed by individual annexes dealing with each point of the field search itinerary. Where appropriate, supporting documentation is appended to the individual annexes.

11. In final summation the field search for Desert Rock Exercise documentation may be considered successful for the following reasons. It eliminated much conjecture on possible sources for missing documentation; at the same time opened additional lines of more promising inquiry. The names with some dosimetry data for some thousands of troop participants in Exercises Desert Rock IV and V were added to lists being compiled by the Army NTPR Project Team. And, finally, it established effective liaison with many non-Army sources of data for future exploitation in connection with the Army's Nuclear Test Personnel Review Project tasking.

IV. PARTICIPATION.

Military personnel participated in nine shots during Exercise DESERT ROCK V. Troop observers were included in all shots and composite Battalion Combat Teams participated in six of the nine shots.

The tactical situation assumed for troop participation was based on the concept that aggressor airborne troops, after an initially successful attack, were now on the defensive and had established a strong position which was holding up the attack by friendly troops. Decision was made to use atomic weapons to force a breakthrough. In each case the actual burst represented one burst out of a group of 5 to 7 employed to execute the planned maneuver.

In each case ground zero was assumed to be 1,500 yards in rear of the enemy lines. Protective trenches were prepared and occupied at 3,500 to 4,000 yards from ground zero in all tower shots and at greater ranges for air dropped and artillery delivered weapons. In planning the maneuvers all tower shots, regardless of KT yield, were assumed to be artillery delivered atomic weapons.

The first atomic explosion in this series occurred on 17 March 1953. This was a tower shot which developed a yield of 16.3 KT and was followed by an attack on an objective to the left (west) of zero from trench positions 3,500 yards from ground zero. This attack was made by two Army BCT's composed of Camp Desert Rock permanent party personnel.

On 24 March two Army BCT's composed of personnel from Second, Third, Fifth, and Sixth Armies entrenched 3,000 yards from GZ attacked an objective to the west of ground zero immediately after the second atomic burst, a tower shot of 24.5 KT yield. In addition, a group of nine volunteer Army, Air Force, and Navy officers were positioned in a trench at 2,500 yards from ground zero as the first step in an experiment to determine how close personnel may be positioned to a burst without harmful effects.

There was no military participation in the third atomic detonation on 31 March 1953. The experimental device used on this occasion developed a yield of only .21 KT.

No military personnel were scheduled to observe the air drop of an atomic weapon on 6 April. However, 75 Marine Corps officers scheduled to participate in Shot V-5 took advantage of the opportunity to witness this detonation in order to be better qualified to orient their troops. They were joined by 60 officers and enlisted men of Camp Desert Rock who had not previously witnessed an atomic detonation. This weapon, yielding 10.3 KT, was detonated 6150 feet above the terrain, and was one of the most spectacular of the series.

The area to be used for Shot V-5 was contaminated by the detonation of Shot V-4. As a result Shot V-6 was advanced to 11 April. The detonation of this device, placed in a cab on a 100 foot tower and which yielded .22 KT, was witnessed by 63 observers originally scheduled to observe Shot 5 but who departed their home stations prior to receipt of the notice of the change in date.

The USMC Provisional Atomic Exercise Brigade formed into two Battalion Landing Teams totaling 2,318 officers and enlisted men, attacked toward ground zero after the detonation of Shot 5 on 11 April. In addition, a Marine Corps Helicopter Group airlifted one company to the vicinity of their objective. This weapon was placed in a cab on top of a 300 foot tower and developed a yield of 27.7 KT. A group of 6 Army and 6 Marine Corps officer volunteers were positioned in a trench 2,000 yards from ground zero to observe this burst. All withstood the atomic blast without incident.

Shot 7, the largest in the series was detonated on 25 April. This shot, an atomic device placed in a cab on top of a 300 foot tower, developed a yield of 51.5 KT. Troops from the Second, Fourth, Fifth, and Sixth Armies, organized as two BCT's attacked toward objectives to the west of ground zero immediately after the detonation. These troops were halted 2,000 yards from ground zero because of the high radiation intensity in the area. Seven Army and one Navy officer volunteers were positioned in two trenches located 2,000 yards from ground zero. No unusual effects were noted by these officers.

On 8 May, a Mark 6 stockpile weapon was air dropped and detonated at a height of 2,423 feet above the terrain. This weapon, scheduled as Shot 9, is estimated to have developed a yield of approximately 26.4 KT. Two BCT's composed of personnel from the First, Third, and Fourth Armies plus a contingent of 326 officers and enlisted men of the Air Force attacked toward ground zero immediately after the detonation. A group of 60 of these officers and enlisted men were air lifted by helicopter to a point 1,500 yards from ground zero. This group reached ground zero one hour and two minutes after the detonation occurred.

~~SECRET~~  
SECURITY INFORMATION

Shot 8, which had been rescheduled because of contamination of the area, was detonated on 19 May. This device placed in a cab on top of a 300 foot tower developed an estimated yield of 34 KT. A total of 903 military personnel observed this detonation and the resulting effects on equipment, emplacements and animals.

Exercise DESERT ROCK V reached its climax with the detonation of a Mark 9 atomic shell delivered by a 280-mm artillery gun on 25 May. Two ECT's composed of troops from all the continental armies, attacked towards objectives beyond ground zero after the detonation. The Secretary of the Army, two members of Congress, the Chief of Staff of the U.S. Army, the Chief of Army Field Forces, the Commanding General of Sixth Army and 787 additional military and civilian personnel observed the detonation from positions in the troop entrenchment area.

A total of 17,696 military and civilian personnel witnessed the nine detonations in which the military participated. This total includes the Exercise DESERT ROCK Control Group which participated in all shots. All of the services were well represented throughout the series, with the total participation for each as follows:

Army	13,364
Navy & USMC	2,921
Air Force	1,273
Civilian (All services)	139

V. PSYCHOLOGICAL REACTIONS OF TROOPS AT THE DESERT ROCK V MANEUVERS.

The investigation of troop psychological reactions at the DR-V maneuvers was undertaken by Army Field Forces Human Research Unit No. 2. Research personnel from this unit were present at all shots attended by provisional battalion combat teams composed of Army personnel. The research performed was designed to accomplish the following objectives:

Observation of troop behavior in the forward trench area immediately prior to and after the detonation of an atomic device.

Measurement of changes in troop attitudes and level of information about atomic warfare before and after participation in the indoctrination and maneuver at DR-V.

Assessment of some of the factors governing the degree to which information gained and attitudes formed at DR-V by troop participants were communicated to home station troops upon return of the maneuver participants.

Obtaining reactions and opinions of a group of officers who were in a special forward volunteer group on some of the shots.

At this date only preliminary analyses have been made of the data collected at DR-V. Consequently, the findings reported here should be regarded as tentative. A final report of the psychological findings will be published under separate cover at a later date.

Preliminary findings indicate:

There was no evidence of panic or even overwhelming anxiety on the part of participating troops.

That participating troops acquired considerable information by the end of the exercise which resulted in a decrease in self-rated anxiety about the danger of injury from all the effects of an atomic burst, except radiation. However, there is little evidence that the experience of the exercise produced changes in broader attitudes about atomic warfare, troops interviewed indicating they were neither more nor less willing for the United States to use atomic weapons in Korea.

That more information is gained by participants who, at their home stations prior to departure to the exercise, participate in group discussions and are provided with lists of questions that members of the group desire answered.

That well indoctrinated officers are willing to position themselves in forward trenches located at distances they have calculated to be safe. That such officers feel that they have learned nothing new about atomic effects but by their actions have added to the confidence of participating troops in this and future exercises.

~~SECRET~~  
SECURITY INFORMATION

prior to the shot. This period was limited to a description of the tactical maneuver situation for the shot, presented by the AC of S, G3, and a brief general orientation and question period conducted by an instructor.

The following subjects were covered in orientations during the exercise periods:

<u>SUBJECT</u>	<u>REVISED TIME</u>
Introduction and Security	30 min
Atomic Weapons Family	50 min
Characteristics and Effects of an Atomic Explosion	50 min
Medical Aspects	30 min
Protective Measures and Radiac	30 min
Army Delivery Means	40 min
Air Force Delivery Means	35 min
Navy Delivery Means	35 min
Tactical Employment	80 min
History of Desert Rock Exercises	20 min
Seminar and "TUMBLER/SNAPPER" Film	30 min

Training films concerning atomic matters were shown at night for BCT and officer personnel on a voluntary attendance basis.

The orientation periods were revised continuously as new material became available to the instructors. Lessons learned from experience and suggestions from officers operating in the field of atomic energy who attended the orientations contributed to the improvement of the orientations.

X. RADIOLOGICAL SAFETY.

The Directive for Exercise DESERT ROCK V, issued by JCAFF, made the Exercise Director solely responsible for providing radiological safety for all participants in the exercise. This marked the first time the military was given the entire responsibility for radiological safety of its personnel in maneuvers conducted in connection with an atomic burst.

The Directive provided the Exercise Director with criteria to be used in exposing participants to atomic weapons effects. These criteria provided for a maximum permissible dosage of six (6) roentgens for the exercise.

Based upon the above criteria the Rad-Safe Officer prepared an SOP for Radiological Safety covering all operations in the forward area. These procedures prescribed the use of radiac instruments and film badges, monitoring requirements and decontamination regulations.

Prior to each shot the Radiological Safety Section conducted a school for monitors selected by the participating BCT's. During the maneuver following each shot these monitors checked for nuclear radiation in the area used by their respective units. In addition, the Rad-Safe officer and his monitors surveyed the entire maneuver area, reported intensity levels to the Exercise Director, and exercised overall radiological safety control.

Prior to each shot the Rad-Safe Section placed film badges in the field fortifications located in the display area. These badges were recovered after the shot and the readings were studied to determine the radiation dosages received in the fortifications. In addition, where possible, these readings were compared with radiation effects predicted by trained staff officers.

After each shot radiological surveillance of the area was continued, decay predictions made, and a situation map showing intensity levels was maintained.

XI. PREPARATION OF MANEUVER AND DISPLAY AREAS.

The 412th Engineer Construction Battalion was assigned to Camp Desert Rock for the purpose of constructing troop trenches and preparing the display areas for Exercise DESERT ROCK V. In addition, this unit was to render engineer support, in so far as its capabilities permitted, to the Directorate of Weapons Effects Tests, AFSEP and to Camp Desert Rock.

Preparation of the Exercise DESERT ROCK V sector of each shot area required the expenditure of 26,361 man hours and 7,700 equipment hours during the period 12 January to the detonation of Shot 10 on 25 May. Approximately 10,000 feet of trenches were dug for Shot V-1, V-2, V-5, V-7, V-9, and V-10 with Shots V-6 and V-8 requiring a lesser amount.

~~SECRET~~  
SECURITY INFORMATION

~~RESTRICTED DATA~~  
ATOMIC ENERGY ACT 1946

~~SECRET~~  
SECURITY INFORMATION

All display areas contained a standard layout of stakes, shallow trenches and bunkers, beginning at 500 yards from Ground Zero and at each 500 yards thereafter up to 3,500 yards. The following emplacements and stakes were placed on each 500 yard arc:

- C-1 (C-9) Stake - A 4" x 4" wooden stake, extending 2' above the ground. Fig 1 (Page 77).
- C-2 (C-8) Trench - A slit trench 4'6" long, 2' wide and 2' deep. Fig 2 (Page 77).
- C-3 (C-7) Trench - A slit trench 4' long, 3' wide and 3'6" deep. Fig 3 (Page 77).
- C-4 (C-6) Bunker - A one man covered emplacement. Fig 4 (Page 78).
- C-5 "B" Bunker - A two man covered emplacement. Fig 5 (Page 79).

In addition, deep "A" type bunkers were dug at 100, 200, and 300, and 400 yards from ground zero for Shots V-2 and V-9. Various items of military equipment were also placed in the display areas to provide visible evidence of the damage effects of atomic weapons. Sheep were placed in selected A, B, and C type emplacements. Fig 6 (Page 80).

The Engineer support rendered to AFSTP T-1ST GROUP required an expenditure of 12,209 man hours and 2,318 equipment hours up to 25 May 1953. This effort was largely expended in the Frenchman Flat area.

Engineer support rendered to Camp Desert Rock for the construction of additional facilities required the expenditure of 17,929 man hours and 614 equipment hours.

The clean up of destroyed equipment in display areas for Exercise DESERT ROCK V and AFSTP will require additional effort.

Communication facilities for Exercise DESERT ROCK V were installed by Composite Company, 505th Signal Group. These facilities included telephone communication between the Control Group and the BOT Commanders, ABC Control Point, the vehicle parking areas, Camp Desert Rock and a forward line to Rad-Safe monitors. In addition, a radio net was established to duplicate the telephone system. A public address system was constructed in each trench and vehicle parking area to enable instructors to give "on site" orientation and instructions to the participants. The establishment of these communications facilities required the expenditure of 7,776 man hours and 2,340 equipment hours.

This unit also expended 10,080 man hours and 2,450 equipment hours in support of Project 3.20 (SIGNAL) in the AFSTP test area. This effort was expended in the construction of pole lines, buried lines, surface lines and construction of radio towers.

### XIII. VOLUNTEER OBSERVER PROGRAM.

Selected officer volunteers, capable of calculating effects of atomic weapons, were positioned in trenches at 2,500 and 2,000 yards on three shots.

Four Army, four Naval and one Air Force officer volunteers were positioned in a heavily revetted trench located 2,500 yards from ground zero on Shot 7-2. For Shot V-5, the volunteer trench was located 2,000 yards from ground zero and was not revetted. This trench was occupied by 6 Army and 6 Marine Corps Officers. Two trenches, one revetted and one not revetted, located at 2,000 yards from ground zero were utilized by the volunteer officer group on Shot V-7. This group consisted of seven Army and one Naval officer.

The location of the trench in each case was based upon the determination of a safe distance by the volunteers. This distance was calculated for the criteria under which the program was established, using effects data listed in TM 23-200 dated 1 Oct 1952. These criteria, established by CCAFF, were:

- "Overpressure 8 psi at ground level."
- "Thermal 1 cal/cm<sup>2</sup>."
- "Nuclear radiation 10 r in any one test, of which no more than 5 r is prompt, whole body radiation, and with the further limitation that no volunteer shall take more than 25 r in this series of tests."

All calculations were based upon the above criteria and the predicted yield of the weapon to be detonated. The actual yield was less than the predicted yield for Shots V-2 and V-5, but exceeded the predicted yield of 40 KT by 25 percent on Shot V-7.

As a result of their experience these officer volunteers concluded:

That the volunteer trenches were located at a safe distance under the given conditions for each shot.

~~SECRET~~  
SECURITY INFORMATION

That data in TM 23-200, dated 1 October 1952, can be used to determine safe observer positions if properly qualified officers make the computations.

That troops could have observed these shots safely from positions located in the same areas as the volunteer trenches. However, it was further concluded that troops should be placed no closer than 3,500 or 4,000 yards to ground zero in troop orientation and indoctrination exercises, such as Exercise DESERT ROCK V, for the following reasons:

Troops can feel the effects of the detonation at those distances as well as they could at a closer point.

Troops can better observe the fireball and mushroom cloud at those distances.

Troops are sufficiently removed from the heavy dust cloud and possible radiation hazard.

Reduction of the distance between ground zero and the troop entrenchment area below 3,500 to 4,000 yards reduces the area available for troop maneuvers.

That a trench six feet deep and unrevetted gave adequate protection under the given conditions.

That there was no discomfort from blast or thermal effects.

That ground shock, at this distance, is not of sufficient magnitude to be of any concern.

That the existing volunteer program, with its present mission and limiting criteria, has served its purpose and should be discontinued.

That a volunteer program of this type, with a mission of indoctrination for personnel having special weapons training or assignments with special weapons programs, would be worthwhile.

That future volunteer programs would have greater value if volunteers were positioned in a variety of standard field fortifications and combat vehicles approximating actual combat conditions.

That instrumentation placed in trenches to record pressures, heat, ground shock, and nuclear radiation would be of assistance in evaluating observers' reactions.

Study of the results of the volunteer program must be done with great care. Readers are cautioned to remember that all shots in which volunteers participated were tower shots. Different information might result if a similar program were undertaken for shots in which the detonation took place considerably higher than the 300 foot height of the tower used in these shots.

### XIII. CONCLUSIONS.

From experience gained in Exercise DESERT ROCK V it is concluded:

That the overpressure and thermal radiation criteria used in determining troops positions for this exercise are sound and should be followed in future exercises.

That the criteria for nuclear radiation to be accepted should be increased to permit maneuver closer to ground zero than was possible in this exercise. The amount of increase should be determined by observation of the volunteer officers who accepted larger dosages than permitted for troop participants.

That the criteria for distances between ground zero and the troop trenches used in this exercise are sound and should be retained in future exercises.

That a volunteer program which would permit officers trained in special weapons or assigned to special weapons programs to be positioned in trenches closer to ground zero than the participating troops would be worthwhile for indoctrinating such officers in atomic weapons effects.

That atomic weapons effects data found in TM 23-200, dated 1 October 1952, can be used by qualified officers to determine safe troop positions and to predict damage to equipment, emplacements and personnel as the result of an atomic weapon detonation.

That indoctrinated soldiers show no evidence of fear of an atomic detonation and will willingly attack objectives at or near ground zero.

That continued detonation of atomic weapons over the same flat terrain found in the Yucca and

~~SECRET~~

~~SECRET~~  
SECURITY INFORMATION

Frenchman Flats of the Nevada Proving Ground precludes the obtaining of valuable data on the effects of atomic weapons detonated in rough terrain and under other than ideal conditions.

That improved military participation could be obtained by more direct contact between the Exercise Director and the Test Manager, AEC Nevada Proving Ground, rather than the Exercise Director being required to communicate through AFSTF to the Test Manager. | X

That emphasis in future atomic weapons tests should be placed upon tactical operations rather than weapons effects in order to increase our knowledge of the tactical employment of nuclear weapons. Although a great deal of theoretical work has been done on the tactical employment of nuclear weapons, a great deal remains to be done. Ultimately, and with as little delay as possible, armored and infantry divisions should attack behind multiple atomic detonations which have been incorporated into a fire plan involving all of the conventional weapons. A vast amount of data is presently available on weapons effects. | X

That the assignment of a photodosimetry team and laboratory to Camp Desert Rock would have made more accurate and complete Rad-Safe operations in Exercise DESERT ROCK V. | X

That dependence upon Camp Mercury sources for photographic coverage of Exercise DESERT ROCK V is unsatisfactory. | X

XIV. RECOMMENDATIONS.

To improve future Exercises DESERT ROCK, it is recommended:

That the overpressure and thermal criteria used in this exercise be retained.

That the nuclear radiation tolerances be increased to permit maneuver closer to ground zero.

That troops entrenching positions be located no closer to ground zero than 3,500 to 4,000 yards. |

That future exercises of this type include a volunteer observer program with a mission of indoctrination for officers having special weapons training or assignments in special weapons programs, and that such a program be expanded to include larger numbers and less stringent prerequisites for participants. |

That future exercises include attacks against fortified positions located in rough terrain, utilizing stockpile weapons that would be used under similar conditions in combat where possible. | ?

That future exercises employ standard atomic weapons under adverse weather conditions to determine the effectiveness of these weapons under such weather conditions from offensive and defensive points of view. | ?

That Department of the Army obtain the necessary authority to secure and utilize limited numbers of stockpile weapons in exercises for which it is completely responsible and which are free from artificial test detonations, equipment and electronic measuring devices. | ✓

That planning be started for a large scale exercise, employing two or more divisions attacking a simulated enemy after detonations of multiple burst of stockpile weapons and in conjunction with the coordinated fire of conventional weapons. | ?

That the Department of Defense take steps to have greater emphasis placed upon tactical operations and troop participation in any future test series scheduled by the AEC. | ?

That the Exercise Director for future exercises DESERT ROCK be made a deputy to the Test Manager in order to have direct contact on all matters pertaining to troop participation and tactical operations. | ✓

That steps be taken to obtain items of display equipment through technical service channels at least 4 months prior to the first shot.

That the quotas for troop observers and BCT's be held at the same level as quotas for Exercise DESERT ROCK V; that is, a maximum of 600 troop observers and two (2) BCT's with a strength of 1,200 each.

That in future exercises a photodosimetry team and laboratory be assigned to Camp Desert Rock.

~~SECRET~~  
SECURITY INFORMATION

That steps be taken to obtain AEC permission for Camp Desert Rock photographers to cover Exercise DESERT ROCK activities within the Nevada Proving Ground, with the complete understanding that all photographs will be developed and classified within the Nevada Proving Ground and in conjunction with AEC personnel.

HQ CAMP DESERT ROCK  
LAS VEGAS (872536) NEV  
011200 June 1953

Annex 3 (SHOT VICTOR 2) to Final Report  
EXERCISE DESERT ROCK V

I. GENERAL.

Incoming observers and troop personnel for Shot 2 closed in Camp Desert Rock on 20 March. Troop participants were from the Second, Third, Fifth, and Sixth Army Areas.

A full dress rehearsal was conducted on 22 March in the Tuuca Flat Area, actual site for this shot. The control group departed Camp Desert Rock at 0807 hours and all units closed in the entrenchment area at 1045 hours.

Actual shot day conditions were in order during the rehearsal. One of the ECT commanders experienced some difficulty in placing members of his command in the allotted trenches. Another "dry run" remedied this situation.

The arrival and detrucking of approximately 3,000 officers and men at the entrenching area was accomplished in the one (1) hour allotted for this purpose. It was surprising to note the crowded conditions that existed when troops detrucked in the relatively small area.

The ECT started the simulated attack from the trenches at 1200 hours. The attack continued for 1,500 yards and at that point the advance was halted. This concluded the tactical phase of the rehearsal.

The observers and troop personnel were taken through the equipment and animal display area shortly after the tactical phase ended. Later the observers were taken to the site of Shot 1 to observe the damage to equipment from a previous detonation.

Movement for return trip started at 1350 hours and all personnel closed in Camp Desert Rock at 1632 hours. The rehearsal progressed on schedule and much experience was gained by the staff in executing this phase of the exercise.

The control group departed camp for Shot 2 at 0011 hours, 24 March. A total of 185 vehicles were required to transport the Control group, observers and troops to the shot site. All personnel closed in the entrenchment area at 0340 hours. Vehicles were moved to a motor park, 8.5 miles from ground zero.

A pre-shot indoctrination and orientation was delivered over the public address system from 0410 to 0500 hours.

At H-Hour minus 10 minutes the Exercise Director ordered all personnel into the trenches.

At H-Hour minus 2 minutes, all personnel were ordered to crouch low in the trenches. A siren blast of 30 seconds duration was sounded at this time.

At H-Hour minus 90 seconds, the Atomic Energy Commission took over the public address system and counted off the remaining time at 30 second intervals until reaching H-Hour minus 10 seconds. Once more came the now well remembered "9, 8, 7, 6, 5, 4, 3, 2, 1 and ECT count" (0510 hrs).

A very bright light, which seemed to linger longer than the light noticed during the first shot, was observed in the trenches. Very little ground shock was received but the noise was deafening. Debris falling into the trenches in large quantities, followed by dust conditions, obscured the vision of personnel. None of the debris was large enough to cause injury.

A large fireball, engulfed in a huge dust cloud, was observed initially. Soon after the blast, the wind direction changed and caused a dust cloud to blow over the troops in the entrenchment area. A reading of 18 mr was noted at the trenches.

At 0533 hours the ECT's attacked objectives 4,000 yards to the north. The unit on the east, nearest to ground zero, had to sidestep to the west as the advance neared ground zero because of radiation intensities. Troops were able to move to within approximately 500-700 yards of their objectives when halted by Rad-Safe personnel as no further advance could be made under the established radiation criteria.

~~SECRET~~  
**SECURITY INFORMATION**

Nine (9) volunteer officers were positioned in a trench 2,500 yards from ground zero during the blast. They were in constant wire communication with the control trench, 1,500 yards to the rear, before, during and after the blast. None of the volunteers experienced any ill effects and all felt their combat efficiency would have been unimpaired.

A Marine Corps Helicopter Group (H-19) conducted experiments during the shot. Four (4) helicopters were on the ground approximately 16,500 yards from ground zero during the detonation. Three (3) of the aircraft became airborne immediately after the detonation and prior to the arrival of the blast wave. One of the airborne aircraft proceeded towards the burst after the arrival of the blast wave and was flown to within 3,500 yards of ground zero. Dust and airborne radiation limited any further movement toward ground zero.

The shock wave produced no adverse effects on either airborne or parked helicopters. It was determined that the initial intense light from a detonation would not noticeably affect the pilot of an airborne helicopter providing the pilot was observing 180 degrees from the blast area.

An Army helicopter (H-23) was used to perform a rapid survey of the equipment and animals in the display area two (2) hours after the detonation. Using this mode of travel, it was possible to proceed to within 400 yards of ground zero.

The observer group departed the entrenchment area at 0631 hours for a tour of the equipment and animal display. Troop units also visited the display area at the conclusion of the tactical maneuver. Shortly after 0600 hours, march units started the return trip and all closed in Camp Desert Rock at 1032 hours.

The maneuver, motor movement and other portions of the exercise were executed according to schedule and without incident.

No damage occurred in protective trenches at 1,500 yards and beyond. Sheep positioned in the open were alive and walking around after the blast. All sand bags, facing ground zero, were burned at this distance.

Participating in the exercise were 2,845 military and 16 civilian personnel, a total of 2,861 persons.

At ground level, in the entrenchment area, at shot time, temperature was recorded at 50.7 degrees Fahrenheit. Wind velocity, from a direction of 310 degrees true north, was 2 knots per hour. Almost simultaneously with the burst, a wind of 4 - 6 knots from approximately 5 degrees developed.

## II. INTELLIGENCE AND SECURITY.

The two Battalion Combat Teams arrived properly cleared, were briefed, performed in a most cooperative manner and presented no security problems before, during, or after the shot.

The vehicle convoy was cleared through the forward area more smoothly than on the previous shot.

No press representatives were not allowed to be present in the Shot Area for this shot. The problem of safeguarding of classified information was greatly reduced because of the absence of news interviews.

Signal photographers were barred by the Atomic Energy Commission from taking pictures unless the photographers were "Q" cleared. No "Q" clearances have been received for any of the photographers although more than six weeks have elapsed since application for such clearance was initiated. In order for the exercise to receive proper documentation it is extremely necessary that certain photographs of the area be secured. Because of this new ruling Desert Rock must rely on photographers within Camp Mercury, who are already assigned other commitments, in order to secure these photographs.

## III. INSTRUCTOR GROUP.

On 21 March the orientation of one BCT in two groups of approximately 600 men each and the observer group for shot V-2 began. A rehearsal was held on 22 March which included a trip for the observer group to the display areas for Shot V-1. A discussion of the damage to equipment and the general condition of the area of the shot was presented.

The second BCT and remainder of the observer group instruction was completed on 23 March. A

~~SECRET~~  
**SECURITY INFORMATION**

1 hour evening orientation was given to late arrivals. This was followed by a showing of Training Film "Operation TUMBLER-SHAPPER" (SECRET) to all observer personnel, on a voluntary attendance basis. This training film was favorably received. The same evening, in the open air theater, the following training films were shown on a voluntary basis to the ECT's: "The Effects of Atomic Explosion" (RESTRICTED), "Medical Aspects of Nuclear Radiation" (RESTRICTED), "Self-preservation in A-bomb Attack" (RESTRICTED), and "The Great Gun" (UNCLASSIFIED).

Shot V-2 was fired on 24 March and ECT's and observers were conducted through the equipment display area to observe, and receive orientation as to the effects of the detonation.

The conduct of the orientation for shot V-2 was improved both in the training auditorium and the forward area as a result of the use of proper equipment and training aids which were unavailable for shot V-1. Mobile sound trucks were furnished to the instructors with the ECT's to further assist in the orientation and control in the forward area.

**IV. SIGNAL.**

The requirements for this shot were generally the same as for Shot V-1. A few changes were made to provide a better communication system in the forward area.

Public address loudspeakers were installed on three (3) thirty (30) foot poles in the entrenchment areas. This provided a good coverage for all parts of the trench area.

Once more the battalion commanders were provided AN/PRC-10 radios for command and control purposes. More frequencies were assigned to the Exercise Director and, although radio communication was improved considerably, some transmission difficulty was experienced when the battalions were 2000-3000 yards from the control trench.

A more satisfactory wire communications service was provided in the display area than on Shot 1. This was accomplished by burying the wire along both sides of the equipment display triangle prior to the shot. This wire system terminated at stakes which were located at 500 yards intervals as far forward as 1000 yards from ground zero. Rad-Safe personnel installed telephones at these locations when wire communications with the control trench was desired.

**V. RADIOLOGICAL SAFETY.**

Shot Day Operations. The 2.5 r/hr limit was reached by the monitors at 850 and 1250 yards from ground zero on the right and left sides of the sector respectively. The 5 r/hr line was less than 100 yards beyond. Intensities ranging from 5 mr/hr upward were encountered over the entire test area. Rad-Safe Operations for Shot 2 were the same as for Shot 1 with two exceptions:

The monitor and marking party trucks were used to transport the volunteer observers to and from their trenches on the 2500 yard line.

A change in the direction of the wind caused part of the radioactive cloud to pass over the trenches. There was no appreciable fall-out in the trench area, but radiation intensities at ground level reached 18 mr/hr while the cloud was overhead. There was rather heavy fall-out of radioactive material in the maneuver area, particularly in a draw which lay between the attacking troops and their objective. The deposit in the draw was of high enough radiation intensity (about 14 r/hr) and of sufficient extent to call for withdrawal of the troops from the contaminated ground. The CER monitors of the ECT's proceeded into the area without giving any indication of their readings to their unit commanders. Upon being directed by the Rad-Safe Officer, the unit commanders seemed to experience difficulty in withdrawing their men. However, little time was spent in the area. The first of these deficiencies may be attributed to training which emphasizes techniques and does not train the monitor in what to do when radiation fields of high intensity are approached and entered. The second deficiency probably resulted from the provisional organization of the attacking troops.

**Special Operations.**

Immediate radiation intensities were recorded in the same manner as in Shot 1.

The unexpected fall-out in the area west of Shot 2 ground zero extended over positions being prepared for Shot 5. Since the radiation intensity was approximately 2 r/hr work was discontinued. Prediction of decay rates and calculation of time of stay in the area was necessary to plan for engineer operations. Future intensities and conditional dosages were calculated. Early morning surveys were made daily to check the calculations. It was found that the actual reduction in intensities

HQ CAMP DESERT ROCK  
LAS VEGAS (872536) NEV  
011200 June 1953

Annex 6 (SHOT VICTOR 6) to Final Report  
DESERT ROCK V

GENERAL.

Shot V-6 was detonated on a 300 foot steel tower at 0445 hours, 11 April. Observers from all services witnessed the explosion from a vantage point on News Nob, a small hill near the Atomic Energy Commission Control Point at the entrance to Yucca Flat. The steel tower containing the nuclear device was located in the west-central portion of Yucca Flat, approximately ten (10) miles from the observers.

This shot was a low yield experiment and no troop exercise was conducted in connection with it. Participating as an observer group from Camp Desert Rock, were thirty three (33) Army, twenty five (25) Marine, four (4) Air Force and one (1) Navy officers. The twenty five (25) Marine personnel were commanders and staff officers of the Marine Corps Provisional Atomic Exercise Brigade who came to Camp Desert Rock as members of the advance party of the Brigade to prepare for Marine participation in shot V-5 which followed Shot V-6 due to a change in AEC schedules. The purpose of having these Marine officers attend the V-6 shot was to familiarize them with atomic phenomena so that they could disseminate the information to the Marine units. The effectiveness of having commanders view a detonation prior to directing troops in an atomic exercise was well demonstrated in later operations.

The observers, totaling 63 personnel, departed Camp Desert Rock at 0300 hours, 11 April for News Nob, a distance of twenty five (25) road miles. The convoy arrived at News Nob at 0412 hours without incident.

Vehicles were parked in a parking area 100 yards from News Nob near the observation point. A member of the Camp Desert Rock Instructor Group gave all observers a twenty minute briefing and orientation on the burst phenomena at the observation point.

Since the burst was small, and the observers were 10 miles from the detonation, no shelter was necessary for personnel or equipment. The observers were required to face away from the tower immediately prior to H-hour and remain faced away until after the flash of detonation. The observers witnessed the formation of the mushroom cloud and the subsequent action of the fireball very clearly. No blast wave was felt, but a sharp crack of sound reached the observation point. Four Marine helicopters (H19 type) participated in the shot and were clearly seen from the observation point on News Nob.

The return trip to Camp Desert Rock was completed without incident at 0540 hours. No assistance from the Rad-Safe personnel was required at any time during the operation. No measurable radiation was received at the observation point.

Communications for the operation consisted of direct telephone lines into the Proving Ground Command Post and into the AEC switchboard. A loudspeaker system tied into the AEC command post circuit was also used to broadcast the count down sent out by an AEC announcer from the control point.

HQ CAMP DESERT ROCK  
LAS VEGAS (872536) NEV  
011200 June 1953

Annex 7 (SHOT VICTOR 7) to Final Report  
EXERCISE DESERT ROCK V

I. GENERAL.

Troop observers arrived at Camp Desert Rock during the period 21-24 April. Arrival times were so separated that less than one half of the observers were present the first day the orientation course was conducted. Troops from the Second, Fourth, Fifth and Sixth Armies closed in camp on 22 April and were organized into two (2) BCT's for participation in the tactical maneuver.

A rehearsal of the tactical maneuver and the observer program was conducted in the Yucca Flat area on 23 April. Actual site positions to be occupied on shot day were utilized. The Control Group departed Camp Desert Rock for the forward area at 0700 hours and all march units closed in the exercise area, 33.2 miles from camp, at 0945 hours.

An on site orientation program was conducted by a member of the Instructor Group. Time selected for H-Hour was 1030 hours. At this time all personnel positioned themselves in the trenches and troop units started the simulated attack at 1035 hours.

The attacking forces moved very rapidly and at the end of thirty five (35) minutes had advanced a distance of 2500 yards. Attacking waves of troops formed solid masses in some instances and the commander experienced difficulty in controlling his units. Upon arrival at the 2000 yard line, the attack was halted and this completed the tactical phase of the maneuver.

Troop units and observers were taken through the equipment display area. Later the observer group was taken to the site of Shot V-5 (18 April) to observe damage incurred on equipment by a previous detonation. Return motor movement to camp started at 1500 hours and the last march unit closed in Camp Desert Rock at 1505 hours. No unusual incidents occurred during the rehearsal.

The control group departed camp for Shot V-7 at 0030 hours 25 April. Transportation requirements to move the control group, observers and troops to the shot site totaled 179 vehicles. All march units and personnel closed in the entrenchment area at 0322 hours. Vehicles were moved to a parking area 5.9 miles from ground zero.

A member of the Instructor Group conducted a pre-shot orientation from 0330 to 0420 hours. Information pertaining to an atomic device detonated from a tower was presented to the observers and troops.

The Exercise Director ordered all personnel to enter the trenches at H minus 15 minutes and at H minus 2 minutes all personnel were instructed to crouch low in the trenches. A siren warning of 30 seconds duration was sounded at this time. With 90 seconds remaining prior to the detonation, an Atomic Energy Commission spokesman from the command post took over on the public address system and counted off the remaining time at 30 second intervals until reaching H minus 10 seconds. At H minus 5 seconds, the final count down started with the familiar "4, 3, 2, 1 and NO!" It was now 0430 hours.

A bright light, of approximately 3 seconds duration, was noted at the time of detonation. The ground shock was heavy, and the earth appeared to roll for a moment. Noise accompanying the blast was deafening, loudest of this series of shots. Dust conditions following the blast and debris falling into the trenches obscured the vision of personnel in the trenches.

As usual for tower shots, the fireball was engulfed in a large dust cloud initially. The cloud rose steadily and actually formed the well known "atomic mushroom." This was by far the most picturesque atomic cloud to be observed, from a tower shot, in this series of shots. An initial radiation intensity of 5 r/hr registered on survey meters in the trenches; however, the radiation lasted for such a short time, the initial radiation dose was less than 25 mr.

Both BCT's started the attack at 0444 hours towards objectives 4000 yards to the north. The BCT on the east (R) advanced to within 2000 yards of ground zero at 0600 hours. At this time the attack was halted by the Rad-Safe monitors due to a reading of 2.5 rcontgens at this point. The BCT on the west (L) encountered no areas having a high radiation intensity and advanced until the attack was halted for other reasons.

~~SECRET~~

~~SECRET~~

~~SECRET~~  
SECURITY INFORMATION

Upon completion of the tactical phase of the maneuver, observer and troop personnel were moved through the equipment and animal display area. Movement forward was limited to the 3000 yard line due to radiation levels encountered.

Eight (8) volunteer Army and Navy officers were positioned in trenches 2000 yards from ground zero during the blast. Telephone communication was established from the control trench to the volunteers and the Exercise Director was able to keep all volunteers informed prior to, during and after the shot. All volunteers withstood the blast without incident.

The Marine Corps Helicopter Group (H-19 type) conducted experiments during the shot. A full report on this participation is included in paragraph VIII.

An army helicopter (H-23) was used for reconnaissance purposes after the detonation. It was possible to observe the equipment and animals in the forward area during these flights. Another helicopter was available for evacuation purposes.

Return movement to Camp Desert Rock started at 0625 hours and all march units and personnel closed in camp at 0957 hours without incident.

Sand bags in the entrenchment area, 4000 yards from ground zero were singed. Joshua trees, located 400 yards west and 200 yards north of the entrenchment area were ignited shortly after the detonation.

Of unusual interest, occurring as a result of this shot, was the caving in of a C-4 type bunker at the 1500 yard line. A sheep, tied to a stake, was placed in this bunker on 24 April, prior to time of caving-in. On 13 May, a working party removed the top portion of the bunker and the trapped sheep leaped from the emplacement. Even though the animal had been without food and water for nineteen (19) days, it appeared in good condition and was able to walk. The animal recovered completely and was used in an animal display for a subsequent shot.

Participating in the exercise were 3,102 military and 24 civilian personnel, a total of 3,126 persons.

At ground level, in the entrenchment area, temperature was recorded at 53 degrees Fahrenheit. Wind velocity, from a direction of 340 degrees, true north, was 5 knots per hour and visibility was 50 miles. Measured humidity was 26 percent and atmospheric pressure was 870 millibars.

#### II. INTELLIGENCE AND SECURITY.

The major difficulty encountered during the convoy movement was the identification of vehicles within the march units. Only two march units dimmed their lights at check points. Signs were dusty and hard to decipher.

Once again observers arrived without security clearance indicated on their orders. This was corrected by sending messages to observers home station for clearances.

Late arrivals created a problem as to checking attendance at orientation briefings in that rosters could not be completed prior to check-in time at the theater. No security violations were reported for the group attending this shot.

#### III. DISTRICTOR GROUP.

In preparation for Shot V-7, the instructor Group presented three types of orientation programs. An eight hour period of SECRET classification was presented to those troop observers who arrived at Camp Desert Rock on or before 22 April. A four hour period of orientation was presented to those observers who arrived after 22 April, and another four hour presentation was provided on the CONFIDENTIAL level for DCP's and all observers not cleared above the CONFIDENTIAL access level. In general, the change in arrival plans of certain contingents of observers was such that they arrived at Camp Desert Rock on the day prior to the shot rather than three days before caused a hurried re-arrangement of orientation programs. Each group, however, received adequate orientation prior to the shot, though not the full eight hours originally planned.

Two hundred and ten (210) observers for Shot V-7 arrived at Camp Desert Rock prior to 0700 hours 22 April. All DCP personnel were present prior to this time. The Instructor Group presented a four hour CONFIDENTIAL orientation for DCP ABLE during the morning of 22 April and for DCP BAKER in the afternoon. All classes were conducted in the open air amphitheater. Ample seating was available for the full twelve hundred men oriented at one time. No difficulty was encountered in hearing

~~SECRET~~  
SECURITY INFORMATION

the instructor from any part of the amphitheater, the Signal Corps amplifiers completely filling the requirement for sound. Training aids such as charts set up on the stage could be seen very well from the rear of the amphitheater.

The 210 observers arriving on 21 April received a four hour portion of the standard eight hour orientation for observers on the SECRET level beginning at 0730 and concluding at 1155 hours, 22 April. For this same group, two films were shown during the afternoon. "Operation Greenhouse", a documentary of the AEC tests on Eniwetok Atoll in the spring of 1951, and "Operation Tumbler or Snapper", a documentary of military participation in the spring tests at Nevada Proving Ground in 1952, were screened on a voluntary basis. A total of one hundred and sixty hour (164) observers attended the film showing.

On 23 April, a rehearsal of the troop and observer participation in Shot V-7 was conducted. Although one half of the observers had not yet arrived, those present went through the rehearsal and were able to pass on instructions and assistance to later arrivals. Both ECT's took part in the rehearsal. In the trench area, at a time simulated as H minus 20 minutes, a member of the Instructor Group carried out a terrain orientation followed by instructions for procedure in the trenches prior to H hour. Following H-Hour, an instructor escorted the observer group and other instructors conducted each ECT through the display areas so that a basis for comparison of damage could be made following the actual shot. It was carefully pointed out to all that contamination might deny the area to observers and troops on shot day, nearer the tower than 1500 or 2000 yards.

On 24 April, those observers who had received the first four hour period of orientation on 22 April were presented the second four hours. During the afternoon of 24 April, 250 observers were oriented in weapon delivery means available to the services and in tactical employment of atomic weapons. At 1930 hours, 24 April, late arrivals and general officers were briefed as to the tactical problem of the exercise and, in general, procedures to follow while in the forward area. At this time technical questions, within the limits of SECRET classification, were answered by a member of the Instructor Group.

From H minus 60 minutes to H minus 2 minutes on shot day, a member of the Instructor Group conducted a pre-shot orientation of a general nature as to terrain, safety, and air participation in the exercise. Following the shot, instructors conducted each ECT and the observer group through the display area to the 2000 yard line. Closer approach was prohibited by radiation levels. Damage results at ranges closer than 2000 yards were obtained by the instructors and presented to all personnel, though viewing by all was not possible.

#### IV. SIGNAL COMMUNICATION.

The layout of the trench area for this shot was generally the same as for previous shots in the forward area and the communication installations generally conformed to the plan followed in prior shots detonated in this area.

Three speaker poles were installed in the trench area, mounted with four speakers pointing in four directions to cover all troops within the general area of the speaker pole. Each group of four speakers were fed from one public address system and the three systems were all tied in to one central system in the Exercise Director's trench for control. This installation proved to be very satisfactory and is now the standard installation used in all shots.

Telephones were installed in the forward trench of each ECT commander. In addition, telephones were installed in the observers trench, the parking area and the heliport. Communication with Camp Mercury and Camp Desert Rock was provided through the forward switchboard located in the trench area.

Normal radio communication was installed with the Rad-Safe officers in one net, the Exercise Director and the ECT commanders, the parking area and the heliport in another net and each of the ECT's in a separate net.

Four mobile public address systems were used for orientation purposes in the display area. The public address systems worked out very well and were in place ready for operation prior to the arrival of the troop units. Two power megaphones were used by the ECT commanders for oral orders to their respective units and proved quite satisfactory.

#### V. RAD-SAFE

No changes were made in the organization and operation of the Camp Desert Rock Rad-Safe org-

~~SECRET~~  
SECURITY INFORMATION

ation. Pre-shot tasks included conducting a 6 hour radiological monitor refresher course and test for participating army units.

This shot was characterized by an apparent higher yield and more wide-spread radiological contamination than previously encountered. There was little wind at shot time. The cloud drifted eastward with a heavy fall-out in that direction. Radiological Safety monitors for the troop units were in position at H plus 5 minutes in spite of the heavy dust cloud which hung over the area. The display area survey teams reached their initial points at approximately H plus 15 minutes. The 2.5 r/hr intensity was reached on the east (R) side of the display area at 2200 yards from Ground Zero with the 5 r/hr intensity being reached at 2000 yards. On the west (L), the 2.5 r/hr intensity was reached at 2500 yards with the 5 r/hr intensity at 2100 yards. Intensities in the troop trench area slowly rose to 120 mr/hr but quickly receded to about 30 mr/hr. Due to the high intensities encountered in the test area and on the access roads, final personnel and vehicle monitoring was impossible in the test area. Troops and vehicles were moved to the decontamination station at Jucca Pass and to Parking Area A (837925) for field decontamination and final monitoring.

The performance of the unit CBR personnel as radiological monitors was considerably improved over the previous army units. Troop participation from the stand point of radiological safety was excellent.

Rad-Safe operations in the field of providing for the collection of information were continued on the same scale as for Shot V-5, except no pressure gauges were available for this shot.

Post shot evaluation of the operation indicated that the corrective measures taken after Shot V-5 were effective.

Procedure:

Heat sensitive paper was placed in positions exposed to direct thermal radiation and in positions shielded from direct radiation but exposed to reflected or scattered radiation at 500 yard intervals from ground zero from 500 yards to 3000 yards. The exposed papers were placed in vertical position so as to receive near maximum radiant energy. The sheltered ones were placed in a horizontal position, face up to measure radiation in the trenches. At 1500 yards and 2000 yards papers were exposed in a horizontal position on the surface of the ground with no thermal shielding.

Results:

Values given are approximations:

Distance from GZ in yards	Sheltered Position	Exposed Position
500	Lost	Paper destroyed, more than 34 cal/cm <sup>2</sup> .
1000	Lost	Paper destroyed, more than 34 cal/cm <sup>2</sup> .
1500	No effect, less than .45 cal/cm <sup>2</sup> .	Vertical paper destroyed, more than 34 cal/cm <sup>2</sup> . Horizontal paper, about 5 cal/cm <sup>2</sup> .
2000	No effect, less than .45 cal/cm <sup>2</sup> .	Vertical paper, 25 cal/cm <sup>2</sup> . Horizontal paper, about 5 cal/cm <sup>2</sup> .
2500	No effect, less than .45 cal/cm <sup>2</sup> .	4 cal/cm <sup>2</sup> .
3000	No effect, less than .45 cal/cm <sup>2</sup> .	25 cal/cm <sup>2</sup> .

Immediate Radiation in roontgens received in emplacements.

~~SECRET~~  
~~RESTRICTED DATA~~  
SECURITY INFORMATION

Distance from GZ in yards	C1 Exposed post	C2 Shallow slit Trench	C3 Deep slit Trench	C4 1 Man emplacement	C5 2 Man emplacement
1500	1150.0	lost	lost	24.5 r	lost
2000	175.0	lost	80.0	3.2	4.6
2500	22.0	18.5	11.0	.2	1.0
3000	5.6	1.7	.7	.5	.5
3500	.95	.25	.1	0	0

Badges placed in 6 ft trenches at 1500 yards recorded 28.1 r. The film badge in the 1750 yard trench was lost. Trench at 2000 yards received 8.75 r.

These data represent the immediate radiation personnel protected by the emplacements and unprotected at the same distance from ground zero would have received.

Badges were exposed in National Bureau of Standards holders.

#### VI. MEDICAL.

The medical support for this operation was carried out in an identical manner to that for V-5. The same plan for emergency medical care for the volunteer group was prepared, but as no casualties occurred it was not implemented. The only casualty reported was one of the enlisted men from EOT Baker. This man developed a rather severe nose bleed just prior to the detonation. He was treated immediately after H-Hour. It was felt that he should not participate with the troops and he was therefore held at the aid station until the conclusion of the exercise.

#### Medical evaluation of test items:

On the day prior to the detonation 37 sheep were placed at varying distances from ground zero. Commencing at 500 yards five sheep were placed at each 500 yard interval extending through 3500 yards from ground zero. The sheep employed at each of the 500 yard intervals were placed one to each S-type position (C-5, C-6, C-7, C-8 and C-9). In addition to the above positions there were two special trenches, one at 1500 yards and one at 1700 yards. One sheep was placed in each of these two positions.

The two special trenches at 1500 yards and 1700 yards are conventional type trenches 6 ft. in depth similar in design to the trenches used by volunteer observers.

The veterinary officer and one enlisted man accompanied the control group. Immediately following the detonation a medical technician accompanied by a monitor moved forward by truck to observe the sheep. A veterinary technician accompanied the loading party later in the morning to aid in rendering a tentative evaluation of the effects of the detonation in relation to the effects incurred by the sheep. When the sheep were returned to Camp Desert Rock a final evaluation was rendered by the veterinary officer. The veterinary officer, because of previously acquired radiation, was not permitted to advance past the control trench, so it was necessary to follow the above procedures in relation to evaluating the effects incurred by the sheep.

Most of the evaluation results are covered in the evaluation forms or the picture captions, but following are some of the more pertinent results.

The sheep at 3500 yards were all found to be normal.

The sheep at position C-9, 3000 yards had moderate wool burns. The other sheep at this distance were normal.

At 2500 yards the sheep at position C-9 had second degree burns on the face and wool burns covering 1/4 of the body area. The sheep at position C-7 had moderate wool burns. The sheep at positions C-5, C-6 and C-8 were all normal.

At 2000 yards the sheep at position C-9 had second degree burns on the ears and extensive wool burns covering 1/2 the body area. This animal suffered no other ill effects until epilation, i.e., loss of hair, appeared 8 May. This animal has as yet shown no inappetence and it is considered to have a better than average chance to effect a recovery. The dose of radiation this animal received was 253 r. The sheep at position C-8 had third degree burns on the face and moderate wool burns.

~~SECRET~~  
SECURITY INFORMATION

It suffered no other ill effects until epilation appeared 10 May. This animal has, as yet, shown no inappetence and it is believed that it will recover. The radiation dosage for this animal was 175 r. The sheep at position C-7 suffered no visible effects from the detonation. Epilation ensued 10 May. This animal has, as yet, shown no inappetence and it is believed that it will recover. The radiation dosage for this animal was 113 r. The sheep at position C-5 and C-6 were both normal.

At 1500 yards the sheep at position C-9 had third degree burns on the face and extensive wool burns. It refused food and water after being returned to the sheep pens and died the night of 26 April. The data on the amount of radiation received by this animal was lost, but it is assumed to have received in excess of 1000 r. The sheep at position C-8 had moderate wool burns. It remained normal until 3 May when epilation ensued. This animal has not shown any inappetence, but it is inconceivable that this animal will survive since the radiation dosage it received was 950 r. The sheep at position C-6 and C-7 have shown no visible effects. The radiation dosage reported for them was 464 r and 427 r respectively. At position C-5 the entrance to the bunker collapsed so the sheep is assumed to have died from suffocation.

The sheep in the conventional type trenches at 1500 and 1700 yards initially suffered no visible effects. Epilation appeared in the sheep placed at 1700 yards on 3 May. It has shown no inappetence, so it is assumed this sheep will recover. The radiation dosage received by this animal was 173 r. Epilation appeared in the sheep placed at 1500 yards on 10 May. This sheep has shown no inappetence, so it is assumed it will recover. The radiation dosage received by this sheep was 222 r. Both sheep have previously been exposed to an atomic detonation.

At 1000 yards the sheep at position C-9 was killed by blast effects. It was blown back approximately 50 yards. The sheep at position C-8 was killed by blast effects. It was blown clear of the trench and back approximately 40 yards. The sheep at position C-7 had extensive wool burns on the back. It developed in-coordination the morning of 26 April and became prostrate the afternoon of 27 April. Death occurred the night of 27 April. Death was attributed to acute radiation sickness. The radiation dosage this animal received was 10,435 r. The sheep at position C-6 initially suffered no visible effects. It became prostrate the afternoon of 28 April and died the night of 28 April. There was a complete absence of external injuries, and this can be considered a typical case of acute lethal radiation sickness. The radiation dosage received by this animal was 4,638 r. The sheep at position C-5 initially suffered no visible effects. Epilation appeared 10 May. This animal has shown no inappetence, but it is doubtful that this animal will recover since the radiation dosage received was 623 r.

At 500 yards the sheep at position C-6, C-7, C-8 and C-9 were all killed by blast effects. At position C-5 the bunker was collapsed, so it is assumed the sheep at this position died directly from blast effects or indirectly from suffocation.

Total number of sheep exposed thirty-seven; eight killed directly or indirectly from blast (suffocation); three died from acute lethal doses or radiation. At the present time twenty-six of the original thirty-seven are still alive. It is considered that at least two of this total will eventually die.

It will be noted that the picture section of this report is rather brief in comparison with the two preceding reports. This is due to the fact that there was too much radiation present in the display area, and consequently a photographer could not enter this area for several days following the detonation.

#### VII. VOLUNTEER OBSERVER PROGRAM.

Volunteer observer trenches were located 2000 yards from ground zero on an azimuth of approximately 180°. Trenches were 6 feet deep and 3 feet wide. One trench was revetted with sandbags and timber. The second was an unrevetted trench with a sandbag parapet.

The volunteers consisted of 7 Army Officers and 1 Naval Officer. All officers were well indoctrinated in the field of special weapons and capable of calculating effects of atomic weapons, utilizing TM 23-200, dated 1 Oct 1952. After careful calculation all agreed that the trenches were located at a safe distance for a weapon of the yield predicted.

The atomic weapon exploded was an experimental device placed on a 300 foot tower. The predicted yield was estimated as 35 KT, plus or minus 5 KT. Calculations of volunteers were based on the highest predicted possibility, 40 KT. It is estimated that the actual yield, although not available at this time, will probably exceed the highest predicted possibility by as much as 25 percent.

~~SECRET~~  
**SECURITY INFORMATION**

Weather data for Ground Zero at the time of burst were:

Temperature	53 degrees F
Wind Direction	040 degrees T
Wind Speed	7 Knots
Visibility	50 miles
Pressure	870 millibars

Volunteers reported the following effects were noted:

Initial flash. The light was reported as being of great intensity. Objects in the trench could not be distinguished during the period of greatest intensity. Normal vision returned immediately after the light subsided.

Thermal effects. All observers reported feeling heat from above at the time of the light. This heat was not intense but was distinctly noticeable. There were no instruments available for measuring the amount of heat received in the trench.

Blast effects. The air blast was reported as a very loud sharp noise. Concussion pressure was felt but no pain or after effects were noted. Sand and dirt blown into the trenches by the air blast.

Ground shock. The ground shot was described as being short vibration-like motions similar to a mild earthquake. The duration of the shock was short and no separate pulses were felt.

Nuclear radiation effects. First reading noted on radiac instruments gave a rate of 100 roentgens per hour. During the 5 minute period the volunteers remained in the vicinity of the trenches this rate fell to 20 roentgens per hour. As the group moved toward the road, to meet vehicles sent forward to evacuate them, they passed through a heavy fall out of sand sized particles carrying a radiation reading of 50 roentgens per hour. As they evacuated to the rear radiac instrument readings declined rapidly to 1 roentgen per hour 1000 yards in rear of the trenches they had occupied. Dosimeters carried by the volunteers registered an average total dosage of 10.4 roentgens. Developed film badges registered total dosages ranging from 11.7 to 16.3 roentgens. The wide range of the readings of these film badges raises a question as to the reliability that should be assigned to readings so obtained.

Miscellaneous effects. At the instant of first light several observers felt a shock variously reported as similar to an earth tremor or air blast. One observer holding a telephone, connected to a direct line between volunteer trench and control trench, received a distinct electric shock and a tingling sensation about the neck. The operator holding the telephone in the control trench (at 4000 yards from Ground Zero) reported receiving a shock equivalent to that received when holding a bare 110 volt electric wire. All observers reported a generally reduced efficiency during the first 5 minutes after the blast because of heavy dust conditions.

The following conclusions were made by the volunteer observers:

That troops would gain very little by being entrenched closer to Ground Zero than 4000 yards during orientation and indoctrination exercises because:

They can feel the effects of the detonation at this distance as well as they could at a closer point.

They can better observe the fireball and mushroom cloud.

They are sufficiently removed from the heavy dust and possible radiation hazard.

That the present volunteer observer program, with present mission and limiting criteria, has served its purpose and should be discontinued.

That a volunteer program of this type with a mission of indoctrination for personnel having special weapons training or assignments with special weapons programs would be worthwhile.

That future volunteer programs would have greater value if volunteers were positioned in a variety of standard field fortifications and combat vehicles approximating actual combat conditions.

That instrumentation placed in the trenches to record pressures, heat, ground shock, and nuclear radiation would be of assistance in evaluating observer's reactions.

~~SECRET~~  
SECURITY INFORMATION

MARINE CORPS AIR (HELICOPTER).

Marine Helicopters "A" and "B" were positioned at approximately 12,440 yards from ground zero. Helicopter "A" was positioned with its left side exposed and "B" was facing the blast. From one (1) minute prior to the blast until after the passage of the shock wave, Helicopters "A" and "B" hovered at about ten (10) feet above the ground.

The pilots of Helicopters "A" and "B" protected their eyes by lowering the bills of their caps so as to shield their eyes from the flash. The pilots experienced no flash blindness. The co-pilots wore standard 4.2 density goggles at the time of detonation and were prepared to assume control of the helicopter should the pilot be blinded by the flash.

Helicopters "A" and "B" were subjected to .59 psi at their position. The control of the helicopters was not effected; however, a window in the passenger compartment of Helicopter "A" was blown out of the rubber molding. No other damage occurred.

After passage of the shock wave, Helicopters "A" and "B" proceeded toward the shot area. Helicopter "A" skirted the dust column noting radiological conditions up to 50 r/hr. Helicopter "B" proceeded to a position 2000 yards west of ground zero and landed. The monitor in "B" disembarked and continued on foot to a position 950 yards from ground zero recording radiological readings up to 10 r/hr.

Helicopter "C" took off from Camp Desert Rock twenty two (22) minutes prior to detonation and arrived at the south end of Yucca Lake two (2) minutes prior to detonation. Helicopter "C" was continuing its flight toward the shot area at the time of detonation and during the passage of the shock wave maintaining 400 feet altitude and 60 knots indicated air speed. The pilot protected his eyes from the direct rays of the flash by lowering the bill of his cap and concentrating his vision on the flight instruments. No flash blindness was noted. The co-pilot wore standard 4.2 density goggles. The passage of the shock wave, which subjected "C" to .55 psi, did not effect the control or harm the helicopter in any way.

After passage of the shock wave, Helicopter "C" proceeded around the upwind side of the dust column and landed about 2200 yards northwest of ground zero.

18 June 1978 to 14 July 1978**

**Mini-GFSR for the Automation of the  
US Army Portion of the DOD Nuclear  
Test Personnel Review (NTPR) Program**

**INCLOSURE #2 to the  
Summary Statement**

10

RE: Mini-GFSR for the automation of the Army portion of the DOD Nuclear Test Personnel Review (NTPR) Program.

1. SYSTEM TITLE: Army Nuclear Test Personnel Review (ANTPR).
2. SYSTEM CLASSIFICATION: Data acquisition and process control.
3. GENERAL DESCRIPTION OF FUNCTIONAL AREA: The system, when fully implemented, will be an immediately accessible data base containing information on all individuals involved in nuclear atmospheric testing. The system objective is to provide an automated method of searching a variety of data sources, assembling required information in a common base, and providing a data base update and random query capability for records on at least 100,000 person involved in nuclear atmospheric testing during the period 1945 to 1962. The process will be iterative in nature starting with data collection followed by data validation and culminating in a continuing need to update and provide data in support of medical follow-up, litigation and claims of over at least the next 5 to 7 years. Data sources are numerous including DA, DOD, other government agencies, and civilian contractor sources (see attachment 1). Data elements are also numerous including a need to identify the source of most separate bits of data (see attachment 2). DA agencies involved include as a minimum: OCSA, OTAG, OTSG, ODCSOPS and OTJAG. Numerous agencies outside DA will also have to interface with the data base, these are elaborated on in more detail in paragraph 7.
4. SYSTEM OBJECTIVES: It is not possible at this time to envision all the objectives since the ANTPR is iterative in nature and has the

potential for long term use. Some specific system objectives are listed below.

- a. Establish a system that is capable of assimilating data from a variety of source (attachment 1) in a variety of input modes i.e., computer tape to computer tape, card to tape, transaction tape to computer tape and hard copy to computer tape.
- b. The initial phase (already underway) is primarily data reduction - hard copy source documents to transaction tape. Additional AAD assistance is required in terms of increased data reduction capability.
- c. Once the data base is established, a random query capability preferably by CRT, will be required. This capability needs to be on-line in order to provide timely answers to Congressional, Federal agency, and private inquiries.
- d. There will be a continuous requirement to update the data base with new or more current information. This should be done "on-line" by CRT so the program manager has immediate access to current files in order to compare new or conflicting data and determine data validity in cases of conflicting information.
- e. A random ad hoc query capability is required for the following data sorts as a minimum.
  - (1) Ability to review the records on an individual.
  - (2) Identify all individuals in a specific Army unit at a specific time.

- (3) Identify all individuals with specific dose reading or dose ranges over various time periods.
- (4) Identify individuals at a specific test site and for specific time periods.
- (5) Identify individuals by shot status i.e., participant, observer, volunteer.
- (6) Identify individuals by organization outside the Army i.e., DOE, contractors, press etc. ?
- (7) Identify individuals with specific medical maladies. ?
- (8) In general, we need the capability to fix parameters on each data element and sort out records that fit those parameters.

f. Once a validated data base is established, certain data elements will have to be reported to DOD in a format yet to be determined.

5. ASSUMPTIONS: Congress will continue to have great interest in this program. The results of this data collection and research effort could have international significance if low level radiation exposure increases the incidence of cancer.
6. CONSTRAINTS: The events being researched occurred 20 to 25 years ago. Formats of existing computerized data probably vary widely between agencies since the systems were not designed to be compatible. Social security numbers, a key interface data element, will not be available initially since most source documents contain a service number rather than a SSAN. The system is required by 1 August 1978

which may be a short suspense for such an effort. About 90% of the system requirements have been identified as of now, the remaining requirements will be developed during the course of the system development.

7. SYSTEMS INTERFACE:

External Interface: (see attachment 1 for abbreviations)

GSA - Records availability search

VA - SSAN and claims information

DNA - a. Computerized list of telephone and letter information

b. Two contractor theoretical dose programs.

c. Report of final results and subsequent updates.

DOE - Computerized dose information

HEW - CDC medical follow-up program

All Other Services - Data exchange on Army personnel involved  
in other service tests and visa versa

DASIAC - Source document identification

IRS - SSAN

NAS - Exchange of detailed data on specific individuals

DRB - Any available data

NPRC - Any available data

Purpose/Requirement: (See external interface above)

Input Vehicle: Magnetic transaction tape, computer tape, punch cards

Constraints: see paragraph 6

Interface Event: Data input from a variety of sources already described. Periodic exchange of data between agencies. Congressional report requirements. Final DOD report input.

Frequency of Interface: Continuous

Security Classification: Unclassified but subject to privacy act provisions.

Remarks: It is desirable to have computer interface with any source of missing information if feasible. Information sources are not limited to those identified in attachment 1. As new data sources are discovered during the research phase they will be exploited.

8. BENEFITS OF THE SYSTEM: It appear evident without detailed economic analysis that data collection, analysis, update and exchange of information on 100,000 individuals involving 30 or more data sources over a 5 to 7 year period would require for more resources to accomplish manually than by computer.
9. AUTHORIZATION DIRECTIVE: DAS Memorandum of 28 April 1978, subject, Automation Support for the Nuclear Test Personnel Review (NTPR) Program.
10. DATA COMMUNICATIONS: On line cathode ray tube type access is required at DACS-DMC and TAG. Hard copy print capability is required but not necessarily at DACS-DMC and TAG.

11. SECURITY REQUIREMENT: Unclassified.
12. PRIVATE IMPACT: Privacy act provisions apply.
13. PROJECT CONTROL: DACS-DMC is the current focal point. The ANTRP will eventually be assigned to another DA Staff agency probably TAG.
14. BACKUP REQUIREMENTS: Copies of other agency computer inputs must be maintained. A method to insure our master data base cannot be destroyed, must be provided.

HQDA Memorandum (DACS-DMC), 12 April  
1978, Subject: Nuclear Test Person-  
nel Review Priority of Effort

INCLOSURE #4 to the  
Summary Statement

WASHINGTON, D.C. 20310

12 April 1978

DACS-DMC

MEMORANDUM FOR COLONEL McINDOE

SUBJECT: Nuclear Test Personnel Review Priority of Effort

1. Reference is your 24 March 1978 memorandum, subject as above, requesting Service recommendations for priority of effort in developing the required reports.

2. At Inclosure 1 are prioritized recommendations for the various Desert Rock (DR) series at the Nevada Test Site. Supporting rationale for priority assignment is as outlined below:

<u>Priority</u>	<u>Series</u>	<u>Rationale</u>
1	DR VII & VIII (1957) <i>28 May - 21 Sep</i>	<ul style="list-style-type: none"><li>- Largest number of troops involved</li><li>- Widespread media/public interest, especially in Smoky</li><li>- Good availability of information</li><li>- Informal request by HAS</li></ul>
2	DR VI (1955) <i>18 Feb - 5 May</i>	<ul style="list-style-type: none"><li>- Relatively large troop population</li><li>- Number of shots in the test series</li><li>- Different types of shots in the test series</li><li>- Relatively complete data base</li></ul>
3	DR V (1953) <i>17 Mar - 25 Apr</i>	<ul style="list-style-type: none"><li>- Large number of troops involved</li><li>- Most shots for which potential problems exist</li><li>- Army responsible (1st instance) for radiation monitoring</li><li>- Data base initially incomplete, now relatively complete</li></ul>
4	DR I (1951) <i>1 Nov</i>	<ul style="list-style-type: none"><li>- 1st series using troops</li><li>- Radiation data base (REECO) complete although not in usable form</li><li>- Potential use as comparison base with other shots</li></ul>

DACS-DMC

SUBJECT: Nuclear Test Personnel Review Priority of Effort

<u>Priority</u>	<u>Series</u>	<u>Rationale</u>
5	DR IV (1952) <i>28 Nov - 1 film</i>	<ul style="list-style-type: none"><li>- Fairly sizable troop population in comparison with remaining series</li><li>- More shots in series than remaining series</li><li>- Army given more responsibility in radiation monitoring</li><li>- No potential problems noted</li></ul>
6	DR III (1951) <i>29 Nov</i>	<ul style="list-style-type: none"><li>- Single shot in series</li><li>- Small yield</li><li>- High radiation levels reported</li><li>- Potential problem</li><li>- Only observers present for shot</li></ul>
7	DR II (1951) <i>19 Nov</i>	<ul style="list-style-type: none"><li>- Single shot</li><li>- Small yield</li><li>- No problems reported</li></ul>

Within each test series, shots are arranged first according to potential problems and then according to the reported size of the troop population.

3. Inclosure 2 is submitted as a recommended breakout of volume/series essentially arranged geographically along chronological lines with separate volumes for each year. This format is suggested because of simplicity in treating each shot series and the relative ease in accommodating changes in radiation monitoring procedures that apparently took place from year to year. The grouping/number of volumes may change depending on the overall size of each. The Trinity shot is recommended for separate treatment, preferably in an overview volume.

Division of Operational Safety, HQ

**DESERT ROCK PERSONNEL EXPOSURE**

This report is submitted in partial fulfillment of a request by Dr. Roy D. Maxwell, Division of Operational Safety, to research all available records in answer to the following questions:

- a. How many troops were exposed during the Desert Rock Exercises?
- b. What range of exposures did the participating troops incur?

A meeting was held March 12, 1970 with Col. R. Ray of the Military Liaison Committee, where the decision was made "to only identify military exposures which exceeded the criteria dose". With this decision only the names of military personnel whose exposure was equal to or greater than 5 rem were recorded.

This report is submitted as a preliminary report rather than a final one to allow the reporting of any additional individuals whom may be identified in yet to be located records.

In answer to the questions proposed above, the information was compiled and is reported by year and exercise as follows:

a. 1951, 1952 - Enter Jangle - Tumbler Snapper Series

Because the exercise reports for these series were not located, the exact number of participating personnel is not as yet known. Dosimetry records maintained during this period of time however, appear to be comprehensive with several thousand names identified as Desert Rock with exposures listed. These dosimetry records were obtained from Col. E. Fountain, U. S. Army during a process consolidation of exposure records at the Nevada Test Site. A review of the records indicated only five (5) individuals whose exposure exceeded 5 rem (see Enclosure 1).

b. 1953 - Desert Rock V - Whet-Knot Hole Test Series

The number of military personnel who participated in nine (9) events of this series are as follows:

Army - 13,364

Navy and Marine Corps - 2,921

Air Force - 1,273

The dosimetry criteria established for this test series did not provide for individual dosimeters. Dosimetry was accomplished by issuing one film badge and one pocket dosimeter per platoon. Observers were issued one film badge per bus load.

The dosimetry for the participating troops was "apparently" performed by the test site dosimetry organization. This is assumed from a statement made in the conclusions and recommendations section of the Desert Rock V report. The statement in effect suggests that a separate dosimetry unit be assigned and made available for the participating troops in future Desert Rock exercises.

The records as maintained by Reynolds Electrical & Engineering Co., Inc. (REECO) were searched for military exposures exceeding 5 rem during 1953. Forty-one (41) individuals were identified as military personnel in excess of 5 rem (see Enclosure 1). The Desert Rock V report mentions that the 1st Battalion, 8th Marines encountered a highly radioactive area. Dosimeters carried by personnel registered more than 6R. The Battalion was subsequently removed from further test activity. To date no specific names have been identified in the records as belonging to the 8th Marines. Efforts to search the 1953 records to locate individuals as representatives of this group are continuing.

c. 1955 - Desert Rock VI - Teapot Test Series

The total number of military personnel participating in this exercise totaled 8,135. Actual troop observers directly associated with the test events are estimated to be 2,033. The Dosimetry Criteria or the issuance of film badges is as follows:

- (1) One badge per permanent party observer.

- (2) One badge per VIP.
- (3) One badge per squad of official observers.
- (4) One badge per tank crew.
- (5) One badge per individual not in a group.

There has been no comprehensive dosimetry record of the Desert Rock participants located for exercise Desert Rock VI at this date. In the Desert Rock VI report under the Appendix entitled "Signal Corps", statements are made describing the presence of two photo vans and the processing of 7,500 film badges. Statements were made telling that the photo team also handled the photo dosimetry. From this information, it is believed that the complete record for this exercise is stored somewhere with the records of the Signal group who performed the photo coverage. The list of participating agencies in the Desert Rock VI report makes mention of a ~~group~~. This group is the likely candidate for possessing the dosimetry records of interest for ~~1957~~. Enclosure 1 lists those military personnel with greater than 5 rem exposure as extracted from the records maintained by RECO.

See Enclosure 3 for the listing of agencies and personnel contacted in attempting to locate the 1955 dosimetry records.

The following exposure summary was extracted from the Desert Rock VI report.

97 persons received >3R < 6R

15 persons received >6R < 20R

2 persons received >20R

d. 1957 - Desert Rock VII and VIII - Flubbob Series

The total number of participating military personnel was 20,103. Actual event related personnel is believed to be closer to 6,213. The dosimetry criteria during these exercises called for film badging of each individual involved in the operation.

Martin D. Eiles

-4-

207 1973

The dosimetry support was provided by the Sixth U. S. Army Signal Electronics Branch, Lexington Signal Depot, Lexington, Kentucky. The dosimetry records were located at Lexington. The records were retrieved, examined and eleven (11) individuals were listed in excess of 5 rem (see Enclosure 2).

Exposures of military personnel extracted from REECO's dosimetry records for the Plumbob Series are listed in Enclosure 1. All these individuals were from Kirtland Air Force Base, New Mexico.

ANNEX A

Lexington-Bluegrass Army Depot Activity  
Date of Visit: 18-20 June 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. LTCOL George S. Crawford, Acting Depot Commander
- b. Mr. Jerome Flynn, Depot Chief Administrative Officer
- c. Mr. Joseph King, Senior Health Physicist, Nucleonics Branch
- d. Mr. Edward Abney, Nucleonics Technician (ADP)
- e. Mr. Paul Rogers, Nucleonics Technician

2. BACKGROUND:

a. The installation occupied by the US Army Lexington-Bluegrass Depot Activity was established about 15 miles distant from Lexington, Kentucky, at the beginning of World War II, circa 1941-42. It was originally chartered as a Signal Corps Depot and training activity and has performed communications and electronics responsibilities to the present. In recent years, it has performed maintenance, modification and repair functions for electronics equipment. It is now a Department of the Army Readiness Command (DARCOM) installation. A few months ago, the economy axe fell heavily on Lexington. It lost its long-standing depot status and became a "depot activity" under the US Army Red River Depot. It also lost its traditional maintenance function and with this about three-quarters of its normal personnel complement.

b. In 1954, US Army-wide film badge together with radiation exposure dosimetry recording service was assigned to the Lexington depot. Prior to this an ill-defined film badge and dosimetry service was provided by the Evans Signal Corps Laboratory at Fort Monmouth, New Jersey. When Lexington took-over the function from Fort Monmouth, its clientele list consisted of only a few dozen US Army Installations. Within the next four years, this clientele list was expanded to include all radiation sources (less direct control of tactical exposure sources) under Army jurisdiction. For a while this also included to some non-Army clients such as the Veterans Administration on a reimbursement basis.

c. In 1957, Lexington formally entered the nuclear testing aspects of radiation exposure and dosimetry recording. Until this date, it had more or less played a passive role, i. e., recording dosimetry data provided it by on-site exercise radiology safety units. Commencing with EXERCISE DESERT ROCK IV (which appears in AEC history as TUMBLER-SNAPPER), Lexington executed the on-site exercise dosimetry responsibility. To these ends, mobile vans were designed and equipped at Lexington and were patched to the Nevada Test Site together with depot trained technicians. Complete film badge service was, thus, provided in the field and more importantly, the complete record of this service was sent to Lexington on termination of the exercise. This was also

true of EXERCISE DESERT ROCK VIII (AEC Exercises UPSHOT-KNOTHOLE) in 1958. As far as can be determined at this time, DR VII and DR VIII were the only two exercises in the entire series which received this meticulous attention. Lexington currently holds this complete record and has provided microfilm copies to all other affected activities including the Reynolds Electrical and Engineering Company (REECO) which will be discussed in greater detail in a subsequent annex.

d. Decision was taken in 1958 to split the Army-wide dosimetry responsibility mission. This decision probably stemmed from the "alternate headquarters" concept of the Era of Massive retaliation. The US Army Depot at Sacramento, California was, thereupon, assigned responsibility for film badge and dosimetry service for the western quarter of the United States, i. e., geographical area of responsibility of the 6th US Army, and all United States Army activities in the Pacific. This was later expanded eastward to include the geographical area of the 4th US Army thus roughly dividing the United States along the Mississippi River. Sacramento provided precisely the same services to its assigned western client installations as Lexington continued to provide its eastern clientele. Effective 1 January 1978, the Army-wide film badge and dosimetry service function was restored to Lexington.

e. Sacramento terminated its service on 31 December 1977 and shortly thereafter shipped its accumulated records to Lexington. This collection of dosimetry data consisted of approximately 30 linear feet of hardcopy arranged chronologically by client installation. Since its origin with the Evans Signal Corps Laboratory, dosimetry records have been handled on an installation basis, i. e., the same servicing depot or laboratory providing the film badges to the used installations develops, reads, records and reports its findings back to the client installation. The client installation is responsible for entering the dosimetry in the individual health records. Evans Signal Corps Laboratory retired its dosimetry hardcopy records through normal records management channels until it was relieved of the mission in 1954. Final location of these files was the military organizational records division of the National Personnel Records Center at St Louis. We think that we have been reasonably successful in recovering these records; they will be shipped to Lexington on completion of the current investigation for integration into the Army-wide master dosimetry collection.

f. Accompanying the hardcopy which the Sacramento Depot had shipped to Lexington was an incomplete collection of duplicatory microfilm. The completeness of the microfilm collection is yet to be determined; however, a brief examination at this time indicated that it appeared to be complete except for last few months of the operation at Sacramento. The microform employed by the Sacramento Depot consisted of 16 mm film strips arranged in 5 X 8 inch plastic jackets -- a somewhat primitive forerunner of the microfiche. However, a trial run showed that the reproducible qualities of this film was excellent. None of the Sacramento data had been automated prior to shipment to Lexington. Nor at the time of the visit had any plans been formulated or put into action to integrate the Sacramento documentation into the Lexington files.

g. In 1964, Lexington commenced to automate its dosimetry data. None of the 1954-64 data held by Lexington had been computerized at the time of the visit. Nor is automation of the 1964-72 data fully reliable. Lack of an

effective cross-match audit system in the 1964 computer program for loading data, introduced a small degree of error into the data base. Key-punch or original hardcopy error, i. e., discrepancies between names and serial or social security numbers, differing middle initials, missing initials, mis-spelled names, missing digits in serial/social security numbers, etc., makes this portion of the data base unreliable for computer production of individual lifetime dosimetry histories. Each of the errors noted above causes the computer to register a "new individual" or new history instead of combining accumulating entries into the correct individual accounts. In 1972, a name/social security number cross-reference was added to the loading program which causes the computer to reject any incompatible data until manual verification and correction has been made.

### 3. CURRENT SITUATION:

a. Lexington is capable of producing individual radiation exposure histories on an extremely limited scale. With difficulty, this can be done for a single individual or a small list of individuals. Certainly, for nothing even remotely approaching the scope of the present investigation. First of all, except for the data garnered directly by its own depot technicians for DR VII and DR VIII, it holds very little other tactical exposure data. As a matter of fact, it holds little if any pre-1954 data from any source. A combination of computer and manual search operations are required in order to produce a lifetime radiation exposure history for any given individual. Moreover, a service history is required for each individual search, e. g., all known dates and places of probable exposure. Otherwise, the manual data banks cannot be searched for possible additions to the known computer produced totals. Not only is individual memory spanning 25-30 years surely faulty, but the probability of survivors of a decedent member possessing reliable data here is remote at best. Full automation of all available data Army-wide is the only workable and realistic solution to this dilemma.

b. While certainly the best that the Army possesses at this time, there is ample evidence that serious gaps exist in the Lexington dosimetry data collection. Part of this discrepancy can be overcome by simple interfile of the Sacramento collection in the Lexington data base. Ideally, this should take the form of automation and integration in a single combined operation. But even then other serious known gaps would still exist. Subsequent to Lexington's tasking with the Army-wide mission in 1954, provisions came into existence for granting of waivers from mandatory utilization of the Lexington provided dosimetry service. Army installations and activities which possessed dosimetry service capability could request and were granted waivers. Notable among these, for example, were Dugway Proving Ground, the US Army Chemical Center at Edgewood/Aberdeen, MD., and the Chemical Corps School at Fort McClellan, Alabama.

c. Probably most crucial among these waived activities for present consideration was the US Army Chemical Corps School. The Lexington health physicists expressed grave concern during the course of the visit over certain training techniques and devices employed by the Chemical Corps School during most of the decade of the 1950's. Much of this concern centered on the creation and use of a "cobalt 60 radiation minefield" for certain school training courses.

Estimates ran as high as possibly 3000 individuals for this type of radiation exposure, e.g., computed at the rate of 400 students per year for the 7-8 year period that the Chemical Corps School was in operation at Fort McClellan. The Lexington Depot provided the film badges, but McClellan processed the film and recorded (?) the dosimetry on waiver as a practical school training exercise. Here we lose sight of the dosimetry data accumulated by the school. It was never forwarded to Lexington for integration into the main data bank nor were the lab reports retired to St Louis as in the case of the Evans Signal Corps Lab. Contemporary search for dosimetry data retired to St Louis has failed to locate any such data from McClellan. Further details on this search will be found in ANNEX H (St Louis).

d. Neither Lexington nor Sacramento ever retired any dosimetry records to GSA Federal Records Centers. It is good for immediate considerations that this "hardcopy" was retained by the processing activity as permanent background material substantiating its automated data base. Comparable files which had been retired by the Evans Signal Corps Laboratory in the mid-1950's had been sent to St Louis as "disposable materials." Only by virtue of the fact that GSA was some 25 years behind in its work were these materials still "on the shelves" in the retired organizational records section of the Federal Records Center in St Louis. With this discovery, however, an immediate freeze was placed on any further destruction of these materials or certain other related files in the St Louis Collection pending completion of the current investigation. Further discussion of this action will be found in ANNEX H (St Louis).

e. Dosimetry data collection and management involves far more than the dramatic, colorful and often terrifying publicity connected with the detonation of nuclear devices. Certainly this is the aspect which has captured public attention and has rightly prompted the current investigation. However, mounting concern for voluntary or involuntary troop tactical exposure has allowed very notice to be taken of another aspect of the same problem. It could well be that tactical exposure is but the tip of the iceberg. The other dimension of this problem has to take cognizance of that vast army of calibration, medical treatment, dental and X-ray technicians, storage dump custodians and guards, crews and personnel complements of nuclear-powered ships and submarines, etc., who, routinely day-in and day-out, year after year perform their duties under constant and accumulating dosages of low-yield radiation exposure. The Army as well as its sister services have a 30-year history in this area. Lexington is currently accumulating data here at the rate of roughly 225,000 dosimetry reports per year, i.e., 12-20 readings per year for each of approximately 15,000 individuals.

f. The automated data base dosimetry readings maintained by Lexington is an in-house product. It was designed and developed by the local health physicists, bio-medical technicians and ADP specialists without benefit of formal project management or funding. It was purely the product of local initiative, imagination and ingenuity. Its base funding was opportune or windfall. It was designed to produce individual radiation exposure histories on demand. It is far from perfect, but sufficiently developed to prove its eminent practicality and basic value. Lexington has submitted a formal proposal to DARCOM through Red River for formal funding in order to allow for expansion of the data base at a modest annual to allow for integration of the Sacramento data and re-verification of the pre-1972 data already in the computer. Copies of this proposal and format for computer produced radiation histories are included in the Appendices to this Annex.

#### 4. CONCLUSIONS:

a. The Nucleonics Branch of the US Army Lexington-Bluegrass Depot Activity currently holds the Army's largest and completest collection of individual radiation dosimetry data (including complete data for EXERCISES DESERT ROCK VII and VIII).

b. The Lexington collection is notably deficient in certain significant areas but possesses flexibility for virtually unlimited expansion.

c. The Lexington Nucleonics Branch has developed a workable, but highly limited, system consisting of manual search of hardcopy files and computer assisted operation for the production of individual radiation exposure dosimetry histories.

d. The Lexington Nucleonics Branch has the expertise and capability for further development and expansion of its in-house automated data base to meet Army-wide tasking in the production of individual radiation exposure dosimetry histories and computer assisted studies.

#### 5. RECOMMENDATIONS:

a. That sufficient funding be made available to the Lexington-Bluegrass Depot Activity Nucleonics Branch immediately to allow for the fullest possible expansion and updating of its individual radiation exposure dosimetry data base.

b. That updating of the Lexington individual radiation exposure dosimetry data base be accomplished simultaneously and combined with creation of the ARMY NUCLEAR TEST PERSONNEL REVIEW (ANTPR) Project.

c. That all raw individual radiation exposure dosimetry data discovered as a result of the present search and investigation be deposited with Lexington for eventual integration into its existing data base.

9 June 1978

MEMORANDUM FOR RECORD

SUBJECT: Estimate for Computerizing Old Dosimetry Records (1954-1964)

1. Number of Individual Records - 1.5 Million.
2. Keypunch Cost - In-house:
  - a. Number per M/H - 100.
  - b. M/H required - 15,000.
  - c. Cost to punch @ 10.35 - \$155,250.
  - d. Cost to verify @ 10.35 - \$155,250.
  - e. Purchase/lease of machines - \$26,000.
  - f. Total cost in-house - \$310,526.
3. Keypunch Cost - by Contract:
  - a. Cost to keypunch @ .08/card - \$120,000.
  - b. Cost to prepare hard copy from microfilm to furnish contractor - \$76,500.  
(150,000 pages @ .05 - \$7,500      3000 M/H @ \$23 - \$69,000)
  - c. Total cost by contract - \$196,500.
4. Cost of Programming, Analyzing and Assembling Data:
  - a. 3500 M/H clerical to match social security numbers, correct errors, etc.  
3500 x \$23 - \$80,500
  - b. 1750 M/H to analyze and put data in final form.  
1750 x \$23 - \$40,250

SDSRR-LQ

9 June 1978

SUBJECT: Estimate for Computerizing Old Dosimetry Records (1954-1964)

c. 1000 M/H for revising programs.

1000 x \$10.35 - \$10,350

5. Total Cost:

a. If keypunched in-house - \$441,626.

b. If keypunched by contract - \$327,600.

Conducted by Representatives of The Adjutant General  
18 June 1978 to 14 July 1978**

**US Army Regulatory History of Individual  
Exposure to Ionizing Radiation Exposure**

**APPENDIX #4 to ANNEX A**

**MEDICAL SERVICE**  
**RECORDS OF EXPOSURE TO IONIZING RADIATION**

	Paragraph
Purpose.....	1
Definition.....	2
Maintenance of dosimetry records.....	3
Preparation of individual medical records.....	4
Film badge inserts.....	5

1. **Purpose.**—These regulations prescribe the method for recording data pertaining to persons exposed to hazardous ionizing radiation.

2. **Definition.**—The term “dosimetry” as used herein is the accurate and systematic determination of ionizing radiation exposure received from sources of ionizing radiation.

3. **Maintenance of dosimetry records.**—Because of the possible latent residual effects and the cumulative factor involved when persons are subjected to ionizing radiation received from sources of ionizing radiation, the following procedures will govern the maintenance of dosimetry records:

*a. Combat exposure.*—This type of exposure is that in which the individual is subjected to infrequent exposure as the result of tactical operations in a combat zone. Individual exposure records will not be maintained for personnel exposed under these circumstances.

*b. Noncombat exposure.*—This type of exposure is that in which the individual is subjected to frequent exposure. Personnel performing research and development activities, laboratory activities, handling of sources of ionizing radiation, and atomic weapons tests or training activities are examples of this group. Individual records will be prepared and maintained for each person in this group. Each record will be prepared and maintained by the personnel officer based upon information received from Signal Corps photographic laboratory facilities, and will show date of exposure, amount of exposure in milliroentgens, duration of exposure in hours and minutes, and a space for remarks such as limitations on assignment because of such exposure. Each record will be signed by the personnel officer, and become a permanent part of the field military 201 file or the civilian personnel 201 file, whichever is applicable, so that a medical officer can evaluate the data from time to time and make such recommendations as may be appropriate.

*c. Personnel exposed to X-ray radiation.*—Records will be maintained in accordance with TB Med 62.

SR 40-1025-66

2

4. **Preparation of individual medical records.**—Individual medical records as required by AR 40-1025 will be prepared when individuals are treated for a disease or injury incident to or resulting from exposure to hazardous ionizing radiation received from sources of ionizing radiation.

5. **Film badge inserts.**—Processing of film badge inserts is a responsibility of the Signal Corps. Inserts will be processed in accordance with SR 110-50-5.

MEDICAL SERVICE

RECORDS OF EXPOSURE TO IONIZING RADIATION

	Paragraph
Purpose.....	1
Definition.....	2
Maintenance of dosimetry records.....	3
Preparation of individual medical records.....	4
Film badge inserts.....	5

1. **Purpose.**—These regulations prescribe the method for recording data pertaining to persons exposed to hazardous ionizing radiation.

2. **Definition.**—The term "dosimetry" as used herein is the accurate and systematic determination of ionizing radiation exposure received from sources of ionizing radiation.

3. **Maintenance of dosimetry records.**—Because of the possible latent residual effects and the cumulative factor involved when persons are subjected to ionizing radiation, the following procedures will govern the maintenance of dosimetry records:

a. *Combat exposure.*—This type of exposure is that in which the individual is subjected to infrequent exposure as the result of tactical operations in a combat zone. Individual exposure records will not be maintained for personnel exposed under these circumstances.

b. *Noncombat exposure.*

(1) *General.*—This type of exposure is that in which the individual is subjected to frequent exposure. Personnel engaged in research and development activities, laboratory activities, handling of sources of ionizing radiation, and atomic weapons tests or training activities are examples of this group.

(2) *Preparation and maintenance of individual records.*—Individual records for each person in this group will be prepared and maintained by the personnel officer. Where film badges are used, Signal Corps photographic laboratory facilities will process the badges and furnish to the unit the record of exposure present on the film badges. For each individual exposed to hazardous ionizing radiation, the record prepared by the personnel officer will show the date of exposure, amount of exposure in milliroentgens, and space for remarks such as limitations on assignment because of such exposure. The

\*These regulations supersede SR 10-1025-66, 21 April 1952.  
TAGO 12408

duration of exposure also will be recorded. When possible, the exact period of exposure in minutes, hours, days, etc., will be determined. In some circumstances, it will be possible to record only the approximate period of exposure. Records will indicate whether the time of exposure is "Exact" or "Estimated." Each record will be signed by the personnel officer and will become a permanent part of the field military 201 file or the civilian personnel 201 file, whichever is applicable, so that a medical officer can evaluate the data from time to time and make such recommendations as may be appropriate. In the event the 201 files of personnel who are participating in activities such as atomic weapons tests or training exercises, etc., are not available, the records of exposure to hazardous ionizing radiation will be promptly forwarded to the personnel officer having custody of the 201 files.

*c. Personnel exposed to X-ray radiation.*—Records will be maintained in accordance with TB Med 62.

4. **Preparation of individual medical records.**—Individual medical records as required by AR 40-1025 will be prepared when individuals are treated for a disease or injury incident to or resulting from exposure to hazardous ionizing radiation.

5. **Film badge inserts.**—Processing of film badge inserts is a responsibility of the Signal Corps. Inserts will be processed in accordance with SR 110-50-5.

SPECIAL REGULATIONS  
No. 40-1025 70

DEPARTMENT OF THE ARMY  
WASHINGTON 25, D. C., 3 February 1954

**MEDICAL SERVICE**

**CLINICAL RECORD, OPHTHALMOLOGIC CONSULTATION CLINICAL  
RECORD, VISUAL FIELD EXAMINATION**

	Paragraph
General.....	1
Purpose.....	2
Instruction for completing forms.....	3
Availability of forms.....	4

**1. General.**—These regulations provide information concerning the use of Clinical Record, Ophthalmologic Consultation (DD Form 741), and Clinical Record, Visual Field Examination (DD Form 742) in Army medical facilities. These forms have been standardized by the Department of Defense for use at medical facilities of the Armed Forces.

**2. Purpose.**—The Clinical Record, Ophthalmologic Consultation and Clinical Record, Visual Field Examination are records of ophthalmologic examination of a patient to be incorporated in his clinical record file.

**3. Instructions for completing forms.**—DD Form 741 and DD Form 742 are used by trained examiners and the items requiring completion are self-explanatory.

**4. Availability of forms.**—These forms will be available on or about 20 March 1954 to all medical treatment facilities through normal publications supply channels.

AFR 160-31

ARMY REGULATIONS No. 40-431 BUMED INSTRUCTION No. 6150-18 AIR FORCE REGULATION No. 160-31	}	DEPARTMENTS OF THE ARMY, THE NAVY, AND THE AIR FORCE WASHINGTON 25, D. C., 12 September 1956
--	---	--

**MEDICAL SERVICE**  
**RECORD OF EXPOSURE TO IONIZING RADIATION**

	Paragraph
Purpose.....	1
Definitions.....	2
General instructions.....	3
Responsibilities.....	4
Recording of exposures.....	5
Supply of forms.....	6

**1. Purpose.** These regulations prescribe the method of recording exposure to ionizing radiation of personnel who are employed by, or are members of, the Armed Services. It does not apply to combat exposures incurred by Department of the Army personnel.

**2. Definitions.** *a. Radiation hazard.* Any situation where individuals may be exposed to radiation in excess of one-quarter of the maximum permissible exposure established for the particular type of radiation involved. On special occasions, the Surgeon General of the military department concerned may specifically waive the requirement for personnel desimetry in areas exceeding this limit, following a radiation protection survey by qualified personnel.

*b. Radioactive area.* Any area where there is any reasonable possibility that the external weekly radiation intensity would exceed 0.075 rep (75 millirep), or where there is any possibility of deposition of any radioactive material within the body.

*c. Roentgen.* For the purpose of these regulations, the roentgen is the unit of measurement of x- or gamma radiation.

*d. Rep (roentgen equivalent physical) and rad (unit of absorbed dose).* For the purpose of these regulations, the rep and the rad are units of measurement of all forms of ionizing radiation.

*e. Milliroentgen, millirep, and millirad.* A submultiple equivalent to one-thousandth ( $\frac{1}{1000}$ ) of a roentgen, a rep, or a rad, respectively.

*f. X-ray area.* Any area where x-radiation hazard exists.

*g. Equivalent units.* For the purpose of these regulations, the roentgen, rep, and rad may be considered equivalent units.

**3. General instructions.** Activities concerned will measure the exposure to ionizing radiation of all personnel who work in a radioactive environment, handle radioactive materials, or enter a radioactive

TAGO 1401B—Sept. 400479\*—56

AR 40-431  
BUMEDINST 6150.18  
AFR 160-31

2

area, and will record the results on DD Form 1141 (Record of Exposure to Ionizing Radiation). (*Exception:* Ionizing radiation incurred by patients undergoing diagnostic procedures and treatments.) DD Form 1141 is a permanent record, which will accompany the individual when he is transferred. It will include any recorded exposures to ionizing radiation from nuclear explosives, except combat exposures incurred by Department of the Army personnel. When an individual is exposed to ionizing radiation at a location other than the one where his medical record is maintained, the dates of exposure total dosage, type of radiation, method of measurement, and place of exposure should be forwarded to the commander responsible for maintaining the medical records for entry on the individual's DD Form 1141.

**4. Responsibilities.** *a.* The commander of any project dealing with radioactive materials or equipment capable of producing X-rays will see that all personnel who may be exposed to a radiation hazard as defined in these regulations wear a dosimetric device and that their exposures are recorded. (*Exception:* See par. 3.) Periodically, at least once a month, such exposures will be transmitted to the medical service for recording on DD Form 1141. Any record of overexposure is to be transmitted to the medical service immediately.

*b.* The local medical service is responsible for maintaining DD Form 1141 on each individual exposed to ionizing radiation. (*Exception:* See par. 3.)

**5. Recording of exposures.** *a.* DD Form 1141 will be initiated immediately and completed to the maximum extent possible for all personnel who have been exposed to ionizing radiation within the past 10 years and are now in assignments where further exposure is probable (*d* (9) below). However, the form will not be initiated solely because personnel are undergoing diagnostic or therapeutic X-ray procedures. For other personnel, DD Form 1141 will be initiated when they are first exposed to ionizing radiation.

*b.* DD Form 1141 will be part of the individual health record for military personnel. Until an individual health record system is established in the Department of the Army, DD Forms 1141 for Army military personnel will be transferred with their personnel records jackets. DD Forms 1141 for civilian employees will be transferred with the employees.

*c.* DD Forms 1141 and a copy of these regulations will be included in the records of individuals who are to be assigned to nonmilitary agencies.

*d.* Method of recording.

- (1) Column, "Inclusive Dates." Enter the date or dates of the measured exposure. For example: If an individual is exposed continuously or intermittently throughout the month, make one entry, as "1-31 May 1955." However, if the individual received an overexposure on 18 May 1955, make the entries "1-17 May 1955," "18 May 1955," and "19-31 May 1955." Where a single record of exposure is reported for the month, indicate the date or inclusive dates of the exposure.
- (1) Column "Type of Radiation," Enter the type of radiation, as "x-," "gamma," "beta-gamma," "alpha," etc.
- (3) Column "Method of Measure." Record the method of measuring the dose. For example: The method might be entered as "film badge," or "pocket chamber." If the dose has been estimated, enter the word "estimated." For Air Force and Navy personnel, enter DT-60 readings only in column, "DT-60 Readings (AF and Navy only)," as explained later.
- (4) Column, "Place of Exposure." Enter the name of the facility and its geographical location or other acceptable method of designating the location. For example: "Oak Ridge National Laboratories, Oak Ridge, Tennessee."
- (5) Column, "Dose (in rep, rad, or r)." Enter the actual reading in rep, rad, or r. For example: "0.2" would be the recording for an exposure of 200 milliroentgens.
- (6) Column, "Accumulative Total Dose." Enter the total dose received, starting from the time records have been kept on the individual. For example: If the first exposure recorded for this individual is 0.2 rad, record "0.2" in column, "Dose (in rep, rad, or r)" and also in column, "Accumulative Total Dose." If on some future date the individual receives a dose of 3.4 rad, enter "3.4" in column "Dose (in rep, rad, or r)," and enter "3.6" in column, "Accumulative Total Dose."
- (7) Column, "DT-60 Readings (AF and Navy only)." Enter the DT-60 readings. Since, in many instances, an additional method of measurement may be utilized (such as a film badge), keep DT-60 readings separate in this column so as not to enter the same exposure twice, thereby recording double the actual dose received. Enter all DT-60 readings in this column only. Whenever the DT-60 is read, make a

AR 40-431  
BUMEDINST 6150.19  
AFB 160-31

4

completely separate entry. On initial issue, record the serial number of the DT-60 in column, "Place of Exposure"; for example, if on initial issue of the DT-60 on 5 January 1955 at the Oak Ridge National Laboratories, the reading was 5 r, make the following entries:

Column, "Inclusive Dates"—Enter "Initial 5 January 1955."  
Column, "Type of Radiation"—  
Column, "Method of Measure"—  
Column, "Place of Exposure"—Enter the serial number of the DT-60.  
Column, "Dose (in rep, rad, or r)"—  
Column, "Accumulative Total Dose"—  
Column, "DT-60 Readings (AF and Navy only)"—Enter "5.0."

If on 10 January 1956 the DT-60 is again read, and the reading is 10 r with no known exposure, make the following entries:

Column, "Inclusive Dates"—Enter "5 January 55 to 10 January 56."  
Column, "Type of Radiation"—Enter "Unknown"  
Column, "Method of Measure"—  
Column, "Place of Exposure"—Enter "Oak Ridge National Laboratories, Oak Ridge, Tennessee."  
Column, "Dose (in rep, rad, or r)"—  
Column, "Accumulative Total Dose"—  
Column, "DT-60 Readings (AF and Navy only)"—Enter "10.0."

- (8) In case of a radiation accident, enter on the form the date, external dose in rep, rad, or r, and quality and quantity (estimated) of internal deposition of radioactive substances, and give a brief narrative summary of the accident.
- (9) In the case of personnel exposed to ionizing radiation prior to the initiation of DD Form 1141, record the total dose received up to the date the form was initiated. For example: If an individual's first exposure to ionizing radiation was on 12 February 1951 and his last exposure was on 16 June 1955, and the total dosage received during that period was 6.3 rad, make the following entries: In column, "Inclusive Dates," enter "12 February 1951-16 June 1955"; in column, "Dose (in rep, rad, or r)," enter "6.3"; and in column, "Accumulative Total Dose," enter "6.3." You may or may not complete the remaining columns, depending on the amount of information available.

6. Supply of forms. DD Form 1141 will be requisitioned through normal AG publications supply channels.

MEDICAL SERVICE

NONCOMBAT PERSONNEL DOSIMETRY

CHANGES  
No. 1

DEPARTMENT OF THE ARMY  
WASHINGTON 25, D. C.

AR 40-114, 16 December 1954, is changed as follows:

4. Maintenance of dosimetry records. When personnel are \* \* \* of dosimetry records:

a. (Superseded) *Noncombat exposure*. The method of recording exposure to ionizing radiation and the responsibilities therefor will be as prescribed in AR 40-431. The records of exposure will be based upon information received from radac charger-readers or from Signal Corps facilities. Where film badge service is required, the Signal Corps will furnish film badge holders, calibrate, and supply film badge inserts, and process, evaluate, and return information of exposure to using installations or activities for entry on the Record of Exposure to Ionizing Radiation (DD Form 1141). The developed film will be destroyed. The Signal Corps facility will retain a permanent record of exposure readings. Developed film now being retained by using installations or activities may be destroyed.

5. Preparation of individual medical records. Individual medical records as required by AR 40-100 will be prepared when individuals are treated for a disease or injury incident to or resulting from exposure to ionizing radiation.

[AG 730 (31 Jan 57) MEDDD]

By Order of *Wilber M. Brucker*, Secretary of the Army:

MAXWELL D. TAYLOR,  
*General, United States Army,*  
*Chief of Staff.*

Official:

HERBERT M. JONES,  
*Major General, United States Army,*  
*The Adjutant General.*

Distribution:

*Active Army: C.*

To be distributed on a need-to-know basis to all installations, activities located off an installation, and to all units and headquarters down to and including divisions, and units and headquarters of comparable size.

*NG: State AG.*

*USAR: None.*

**MEDICAL SERVICE**  
**NONCOMBAT PERSONNEL DOSIMETRY**

	Paragraph
Purpose.....	1
Definitions.....	2
Requirements.....	3
Maintenance of dosimetry records.....	4
Preparation of individual medical records.....	5

1. **Purpose.**—These regulations prescribe Department of the Army policy with respect to radiation detection and recording methods to be utilized by persons exposed to ionizing radiation.

2. **Definitions.**—For the purpose of these regulations, the following definitions apply:

a. **Dosimetry.**—The term “dosimetry” as used herein is the accurate and systematic determination of ionizing radiation received from exposure to sources of ionizing radiation.

b. **Film badges.**—Devices containing inclosed photographic film worn by personnel exposed to radiation to show dosage received.

c. **Pocket chambers.**—Pencil-size ionization chambers (not self-reading) used to detect and measure an accumulated dosage of radiation.

d. **Self-reading dosimeters.**—Pencil-size ionization chambers with built-in self-reading electrometer used to detect and measure an accumulated dosage of radiation.

e. **Noncombat exposure.**—Exposure to ionizing radiation devices and sources to which personnel are subjected incident to their occupation in research and development, industrial, medical, laboratory, field and depot maintenance, training, atomic tests, and similar activities.

f. **Combat exposure.**—Exposure to which the individual is subjected as the result of combat operations, by either enemy or friendly forces.

g. **Class “A” X-ray facility.**—A facility determined by The Surgeon General as meeting the prescribed radiological safety standards for such classification.

h. **Qualified expert.**—A person having the knowledge and training needed to measure radiations and to advise regarding radiation hazards, such as a registered physicist certified by the American Board of Radiology.

3. **Requirements.**—a. **General requirements.**—All persons, except patients being examined or treated, who are exposed to noncombat ionizing radiation will utilize the radiation and detection methods outlined in these regulations. When film dosimetry only is required,

\*These regulations supersede SR 40-102346, 12 October 1951.  
TAGO 2354B—Doc. 310482\*—34

the Signal Corps film badge service will be used except in unusual circumstances as approved by the Chief Signal Officer. Those installations currently receiving film badge service from civilian commercial agencies on a contractual basis will, upon the publication of these regulations, continue such service as required to fulfill the obligations incurred within the provision of the contract, but at the conclusion of said contract an extension or renewal will not be made without the specific approval of the Chief Signal Officer.

*b. Specific requirements.*— Personnel dosimetry will be accomplished as directed below for all personnel exposed to ionizing radiation.

- (1) *Medical facilities in the continental United States engaged in X-ray activities, excluding nonfixed hospitals.*—All personnel will utilize film badge service, except those personnel only infrequently exposed to ionizing radiation. These excepted personnel and those awaiting film badge service, i. e., temporary employees, visiting personnel, and persons for whom film badge service has been requested, will utilize pocket chambers. Radiologists will, in addition to the film badge service, utilize self-reading dosimeters.
- (2) *Fixed medical facilities outside the continental United States engaged in X-ray activities.*—All personnel other than radiologists will utilize pocket chambers. Radiologists will utilize self-reading dosimeters.
- (3) *Nonfixed hospitals engaged in X-ray activities.*—All personnel will utilize pocket chambers.
- (4) *Radioisotope laboratories.*—All personnel will utilize film badge service, self-reading dosimeters, and other special monitoring devices as indicated by the nature of the radiation exposure.
- (5) *Industrial radiography.*—All radiographers and other personnel exposed to ionizing radiations will utilize film badge service unless this requirement is waived by The Surgeon General as a result of a protection survey conducted under the direction of a qualified expert, or unless the activity has been classified by The Surgeon General as "Class A."
- (6) *Calibration and other radioisotope sources.*—Personnel monitoring will be required where radiation safety depends upon proper operating procedures. A film badge, self-reading dosimeter, or pocket chamber may be used. If a particular operation is routine or repetitive and the hazard slight, i. e., less than 75 milliroentgens per week, the local exposure may be established initially without the necessity of wearing such devices continuously.

TAGO 2784B

**4. Maintenance of dosimetry records.**—When personnel are subjected to ionizing radiation, the following procedures will govern the maintenance of dosimetry records:

*a. Noncombat exposure.*—Each record will be prepared on a local form and maintained by the personnel owner based upon the information received from radiac charger-readers or from Signal Corps facilities. Where film badge service is required, the Signal Corps will furnish film badge holders, calibrate and supply film badge inserts, and process, evaluate, and return developed films with record of exposure to using installations or activities for their retention. For each individual who utilizes the radiation detection methods outlined in these regulations, the record prepared by the personnel officer will show the date of exposure, amount of exposure in milliroentgens, and remarks such as limitations on assignment because of such exposure. The duration of exposure also will be recorded. When possible, the exact period of exposure in minutes, hours, days, etc., will be recorded. In some circumstances, it will be possible to record only the approximate period of exposure. Records will indicate whether the time of exposure is "Exact" or "Estimated." Each record will be signed by the personnel officer and will become a permanent part of the field military 201 file or the civilian personnel 201 file, whichever is applicable, so that a medical officer can evaluate the data from time to time and make such recommendations as may be appropriate. In the event the 201 files of personnel who are participating in activities such as atomic weapons tests or training exercises, etc., are not available, the records of exposure to ionizing radiation will be forwarded promptly to the personnel officer having custody of the 201 files.

*b. Combat exposure.*—Individual exposure records will not be maintained for personnel exposed under these circumstances.

**5. Preparation of individual medical records.**—Individual medical records as required by AR 40-1-25 will be prepared when individuals are treated for a disease or injury incident to or resulting from exposure to ionizing radiation.

BY ORDER OF THE SECRETARY OF THE ARMY:

M. B. RIDGWAY,  
General, United States Army,  
Chief of Staff.

OFFICIAL:

JOHN A. KLEIN,  
Major General, United States Army,  
The Adjutant General.

DISTRIBUTION:

Active Army: C.

To be distributed to all units and headquarters down to and including divisions and to units and headquarters of comparable size (class I and II installations and class II activities located off an installation are included).

NG: State AG (3).

USAR: None.

ARMY REGULATIONS }  
 No. 40-414

HEADQUARTERS,  
 DEPARTMENT OF THE ARMY  
 WASHINGTON 25, D. C., 26 November 1957

**MEDICAL SERVICE**  
**NONCOMBAT PERSONNEL DOSIMETRY**

	Paragraph
Purpose.....	1
Definitions.....	2
Dosimetry requirements.....	3
Dosimetry records.....	4
Preparation of individual medical records.....	6

**1. Purpose.** These regulations prescribe Department of the Army policy with respect to the utilization of dosimeters for the determination of the exposure of persons to ionizing radiation, while engaged in noncombat activities.

**2. Definitions.** For the purpose of these regulations, the following definitions apply:

*a. Dosimetry.* The accurate and systematic determination of exposure to ionizing radiation.

*b. Dosimeter.* A device worn by a person for the purpose of determining his exposure to ionizing radiation from external sources.

*c. External source of radiation.* A source of radiation not deposited in an organ in the human body.

*d. Film packet.* One or more pieces of calibrated film in a light proof envelope. Fits into film holder.

*e. Film badge.* A convenient holder for film packets, usually fastened to the clothing by an alligator, or similar, clip.

*f. Photodosimetry.* Measurement, by means of exposure on photographic film, of radiation dosage received from beta, gamma, and X-ray emitting sources including radioactive materials, X-ray machines, nuclear reaction equipment, and nuclear bombardment devices.

*g. Non-self-reading dosimeter.* A pencil size ionization chamber which requires accessory equipment to obtain a reading.

*h. Self-reading dosimeter.* A pencil size ionization chamber with a built-in self-reading electrometer.

*i. Noncombat exposure.* Exposure to external sources of ionizing radiation to which persons are subjected incident to their occupation in research and development, industry, medicine, laboratory, field and depot maintenance, training, atomic tests, and similar activities.

*j. Combat exposure.* Exposure to which persons are subjected as a result of combat operations, by either enemy or friendly forces.

\*These regulations supersede AR 40-414, 16 December 1954, including C 1, 6 March 1957.

TAGO 3071B—Nov. 440481\*—57

*k. Rad.* A unit of measurement of radiation.

*l. Millirad.* One one-thousandth of a rad.

*m. Rem.* Rad multiplied by relative biological effectiveness. For the purposes of these regulations, X-rays, electrons, and positrons of any specific ionization, the relative biological effectiveness is equal to one. For recommended values of relative biological effectiveness of neutrons, see TB MED 25t.

*n. Millirem.* One one-thousandth of a rem.

*o. Qualified expert.* A person having the knowledge and training needed to measure radiation and to advise regarding radiation hazards, such as registered physicist, certified by the American Board of Radiology.

**3. Dosimetry requirements. a. Personnel.**

- (1) All persons, except patients being examined or treated, who are engaged in the use of ionizing radiation for any non-combat purpose will utilize film packet dosimeters. Other dosimeters which will enhance the completeness of the dosimetry problem, will be employed as deemed necessary by competent medical authority.
- (2) All persons exposed to ionizing radiation other than therapeutic or diagnostic radiation will utilize dosimeters except when the potential radiation is negligible and exemption from use is authorized by The Surgeon General.

**b. Dosimeters.**

- (1) Only dosimeters capable of measuring a radiation dose with an accuracy of 10 percent or better in the average energy range normally encountered in the use of sources of ionizing radiation in the Army will be used. This includes beta as well as gamma and x-radiation.
- (2) The film packet dosimetry service for Army installations is provided by the Signal Corps in accordance with SB 11-206, and will be employed solely except in unusual circumstances as approved by the Chief Signal Officer.

**c. Monitoring period.**

- (1) *Pocket chambers and self-reading dosimeters.* These dosimeters will be charged and read at least every 2 days.
- (2) *Film packets.* These will be worn for the periods compatible with the potential hazards involved, but in no case longer than 4 weeks. Exposed film packets will be dispatched by the most direct means to the developing and evaluating agency with the absolute minimum of administrative delay. See SB 11-206.

4. [REDACTED] Dosimetry records will be maintained in accordance with AR 40-431. The Signal Corps dosimeter film developing and evaluating agency will maintain permanent records of all exposure readings made by that agency and will discard exposed dosimeter film unless an exception is requested by the using installation commander.

b. All entries in column marked [REDACTED] will be made in rem units. For the low order of exposure encountered in noncombat dosimetry, the rad, rep (roentgen equivalent physical), and roentgen are considered equivalent. For heavy ionizing particles, an estimate of the relative biological effectiveness (RBE) will be noted. For definitions of terms used in this paragraph, see TB MED 254.

c. Where an entry in the "Dose" column is greater than 0.3 rem in one calendar week, a brief explanation of the probable cause of the overexposure will be attached to DD Form 1141, regardless of whether or not the individual to whom the dosimeter was issued was wearing the badge during the period the dosimeter was overexposed.

5. Preparation of individual medical records. Individual medical records as required by AR 40-400 will be prepared when individuals are treated for a disease or injury incident to or resulting from exposure to ionizing radiation.

[AG 730 (18 Nov 57) MEDCA]

By Order of *Wilber M. Brucker*, Secretary of the Army:

Control and Recording Procedures  
Occupational Exposure to Ionizing Radiation

	Paragraph
Purpose . . . . .	1
Cancellation . . . . .	2
Definitions . . . . .	3
Responsibilities . . . . .	4
Radiation Protection . . . . .	5
Personnel Dosimetry . . . . .	6
Recording Procedures . . . . .	7
Control Procedures . . . . .	8
Supply of Forms . . . . .	9

1. Purpose. These regulations prescribe procedures and responsibilities for the control and recording of occupational exposure to sources of ionizing radiation and implement the guidelines promulgated by the Federal Radiation Council. These regulations are applicable to all individuals who are employed by or are members of the Armed Forces. They are not applicable to exposure: (a) to ionizing radiation resulting from the employment of nuclear or thermonuclear weapons in combat military operations, or (b) of personnel being examined or treated for medical or dental purposes. For activities holding U. S. Atomic Energy Commission licenses, the appropriate provisions of Title 10, Code of Federal Regulations also apply except that the DD Form 1141, "Record of Occupational Exposure to Ionizing Radiation," will be used in lieu of AEC Form 4, "Occupational External Radiation Exposure History," and AEC Form 5, "Current Occupational External Radiation Exposure."

2. Cancellation. This directive cancels and supersedes AR 40-431/BUMEDINST 6150.18/AFR 160-31 as amended of 12 September 1956, TB MED 254 of 6 May 1957, and AR 40-414 of 26 November 1957.

3. Definitions. Terms used in these regulations are defined as follows:

a. Roentgen, rad, rem, and dose equivalent.--For the practical application of these regulations, one roentgen of X- or gamma-radiation, measured in air at or near the point of delivery to the body, is considered to deliver a Dose Equivalent of one rem to the body tissues. The Dose Equivalent for protons, neutrons, beta and other particles is the dose in rads multiplied by the appropriate modifying factors. For beta particles having an average energy greater than 1.2 MEV, the modifying factor is 1. For neutrons of unknown energies, a modifying factor of 10 shall be used.

Where more definitive definitions are required, those provided in National Bureau of Standards Handbook 84, Radiation Quantities and Units, shall be used.

b. Ionizing radiation.--Electromagnetic or particulate radiation, which may cause ionization within the cells or tissues of the body. For purposes of these

regulations, alpha and beta particles, gamma rays, X-rays, and neutrons are examples of types of ionizing radiation.

c. Occupational exposure to ionizing radiation.--An exposure incurred as a result of an individual's employment or duties. Occupational exposure shall not be deemed to include the exposure of an individual to sources of ionizing radiation for the purpose of medical or dental diagnosis or therapy of that individual.

d. Radiation sources.--Materials, equipment, or devices which generate or are capable of generating ionizing radiation, including: (1) naturally occurring radioactive materials, (2) byproduct materials, (3) source materials, (4) special nuclear materials, (5) fission products, (6) materials containing induced or deposited radioactivity, (7) nuclear reactors, (8) radiographic and fluoroscopic equipment, (9) particle generators and accelerators, and (10) radio frequency generators such as certain klystrons and magnetrons which produce X-rays.

e. User.--The activity, section, division, or other organizational unit which has been assigned responsibility for the use, operation or storage of radiation sources.

f. Radiological protection officer.--An individual designated by the commander to provide consultation and advice on the degree of hazards associated with ionizing radiation and the effectiveness of measures to control these hazards. This individual shall be technically qualified by virtue of education, military training, and/or professional experience to assure a capability commensurate with the assignment. The term "Radiological Protection Officer" is a functional title and is not intended to denote a commissioned status or a job classification within the Armed Forces.

4. Responsibilities. The commander of any installation, or activity, which possesses or uses a radiation source or sources is responsible for ensuring that measures are established to control ionizing radiation from such sources so that the radiation dose to individuals under his command or within his jurisdiction will be no greater than the amount prescribed in these regulations. He shall also ensure that the necessary measurements of exposures of personnel are made and the amount of such exposures recorded as here prescribed.

a. The commander of an installation or activity where there are operations involving the use of multiple radiation sources for purposes of research and development, industrial radiography, or medical or dental diagnosis or therapy shall appoint a radiological protection officer to advise on the control of the hazards to health and safety from the specific materials or devices being used.

b. The commander of an installation or activity licensed by U. S. Atomic Energy Commission to use byproduct materials (unless otherwise specifically exempted) shall appoint an ionizing radiation control committee to review proposals for the use of the licensed radiation sources and to make recommendations to the commander concerning the protective measures to be taken. This committee shall include: (a) the radiological protection officer, (b) the responsible staff medical officer, and (3) other persons as deemed necessary. The committee described herein shall not exercise the functions of a clinical board or committee on radioisotopes in a medical facility, nor shall this committee exercise any function in nuclear reactor or weapons programs which are administered by each of the Armed Forces under the provisions of appropriate Departmental Directives.

5. Radiation Protection Standards. Every effort shall be made to maintain radiation doses as far below the following Radiation Protection Standards as practicable.

Positive efforts shall be carried out to fulfill this objective, and a determination of necessity should be weighed against the benefits to be expected.

a. Basic Radiation Protection Standards adopted by the Departments of the Army, Navy, and Air Force for the control of occupational exposures to ionizing radiation include:

(1) The accumulated dose of radiation to the whole body, head and trunk, active blood-forming organs, gonads or lens of the eye shall not exceed

- (a) 3 rem in any calendar quarter, nor
- (b)  $5(N-18)$  rem total lifetime dose, where N equals the present age in years.

(2) The accumulated dose of radiation to the skin of the whole body or the thyroid shall not exceed

- (a) 10 rem in any calendar quarter, nor
- (b) 30 rem in any calendar year.

(3) The accumulated dose of radiation to the hands and forearms or the feet and ankles shall not exceed

- (a) 25 rem in any calendar quarter, nor
- (b) 75 rem in any calendar year.

b. Alternate Radiation Protection Standards, less restrictive than those prescribed in paragraph a, may be used in special circumstances, when approved by the Surgeon General of the military department concerned. Proposals for the use of alternate standards will contain complete justification and should describe the means by which the standard will be implemented.

c. No individual under 18 years of age shall be occupationally exposed to ionizing radiation in excess of that allowed to any individual in the population at large.

6. Personnel Dosimetry. An appropriate personnel monitoring device shall be used to measure the exposure of each individual who is likely to receive an accumulated dose of radiation in excess of 10% of the applicable quarterly basic Radiation Protection Standard. Consideration shall be taken of all other occupational exposures the individual may receive during that calendar quarter.

a. Commanders of installations or activities under the jurisdiction of the Department of Defense shall furnish the required exposure information to the appropriate custodian of the medical records of each monitored individual at intervals not to exceed a calendar quarter. The commander need not furnish reports of zero exposures to monitored visitors, unless requested by the visitor or the custodian of his medical records.

b. When a Department of Defense employee or a member of the Armed Forces governed by these regulations is exposed to ionizing radiation at an installation outside the jurisdiction of the Department of Defense, he shall ensure that the required exposure information is furnished to the custodian of his medical record.

c. The separate requirements of the individual military departments with respect to personnel dosimetry are as follows:

(1) Department of the Army.--The primary dosimetric device shall be the film packet, except for field radiography in combat or simulated combat conditions when the direct reading personnel dosimeter (0-200 mr range) has been designated by the command Surgeon as the primary device to be worn by personnel occupationally exposed to X-ray. The film packet dosimetry service for Army installation and units is provided for by SB 11-206, Film Badge (Photodosimetry) Supply and Service for Technical Radiation Exposure Control, and this service will be employed solely for film packet dosimetry, except in unusual circumstances as approved by the Commanding General, U. S. Army Materiel Command.

(2) Department of the Navy.--Navy and Marine Corps activities shall utilize appropriate dosimetric devices in accordance with U. S. Navy Safety Precautions, OPNAV 34Pl, and other applicable directives.

(3) Department of the Air Force.--The primary dosimetric device shall be the film badge. The film badge service for Air Force installations is provided by the USAF Radiological Health Laboratory, Wright-Patterson AFB, in accordance with the provisions of AFR 161.11.

7. Recording Procedures. The custodian of the medical records shall prepare and maintain DD Forms 1141 for each person occupationally exposed to ionizing radiation. All exposure entries shall be made in rem.

a. Initial determination of accumulated dose.--In the initial preparation of a DD Form 1141, reasonable efforts should be made to obtain complete reports of all previous exposure based on recorded personnel dosimetry. For each period in which the individual was engaged in activities where occupational exposure to ionizing radiation was probable, and no record, or only an incomplete record, of his exposure during the period can be obtained, it shall be assumed that an occupational exposure of 1.25 rem was incurred per quarter of each calendar year or fraction thereof. In cases where the nature of the radiation is unknown, it shall be assumed to be gamma radiation. If an individual was potentially exposed at more than one facility, the cumulative exposures shall be calculated and recorded in items 7 through 12, as appropriate. The sum of these whole body exposures shall be entered in item 13, and a statement regarding the source of that information shall be entered in item 16, REMARKS.

b. Current record.--Appropriate entries on each individual's DD Form 1141 shall be made periodically, at least quarterly, from the exposure records supplied under the provisions of paragraph 6 above. Separate DD Forms 1141 shall be maintained to record exposures other than whole body, with appropriate descriptions under item 16, REMARKS.

c. Retention and Disposition of DD Forms 1141.

(1) The DD Form 1141 is a permanent component of the individual's medical record and shall not be used for other purposes. All previous copies of this form shall be retained in the individual's medical record. Commanders or commanding officers, authorized inspecting officials, or supervisors of persons occupationally exposed to ionizing radiation, and the individual concerned, may review his DD Form 1141 with the custodian of the medical records.

(2) When a civilian employee of the Armed Forces is not included in a Federal civilian employees health service, a DD Form 1141 will be maintained as a permanent document in his SF 66, "Official Personnel Folder."

(3) The DD Form 1141 shall be retained in the retired medical records of any member of the Armed Forces who has been occupationally exposed to ionizing radiation during his services. Disposition of DD Forms 1141 for retired or separated civilian personnel will be made in accordance with governing civilian personnel directives.

(4) If any member of the Armed Forces is released from active duty, or if a civilian employee terminates employment with a DOD agency, he may be furnished the appropriate information concerning his radiation exposure history.

8. Control Procedures. The custodian of the health records shall evaluate at intervals not to exceed a calendar quarter the DD Form 1141 of each individual engaged in duties involving occupational exposure to ionizing radiation. He shall establish procedures to inform and advise the cognizant commander when action is necessary to limit an individual's exposure to ionizing radiation.

When an individual has received a dose of ionizing radiation in an amount exceeding 3 rem per calendar quarter, he shall be removed from duties involving occupational exposure to ionizing radiation until subsequent exposure limitations are established in consultation with competent medical authority. When an individual has received an accumulated dose of ionizing radiation in excess of 5(N-18) rem, he shall be removed from duties involving occupational exposure to ionizing radiation until his exposure record has been evaluated by the Surgeon General of the military department concerned and subsequent exposure limitations are established as necessary.

Reports of exposures in excess of the limitations, as defined by the Surgeon General of each of the Armed Forces, shall be made in accordance with applicable directives.

9. Supply of Forms. DD Form 1141 will be available through normal supply channels.

Definitions.....	3
Responsibilities.....	4
Radiation Protection Standards.....	5
Personnel Dosimetry.....	6
Recording Procedures.....	7
Control Procedures.....	8
Supply of Forms.....	9

**1. Purpose.** These regulations prescribe procedures and responsibilities for the control and recording of occupational exposure to sources of ionizing radiation and implement the guidelines promulgated by the Federal Radiation Council. These regulations are applicable to all individuals who are employed by or are members of the Armed Forces. They are not applicable to exposure: (a) To ionizing radiation resulting from the employment of nuclear or thermonuclear weapons in combat military operations, or (b) of personnel being examined or treated for medical or dental purposes. For activities holding U.S. Atomic Energy Commission licenses, the appropriate provisions of Title 10, Code of Federal Regulations also apply except that the DD Form 1141, "Record of Occupational Exposure to Ionizing Radiation," will be used in lieu of AEC Form 4, "Occupational External Radiation Exposure History," and AEC Form 3, "Current Occupational External Radiation Exposure."

**2. Cancellation.** This directive cancels and supersedes AR 40-14/BUMEDINST 6150.13A AFR 161-8, 21 October 1964.

**3. Definitions.** Terms used in these regulations are defined as follows:

a. *Roentgen, rad, rem, and dose equivalent*—For the practical application of these regulations, one roentgen of X- or gamma-radiation, measured in air at or near the point of delivery to the body, is considered to deliver a Dose Equivalent of one rem to the body tissues. The Dose Equivalent for protons, neutrons, beta and other particles is the dose in rads multiplied by the appropriate modifying factors. For beta particles having an average energy greater than 1.2 MEV, the modifying factor is 1. For neutrons of unknown energies, a modifying factor of 10 shall be used.

Where more definitive definitions are required, those provided in National Bureau of Standards Handbook 81, *Radiation Quantities and Units*, shall be used.

b. *Ionizing radiation*.—Electromagnetic or particulate radiation, which may cause ionization within the cells or tissues of the body. For purposes of these regulations, alpha and beta particles, gamma rays, X-rays, and neutrons are examples of types of ionizing radiation.

c. *Occupational exposure to ionizing radiation*.—An exposure incurred as a result of an individual's employment or duties. Occupational exposure shall not be deemed to include the ex-

~~Supersedes AR 40-14/BUMEDINST 6150.13A/AFR 161-8, 21 October 1964.~~

BUMEDINST 6150.18B  
AFR 161-8  
DSAR H45.24

posure of an individual to sources of ionizing radiation for the purpose of medical or dental diagnosis or therapy of that individual.

d. *Radiation sources.*—Materials, equipment, or devices which generate or are capable of generating ionizing radiation, including: (1) naturally occurring radioactive materials, (2) by-product materials, (3) source materials, (4) special nuclear materials, (5) fission products, (6) materials containing induced or deposited radioactivity, (7) nuclear reactors, (8) radiographic and fluoroscopic equipment, (9) particle generators and accelerators, and (10) radio frequency generators such as certain klystrons and magnetrons which produce X-rays.

e. *User.*—The activity, section, division, or other organizational unit which has been assigned responsibility for the use, operation, or storage of radiation sources.

f. *Radiological protection officer.*—An individual designated by the commander to provide consultation and advice on the degree of hazards associated with ionizing radiation and the effectiveness of measures to control these hazards. This individual shall be technically qualified by virtue of education, military training, and/or professional experience to assure a capability commensurate with the assignment. The term "Radiological Protection Officer" is a functional title and is not intended to denote a commissioned status or a job classification within the Armed Forces.

**4. Responsibilities.** The commander of any installation, or activity, which possesses or uses a radiation source or sources is responsible for ensuring that measures are established to control ionizing radiation from such sources so that the radiation dose to individuals under his command or within his jurisdiction will be no greater than the amount prescribed in these regulations. He shall also ensure that the necessary measurements of exposures of personnel are made and the amount of such exposures recorded as herein prescribed.

a. The commander of an installation or activity where there are operations involving the use of multiple radiation sources for purposes of research and development, industrial radiography, or medi-

cal or dental diagnosis or therapy shall appoint a radiological protection officer to advise on the control of the hazards to health and safety from the specific materials or devices being used.

b. The commander of an installation or activity licensed by U.S. Atomic Energy Commission to use byproduct materials (unless otherwise specifically exempted) shall appoint an ionizing radiation control committee to review proposals for the use of the licensed radiation sources and to make recommendations to the commander concerning the protective measures to be taken. This committee shall include: (a) the radiological protection officer, (b) the responsible staff medical officer, and (c) other persons as deemed necessary. The committee described herein shall not exercise the functions of a clinical board or committee on radioisotopes in a medical facility, nor shall this committee exercise any function in nuclear reactor or weapons programs which are administered by each of the Armed Forces under the provisions of appropriate Departmental Directives.

**5. Radiation Protection Standards.** Every effort shall be made to maintain radiation dose as far below the following *Radiation Protection Standards* as practicable. Positive efforts shall be carried out to fulfill this objective, and determination of necessity should be weighed against the benefits to be expected.

a. *Basic Radiation Protection Standards* adopted by the Departments of the Army, Navy, and Air Force and the Defense Supply Agency (DSA) for the control of occupational exposures to ionizing radiation include:

- (1) The accumulated dose of radiation to the whole body, head, and trunk, active blood-forming organs, gonads, or lens of the eye shall not exceed:
  - (a) 3 rem in any calendar quarter, nor
  - (b)  $5(N-18)$  rem total lifetime dose, where  $N$  equals the present age in years.
- (2) The accumulated dose of radiation to the skin of the whole body or the thyroid shall not exceed:
  - (a) 10 rem in any calendar quarter, nor
  - (b) 30 rem in any calendar year.

(3) The accumulated dose of radiation to the hands and forearms or the feet and ankles shall not exceed:

- (a) 25 rem in any calendar quarter, nor
- (b) 75 rem in any calendar year.

b. *Alternate Radiation Protection Standards.* less restrictive than those prescribed in paragraph a, may be used in special circumstances, when approved by the Surgeon General of the military department concerned. Proposals for the use of alternate standards will contain complete justification and should describe the means by which the standard will be implemented.

c. No individual under 18 years of age shall be occupationally exposed to ionizing radiation in excess of that allowed to any individual in the population at large.

6. *Personnel Dosimetry.* An appropriate personnel monitoring device shall be used to measure the exposure of each individual who is likely to receive an accumulated dose of radiation in excess of 10 percent of the applicable quarterly basic *Radiation Protection Standard*. Consideration shall be taken of all other occupational exposures the individual may receive during that calendar quarter.

a. Commanders of installations or activities under the jurisdiction of the Department of Defense shall furnish the required exposure information to the appropriate custodian of the medical records of each monitored individual at intervals not to exceed a calendar quarter. The commander need not furnish reports of zero exposures to monitored visitors, unless requested by the visitor or the custodian of his medical records.

b. When a Department of Defense employee or a member of the Armed Forces governed by these regulations is exposed to ionizing radiation at an installation outside the jurisdiction of the Department of Defense, he shall ensure that the required exposure information is furnished to the custodian of his medical record.

c. The separate requirements of the individual military departments with respect to personnel dosimetry are as follows:

- (1) *Department of the Army.*—The primary dosimetric device shall be the film packet,

except for field radiography in combat or simulated combat conditions when the direct reading personnel dosimeter (0-200 mr range) has been designated by the command Surgeon as the primary device to be worn by personnel occupationally exposed to X-ray. The film packet dosimetry service for Army installation and units is provided for by SB 11-206, *Film Badge (Photodosimetry) Supply and Service for Technical Radiation Exposure Control*, and this service will be employed solely for film packet dosimetry, except in unusual circumstances as approved by the Commanding General, U.S. Army Materiel Command.

- (2) *Department of the Navy.*—Navy and Marine Corps activities shall utilize appropriate dosimetric devices in accordance with NAVMED P-5055, *Radiation Health Protection Manual*, and other applicable directives.

- (3) *Department of the Air Force.*—The primary dosimetric device shall be the film badge. The film badge service for Air Force installations is provided by the USAF Radiological Health Laboratory, Wright-Patterson AFB, in accordance with the provisions of AFR 161-11.

- (4) *Defense Supply Agency.* The primary dosimetric device shall be the film packet. The film packet dosimetric service for DSA field activities will be prescribed by HQ DSA (DSAH-W).

7. *Recording Procedures.* The custodian of the medical records shall prepare and maintain DD Forms 1141 for each person occupationally exposed to ionizing radiation. All exposure entries shall be made in rem.

a. *Initial determination of accumulated dose.*—In the initial preparation of a DD Form 1141, reasonable efforts should be made to obtain complete reports of all previous exposure based on recorded personnel dosimetry. For each period in which the individual was engaged in activities where occupational exposure to ionizing radiation was probable, and no record, or only an in-

AR 10-14  
BUMEDINST 6150.18B  
AFR 161-8  
DSAR 1115.24

complete record of his exposure during the period can be obtained, it shall be assumed that an occupational exposure of 1.25 rem was incurred per quarter of each calendar year or fraction thereof. In cases where the nature of the radiation is unknown, it shall be assumed to be gamma radiation. If an individual was potentially exposed at more than one facility, the cumulative exposures shall be calculated and recorded in items 7 through 12, as appropriate. The sum of these whole body exposures shall be entered in item 13, and a statement regarding the source of that information shall be entered in item 16, REMARKS.

b. *Current record.*—Appropriate entries on each individual's DD Form 1141 shall be made periodically, at least quarterly, from the exposure records supplied under the provisions of paragraph 6 above. Separate DD Forms 1141 shall be maintained to record exposures other than whole body, with appropriate descriptions under item 16, REMARKS.

c. *Retention and Disposition of DD Forms 1141.*

- (1) The DD Form 1141 is a permanent component of the individual's medical record and shall not be used for other purposes. All previous copies of this form shall be retained in the individual's medical record. Commanders or commanding officers, authorized inspecting officials, or supervisors of persons occupationally exposed to ionizing radiation, and the individual concerned, may review his DD Form 1141 with the custodian of the medical records.
- (2) When a civilian employee of the Armed Forces is not included in a Federal civilian employees health service, a DD Form 1141 will be maintained as a permanent document in his SF 66, "Official Personnel Folder."
- (3) The DD Form 1141 shall be retained in the retired medical records of any member of the Armed Forces who has been

occupationally exposed to ionizing radiation during his services. Disposition of DD Forms 1141 for retired or separated civilian personnel will be made in accordance with governing civilian personnel directives.

- (4) If any member of the Armed Forces is released from active duty, or if a civilian employee terminates employment with a DOD agency, he may be furnished the appropriate information concerning his radiation exposure history.

8. *Control Procedures.* The custodian of the health records shall evaluate at intervals not to exceed a calendar quarter the DD Form 1141 of each individual engaged in duties involving occupational exposure to ionizing radiation. He shall establish procedures to inform and advise the cognizant commander when action is necessary to limit an individual's exposure to ionizing radiation.

a. When an individual has received a dose of ionizing radiation in an amount exceeding 3 rem per calendar quarter, he shall be removed from duties involving occupational exposure to ionizing radiation until subsequent exposure limitations are established in consultation with competent medical authority. When an individual has received an accumulated dose of ionizing radiation in excess of 5(N-18) rem, he shall be removed from duties involving occupational exposure to ionizing radiation until his exposure record has been evaluated by the Surgeon General of the military department concerned or by authorized personnel in HQ DSA and subsequent exposure limitations are established as necessary.

b. Reports of exposures in excess of the limitations, as defined by the Surgeon General of each of the Armed Forces or by authorized personnel in HQ DSA, shall be made in accordance with applicable directives.

9. *Supply of Forms.* DD Form 1141 will be available through normal supply channels.

MEDICAL SERVICES  
CONTROL AND RECORDING PROCEDURE FOR OCCUPATIONAL  
EXPOSURE TO IONIZING RADIATION

Effective 27 September 1975

This change implements the Privacy Act of 1974 (5 U.S.C. 552a) by adding Privacy Act Statements for forms prescribed in this publication that are covered under the act.

AR 10-11, 20 May 75, is changed as follows:

1. The following form(s) (col m b) will be reproduced locally on 8 x 10 1/2 inch paper and made available on and after 27 September 1975 to the individual supplying data on form(s) in column a.

Column a	Column b
DD Form 1952 -----	DD Form 1952, Privacy Act Statement

2. File this change sheet in front of the publication for reference purposes. *10/27/75*

The proponent agency of this publication is the Office of the Surgeon General.  
 (Users are invited to send comments and suggested improvements on DA Form 2028 (Recommended Changes to Publications and Blank Forms) direct to HQDA (DASG-HCH-E) WASH DC 20311.

By Order of the Secretary of the Army:

Official:  
VERNE L. BOWERS  
Major General, United States Army  
The Adjutant General

FRED C. WEYAND  
General, United States Army  
Chief of Staff

DISTRIBUTION: To be distributed in accordance with DA Form 12-9A requirements for AR, Medical Services - Applicable to all Army Elements. Active Army, ARNG, & SAR 3 (Qty req block no. 4).

**DATA REQUIRED BY THE PRIVACY ACT OF 1974**

### MEDICAL SERVICES

## CONTROL AND RECORDING PROCEDURES FOR OCCUPATIONAL EXPOSURE TO IONIZING RADIATION

*This is a complete revision of AR 40-14 and DSAR 4145.24. AR 40-27 (rescinded by DA Cir 310-70, 28 Feb 75) has been incorporated into this regulation. This regulation is applicable to Federal and non-Federal agencies (including civilian contractors) when their personnel are occupationally exposed to ionizing radiation on or at a military installation or activity. This revision requires that the individual responsible for maintaining the DD Form 1141, Record of Occupational Exposure to Ionizing Radiation, be appointed on orders. Additionally, it describes how the film badge is to be worn; and the care and handling of dosimeter film and film badges. Sample DD Forms 1141 are included for whole-body and wrist badges to provide guidance for the proper posting and maintenance of such records. Local supplementation of this regulation by an Army element is prohibited.*

✓  
\* Supersedes AR 40-14/DSAR 4145.24, 29 September 1966.

**1. Purpose.** This regulation prescribes procedures and responsibilities for the control and recording of occupational exposure to sources of ionizing radiation and implements the guidelines promulgated by Title 10, Code of Federal Regulations (CFR), Part 20 and Title 29, CFR, Part 1910. In addition, the provisions of this regulation are based in part on the recommendations of the National Council on Radiation Protection and Measurements (NCRP) Report No. 39, Basic Radiation Protection Criteria; the International Commission on Radiological Protection (ICRP) Report No. 9, Recommendations of the ICRP and ICRP Report No. 12, General Principles of Monitoring for Radiation Protection of Workers.

**2. Applicability.** This regulation is applicable to all individuals who are employed by or are members of the Department of the Army (DA) and Defense Supply Agency (DSA). In addition, this regulation is applicable to Federal and non-Federal agencies (including civilian contractors) when their personnel are occupationally exposed to ionizing radiation on or at an installation or activity of the DA or DSA, except as specified by agreement. This regulation is not applicable to the exposure of (a) personnel to ionizing radiation resulting from the employment of nuclear or thermonuclear weapons in combat military operations or (b) personnel being examined or treated for medical or dental purposes. For DA and DSA in-

stallations or activities holding US Nuclear Regulatory Commission (NRC) licenses, the appropriate provisions of Title 10, CFR, also apply, except that the DD Form 1141, Record of Occupational Exposure to Ionizing Radiation, and DD Form 1952, Film Badge Application and Record of Occupational Radiation Exposure, will be used in lieu of Form NRC-4, Occupational External Radiation Exposure History, and Form NRC-5, Current Occupational External Radiation Exposure.

**3. Definitions.** Terms used in this regulation are defined as follows:

*a. Absorbed dose.* The energy imparted to matter in a suitably small element of volume by ionizing radiation divided by the mass of that element of volume. It is commonly expressed in rads. Rad: A unit of absorbed dose. (1 rad =  $10^{-2}$  joule per kilogram equals 100 ergs per gram).

*b. Bioassay.* The determination of kinds, amounts or concentrations, and locations of radioactive materials in the human body, whether by in vivo counting (whole-body counting, selected organ counting, etc.) or by analysis and evaluation of materials excreted or removed from the human body.

*c. Calendar quarter.* Is a period of not less than 12 consecutive weeks nor more than 14 consecutive weeks. The first calendar quarter

of each year will begin in January and subsequent calendar quarters will be such that no day is included in more than one calendar quarter or omitted from inclusion within a calendar quarter (10 CFR 20.3).

*d. Controlled area.* A defined area in which the exposure of personnel to ionizing radiation is under the supervision of an individual in charge of radiation protection.

*e. Dose.* A general term denoting the quantity of radiation or energy absorbed. For special purposes, it must be appropriately qualified.

*f. Dose equivalent.* The product of absorbed dose, quality factor, distribution factor, and other modifying factors necessary to obtain an evaluation of the effects of radiation received by exposed persons, so that the different characteristics of the exposure are taken into account. It is commonly expressed in rems.

*g. Exposure.*

(1) For x-ray or gamma radiation in air, the sum of the electrical charges of all of the ions of one sign produced in air when all electrons liberated by photons in a suitably small element of volume of air are completely stopped in air, divided by the mass of the air in the volume element. It is commonly expressed in roentgens.

(2) The incidence of radiation on living or inanimate material by accident or intent.

*h. High radiation area.* Any area, accessible to personnel, in which there exists radiation at such levels that a major portion of the body could receive in any 1 hour a dose equivalent in excess of 100 millirem.

*i. Ionizing radiation.* Electromagnetic or particulate radiation capable of producing ions, directly or indirectly, in its passage through matter. Alpha and beta particles, gamma rays, x-rays, and neutrons are examples of ionizing radiation.

*j. Occasionally exposed individual.* An individual whose work is not normally performed in a controlled area and whose duties do not normally involve exposure to ionizing radiation; however, these individuals may have rea-

son to enter a controlled area in the performance of their duties (messengers, deliverymen, maintenance workers, etc.). (These individuals will not receive an exposure to ionizing radiation in excess of that allowed to any individual in the population at large. See paragraph 6a(6).)

*k. Occupational exposure to ionizing radiation.* Exposure to ionizing radiation that is incurred as a result of an individual's employment or duties, which are in direct support of the use of radioactive materials or equipment, capable of producing ionizing radiation. Occupational exposure will not be deemed to include the exposure of an individual to sources of ionizing radiation for the purpose of medical or dental diagnosis or therapy of that individual.

*l. Occupationally exposed individual.* An individual whose work is performed in a controlled area and whose duties might involve exposure to ionizing radiation. The term "occupationally exposed individual" is synonymous with the term "radiation worker."

*m. Radiation area.* Any area, accessible to personnel, in which there exists radiation at such levels that a major portion of the body could receive in any 1 hour a dose equivalent in excess of 2 millirem or in any 5 consecutive days a dose equivalent in excess of 100 millirem.

*n. Radiation sources.* Materials, equipment, or devices which generate or are capable of generating ionizing radiation, including naturally occurring and accelerator produced radioactive materials; byproduct materials; source materials; special nuclear materials; fission products; materials containing induced or deposited radioactivity; nuclear reactors; radiographic and fluoroscopic equipment; particle generators and accelerators; klystron, magnetron, rectifier, cold-cathode tubes, and other electron tubes operating above 10 kV; x-ray diffraction and spectrographic equipment; electron microscopes; and electron-beam welding and melting devices.

*o. Radiation work permit.* A locally developed form which is completed prior to the start

of any work that is to be performed in a controlled area and describes the potential radiation hazards and protective equipment requirements for a given job. It should also provide a running record of radiation exposures received during a given job.

*p. Radiation worker.* The term "radiation worker" is synonymous with the term "occupationally exposed individual." A radiation worker is an individual who might be exposed to more than 10 percent of the basic radiation protection standards as established in paragraph 6a(1), (2), (3), (4), and (5) of this regulation as a result of his employment or duties in a controlled area.

*q. Radiological protection officer.* An individual designated by the commander to provide consultation and advice on the degree of hazards associated with radiation and the effectiveness of measures to control these hazards. In addition, he is tasked with the supervision of the radiation protection program. This individual will be technically qualified by virtue of education, training, and professional experience to assure a capability commensurate with the assignment. (The term "Radiological protection officer" is not intended to denote a commissioned status.)

*r. Rem.* The dose equivalent (H) in rems is numerically equal to the absorbed dose (D) in rads, multiplied by the quality factor (Q), and any other necessary modifying factors (N). *Rem:* A unit of dose equivalent ( $H=DQN$ ). (1 rem =  $10^{-7}$  joule per kilogram equals 100 ergs per gram.)

*s. Roentgen.* A unit of exposure. (1R =  $2.58 \times 10^{-4}$  coulomb per kilogram equals  $7.7 \times 10^5$  electrostatic units per gram.)

*t. Units of roentgen, rad, and rem.* For practical application of this regulation, the exposure of 1 roentgen of gamma radiation, is equal to an absorbed dose of 1 rad and a dose equivalent of 1 rem. The dose equivalent for protons, neutrons, beta, and other particles is the absorbed dose in rads multiplied by the quality factor and the appropriate modifying factors. (The product of all modifying factors (N) is

assigned a value of 1 for all irradiations by external sources.) The quality factor for beta, gamma, and x-rays is 1. For alpha particles and neutrons of unknown energies and for protons having energies up to 10 MeV, a quality factor of 10 will be used. Where more exact definitions are required, those provided in International Commission on Radiation Units and Measurements (ICRU) Report No. 19, Radiation Quantities and Units, and Supplement to ICRU Report No. 19, Dose Equivalent, will be used.

*u. User.* An individual assigned to an activity, section, division, or other organizational unit which has been delegated the responsibility for the use, operation, or storage of radiation sources.

**4. Responsibilities.** *a.* The Surgeon General's (TSG) responsibilities are delineated in AR 10-5. Additionally, TSG will—

(1) Approve alternate radiation protection standards which are less restrictive than those prescribed in paragraph 6a.

(2) Provide a copy of the results of investigations concerning the alleged overexposure of individuals, including appropriate recommendations to the Army depot furnishing the photodosimetry service (SB 11-206).

*b.* The US Army Materiel Command's (AMC) responsibilities are delineated in AR 10-11. Additionally, AMC will—

(1) Provide the film holder and film packet for the Army in accordance with SB 11-206.

(2) Establish a repository for the external ionizing radiation exposure history for each individual who is issued a film badge within DA and DSA.

*c.* DSA Headquarters (DSAH-KH) will be responsible for—

(1) Approving alternate radiation protection standards which are less restrictive than those prescribed in paragraph 6a.

(2) Providing a copy of the results of investigations concerning the alleged overexposure of individuals, including appropriate recommendations, to the Army depot furnishing the photodosimetry service (SB 11-206).

*d. Commander of an installation or activity—*

(1) Which possesses or uses a radiation source or sources, is responsible for insuring that measures are established to control ionizing radiation from such sources so that the radiation dose equivalent to individuals under his command or within his jurisdiction will be as low as practicable. He will also insure that the necessary monitoring of exposures of personnel is conducted and that the amount of such exposures is recorded as herein prescribed.

(2) Where there are operations involving exposure to radiation sources for purposes of research and development, repair and maintenance, storage, calibration, industrial radiography, medical and dental diagnosis, or medical therapy, will appoint on orders a radiological protection officer and an alternate to advise on the control of the hazards to health and safety from the radioactive materials or radiation-producing devices being used and to supervise the radiation protection program. If the assignment as radiological protection officer is an additional duty, then this assignment should be given priority over other functions to be performed by that person.

(3) Which possesses radioactive material under an NRC license or DA Authorization, will appoint on orders an Ionizing Radiation Control Committee (unless otherwise specifically exempt) to review proposals for the use of ionizing radiation sources and to make recommendations to the commander concerning the protective measures to be taken. This committee will include: (a) the radiological protection officer; (b) a representative of the staff medical officer; (c) a representative of the safety officer; and (d) other persons as deemed necessary. The committee described herein will not exercise the functions of a clinical board, nor will this committee exercise any function in nuclear reactor or weapons programs, which are administered by DA or DSA under the provisions of the applicable Army/Agency directives.

(4) Should establish procedures for the centralized issue and control of dosimetric devices.

(5) Will provide adequate resources to

implement an effective radiation protection program in accordance with applicable Federal directives.

(6) Will insure that all individuals working in or frequenting a radiation controlled area are informed of the occurrence of radioactive materials or equipment capable of producing ionizing radiation. These individuals will be instructed in the safety precautions and procedures necessary to minimize their exposure. The extent of these instructions will be commensurate with the potential radiological health protection problem in the radiation controlled area (10 CFR 19.12 and 29 CFR 1910.96).

5. **Medical Surveillance.** *a.* Preplacement and termination medical and ophthalmological examinations will be given to all radiation workers. This examination should include a review of prior occupational exposure and a description of any unusual exposure resulting from previous occupations, accidents incidents, or therapeutic procedures, for the purpose of evaluating the individual's acceptability into the occupational program. Base-line blood counts (white cell with differential and hemoglobin) should be performed. For more information concerning medical examinations, see AR 40-501, Standards of Medical Fitness, for DA organizations; and DSAR 1000.7, DSA Occupational Health Program, for DSA organizations.

*b.* Periodic medical and ophthalmological examinations for military and civilian personnel will be performed at times and periods designated by the medical commander or staff medical officer. These medical examinations will be scheduled commensurate with potential radiation hazards, but at least once every 3 years. For DA, see AR 40-501 and DSA, see DSAR 1000.7.

*c.* If an individual is suspected of having been overexposed to ionizing radiation, he will be referred to a physician for such examination as determined by the local medical authority. This examination will include those tests which are deemed necessary by the medical com-

mander or staff medical officer to evaluate any injuries received or treatment necessary.

d. A reported overexposure to ionizing radiation does not necessarily indicate the need for a physical examination. The background related to this reported overexposure must be evaluated to determine the need for such an examination and the tests necessary for proper evaluation. Factors to be considered are total reported dose; type and energy of ionizing radiation; whole-body exposure; length of wearing period for dosimetric device used to measure this radiation; and other appropriate factors. For DA, see AR 40-5.

6. Radiation protection standards. Every effort will be made to maintain the radiation dose equivalent as far below the following radiation protection standards as practicable. It is not desirable to maintain the highest radiation doses to individuals to some fraction of the radiation protection standards if this involves exposing additional personnel and significantly increases the sum of radiation doses received by all involved individuals. Positive efforts will be carried out to fulfill these objectives and determination of necessity will be weighed against the benefits to be expected.

a. Basic radiation protection standards adopted by DA and DSA for the control of occupational exposures to ionizing radiation include—

(1) The accumulated dose equivalent of radiation to the whole-body, head and trunk, active blood-forming organs, gonads, or lens of the eye will not exceed—

(a) 1.25 rems in any calendar quarter,  
nor

(b) 5 rems in any 1 calendar year.

(2) The accumulated dose equivalent of radiation to the skin of the whole-body (other than hands and forearms), cornea of the eye, and bone will not exceed—

(a) 7.50 rems in any calendar quarter,  
nor

(b) 30 rems in any 1 calendar year.

(3) The accumulated dose equivalent of

radiation to the hands and wrists or the feet and ankles will not exceed—

(a) 18.75 rems in any calendar quarter,  
nor

(b) 75 rems in any 1 calendar year.

(4) The accumulated dose equivalent of radiation to the forearms will not exceed—

(a) 10 rems in any calendar quarter,  
nor

(b) 30 rems in any 1 calendar year.

(5) The accumulated dose equivalent of radiation to the thyroid, other organs, tissues, and organ system will not exceed—

(a) 5 rems in any calendar quarter, nor

(b) 15 rems in any 1 calendar year.

(6) Individual(s) under 18 years of age, females known to be pregnant, and occasionally exposed individual(s) will not be exposed to a whole-body dose equivalent of more than—

(a) 2 millirems in any 1 hour, nor

(b) 100 millirems in any 7 consecutive days, nor

(c) 500 millirems in any 1 calendar year.

(d) nor more than 10 percent of the values in (2), (3), (4), and (5) above, for other areas of the body.

(7) Individuals over 18 years of age, but who have not yet reached their 19th birthday, may be occupationally exposed to ionizing radiation provided that they do not exceed 1.25 rems dose equivalent to the whole-body in any calendar quarter, nor 3 rems in the 12 consecutive months prior to their 19th birthday.

b. It is the responsibility of the female employee to advise her employer of the fact that she is pregnant.

c. Radiation protection standards adopted by DA and DSA for the control of planned occupational exposures to ionizing radiation under emergency situations include—

(1) *Life saving*—this applies to search for and removal of seriously injured persons, or entry to prevent conditions that would probably injure a number of people.

(a) The accumulated dose equivalent of radiation to the whole-body should not exceed 100 rems.

(b) The accumulated total dose equivalent of radiation to the hands and forearms should not exceed 300 rems.

(2) *Less severe*—this applies when it is desirable to enter a hazardous area to protect property, minimize the release of effluents, or to control fires.

(a) The accumulated dose equivalent of radiation to the whole-body should not exceed 25 rems.

(b) The accumulated total dose equivalent of radiation to the hands and forearms should not exceed 100 rems.

d. Radiation protection standards adopted by DA and DSA for the control of nonoccupational exposures to ionizing radiation include limiting the use of sources of ionizing radiation such that—

(1) The accumulated dose equivalent of radiation to the whole-body for an individual in the general population (exclusive of natural background and medical and dental exposures) will not exceed 0.5 rems in any 1 calendar year.

(2) The accumulated dose equivalent of radiation to the whole-body for the population as a whole from all sources of ionizing radiation (exclusive of natural background and medical and dental exposures) will not exceed a yearly average of 0.170 rems per person.

e. Alternate radiation protection standards, less restrictive than those prescribed in paragraph 6a above, may be used in special circumstances, when approved by The Surgeon General (DASG-HCH) or DSA Headquarters (DSAH-KH).

(1) Proposals for the use of alternate standards will contain complete justification and will describe the procedures by which the alternate standards will be implemented.

(2) Alternate radiation protection standards will not be considered for individuals under 19 years of age, females known to be pregnant, occasionally exposed individuals, or nonoccupational exposure to ionizing radiation.

7. **Personnel monitoring.** a. An appropriate personnel monitoring device will be used to moni-

tor the exposure of each individual who is occupationally exposed to sources of ionizing radiation or those who periodically enter a controlled area (occasionally exposed individual) and are likely to receive an accumulated dose equivalent of radiation in excess of 10 percent of the applicable quarterly basic radiation protection standard as specified in paragraph 6a(1), (2), (3), (4), (5) and (6) above. Consideration will be taken of all other occupational exposures the individual may receive during that quarter. The monitoring of personnel who work only with soft beta emitters (tritium, carbon-14, calcium-45, and sulfur-35) will be as prescribed by the radiological protection officer.

b. An appropriate personnel monitoring device will be used to monitor the exposure of each individual under 18 years of age who enters a radiation controlled area under such circumstances that he or she receives, or is likely to receive, an accumulated dose equivalent of radiation in excess of 5 percent of the applicable quarterly basic radiation protection standard as specified in paragraph 6a(1), (2), (3), (4), and (5) above.

c. An appropriate personnel monitoring device and either a pocket chamber, a self-reading pocket dosimeter, or thermoluminescent dosimeter will be used, in close proximity, to monitor the whole-body exposure of each individual who enters a high radiation area.

d. Commanders of installations or activities under the jurisdiction of DA and DSA, will appoint, on orders, an individual to be responsible for preparing and maintaining the exposure records (DD Form 1141). This individual may be the custodian of the health records, the custodian of the civilian employee medical files, the individual who prepares the photodosimetry report and who normally controls the issuance and recovery of the personnel dosimetry devices, or the radiological protection officer. This individual will post these records in accordance with instructions on the reverse side of the DD Form 1141, Record of Occupational Exposure to Ionizing Radiation, at least once each calendar quarter. The results of each wearing

period for the personnel dosimetry device will be posted on this record. The wearing period should not exceed 1 month for DA and DSA personnel.

e. The Commander need not furnish reports of zero exposure to monitored visitors, unless requested by the visitor or the custodian of his health record or the custodian of the civilian employee medical file.

f. When a DA or DSA employee or a member of DA or DSA governed by this regulation is exposed to ionizing radiation at an installation outside the jurisdiction of DA or DSA, the employee will ensure that the required exposure information is furnished to the individual responsible for maintaining his DD Form 1141.

g. The separate requirements of DA and DSA with respect to personnel dosimetry are as follows:

(1) *Department of the Army.* The primary dosimetry device will be the film badge, except for field radiography in combat or simulated combat conditions when the low energy direct reading personnel dosimeter (0-200 mR range) has been designated by the command surgeon as the primary device to be worn by personnel occupationally exposed to x-rays. The photodosimetry service for Army installations and activities is provided for by SB 11-206, Film Badge (Photodosimetry) Supply and Service for Technical Radiation Exposure Control; and this service will be employed solely for photodosimetry, except in unusual circumstances as approved by the Commander, USAMC. This requirement in no way precludes the use of supplemental or additional personnel monitoring devices when the particular operation makes such use desirable.

(2) *Defense Supply Agency.* The primary dosimetric device will be the film badge. All DSA field activities will use the Film Badge Service provided by the US Army, as outlined in Department of the Army Supply Bulletin (SB 11-206), except for those DSA activities that have tenant status at a military installation, activity, or base with a film badge program, where they will be included in that pro-

gram. This service will be employed solely for photodosimetry, except in unusual circumstances as approved in DSA Headquarters (DSAH-KH). This requirement in no way precludes the use of supplemental or additional personnel monitoring devices when the particular operation makes such use desirable.

8. How film badge is worn. a. In routine situations in which monitoring of external whole-body radiation exposure is the critical assessment, the film badge will be worn below the shoulders, above the hips, and on the outside of clothing. In relation to the film badge clip, the film badge window must face outward from the body.

b. When a lead apron or similar protective garment (c and d below) is worn during ionizing radiation exposure, the film badge will be worn on the outside of the basic clothing, but beneath the protective garment.

c. In certain situations, such as fluoroscopy, it may be desirable to measure localized exposure to ionizing radiation, e.g., exposure of the head and neck, hands, or forearms. In these cases, multiple film badges will be worn in such location and manner as to permit assessment of the localized exposure. This assessment will be in addition to, but never in lieu of, routine film badge procedures, i.e., assessment of whole-body exposure. An individual's regular whole-body film badge will never be used on other areas of the body during any given reporting period. Conversely, a regular film badge, used to record a specific localized exposure, will never be used to record exposures at other body sites unless the film packets are changed. See paragraph 10d for recording procedures.

d. The wrist badge will be worn when an individual is likely to receive 10 percent of the radiation protection standard in paragraph 6a(4). When a wrist badge is worn, it will be worn on the wrist which is closest to the radiation source. Consideration will be given to proper orientation of the wrist badge in relation to the radiation source.

e. Personnel who may be exposed to ionizir

radiation at other installations or activities may wear film badges issued for that purpose by the radiological protection officer at their duty station, in addition to the film badge(s) that may be provided by that installation or activity being visited; however, only the highest value will be recorded.

**9. Care and handling of dosimeter film and film badges.** *a.* When not being worn, film badges will be stored in a designated area located conveniently close to, but outside of, the controlled area. The control film badge for this controlled area will be stored in the same location. To assure that each individual wears only his own badge, film packet holders will contain some individual identification. Under no circumstances will the film badge holder be permanently inscribed with a name, number, or other identifying device. The recommended procedure is to type the individual's name on an embossing tape or on a small square of paper and attach it to the front or back of the film badge holder with transparent tape. The small window on the front of the film badge will never be covered with tape or any part of an identification device.

*b.* Upon leaving the controlled area at the end of the work day or upon leaving the installation or activity, the individual will remove his film badge and place it in the specific storage area designated by the radiological protection officer.

*c.* Stocks of unissued dosimeter film should be stored at temperatures below 70°F and preferably between 35°F and 46°F. Film packets should never be subjected to physical stress. Physical stress could result in sensitization of the film. The storage area for unissued film will be as remote from ionizing radiation sources as is practical. Further, this storage area will never be in close proximity to chemical fumes, since certain chemicals, such as mercury and formaldehyde, can cause fogging or sensitization, which will result in premature expiration of the film.

**10. Recording procedures.** The DD Form 1141 will be prepared and maintained on each per-

son occupationally exposed to ionizing radiation. The DD Form 1141 may be prepared and maintained by an individual other than the custodian of the health records or custodian of the civilian employee medical files (see para 7d above). When the DD Form 1141 is maintained separately from the health record or civilian employee medical file, a locator card will be placed in each record by the custodian of these records. (AR 40-403).

*a.* When the DD Forms 1141 are prepared by an individual other than the custodian of the health record or custodian of the civilian employee medical file, it will be the responsibility of this individual to advise the custodian of this fact and furnish the locator card.

*b.* Upon transfer, if the DOD Form 1141 is not present in the individual's health record or civilian employee medical file, then the custodian of the health record or civilian employee medical file is required to write to the installation or activity identified on the locator card and request that the DD Form 1141 be forwarded for inclusion into the individual's health record or civilian employee medical file.

*c.* In the initial preparation of a DD Form 1141, reasonable efforts will be made to obtain complete reports of all previous occupational exposure based on recorded personnel dosimetry. DD Form 1952, Film Badge Application and Record of Occupational Radiation Exposure, will be used to record the occupational exposure history information and relevant health physics information. For each period in which the individual was engaged in activities where occupational exposure thereof. In cases where the individual was potentially exposed to ionizing radiation at more than one facility, the cumulative exposures will be calculated and recorded in items 7 through 12 of DD Form 1141, as appropriate. The sum of these whole-body exposures will be entered in item 13 of DD Form 1141 and a statement regarding the source of this information will be entered in item 16 of DD Form 1141, REMARKS. If there were no previous occupational exposures, the statement "no previous

occupational exposure" will be entered on the first line of the DD Form 1141.

d. Separate DD Forms 1141 will be maintained to record exposures other than whole-body or skin of the whole-body, with appropriate descriptions under item 16 of DD Form 1141, REMARKS, i.e., thyroid, head and neck, wrist, forearm, etc. These forms will be cross-referenced with the whole-body record. Results of bioassay and in vivo counting are considered as laboratory studies and are filed accordingly in the individual's health record or civilian employee medical file. Reference to such studies will be entered under item 16 of DD Form 1141, REMARKS (AR 40-403). The DD Form 1141 may be used to record the results of bioassays, e.g., total activity in organ, concentration in a biological specimen, or internal dose.

e. A sample DD Form 1141 is provided in figure 1 as guidance for the proper posting and maintenance of a whole-body record. Also, a sample DD Form 1141 is provided in figure 2 as guidance for the proper posting and maintenance of a wrist badge record.

f. When radiation work permits are used, exposures received should be recorded on the permits. For DA, these records will be retained in accordance with AR 340-18-6.

#### 11. Retention and disposition of DD Form 1141.

a. The DD Form 1141 is a permanent component of the individual's health record or civilian employee medical file and will not be used for other purposes. All previous copies of this form will be retained in the individual's health record or civilian employee medical file. Commanders will authorize inspecting officials or supervisors of persons occupationally exposed to ionizing radiation and the individual concerned to review his form. If this form is being maintained in the health record or civilian employee medical file of the individual concerned, the custodian will withdraw the DD Form 1141 from the health record or civilian employee medical file for review by the individuals indicated above. The entire health record or civilian employee medical file will not be

available for review by the individuals indicated above (AR 40-42, AR 40-403, AR 50-5, AR 340-1, and AR 340-17).

b. When a civilian employee of the DA or DSA is not included in a Federal civilian employee health service, a DD Form 1141 will be maintained as a permanent document in his SF 66, Official Personnel Folder. The DD Form 1141 will be subject to review by authorized inspecting officials.

c. The DD Form 1141 will be retained in the health record of any member retired from DA or DSA who has been occupationally exposed to ionizing radiation during his service. Disposition of DD Form 1141 for retired or separated civilian personnel will be made in accordance with governing civilian personnel directives.

d. If any member of DA or DSA is released from active duty or if a civilian employee terminates employment with these agencies, he will, upon request, be furnished the appropriate information concerning his radiation exposure history. This information will be requested from the radiological protection officer at employee's last duty station in accordance with 14 below.

e. The disposition of "stray" DD Forms 1141 for military personnel will be in accordance with AR 40-403.

12. Control procedures. The radiological protection officer will review and evaluate, at intervals not to exceed a calendar quarter, DD Forms 1141 of each individual engaged in duties involving occupational exposure to ionizing radiation. The radiological protection officer will establish procedures to inform and advise the cognizant commander and medical officer when action is necessary to limit an individual's exposure to ionizing radiation. When an individual is reassigned or terminates his employment at an installation or activity, the custodian of the health record or the custodian of the civilian employee medical file will determine if the individual has a DD Form 1141 or a locator card in his health record or civilian employee medical file (AR 40-403).

a. When an individual has received a dose equivalent of ionizing radiation in an amount exceeding the radiation protection standards in paragraph 6a, or bioassay results indicate excessive internal exposure, the individual will be removed from duties involving occupational exposure to ionizing radiation until subsequent exposure limitations are established (AR 40-5). When an individual has received an accumulated dose equivalent of ionizing radiation in excess of 5(N-18) rems, where "N" equals the individual's age in years at his last birthday, the individual will be removed from duties involving occupational exposure to ionizing radiation until the individual's exposure record has been evaluated by The Surgeon General (DASG-HCH) or by DSA Headquarters (DSAH-KH) and subsequent exposure limitations are established.

b. Reports of overexposures to ionizing radiation, as defined by The Surgeon General (DASG-HCH) or DSA Headquarters (DSAH-KH), will be made in accordance with applicable directives (AR 40-5 and AR 385-40). All abnormal exposures or overexposures to ionizing radiation will be investigated (AR 40-5).

c. When an individual has lost, failed to return, damaged beyond usefulness, or otherwise rendered his primary dosimetric device in a fashion which precludes determination of his dose equivalent for the wearing period, the individual will be assigned an administrative dose for each month during the period in question. There are several methods which can be employed when determining the administrative dose:

- (1) Calculate the individual's exposure based on occupancy information and exposure levels.
- (2) Assign 00.416 rem for each month during the period in question. This value is based on an averaging of 5 rem over 12 months for whole-body dose equivalents.
- (3) Assign dose from supplemental monitoring device, if such was worn during this period.

The method of determining the administrative dose will be annotated in the REMARKS Sec-

tion of the DD Form 1141 and the form will also be annotated to indicate an "administrative dose."

13. Personnel radiation exposure, RCS NRC-1007. a. These required reports apply to NRC licensees conducting industrial type activities which involve the handling of substantial quantities of radioactive material (10 CFR 20.407 and 20.408). The categories are as follows:

(1) Operators of Army nuclear reactors designed to produce electrical or heat energy, research and testing facilities—normally incorporated into annual operating report in accordance with requirements of AR 385-80;

(2) Installations or activities that use or possess byproduct materials for radiographic purposes;

(3) Installations or activities that possess or use at any one time, for the purpose of fuel processing, fabrication, or reprocessing, special nuclear material in a quantity exceeding 5,000 grams of contained uranium-235, uranium-233, or plutonium or any combination thereof;

(4) Installations or activities that possess or use at any one time, for processing or manufacturing for distribution, pursuant to 10 CFR, Parts 30, 32 or 33, byproduct material in quantities exceeding any one of the following amounts:

Radionuclide	Quantity in Curies
Cesium-137 .....	1
Cobalt-60 .....	1
Gold-198 .....	100
Iodine-131 .....	1
Iridium-192 .....	10
Krypton-85 .....	1,000
Promethium-147 .....	10
Technetium-99m .....	1,000

b. Each licensee described above will, within the first quarter of each calendar year, submit a report (Personnel Radiation Exposure RCS NRC-1007) for the previous calendar year to The US Nuclear Regulatory Commission, Wash, DC 20555. Department of the Army licensee will forward information copies to HQDA (DASG-HCH-E), WASH DC 20310.

c. The report indicated in paragraph 13b above will contain the following information:

(1) Either the total number of individuals for whom personnel monitoring was required or the total number for whom personnel monitoring was furnished during the calendar year, provided that such totals include at least the number of individuals required to wear personnel monitoring devices.

(2) A statistical summary report of personnel monitoring information recorded for individuals for whom personnel monitoring was either required or provided pursuant to this paragraph, indicating the number of individuals whose total whole-body exposure recorded during the previous calendar year was in each of the following dose equivalent ranges:

Estimated Whole-body dose equivalent range (rems)	Number of individuals
No measurable	.....
Measurable less than 0.10	.....
0.10 to 0.25	.....
0.25 to 0.50	.....
0.50 to 1.00	.....
1.00 to 2.00	.....
2.00 to 3.00	.....
3.00 to 4.00	.....
4.00 to 5.00	.....
5.00 to 6.00	.....
6.00 to 7.00	.....
7.00 to 8.00	.....
8.00 to 9.00	.....
9.00 to 10.00	.....
10.00 to 11.00	.....
11.00 to 12.00	.....
greater than 12.00	.....

Note: Individual values exactly equal to the values separating dose equivalent range will be reported in the next higher range.

d. When an individual terminates employment with a licensee or an individual assigned to work in a licensee's facility, described in paragraph 13a above, the licensee will furnish to the US Nuclear Regulatory Commission, Washington, DC 20555, a report of the individual's exposure to radiation and radioactive materials, incurred during the period of employment or work assignment in the licensee's facility. Copies of these reports will be forwarded to HQDA (DASG-HCH) WASH DC

20314. Such report will be furnished within 30 days after exposure of the individual has been determined or 90 days after the date of termination of employment or work assignment, whichever is earlier. A copy of this report will also be provided the individual concerned.

14. Report of personnel exposure on termination of employment or work. When an individual terminates employment at an installation or activity where he has been occupationally exposed to ionizing radiation, the radiological protection officer will, upon request of the former employee, provide a report of the former employee's exposure to ionizing radiation as shown in the records maintained by the installation or activity. Such reports will be furnished within 30 days from the time the request is made and will cover each quarter of the individual's employment involving exposure to ionizing radiation or such lesser period as may be requested by the employee. The report will also include the results of any calculations and analyses of radioactive material deposited in the body of the employee. The former employee's request will include appropriate identifying data, such as Social Security Number and dates of employment. The report will be in writing and contain either of the following statements.

a. For a licensee (10 CFR 19.13): "This report is furnished to you under the provisions of Nuclear Regulatory Commission Regulations (10 CFR, Part 19). You will preserve this report for future reference."

b. For others (29 CFR 1910.96): "This report is furnished to you under the provision of the Department of Labor Regulations (29 CFR, Part 1910). You will preserve this report for future reference."

15. Supply of forms. DD Form 1141 and DD Form 1952 will be available through normal supply channels.

Figure 1. Sample DD Form 1141, For Whole-Body Exposure.

May 20 1975

INSTRUCTIONS FOR PREPARATION OF DD FORM 1141

ITEM

1. Enter file, service, badge, check, or clock number by which individual is currently identified.
2. Enter last name, first name, and middle initial. If the combination of last name and first name exceeds 19 spaces, enter last name and initials only.
3. Enter Social Security number.
4. Enter in not more than 10 spaces, rank, rate, grade, title or position that the individual is currently holding. Use standard service abbreviations, e. g., CAPT; MC; HMCS; HM1; SSGT; LCPL, etc. Abbreviate civilian occupation titles as necessary, e. g., Radiological Physicist to Rad Physic; Radiation Physiologist to Rd Physiol; Electrical Welder to Elec Wldr; etc.
5. Enter date of birth by day, month, and year, e. g., 21 Sep 1918.
6. Enter name of activity or unit.
- 7 and 8. "Period of Exposure." Enter the day, month, and year, e. g., 1 Oct 62.
7. Enter the day, month, and year exposure period began.
8. Enter day, month, and year exposure period ended.
- 9 through 12. "Dose This Period." Enter radiation dose received this period to three decimal places, e. g., 02.345 rem. All entries shall be made using five digits including zeros as necessary.
9. Enter skin dose (*soft*) which includes low energy gamma and x-ray of less than 20 KEV effective energy and beta radiation. Total skin dose is the visual addition of columns 9 and 12.
10. Enter gamma and x-ray dose greater than 20 KEV effective energy in rem.
11. Enter Neutron dose in rem.
12. Enter sum of items 10 and 11.
13. Add item 12 to previous item 13; enter total in item 13.
14. Enter permissible dose calculated from the age formula  $5(N-18)$  rem, where N equals the present age in years.
15. Recorder certify entries by initialing.
16. Enter other pertinent information such as known exposure from internally deposited radioactive material or from any external radioactive sources. Describe briefly any activity or assignment bearing a potential for exposure and estimate dose-time relationships, if feasible. If this form is used for other than whole body and skin of whole body, specify the use: i. e., hands and forearms, feet and ankles, thyroid, etc. When recorded dose is not obtained from film badge readings, specify whether estimates were obtained from pocket dosimeters, area or air monitoring, bioassay, etc.

NOTE:

*This record is required on all individuals who are employed by or are members of the Armed Forces and who have been or are being occupationally exposed to ionizing radiation. It shall be the responsibility of each activity of the Department of Defense having personnel so exposed to initiate and maintain this record in accordance with AR 40-14/EUMEDINST 6150.13 series/AFR 161-8/DSAR 4145.24. (29 Sept. 1966)*

## INSTRUCTIONS FOR PREPARATION OF DD FORM 1141

### ITEM

1. Enter file, service, badge, check, or clock number by which individual is currently identified.
2. Enter last name, first name, and middle initial. If the combination of last name and first name exceeds 19 spaces, enter last name and initials only.
3. Enter Social Security number.
4. Enter in not more than 10 spaces, rank, rate, grade, title or position that the individual is currently holding. Use standard service abbreviations, e. g., CAPT; MC; HMCS; HM1; SSGT; LCPL; etc. Abbreviate civilian occupation titles as necessary; e. g., Radiological Physicist to Rad Physic; Radiation Physiologist to Rd Physiol; Electrical Welder to Elec Wldr; etc.
5. Enter date of birth by day, month, and year, e. g., 21 Sep 1918.
6. Enter name of activity or unit.
- 7 and 8. "Period of Exposure." Enter the day, month, and year, e. g. 1 Oct 62.
7. Enter the day, month, and year exposure period began.
8. Enter day, month, and year exposure period ended.
- 9 through 12. "Dose This Period." Enter radiation dose received this period to three decimal places, e. g., 02.345 rem. All entries shall be made using five digits including zeros as necessary.
9. Enter skin dose (*soft*) which includes low energy gamma and x-ray of less than 20 KEV effective energy and beta radiation. Total skin dose is the visual addition of columns 9 and 12.
10. Enter gamma and x-ray dose greater than 20 KEV effective energy in rem.
11. Enter Neutron dose in rem.
12. Enter sum of items 10 and 11.
13. Add item 12 to previous item 13; enter total in item 13.
14. Enter permissible dose calculated from the age formula  $5(N-18)$  rem, where N equals the present age in years.
15. Recorder certify entries by initialling.
16. Enter other pertinent information such as known exposure from internally deposited radioactive material or from any external radioactive sources. Describe briefly any activity or assignment bearing a potential for exposure and estimate dose-time relationships, if feasible. If this form is used for other than whole body and skin of whole body, specify the use: i. e., hands and forearms, feet and ankles, thyroid, etc. When recorded dose is not obtained from film badge readings, specify whether estimates were obtained from pocket dosimeters, area or air monitoring, bioassay, etc.

### NOTE:

*This record is required on all individuals who are employed by or are members of the Armed Forces and who have been or are being occupationally exposed to ionizing radiation. It shall be the responsibility of each activity of the Department of Defense having personnel so exposed to initiate and maintain this record in accordance with AR 40-14/BUMEDINST 6150.18 series/AFR 161-8/DSAR 4145.24. (29 Sept. 1966)*

## FILM BADGE APPLICATION AND RECORD OF OCCUPATIONAL RADIATION EXPOSURE

*Print legibly or type all information requested. Use reverse if required.*

FULL NAME (Last, First, Middle)		2. DATE OF BIRTH (Yr, Mo, Day)	3. SOCIAL SECURITY NO
4. DUTY SECTION (Dept., Ward, Unit, etc.)			5. DUTY PHONE
6. GRADE/RANK		7. HAVE YOU WORN A FILM BADGE ISSUED BY THIS COMMAND IN THE PAST	
CIVILIAN	MILITARY	<input type="checkbox"/> YES <input type="checkbox"/> NO	
8. DATE OF RADIATION PHYSICAL			
9. DUTY STATUS			
<input type="checkbox"/> PERMANENT <input type="checkbox"/> TRANSIENT 6 WEEKS OR LESS (If transient, show mailing address of location of health records)

\_\_\_\_\_  
(Date)

**INSTRUCTIONS FOR PREPARATION OF PHOTODOSIMETRY REPORT (DA FORM 3484)**

(NOTE: SUBMIT IN TRIPLICATE. PLEASE PRINT OR TYPE ALL INFORMATION.)

- ITEM 1. Enter name, address, and office symbol of using installation.
- ITEM 2. Enter the address code which has been assigned to the using installation by either Lexington Blue Grass or Sacramento Army Depot. The address code is a two or three letter code which is stenciled at the top of each film packet.
- ITEM 3. Enter the wearing period code. The wearing period code is either a capital or lower case single letter, stenciled at the top of each film packet.
- ITEM 4. Enter the day, month, and year the films were returned either to Lexington Blue Grass or Sacramento Army Depot for processing.
- ITEM 5. Enter the dates during which the films were used.
- ITEM 6. Enter the name, grade, and Social Security Account Number of each individual using a film.
- ITEM 7. Enter the three digit film number exactly as it appears on the upper edge of the film packet which was used by the individual.
- ITEM 8. Enter the type and energy of radiation to which the individual was exposed (e.g., X-Ray - 90 KV, CS-137, Beta and Gamma, .66 Mev Gamma, etc.).

All remaining spaces will be completed by either Lexington Blue Grass or Sacramento Army Depot.

The film packets and Photodosimetry Report should be returned for processing in accordance with SB 11-206. Any films which are unused or not returned should be so marked on the Photodosimetry Report.

Lexington Blue Grass or Sacramento Army Depot will evaluate the films, record the doses in the columns titled "DOSE (rem)", and return the Photodosimetry Report to the user. The dose column titled "SKIN DOSE (soft)" indicates the amount of exposure in rem due to gamma or X Ray of less than 20 KEV effective energy and beta radiation. The dose column titled "GAMMA and X-RAY" gives the amount of exposure in rem due to X or gamma radiation of greater than 20 KEV effective energy. The doses in these two columns may be recorded in the similarly titled columns on the individual's DD Form 1141 (Record of Occupational Exposure to Ionizing Radiation) following the instructions contained on the reverse of DD Form 1141.

## 609 INDIVIDUAL RADIATION PROTECTION FILES

These files result from efforts to minimize the hazards of ionizing radiation to individual personnel.

File No.	Description	Disposition
609-01	User listing files. Documents reflecting the training, experience, and certification of individuals authorized to handle sources of ionizing radiation. They are posted to official personnel files. Included are listings of approved users and their experience and training and similar or related documents.	Destroy 5 years after transfer or separation of the individual concerned.
	[REDACTED] documents related to recording and reporting external exposures of individuals to ionizing radiation. Included are calibration control badge films and all films processed for evaluation, dosimeter logs, consolidated reports of film badge readings, [REDACTED] when not included in medical records, and similar or related documents.	Office performing dosimetry film evaluation service: Processed film indicating abnormal exposure or unusual exposure pattern [REDACTED] Processed film indicating normal exposure: Destroy after 5 years. Offices of the radiological protection officers: [REDACTED] transfer with medical record upon transfer or separation of individual concerned. Other documents: Destroy after 2 years.
★600-03	Film badge control files. Documents reflecting the issue and control of dosimetry film badges. Included are requests for issue and turn-in of badges, documents used to record issues and turn-ins, and similar or related documents.	Destroy after 1 year.
600-04	Personnel bioassay files. Documents related to recording and reporting internal exposures of individuals to radioactive materials. Included are analysis of biological specimens, whole-body counts, and similar or related documents.	Laboratory performing bioassay service: Permanent. Offices of radiological protection officers: Documents required for filing in individual medical records. Permanent. Other documents: Destroy after 2 years.

Aberdeen Proving Ground, MD 21010

1. The revision of System Notice A0609.01aDASG, coordinated with Mrs. Eckels of this office, is forwarded for your concurrence/comments prior to publication in the Federal Register.
2. The revised notice adds the routine use of radiation data by agencies external to the Department of Defense and the maintenance of the centralized automated dosimetry system at the Lexington Blue Grass Depot Activity. Ancillary changes have been made to describe the storage and safeguarding of automated media.
3. Radiation Protection Officer certification files maintained at the US Army Communications and Electronics Materiel Readiness Command have not been included in the revision of A0609.01aDASG because of their incompatibility with the purpose for which personnel dosimetry records are maintained. These records will be addressed as a separate Privacy Act system notification action in coordination with the US Army Materiel Development and Readiness Command.

+ID-MANUAL

A0609.01aDASG

+SYSNAME

\$609.01 Individual Radiation Protection Files

+SECURITY U

+LOCATION

\$Primary System: Army installations which use or store radioactive materials or byproducts.

\$Decentralized Segment: Nucleonics Section, Quality Assurance Division, Lexington Blue Grass Depot Activity, Lexington, KY.

+INDIVIDUAL-CATEGORY

\$All Army personnel, civilian and military, occupationally exposed to hazards of ionizing radiation and occasionally exposed and monitored visitors.

+RECORD-CATEGORY

\$Installation personnel and Radiation Protection Committee files contain documents, DD Form 1952, DD Form 1141, DA Form 3484, exposed dosimetry film, and related papers reflecting the training, experience, and certification of individual radiation workers to handle specific sources of ionizing radiation; summary listings of certified individuals; external exposures to ionizing radiation, including personnel dosimetry results and reports of film badge readings; and internal exposures to radioactive materials, including analysis of biological specimens and whole-body counts.

\$Lexington Blue Grass Depot Activity automated dosimetry file contains data elements reflecting individual name, social security number, film

badge number, coded cross-reference to place of assignment at time of exposure, from-to dates of exposure and radiation dose, cumulative quarterly, annual and life-time dose, type of measuring device, and coded cross-reference to qualifying data regarding exposure readings.

+AUTHORITY

\$10 CFR 35; 10 CFR 20; Title 44 U.S.C., Section 3101; Title 5 U.S.C., Section 301.

+ROUTINE USES

\$To insure individual qualifications to handle radioactive materials; to monitor, evaluate, and control the risks of individual exposures to ionizing radiation or radioactive materials by comparison of both current (short-term) and long-term exposures; to provide radiation data to other Federal agencies, academic institutions, and non-governmental agencies, such as the National Council on Radiation Protection and Measurement and the National Research Council, authorized to conduct radiation research, evaluation, and monitorship.

+STORAGE

\$File folders, film packets, magnetic tape/disk.

+RETRIEVABILITY

\$Filed alphabetically by name; automated data retrievable by name, social security number, or automatic data processing parameters.

+SAFEGUARDS

\$Buildings employ security guards. Records are maintained in areas accessible only to authorized personnel who are properly screened and trained; access to computer operations room is controlled by card key

system, which requires positive identification and authorization.

+RETENTION

\$Certified user listing files: Retained 5 years after reassignment, transfer or separation of individual.

\$Personnel Dosimetry files: Permanent. Processed film indicating normal exposure is retained 5 years after evaluation and recorded on permanent records.

\$Personnel Bioassay files: Permanent medical records.

+SYSMANAGER

\$The Surgeon General, Headquarters, Department of the Army (HQDA), The Pentagon, Washington, DC 20310.

+NOTIFICATION

\$Information may be obtained by written request to:

XHQDA (DASG-AOM)

XRoom 2D453

XThe Pentagon

XWashington, DC 20310

+ACCESS

\$Requests should be addressed to: Office of The Surgeon General, HQDA (DASG-AOM), Room 2D453, The Pentagon, Washington, DC 20310.

\$All requests should be written since files are not stored in HQDA. If telephone conversation is desired, at the expense of the inquirer, area code and telephone number will be furnished.

\$Personal visits by the individual requesting access may be arranged only with the official assigned to respond to a written request.

+CONTEST

\$The Army's rules for contesting content and appealing initial determination may be obtained from the SYSMANAGER.

+SOURCE

\$Monitored individuals and exposed dosimetry film.

+EXEMPTION

\$None.

For use of this form, see AR 310-1, the proponent agency is the US Army Adjutant General Center.

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
13 June 1978 to 14 July 1978

ANNEX B

Las Vegas Nevada Operations Office, Dept of Energy (NVOO)  
Mercury Nevada Test Site, Reynolds Electrical & Engineering Co (REECO)  
Dates of Visit: 25-27 June 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr John Marooney, Department of Energy (NVOO)
- b. Mr William J (Jay) Brady, Senior Health Physicist (REECO)
- c. Mr Robert Friedrich, Bio-medical Technician (REECO)
- d. Miss Sherry Holdaway, Archivist (REECO)

2. BACKGROUND:

a. The Reynolds Electrical & Engineering Company, Inc., is a subsidiary of EG&G, Inc., and has been associated with the Nevada Test Site at Mercury, Nevada since 1952. Gradually expanding its role in the nuclear testing activity in continental United States, it became a prime contractor in 1955. By 1957 it was virtually responsible for the complete operation of the Mercury Test Site including dosimetry. These expanding roles and contracts were administered by the Atomic Energy Commission which maintained its main Nevada offices in Las Vegas. A DOD liaison function was also located with the Nevada Operations Office (NVOO) in Las Vegas. With creation of the Department of Energy both the Las Vegas office and the Mercury Test Site were assigned to the new federal agency.

b. Operators of the Mercury Test Site did not assume general responsibility for radiation exposure dosimetry until 1957 at which date the Desert Rock Exercises effectively ended. Hence, The Reynolds Electrical & Engineering Company, inc., (REECO) played very little role in creation of the general dosimetry records and data which it holds at this time pertaining to the years 1947-1957. For the most part, what little direct dosimetry service that it provided was limited to scientific and contractor personnel, i.e., its own employees or the employees of sub-contractors. The Atomic Energy Commission provided dosimetry service for all participating personnel (DOD included) in Exercises Desert Rock I, II and III ending in 1951. Commencing with Exercise Desert Rock IV in 1952, DOD assumed this function and tasked the Army for its execution.

c. To carry out this function, the Army created the 1st Radiological Safety Support Unit. The organizational structure was provided by the TDA 9778th Technical Support Unit (TSU) of the US Army Chemical Corps School at Fort McClellan, Alabama. A skeleton manning cadre was taken from the 216th Chemical Service Company also from Fort McClellan. Other specialist and technicians were drawn from the Rocky Mountain Arsenal, the 17th Chemical Technical Intelligence Detachment (of the US Army Chemical Center at Edgewood Arsenal, MD), and the 995th Quartermaster Laundry Company of Fort Devens, Massachusetts. Aside from USAF

Lt Colonel Philip S. Gwynn commanding the unit, it has not been possible to determine whether or how many other USAF or USN personnel were committed to the augmented staff of the Radiological Safety Unit. For field exercise purposes, this departure from AEC procedure seems to have been very successful. It processed approximately 65,000 film badge exposure readings and provided the organizational format for the following Desert Rock Exercises V and VI.

d. From the time of its creation in 1951/52 until termination of atmospheric testing in 1958 and subsequent signing of the nuclear test ban treaty with the Soviets, the Radiological Safety Support Unit stayed more or less in continuous existence. During non-exercise periods or when test activity centered in the Pacific, it was reduced to a manned, standby-basis with a personnel complement of one officer and one non-commissioned officer. When continental United States atmospheric testing resumed in Nevada, the 1st RSSU was beefed-up with a full scale complement. For Exercise Desert Rock V (AEC Exercises UPSHOT and KNOTHOLE), e.g., the USA 9778th TSU contributed 26 officers and 144 enlisted men to the RADSAFE Group which was commanded by Colonel Clinton S. Maupin, USA-MC (duty assignment with the Armed Forces Special Weapons Project). USA Chemical Corps Artillery Officer Lt Colonel Tom D. Collison was the Radiological Safety Officer. In addition to the Army complement, this RAD SAFE unit also had 5 USN Officers 5 USN Enlistedmen; 5 USAF Officers, 13 USAF Enlistedmen. It also had an off-site group with a Los Alamos Scientific Laboratory (LASL) civilian in charge of 15 Public Health Officers, 2 other LASL Civilians, one USA Chemical Corps Officer and 10 Enlistedmen.

e. The same organizational and operational pattern was maintained for Exercise Desert Rock VI. Commencing with Exercises Desert Rock VII and VIII, the RAD SAFE Unit was augmented by a team from the Lexington-Bluegrass Signal Depot. This team came equipped with its own vans for processing and recording film badges. The success of this innovation has been previously discussed in ANNEX A. With the exception of Exercises Desert Rock VII and VIII, the film badge processing and dosimetry records created at the Mercury Test Site or in the various tent cities that sprang-up at Camp Desert Rock during exercise periods were left at Mercury and became the basis of the collection which REECO presently holds. Dosimetry hardcopy for DR VII and DR VIII eventually made its way into the files of the Lexington-Bluegrass Signal Depot. However, evidence is strong at this time that it followed a roundabout trail over a period of years from Mercury to Presidio (6th US Army G-3) and finally to Lexington. This, too, tends to support the recollections of several members of various Desert Rock Exercise staffs as to the handling of exercise records. Additional discussion on general administration during and following the various Desert Rock Exercises will be found in ANNEX F (Fort Ord) following.

f. Evidence is strong at this time to indicate that standing records management procedures in effect during the 1950's were not followed. Almost without exception, all other significant exercises involving the United States Army during the decade of the 1950's followed the procedure of retiring exercise records clearly identified as such, e.g., BLUE BOLT, BIG BLAST, SAGEBRUSH, INDIAN RIVER, etc. However, to date we have not been able to find any such central collection dealing with DESERT ROCK. More discussion on possible explanations for this glaring discrepancy in the retired records inventory of the United States Army will be found in ANNEX H (St Louis National Personnel Records Center, Military Organizational Records) following.

h. The only Exercise Desert Rock records which appear to have been generated on-site and to have weathered the ravages of time are the radiation exposure dosimetry records which over the years were left with REECO. Minute examination of REECO's total records inventory failed to reveal any other general or administrative records generated on site by the various participating DOD activities. This examination included the REECO Archives which are maintained at Mercury; retired GOCO (government-owned, contractor-operated) records held in Records Group 430 at the Federal Archives and Records Center-Los Angeles (located at Laguna-Niguel, California); and approximately 188 linear feet of previously retired RG 430 records which REECO had withdrawn from the FARC-Los Angeles within the past year. More discussion on the GOCO records held by the Federal Archives and Records Center-Los Angeles will be found in ANNEX G (FARC Los Angeles at Laguna Niguel) following.

i. As a prime contractor doing business with the federal government, virtually all of REECO's records are technically the property of the federal government regardless of present or past agency of primary jurisdiction. In REECO's case, this has ranged from the Atomic Energy Commission to the Department of Energy with strong Department of Defense collateral interest. The close working relationship between the AEC and DOD during the years 1947-57 produced a commonality of certain record keeping practices which came to be reflected in REECO records. Unfortunately, none of REECO's general administrative, personnel or housekeeping records appear capable of yielding much of the data sought in the current investigation. The REECO Archives are limited to internal matters of site maintenance as are most of the retired materials held by the FARC-Los Angeles. For all of this, REECO has been unsparing in its efforts to further the investigations of the Army as well as other affected DOD activities.

j. The main focus of the Army's investigation and primary objective of the field search are the troop packets which participated in the various Desert Rock Exercises. These complements are identified only as "Composite Unit, 1st Army," "Composite Unit, 2nd Army," etc., in the official after action reports. Presumption is that they were drawn from the total troop resource of each numbered army participating in a given Desert Rock Exercise during the 1950's. To date personnel rosters of these "composite Units" have not been located. A manual search of Morning Reports is impractical, if not impossible, in this case. For this procedure to be productive, we must have the identification of the military units contributing the personnel. We have this information for units which were committed wholly to the exercises from the after action reports; we have no central identification of units which merely contributed varying numbers of troops on a temporary duty basis to the exercises.

k. Institutional memory from a number of quarters including long-time REECO employees maintains that identification of the troops making-up the composite units AND WHO ACTUALLY PARTICIPATED IN THE EXERCISES OR WERE ACTUALLY EXPOSED TO RADIATION can come from another source. The Armed Forces Special Weapons Project (forerunner of the Defense Atomic Support Agency and currently, the Defense Nuclear Agency) exercised overall control of surface movement into and out of the exercise blast areas or radiation zones. Army convoys moving into the test areas after a shot were required to deposit a complete roster of all convoy personnel with the security checkpoints controlling such movement. These rosters were prepared in quintuplicate for various administrative requirements; one complete set was prepared for and presumably preserved by the security officers of the Armed Forces Special Weapons Project (AFSWP, DASA, etc)

Field Command at Sandia Base, Albuquerque, New Mexico. This information was provided by Mr. Jay Brady who was a Security Officer performing these control duties as early as 1952. Unfortunately, none of these rosters have been discovered to date in the retired records of the Armed Forces Special Weapons Project, Field Command, held by the National Archives and Records Service, and presumed to cover the period 1947-71. See ANNEX C (Field Command, Defense Nuclear Agency, Kirtland Air Force Base, Albuquerque, New Mexico) following for further discussion and new archival leads developed along these lines.

### 3. CURRENT SITUATION:

a. REECO responded immediately to DOD requirements for meeting the Nuclear Test Personnel Review (NTPR) Program by withdrawing all known pertinent retired materials from the Federal Archives and Records Center-Los Angeles. Unfortunately, a shipping mishap delayed effective use of this resource for some months. When this collection of some 188 linear feet arrived at Mercury from Laguna Niguel, it was in complete disarray. Faulty palletizing had allowed the shipment to break loose in transit. When the seals were broken on the commercial van containing the withdrawn collection, the van was discovered not to contain 188 FRC boxes of records but one large mass of shifting paper. Some months were then lost in re-arranging and re-ordering the collection in an effort to restore a semblance of its original provenance. While not completely successful in this respect, an acceptable archival order was realized.

b. As soon as archival order had been restored to these materials, REECO commenced a massive microfilming project which was designed to reproduce its entire collection of dosimetry materials, i.e., the 188 linear feet withdrawn from FARC-Los Angeles plus approximately 200 additional feet of REECO held materials. The microform selected for this project was 16mm 3M cassette. At the time of the field search, five cassettes had been completed and distributed in quintuplicate to DOD activities. Work continued on the microfilming as well as a master, hardcopy index to the entire collection. Estimated completion date for the entire project was 1 September 1978. REECO's primary interest in this collection was dosimetry data which might not have been included in its computerized data bank. Personnel lists, per se, lacking dosimetry data, were of no immediate interest to REECO health physicists and technicians. On the otherhand, such lists are almost desperation objectives of the Army's field search. Consequently, close scrutiny of the entire REECO Collection takes high priority in our current investigation.

c. During the course of the visit to the Mercury Test Site some hardcopy previously included in the first five cassettes of the REECO Microfilm was examined directly. This included Boxes No. 11 and No. 12 for the years 1952 and 1953 for Exercises Desert Rock IV (AEC: Tumbler-Snapper) and Desert Rock V (AEC: Upshot-Knothole). Of particular interest was one 141-page document which had been prepared by the 9778th RAD SAFE Support Unit containing approximately 2000-3000 names and purported to be a complete list of DOD personnel participating in Desert Rock V during the spring of 1953. Poor quality of the sole surviving copy made its microfilm virtually unreadable. A combination of photo-offset-Xeroxophy produce usable copies of the document. Also located in this collection was what appeared to be a simple name list of the personnel complement of the 369th Amphibious Engineer Regiment (and its support elements) from Fort Worden, Washington. This list did not contain military ranks or

serial/social security numbers, but appeared to be a complete listing of the personnel complement which moved as a unit from Fort Worden (on Washington's Puget Sound) to Camp Desert Rock for the 1952 Exercise. Copies of both documents along with other personnel lists were dispatched via registered mail from Mercury to Washington for key-stroking into the NTPR data bank.

d. Another genre of intriguing documents found in the REECO hardcopy collection was tri-service lists of names arranged in annual blocks, i.e., 1951, 1952, 1953, etc., and seemingly identifying troop participation in the entire AEC series of tests. The only captions appearing on what obviously were computer produced lists were "USAF ADP Project 1952, 1953, etc." First impression was that these lists might have been developed from raw data or hardcopy not readily recognized as existing in the REECO Archives or previously retired records. Subsequent exploration of this possibility with REECO Senior Health Physicist Jay Brady and USAF NTPR Project Manager Lt Colonel George S Kush revealed, however, that these lists were merely early products of the REECO computerized dosimetry data base. The USAF designation was in deference to the source of original funding to commence computerization of the REECO data. USAF provided this funding largely in keeping with its overriding role in the Air-drop aspects of the continental tests. Because of surface vessel involvement, the US Navy has taken the primary lead in the Pacific tests.

e. Divergent US Air Force and US Navy interests in the various test exercises also produced a split in contractor involvement. The AFSWP partnership came into existence in 1947 as a working accord between the Secretary of War and the Chief of Naval Operations. From this arrangement, REECO became the land-based prime contractor for continental tests; Narver and Holmes, Inc., became the prime contractor for surface vessel and seaborne operations in the Pacific tests. As AFSWP was succeeded by DASA and DNA and as AEC was succeeded by the Department of Energy (DCE), the original contractors and geographical division of contractual responsibilities remained constant. Interjection of a possible interest (and, hence, records !) of the Narver and Holmes organization in the continental tests opened new possibilities of search. Both contractors had consistently retired their GOCO records to the FARC-Los Angeles. This possibility mandated a change in itinerary to include the FARC-Los Angeles. More discussion on the results of this decision will be found in ANNEX G.

f. At the same time, decision was taken to eliminate Fort Lewis from the original itinerary. The original decision to include Fort Lewis in the field search was predicated on the fact that Fort Worden, traditional Puget Sound home of the 369th Amphibious Engineers, was a satellite of Fort Lewis in 1952. Shortly thereafter, both the 369th Engineers and Fort Worden, were deactivated. As no retired records of the 369th Engineers pinpointing its role in Desert Rock IV -- identification of the participating personnel complement -- had been located in normal records retirement channels, it was reasoned that an archival trail to such materials might be picked-up at the parent installation-Fort Lewis. Location of the 369th personnel rosters in the REECO collection at Mercury eliminated any further need to visit Fort Lewis. While a number of excellent leads were picked-up from REECO sources at Mercury, further direct exploitation of the REECO resources to meet Army needs appear limited.

g. The possibility of name lists possibly lacking dosimetry data still exists in the REECO assets. This will reveal itself when the microfilming of the

entire REECO Collection has been completed and distributed for Army NTPR Team examination. Another possibility lies in the current project of REECO to incorporate dosimetry data held by the Los Alamos Scientific Laboratory, Sandia Laboratory and Lawrence Livermore Scientific Laboratory into the REECO data bank. Part of this project is still in the discussion stage. No date is available at this time as to when this will be completed. Army interest in this project lies chiefly in the area of Army personnel who have performed tours of duty with AFSWP, DASA, DNA, LASL, Sandia and Lawrence Livermore since 1947 and whose dosimetry records may never have been added to the known bases maintained by REECO or the Lexington Depot. More discussion on the role of the "scientific laboratories" in the general context of nuclear testing and NTPR will be found in ANNEX D (LASL: Los Alamos Scientific Laboratory) following.

#### 4. CONCLUSIONS:

a. REECO has never been officially tasked for any overall radiation exposure dosimetry responsibility so far as DOD participation in nuclear test exercises are concerned. However, REECO has executed a limited dosimetry responsibility for scientific and contractor personnel involved in the continental United States nuclear tests.

b. In its role as prime contractor for operation of the Mercury Test Site, REECO has come into possession of considerable dosimetry data which probably was generated originally by DOD activities. This includes AFSWP, DASA, DNA and the United States Army. It now appears that these materials were left at the test site as various AEC nuclear tests and Desert Rock Exercises were completed.

c. REECO has performed an invaluable public service in its handling, use and preservation of the dosimetry data that has come into its custody since 1954 from DOD sources as well as that data which it generated in its role as prime contractor.

d. The REECO dosimetry data collection possesses unique value to the Army's current investigation in connection with the NTPR Project. It is not certain at this time that the fullest value of this collection has been realized nor can this be determined until microfilming of the entire hardcopy collection has been microfilmed and studied by the Army NTPR Team.

e. In much the same manner as the REECO hardcopy and microfilm collections, the computerized collection of dosimetry data holds unique value to the Army's current investigations. This value will grow as additional data -- especially that which will be contributed by the Sandia, Los Alamos and Lawrence Livermore Scientific Laboratories -- is added to the existing base.

#### 5. RECOMMENDATIONS:

a. That the Army NTPR Program and field search for Desert Rock documentation be held open until all known REECO resources have been exploited as fully as possible.

b. That the microfilm copy of the REECO hardcopy collection of dosimetry data be studied carefully for name lists or other personnel rosters which may have been passed over by REECO researchers as not containing usable dosimetry

data but which may possess unusual value in identifying Army personnel who participated in the Desert Rock Exercises.

c. All archival leads furnished by REECO personnel as to identification of additional Army Desert Rock Exercise participants should be followed-up on a priority basis.

d. That a technical inquiry be opened immediately to examine the feasibility of a computer link between existing dosimetry data bases maintained by REECO, the Army and other DOD participants in the NTPR Project with a view to ultimate pooling of all known data.

### Nuclear Industry

## REECo's test support operations, prime ~~REE~~<sup>DOE</sup> contractor at NTS

Drilling, tunneling, mining, electrical engineering,  
medical care, and construction—it's all in a day's work

Up with the sun and out on the desert highway is a routine operation for the majority of the REECo employees at the ~~base~~ Nevada Test Site Mercury, who travel by car and bus more than 130 miles a day from Las Vegas to the site. For those who prefer to live on the base, REECo operates a complete city, with movie theater, steak house, library, and swimming pool. About half of the employees work at base camp, and the rest are spread out over the huge testing grounds, which cover an area larger than the state of Rhode Island.

REECo, an acronym for Reynolds Electrical and Engineering Company, is the prime ~~base~~ contractor for support services at the Nevada Test Site. Its work involves drilling, tunneling,

mining and miscellaneous construction; maintenance and operations; limited architect-engineering services; and health, medicine, and safety. The estimated annual cost for these services is around \$115 million. Indicative of the size and character of the operation, REECo employs over 5,000 people on the site (including a medical staff of 10 doctors and 52 nurses), operates a fleet of 3,000 motor vehicles, digs holes up to 160 inches in diameter, and lays hundreds of miles of wire and cable every year.

• *Drilling.* Since the signing of the Limited Test Ban Treaty in 1963, all nuclear testing by the United States has been underground. To meet the emplacement requirements for this kind of testing, REECo must drill "big

holes" (defined as a hole larger than 36 inches in diameter), and several hundred big holes have been drilled during the 16 years the company has provided services for the nuclear test operations. The first big holes were drilled with auger- or bucket-type drill rigs, but rotary drills are now used routinely on holes up to 160 inches in diameter. The new techniques developed in these operations have contributed substantially to major advances in drilling technology.

• *Mining and Tunneling.* Since 1962, REECo has completed nearly 100,000 linear feet of tunnel or horizontal excavation. Prior to that, over 20 tunnels and drifts of varying sizes, with an aggregate length of 45,000 feet were constructed. Tunneling work at NTS has involved such things as constructing telescoped transitions in drifts at the bottom of a 1300-foot vertical shaft, excavating complexes using combined mining methods to produce large underground chambers,

and placing new and unusual concrete mixes and stemming materials in exotic tunnel configurations and locations.

In one tunnel system, REECo excavated two large and closely proportioned cavities shaped like saucers balanced on edge. The top of each was approximately 150 feet from the tunnel floor. Because of the tremendous size of these cavities, entirely new excavation techniques had to be developed, and REECo, in conjunction with consulting and manufacturing firms, designed specialized equipment and employed new mining methods to meet the unique construction problems and a very tight schedule.

• *Communications.* The huge test site is made up of rolling hills, rugged mountains, dry lakes, and mesas as high as 7000 feet. To tie this complex together, REECo has developed an extensive communications system of direct-line, closed-circuit television and some 30 radio networks. Using closed-circuit TV, scientists and technicians can view nuclear test events from many strategic points, including ground zero. Special mobile TV units that can be controlled remotely and operated from battery banks charged by generators in the vehicles have been designed. Television cameras are also mounted on remotely controlled helicopters, and these give a close-up view of very large events that can cause considerable ground motion and could knock out ground systems.

• *Cabling.* All the miles of tunnels and the thousands of feet of drilled holes would be of little use without the direct links from the testing areas to the scientific instruments that record the effects and the results of the tests. The success of these sophisticated nuclear events, with investments ranging up to several millions of dollars, rests on the integrity and reliability of the multiconductor and coaxial cable systems. These intricate and complex networks are expected to be 100 percent reliable, for they actuate and measure the scientific experiments.

In a typical two-year period, REECo installed over 600 miles of various types of signal and coaxial cable and more than 1400 miles of field wire. Lengths of runs varied from a few feet to several thousand, and cables were placed in every conceivable configuration and angle of repose. A

*Left: Thousands of feet of coaxial cable and signal wire are being made ready for a test.*

*Below: REECo's Rad-Safe trained monitors in the process of decontamination after returning from a test area.*

single test may require as many as 2000 cables.

• *Radiological Safety.* Nuclear testing requires a very high degree of radiological safety, and to meet this requirement, REECo maintains and operates a Radiological Sciences Department Rad-Safe, as it is commonly called at NTS, has as its function the calibration and maintenance of survey meters, remote monitoring systems, and other instruments used in weapons testing and post-shot operations. Health physicists direct programs for measurements and control of personnel exposure, for control of radioactive sources and contaminated waste, for collection and analysis of environmental and biological samples, for data evaluation and recording, and for the maintenance and quality of personal protective equipment.

In the years of specialized participation in the varied nuclear programs, REECo has expanded its radiological sciences capabilities to include engineering of equipment and health physics techniques to support activities at site, and the Rad-Safe Department has designed a film-badge-holder recognized throughout the United States as an advanced dosimetric device.

• *Vehicles and Fire Department.* Vehicles of all sizes and shapes are required to cover the vast expanses and terrain of the test site—more than 3000, in fact. They range from compact sedans to huge trucks and trailers and from pickups and buses to field ambulances equipped for off-road travel. Because of climatic variations (temperatures range from -10 to 120°F), rugged terrain, and the unusual requirements for getting men and materials into remote areas, REECo has developed a preventive maintenance program especially designed to meet the demands unique to the operation. As an example, the airborne dust prevalent in the area is extremely damaging to the intake system of combustion engines. Conventional oil bath filters did not prove satisfactory, so dry filters with pre-cleaners have been installed in all systems.

Fire protection is a major function at NTS, where more than 1200 buildings and structures plus storage yards and special equipment are valued in the hundreds of millions of dollars. To provide adequate fire protection and prevention, REECo operates

seven fire stations around the clock, seven days a week. This department is also called on to provide special protection when explosives or highly flammable materials are brought onto the site.

• *Other Support Operations.* Construction work at NTS includes jobs and services that might normally be done by 20 or more separate companies. A few of the tasks performed almost daily include: heavy rigging, moving, and handling; steel fabrication and erection, excavation and roadwork; framing, forming, general carpentry, and mill work, electrical construction of all types, including transmission lines and substations, secondary power systems, multi-conductor signal installation, complete coaxial cable systems, and sophisticated control devices; sheet metal fabrication and installation; plumbing, piping, and refrigeration systems of various types; fabrication, installation, and checkout of intricate and unique pressure and vacuum systems; special purpose line-of-sight piping and radiological-chemistry containment systems; operation of aggregate production and stemming material and concrete batching plants; transportation and placement of concrete; heavy equipment operation; and repair, maintenance, and painting.

#### The Company

Reynolds Electrical & Engineering Company, Inc., was established in 1932 in El Paso, Texas, by Mr. L. J. Reynolds, Sr., and a few associates. REECo was a depression baby and was obliged at the start to face the rigors of fierce competition in the electrical-construction industry. To offset its initial disadvantages, the newly formed company sought supplemental means of support and elected to enter the electrical wholesale business. This combination proved successful throughout the bad years of the 1930s. The company won its first contract outside El Paso in 1935, and today it has jobs in process in 37 states plus Guam, Puerto Rico, and Japan. In 1967 REECo was acquired by EG&G—a company with which it had worked shoulder-to-shoulder on the NTS programs. EG&G performed tuning, firing, and other scientific functions, and REECo did the drilling, mining, construction, and support operations.

The introduction of engineers into the electrical-construction industry was

an original concept adopted by REECo. This concept accounts for the word "Engineering" in the company name, and it represented an unheard-of deviation from the conventional electrical contracting at that time. The complex installations encountered today confirm the soundness of an early start in this direction and provide a firm foundation on which to build an organization capable of meeting the requirements of the rapidly expanding electrical-construction field.

By the beginning of World War II, REECo had work contracts throughout the United States and in Hawaii, where the underground power distribution system on Hickham Field had just been completed when the field was bombed on December 7, 1941. Thereafter, the company became involved in repairing the extensive damage incurred. During the war, REECo was selected to perform the electrical construction requirements for the Manhattan District Project at Los Alamos, in the development of the atomic bomb.

Following the war, REECo was awarded classified contracts scattered all over the country; these contracts during a five-year period amounted to \$14 million. Sandia Base and other installations in the Albuquerque area accounted for a part of this work. In 1953, REECo and the Newberry Electric Company, Los Angeles, were selected by the AEC to accomplish the electrical installation on the mammoth Gaseous Diffusion Plant, Portsmouth, Ohio. This joint venture received the largest single contract ever awarded up to that time—\$153 million. The work required four years to complete and involved the employment of 4000 people.

When the AEC decided to conduct weapons tests within the continental United States and selected the site in Nevada for its first venture, it selected REECo to provide construction support services for the first shot. Later, additional test shots were scheduled, and these have resulted in contracts with REECo for complete support services lasting over the past 16 years.

Following the acquisition by EG&G in July 1967, the REECo corporate headquarters were moved from El Paso to Tempe, Arizona, and district operations were consolidated into three regional offices at Atlanta, El Paso, and Tempe.

NEWARK, N.J. (AP) — The U.S. Government has agreed to turn over the names of Army officers in command 25 years ago when soldiers were ordered to be present at the site of nuclear bomb explosions.

In a hearing on a suit by a former Army corporal suffering from breast cancer, the Army conceded in federal court Monday that soldiers witnessed the test explosions but said no connection had been established between watching a bomb blast and developing cancer.

Justice department attorney Elizabeth Gere Whitaker told District Judge Herbert J. Stern that it would "reluctantly" turn over the names of Army officers it had determined were involved in the explosion. A 1971 fire destroyed some records and all the names may not be available, she said.

Whitaker promised to hand over the names to the plaintiff's attorneys after Stern refused to dismiss allegations against "unnamed government officials."

Stern did dismiss one count of the suit, which asked that the government be ordered to warn the hundreds of thousands of soldiers who may have been exposed to radiation during the experiments and to treat those suffering from cancer.

"In my view ... I don't think you can sue the government under sovereign immunity unless they agree to it," Stern said.

Stern let stand the rest of the suit pending an appeal of his decision to the third circuit.

The only way the United States can be sued, Stern noted, would be if the complaint was amended to comply with the Tort Claims Act.

The \$13 million negligence suit was filed in May by Stanley Jaffee, 47, of River Edge.

SOURCE DOCUMENTS

Box 1

Continent 1945-1947: Trinity: DTL Alamogordo NM, Trinity source data accession book series 7000-7628. Trinity exposures for July, August, and October.

Report on exposure received during the Trinity experiment of July 16, 1945. Exposures of the personnel in H. L. Anderson's group. Monitoring excavation of tower footings at Trinity.

Report on exposures at Trinity, October 08, 1945 - October 10, 1945.

Report on exposures of people visiting Trinity and of personnel stationed at the site.

Report on exposures sent by Sgt. Lerner November 8, 1945.

Report for exposures at Trinity, film badges worn for about 2-1/2 hours October 02, 1945.

Exposures received at Trinity by the following members of the Mounted Patrol from October 27, 1945 to November 01, 1945. Report on exposures of Guard Patrol at Trinity 500 yards from crater.

Report on exposures of Guard Patrol at Trinity November 27, 1945.

Handwritten documents containing exposures. R-exposures of old Trinity X-ray film badges August 29, 1945 (IBM run). Trinity hard copy for 1945. Trinity 1945 AF report corrected copy. Trinity 1945 exposures January 05, 1945 - November 31, 1945.

1946: Exposures from Trinity Guard Patrol January, February, and March. Exposures of badges worn at Trinity from March 11, 1946 to March 22, 1946. Report on exposures of personnel visiting Trinity crater.

Exposures of construction workers at Trinity September 16 & 15, 1946.

Report of badges found at Trinity when members of Health Group made a trip April 17, 1946. Exposures of Naval officers working with Health-Physics section. Exposures received by civilian workers erecting "man-proof" fence 500 yards from crater at Trinity.

Handwritten document exposures for May, June, and September, 1946. Trinity 1946 hard copy (IBM run).

1947: R-exposures of X-ray film badges worn during monitoring of Trinity February 10, 1947.

Handwritten document with exposures January and August, 1947. Trinity, 1947 hard copy (IBM run).

## Box 2

Pacific 1946: Crossroads: DTL Bikini, 5 x 8 white cards, reporting gamma and beta exposures (IBM run), Crossroads, 1946 for index cards only. Crossroads calibration results on films 5301 and 5302, also film badge dose exposures and overdoses.

Four unlettered green books:

- Book #1, Du Pont film type 552 calibrations;
- Book #2, Eastman Kodak film from No. 2767 to 4484;
- Book #5, personnel 10861-13650 with doses;
- Book #7, personnel 8090-10860 film badge doses.

## Box 3

Pacific 1946: Crossroads: DTL Bikini, Black books (23):

- #1, Casualty badges, 1-413;
- #2, Casualty badges, 414-834;
- #3, Casualty badges, 835-1257;
- #4, Casualty badges, 1258-1679;
- #5, Casualty badges, 1680-2092;
- #6, Casualty badges, 2093-2505;
- #7, Casualty badges, 2506-2918;
- #8, Casualty badges, 2919-3331;
- #9, Casualty badges, 3332-3744;
- #10, Casualty badges, 3745-4171;
- #11, Casualty badges, 4172-4584;
- #12, Casualty badges, 4585-4997;
- #13, Casualty badges and calibration data.

Book #1, Tablet counting data book; key to ships and sample No. approximate point of detonation Test Able.

Book #2, Tablet counting, method of calculating total neutrons from  $\text{Ca}_3(\text{PO}_4)_2$  pills. Methods 5 pills. 1 log book; record of film and pill units issued for Test Able-Baker. Photometry, B-1 film badges.

- Book I 1-1357 personnel type K film.
- Book II 1358-2668 personnel type K film.
- Book III 2669-4025 personnel type K film.
- Book IV 4026-5382 personnel type K film.
- Book V 5382-6739 personnel type K film.
- Book VI 6740-8089 personnel type K film.

5 green record books:

"A" series, K type film, listing of ships and doses.

"B" series, listing of ships and doses.

"C" series, special monitor assignments September-October, listing of ships and doses.

"E" series, listing of ships and doses.

"F" series, ship security (KWAJ) listing of ships and doses.

USAF-ADP project Pacific alpha listing with exposures, punched and verified 10-03-67. Hard copy USAF-ADP project Pacific alpha listing with exposures, punched and verified 2-06-76. Letter: Operation Bikini, 1946 LC-1 (L-327) craft yearly total of mrem and mrad. Test Able film badge data 27 sheets gamma dosage.

## Box 4

Pacific 1948: Sandstone: DTL Eniwetok, physical examinations, alpha order.

## Box 5

Pacific 1948: Sandstone: DTL Eniwatok, Operation Sandstone roster with exposures. White 5 x 8 index cards with individual exposures.

Box 1 of 3, alphabetical order A-P.

Box 2 of 3, Q-Z and ships, dosimeter and instrument use.

## Box 6

Pacific 1948: Sandstone: DTL Eniwetok, white 5 x 8 index cards, box 3 of 3 ships, dosimeter and instrument use. Density of film developed for N.B.S. Tests sheets 2-356. Pacific print-out including military and civilian alpha order with doses. USAF ADP project, alpha order both military and civilian 01-25-67, 09-17-67, 10-03-67.

April 1948 Sandstone, EPG exposures in excess of 100 mR in any 24-hour period.

Headquarters Task Group 7.6 Joint Task Force Seven; roster of officers: U.S. Army, Air Force, Navy, Marine Corps; enlisted men: U.S. Army, Navy, civilians, U.S. Public Health Service Officers.

CTU 7.6.5 U.S.S Bairoko, (CVE 115) exposure data for U.S. Army and U.S. Air Force received during Operation Sandstone 05-28-48. Exposures of 7.6 personnel. Tabulation of personnel exposure data. CTU 7.6.5 report on exposures during Test Zebra. Commander Task Group 7.6 medical records status of Task Group 7 photographic personnel. Headquarters Task Group 7.6 Joint Task Force Seven U.S.S. Bairoko (CVE-115) 05-20-48, Radiological exposure report, memorandums (2) from CTU 7.6.5, personnel exposure data for X-ray day 16 April and 17 April 1948.

Late records Sandstone not recorded in regular records (monitor's data sheet cards), density of films developed on June 16, 1948.

1. History of TU 7.6.5 and samples of forms from Sandstone (spring).
2. History of Photo-Dosimetry Section of TU 7.6.4.
3. Correspondence.
4. Daily monitor status report on exposures of TG 7.6 personnel.
5. Calibration dosimeter readings.
6. Eniwetok film badges distribution lists (in lieu of monitor cards).
7. Alphabetical list with doses.
8. Calibration curves.

Document 52 pages; operation plan number 1-48 Commander Task Group 7.6.  
Assignments for Task Group 7.6 duties AA. Test Zebra radiation injuries U.S.  
Naval communications service mailgram from CTG 7.6.

Headquarters Joint Task Force Seven: Document 5 pages on Radiological Safety  
Plan. Document 3 pages, hazards resulting from Atomic Bomb explosions.

Task Group 7.6 technical report on Radiological Safety at Operation Sandstone.  
Report on Northwest Island perimeter Dukw. Document Engebi Island survey data.  
Task Group 7.6 Withdrawal and Roll-Up plan. Radiological safety during Roll-Up  
and Post Roll-Up Garrison operations at Eniwetok. Report Estimate of Results  
obtained Text X-ray (Gamma Radiation vs. Distance). Critique of Test X-ray  
(BuY&D Structures). Reports of all Naval and Marine Corps personnel physical  
exams. Radiological activity in Engebi Crater. Radiological Safety - physical  
examinations. Test Director Opt. Order No. 2. Released by CMDR F. I. Winant  
exposures in excess of 100 milliroentgens. Dosimeter readings Y day also Zebra  
Day Drone Opt.

Fallout data for X-Ray Test. CTG 7.1 memorandum radiological safety plan.  
Commander Task Group 7.1 responsibility for effecting radiological safety  
within AEC shops and laboratories on the U.S.S. Curtiss and Albemarle. CTU  
7.6.5 report on exposures during the period 2 May to 14 May. Fallout data for  
X-Ray Test. Overlay to accompany map No. 6033 of Eniwetok Atoll. X-7 Day  
Engebi Crater survey. Correspondence.

## Box 7

Pacific 1951: Greenhouse: DTL Eniwetok, index cards 5 x 8 (white) individual exposures, box 1 of 3 and 2 of 3.

## Box 8

Pacific 1951: Greenhouse: DTL Eniwetok, index cards 5 x 8 (white) individual exposures, box 3 of 3. USAF ADP project (EPG) alphabetical listings with exposures:

01-25-67, 10-03-67, and 09-17-67. 1951 Pacific alpha listing with exposures. 07 Greenhouse Test personnel total exposures, 04-01-51 - 05-30-51.

Office memorandum (Greenhouse) personnel exposures listed on cards. LASL-AEC report with exposures (researched from previous report). Report Headquarters Task Unit 3.1.5 Washington 25, D.C. Records of cumulative radiation doses following the fallout after Dog and Item shots. Greenhouse accumulated fallout dose - mR graph from April to May.

## Box 9

Continent 1951: Buster-Jangle: DTL NTS, USAF-ADP Project NTS (3 listings) alpha order with exposures generated 08-01-67, 09-17-67, and 10-03-67. 1951 Nevada alpha listing with exposures. Accumulative dosage received by U.S. Naval Radiological Defense Laboratory personnel, exposed to ionizing radiation during Operation Buster-Jangle.

1. Buster-Jangle the following report is a resume of the records of  
 2. Buster-Jangle Operation held at NTS October and November 1951:

1. Number of personnel film-badged
2. Daily badge issues for Operation Buster
3. Daily badge issues for Surface shot
4. Daily badge issues for Underground shot
5. Film badges issued to USAF for entire operation
6. Film badges issued for project work
7. Recapitulation of all film badges issued
8. Project personnel with exposures in excess of 2.0 r
9. Total exposures of all Rad-Safe monitoring personnel
10. LASL personnel with exposures in excess of 2.0 r
11. Haddock, Newbery and Asbury personnel with exposures in excess of 1.0 r
12. USAF personnel with exposures in excess of 2.0 r
13. Recapitulation - all exposures over 2.0 r

Ranger personnel gamma exposures January-February 1951. Two reports exposures of personnel film badges from NTS, Operation Ranger 03-01-51 and 03-06-51. Headquarters 11 Corps (Camp Desert Rock) Las Vegas, NV: Form for recording film badge issue and processing results Operation Buster-Jangle completed rosters for the fall of 1951. Also platoon number, platoon commander, and platoon MP. Letter: Technical Branch the Chemical Corps School, Ft. McClellan, Alabama, request for film badge dosage information. Scratch paper, no record of film badges.

## Box 9A

Continent 1951: DTI NTS, Operation Buster-Jangle, October-November, white  
5 x 8 cards with film badge accumulated dosimeter exposures. Box 1 of 2 and  
box 2 of 2.

## Box 10

Pacific 1952: Ivy: DTL Eniwetok, USAF ADP project, alpha listing with exposures generated 10-03-67. Two books JTF 132 consolidated list of exposures to radiation of personnel participating in Operation Ivy.

1. Roster of all personnel exposed to radiation at the PPG from 11-21-52 - 10-03-53.
2. Roster of personnel exposed to radiation at PPG from 11-21-52 - 03-30-53 probit tables.

Sixth Army Project Ivy Flats alpha listing. Operation Ivy 10 PPG (2 shots) 10-31-52 - 11-21-52, name, organization, test number, amount of exposure, mR dose and activity number. 5 x 8 white cards (H&M) individual radiation exposures.

## Box 10A

Pacific 1952: DTI. Eniwetok Operation Ivy, white 5 x 8 cards film badge accumulated dosimeter with exposures. Box 1 of 2 and box 2 of 2. 5 x 8 document including personnel information, task unit, project, rad-safe physical exam with dose.

## Box 11

Continent 1952: DTL NTS, Desert Rock, Tumbler-Snapper, USAF-ADP project NTS Tumbler-Snapper and Desert Rock alpha listing with exposures generated 09-17-67 (military ranks are Desert Rock troops). USAF-ADP project NTS with Desert Rock additions alpha listing with exposures generated 10-03-67. 1952 Nevada alpha listing with exposures generated 08-01-67 without Desert Rock additions.

Personnel Rosters Exercise Desert Rock and additions of Daily Record of Radiation Exposure in Milliroentgens Accumulative Dosages for Personnel during Tumbler-Snapper Series.

369th Engineer Amphibious Support Regiment Camp Desert Rock, Las Vegas, NV (Snapper). No doses listed May 1952. Report Headquarters and Service Co. 369th Engineer Amphibious Support Regiment Camp Desert Rock June 2, 1952, with rank, name, ASN and film badge number. Report 10-2 NV with number of exposures accumulated dosage and activity both civilian and military.

Headquarters Test Command Armed Forces Special Weapons Project Nevada Proving Grounds Mercury, NV, Official Observer Roster for Shot 3.

Exposures - Tumbler-Snapper with exposures and accumulated dosages. Report July 8, 1952, from Phillip S. Gwynn, Lt. Colonel, USAF Director. Rad-Safe Group Tumbler-Snapper personnel exposures received in Operation Tumbler-Snapper with name and accumulated dose in milliroentgens (measured gamma only). Listing same as above except organization included.

Tumbler-Snapper 04-01-52 - 06-31-52 report with name, activity name, test #9. Number of exposures, amount dosage mR activity code. Also exposure data (all activities operation 09 mR dosage in hundreds). Calibration F.B. data with film and technical file data.

## Box 12

Pacific 1956: H&N, individual radiation exposure records, form 102-P, white 5x8 cards, box 3 of 4, alpha order Q thru V.

## Box 36

Pacific 1956: H&N, individual radiation exposure records, form 102-P, white 5x8 cards, box 4 of 4, alpha order, W thru Z.

## Box 37

Pacific 1956: Redwing: The following roster of 52 pages includes all personnel from Task Group 7.1 and dose of whole-body ionizing radiation received by them during the period 13 April through 6 August 1956; roster also includes film badge calibration curve.

Roster of 33 pages includes all personnel from Task Group 7.2 and the dose of whole-body ionizing radiation received by them during the period 13 April through 6 August 1956 with film badge calibration curve.

Master Personnel Dosage Report: Rosters - The following roster of 2 pages includes all personnel from the USS Abnaki (ATF-96) and the dose of whole-body ionizing radiation received by them during the period 13 April through 6 August 1956.

Roster of 3 pages from USNS Fred C. Ainsworth Tap 181 and dose of whole-body ionizing radiation received by them during the period 13 April to 6 August 1956.

Roster of 12 pages, personnel from Bado Eng. Strait CVE-116 and the dose of whole-body ionizing radiation received by them during the period 13 April to 6 August 1956.

Roster 4 pages, personnel from the Boat Pool and the dose of whole-body ionizing radiation received by them during 13 April to 6 August 1956.

Roster of 1 page, personnel from 7.3 Boat Pool (Fred) and the dose of whole-body ionizing radiation by them during the period 13 April to 6 August 1956.

Roster of 4 pages, personnel from USS Caliente (AO-53) and the dose of whole-body ionizing radiation received by them during the period 13 April to 6 August 1956.

Roster of 5 pages, personnel from USS Catamount (LSD-17) and the dose of whole-body ionizing radiation received by them during 13 April to 6 August 1956.

Roster of 2 pages, personnel from USS Chickasaw (ATF-83) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 2 pages, personnel from USS Crook County (LST-611) and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 9 pages, personnel from USS Curtiss (AV-4) and the dose of whole-body ionizing radiation received by them during 13 April to 6 August 1956. USS George Eastman (YAG-39) and the dose of whole-body ionizing radiation received by them 13 April to 6 August 1956.

Roster of 1 page, personnel from USS Granville S. Hall (YAG-40) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 3 pages, personnel from USS Knudson (APD-101) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 4 pages, personnel from USS James E. Kyes (DD-787) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 1 page, personnel from USS Lipan (ATF-85) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 3 pages, personnel from the USS McGinty (DE-365) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 9 pages, personnel from USS Mount McKinley (AGC-7) and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 1 page, personnel from USS Navasota (AO-10) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 1 page, personnel from the Nausta Kwajalein N#824, and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 6 pages, personnel from Patrol Squadron One, and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 4 pages, personnel from the USS Shelton (DD-790) and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 3 pages, personnel from USS Silverstein (DE-534) and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 2 pages, personnel from USS Sioux (ATF-75) and the dose of whole-body ionizing radiation received 13 April to 6 August 1956.

Roster of 3 pages, personnel from the HMR-363 and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 2 pages, personnel from 7.3 Staff, and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 1 page, personnel from the T-LST 306, and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

Roster of 1 page, personnel from the USNS T-LST 618, and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956.

The following roster of 66 pages, personnel from Task Group 7.4 and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956, also film badge calibration curves.

The following roster of 25 pages includes all personnel from Task Group 7.5 and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956. Unless otherwise noted, personnel are Holmes & Narver, Inc., employees; also calibration curves.

The following roster of 9 pages includes all personnel from Headquarters JTF Seven and the dose of whole-body ionizing radiation received during 13 April to 6 August 1956, also film badge calibration curve.

Radiation exposure report for PPG, (Redwing), covering period January 1 to April 15, 1956.

Radiation exposure for military and civilian personnel at EPG (Task Group 7.2), 7 August to 30 September 1956.

Roster of personnel exposed to radiation (Task Group 7.4), 7 August to 19 October 1956.

Roster of personnel exposed to radiation (H&N) 7 August to 30 September 1956.

Roster of personnel (H&N) exposed to radiation 1 October to 31 December 1956.

Roster of personnel (AEC 7.5, TG 7.1) 6 August to 30 September 1956.

1956 (Pacific) alpha listing with exposures.

USAF-ADP project - Pacific 1956, alpha listing with exposures.

Folder #6: Roster of personnel exposed to radiation 1 January to 31 December 1956. Roster of personnel exposed to radiation at EPG (total accumulated exposure through 31 December 1956).

Folder #9: H&N administrative personnel October 6. The following listed personnel have accumulated dosages which exceed the 1,000 mR during the quarter ending 30 September. Amended dosage report, August 27. Roster of personnel exposed during Redwing by more than 2,000 mR, 18 August 1956. Roster accumulated radiation dosage report of changes and additions, not previously listed, of exposures which exceed 3,900 mR, 9 August. Changes and additions 6 August, not previously listed, of exposures which exceed 3,900 mR. Changes and additions 6 August, not previously listed, exceed 3,900 mR. Changes and additions 7 August, exposures which exceed 3,900 mR.

Accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 3,000 mR for the individual's current 13-week period.

Accumulated radiation dosage report 4 August, changes and additions not previously listed to the accumulated dosage report dated 28 July 1956. 3 August, changes and additions not previously listed to the accumulated dosage report dated 28 July.

2 August, changes and additions, not previously listed on accumulated radiation exposures of all 7.5 personnel at PPG which exceed 3,000 mR for the individual's current 13-week period.

1 August, changes and additions, dated 28 July 1956. 31 July, changes and additions to the accumulated dosage report dated 28 July 1956. 30 July, changes and additions to accumulated dosage report dated 28 July 1956.

28 July, exposures of all TG 7.5 personnel at PPG exceed 3,000 mR for the individual's current 13-week period.

27 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 3,900 mR for the individual's current 13-week period.

26 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

25 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

24 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

23 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for individual's current 13-week period.

July 21, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

20 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

19 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

18 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

17 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

16 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the individual's current 13-week period.

14 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April through 13 July 1956.

13 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 12 July 1956.

12 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 11 July 1956.

11 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 10 July 1956.

10 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 9 July 1956.

9 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 8 July 1956.

7 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 6 July 1956.

6 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 5 July 1956.

5 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 4 July 1956.

4 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 3 July 1956.

3 July, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 2 July 1956.

2 July, accumulated radiation exposure of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 1 July 1956.

30 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 29 June 1956.

29 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 28 June 1956.

28 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 27 June 1956.

27 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 26 June.

26 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 25 June 1956.

25 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 24 June 1956.

23 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 22 June 1956.

22 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 21 June 1956.

21 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 20 June 1956.

20 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 19 June 1956.

19 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 18 June 1956.

18 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 2,000 mR for the period 15 April to 17 June 1956.

16 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 15 June 1956; these exposures are accumulated only in RADEX areas and are not necessarily indicative of total exposures.

15 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 14 June 1956.

14 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 13 June 1956.

13 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 12 June 1956.

12 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 11 June 1956.

11 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500 mR for the period 15 April to 10 June 1956.

9 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,500mR for the period 15 April to 8 June 1956.

8 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 7 June 1956.

7 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 6 June 1956.

6 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 5 June 1956.

5 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 4 June 1956.

4 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 3 June 1956.

2 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 1 June 1956.

1 June, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 31 May 1956.

31 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 30 May 1956.

30 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 29 May 1956.

29 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 28 May 1956.

28 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 27 May 1956.

26 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 25 May 1956.

25 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 24 May 1956.

24 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 23 May 1956.

23 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 22 May 1956.

22 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 21 May 1956.

21 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 20 May 1956.

19 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 18 May 1956.

18 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 17 May 1956.

17 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 16 May 1956.

16 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 15 May 1956.

15 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 14 May 1956.

14 May, accumulated radiation exposures of all TG 7.5 personnel at PPG which exceed 1,000 mR for the period 15 April to 13 May 1956.

12 May, accumulated radiation exposures of TG 7.5 personnel for the period 15 April to 11 May 1956; these exposures are accumulated only in RADEX areas and are not necessarily indicative of total accumulated exposure.

11 May, accumulated radiation exposures of all TG 7.5 personnel recorded as of 0600 hours 11 May 1956.

10 May, accumulated radiation exposures of all TG 7.5 personnel recorded as of 0600 hours 10 May 1956.

9 May, accumulated radiation exposures of all TG 7.5 personnel. These dosages are based on mission film badges recorded as of 0600 hours 9 May 1956.

7 May, TG 7.5 accumulated radiation dosage report No. 3.

7 May, the following dosages were received by H&N and AEC personnel on 6 May 1956.

6 May, the following dosages were received by H&N and AEC personnel on 5 May 1956.

Letter, 5 May 1956, 1200 hours, to General Supr. Administration, Job 942, from Sr. Rad-Safe Electronic Tech., RE: Radiation Situation at Site Yvonne - Entire camp area has been thoroughly monitored and found to be free of contamination and hot spots.

Letter from T. A. Hardison, August 7, 1956, (ETE:RWT:M-2014) Subject: Radiation exposure to Evan C. Evans III, Reference: 3-730-128, WGN:ams. Above employee received 50 mR of gamma at PPG during the month of February.

Dark room log book (Bikini); H&N radiological counting data sheets, December - January 1956. 5x8 white cards alpha order: H&N Eniwetok 1956, Redwind and beta dose.

## Box 38

Continent 1956: USAF-ADP project - NTS, alpha listing with exposures. Nevada alpha listing with exposures (Quarterly Reports January 1 to December 31, 1956).

30 January 1956, listed below are exposures to gamma radiation received by personnel of your organization working at NTS on January 18, 1956: REECO; Los Alamos Scientific Lab, Los Alamos, New Mexico; 8452nd DU Sandia Base, New Mexico.

20 January 1956, listed below are exposures to gamma radiation received by personnel of LASL on 19 January 1956 at the NTS.

5 January, listings of total cumulative exposures to gamma radiation received by personnel of various organizations working at NTS during quarter of 1 October 1955 to 1 January 1956. Maximum allowable dosage for this quarter was 3,900 mR: Los Alamos Scientific Lab; AEC Santa Fe Operations Office, Albuquerque, New Mexico; University of California Rad Lab, Livermore, California; AEC Las Vegas Branch Office, Las Vegas Nevada; REECO, mercury, Nevada; Wright Air Development Center, Wright-Patterson Air Force Base, Ohio; Chemical Research Lab, Army Chemical Center, Aberdeen Proving Ground, Maryland; Sandia Corp., Albuquerque, New Mexico; Public Health Service, Las Vegas Branch Office, Las Vegas, Nevada; Bureau of Yards and Docks, Washington, DC; Headquarters Field Command AFSWP, Albuquerque, New Mexico; Department of Defense, Mercury, Nevada; 1352nd Motion Picture Squadron, Lookout Mountain Lab, Hollywood, California; Engineering Reserach & Development Lab, Fort Belvoir, Virginia; University of Illinois, Urbana, Illinois; 8459th Du Sandia Base, New Mexico; Ballistics Research Lab, Aberdeen Proving Ground, Maryland; Stanford Research Institute, Stanford, California; Oak Ridge National Lab, Oak Ridge, Tennessee; Navy Research & Development, San Francisco, California; Office Chief Engineers, Washington, DC; EG&G, Las Vegas, Nevada; Armour Research Foundation, Chicago, Illinois; 8452nd Du Sandia Base, New Mexico; Braodview Research & Development, Burlingame, California; Lookout Mountain Lab, Hollywood, California; Robert L. Corsbie Division of Biology & Medicine, AEC, Washington, DC.

5 January 1956, listed below are exposures to gamma radiation received by personnel of your organization working at NTS during the two-week period 19 December 1955 to 1 January 1956: University of California, Rad Lab, Livermore, California; EG&G, Las Vegas, Nevada; REECo, Mercury, Nevada.

1 January, listed below are the total cumulative exposures to gamma radiation received by personnel of your organization working at NTS during the month of December 1956 and for the period October 1 to January 1, 1957: REECo, Mercury, Nevada; H&N, Los Angeles, California; Lembke, Clough and King, Las Vegas, Nevada; Polk Construction Co., Las Vegas, Nevada; Federal Services, Inc., AEC, LVBO, Las Vegas, Nevada; University of California Radiological Lab, Livermore, California; UCLA-AEP, Los Angeles, California; EG&G, Las Vegas, Nevada; Sandia Corp., Albuquerque, New Mexico; U.S. Geological Survey, Washington, DC; U.S. Weather Bureau, Washington, DC; AFSWP, Lowry Field, Denver, Colorado.

8 February 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organizations working at the NTS during the month 1 January to 1 February: Los Alamos Scientific Lab, Los Alamos, New Mexico; University of California Radiation Lab, Livermore, California; REECo, Mercury, Nevada.

5 April, total cumulative exposures to gamma radiation received by personnel of your organizations working at the NTS during the month of March and for the quarter ending 31 March 1956: Los Alamos Scientific Lab, Los Alamos, New Mexico; REECo, Mercury, Nevada; University of California Radiation Lab, Livermore, California; EG&G, Las Vegas, Nevada; U.S. Public Health Service, Las Vegas, Nevada; AEC, Las Vegas, Nevada; Engineering Research & Development Lab, Fort Belvoir, Virginia; Sandia Base, New Mexico; Division of Biology & Medicine, AEC, Washington, DC; Federal Civil Defense Administration, Battle Creek, Michigan; Federal Services, Mercury, Nevada.

2 April 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organizations working at the NTS during the month of March 1956 and for the quarter ending 31 March: Los Alamos Scientific Lab,

Los Alamos, New Mexico; University of California Radiation Lab, Livermore, California; EG&G, Las Vegas, Nevada, U.S. Public Health Service, AEC-LVB.

3 March 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organization working at the NTS during the month of March 1956 and for the quarter ending 31 March: Los Alamos Scientific Lab, Los Alamos, New Mexico; University of California Radiation Lab, Livermore, California; REECO, Mercury, Nevada; AEC-Las Vegas Branch, Las Vegas, NV; 8452nd Du Sargis Base, New Mexico; EG&G, Las Vegas, Nevada.

9 May 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organizations working at the NTS during the month of April 1956: REECO, Mercury, Nevada; University of California Radiation Lab, Livermore, California; EG&G, Las Vegas, Nevada; Oak Ridge National Lab, Tennessee; AEC, Las Vegas, Nevada; AEC, Albuquerque, New Mexico.

6 June 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organizations working at the NTS during the month of May: REECO, Mercury, Nevada; University of California Radiation Lab, Livermore, California; AEC-Albuquerque Office, New Mexico; AEC-Las Vegas Branch; EG&G, Las Vegas, Nevada; Oak Ridge Radiation Lab, Tennessee.

5 July 1956, listed below are the total cumulative exposures to gamma radiation received by personnel to gamma radiation received by personnel of your organization working at NTS during the month of June 1956: REECO, Mercury, Nevada; University of California Radiation Lab, Livermore, California; AEC, Albuquerque, New Mexico; AEC, Las Vegas, Nevada; Oak Ridge Radiation Lab, Tennessee.

6 August 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organization working at NTS during the month of July: REECO, Mercury, Nevada; University of California, Livermore, California; AEC, Las Vegas, Nevada; EG&G, Las Vegas, Nevada; H&N, Los Angeles, California.

7 September 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organization working at NTS during the month

of August: REECo, Mercury, Nevada; University of California, Livermore, California; H&N, Los Angeles, California; AEC, Las Vegas, Nevada; EG&G, Las Vegas, Nevada; U.S. Geological Survey, Armed Forces Special Weapons Project, Armour Research Foundation, Urbana, Illinois; civilians (miners), 23 Arizona Way, Henderson, Nevada.

5 October 1956, listed below are the total cumulative exposures to gamma radiation received by personnel of your organization working at NTS during the month of September and for the quarter ending 30 September: REECo, Mercury, Nevada; University of California, Livermore, California; H&N, Los Angeles, California; AEC, Las Vegas, Nevada; EG&G, Las Vegas, Nevada; U.S. Geological Survey, Washington, DC; Armed Forces Special Weapons Project, Armour Research, Urbana, Illinois.

15 November 1956, radiological exposures of personnel working at NTS during the month of October and for quarter ending December 31, 1956: REECo, Mercury, Nevada; H&N, Los Angeles, California; University of California, Livermore, California; EG&G, Las Vegas, Nevada; U.S. Geological Survey, Washington, DC; UCLA AEP, Los Angeles, California.

7 December 1956, radiological exposures of personnel working at NTS during the month of November and for the period of October 1 to November 30, 1956: REECo, Mercury, Nevada; H&N, Los Angeles, California; University of California, Livermore, California; UCLA-AEP, Los Angeles, California; Lembka, Clough and King, Las Vegas, Nevada; Federal Services Inc., Las Vegas, Nevada; USGS, Washington, DC; U.S. Weather Bureau, Washington, DC; EG&G, Las Vegas, Nevada; Bell Telephone Co., Las Vegas, Nevada.

Monthly Report (REECo) dosage mR, November 1-30, and cumulative dosage, October 1 to November 30. Also H&N, UCRL, UCLA, LC&K, Polk Construction Co., FSI, USGS, U.S. Weather Bureau, EG&G, and Bell Telephone Co.

Report accumulative dosage on the following personnel (Date Hired and Terminated) 1953, 1954, 1956, dated May 11, 1956, to John Elmgren from Tom Morgan, letter and report August 8, 1956 (NTS-7419-m): Information is forwarded in explanation.

of certain personnel radiation exposures shown on the Rad Exposure Report 6 August 1956, William Poe and Paul Stephenson, UCRL.

Yellow paper, final monthly and quarterly report, October, November, and December, 1956, for: REECO, H&N, LC&K, POLK, FSI, AEC, UCRL, UCLA, EG&G, Sandia, Bell Tel, USGS, and AFSWP.

Personnel log, Areas 7 to 9, dated December 7, 1956, (Station BJY) with nose swipe results. Personnel log sheets, Areas 3, 7 and 9 dated December 6, 5, and 4 (Station BJY) with nose swipe results. Personnel log sheets Areas 3, 7, 9 and odd outfits, dated December 13, 12, 10, and 26 (Station BJY) with nose swipe results.

Record of Radiation Exposure sheets, form R-105A (102's) January-December 1956. Cumulative dosage report for personnel on decontamination work in Areas 1, 2, 3, 3A, 4, 7, 9B, 9C from August 25, 1956, to October 1, 1956.

Correspondence by D&R Section, January 1 to February, 1956: January 31, 1956, University of California, Los Alamos, New Mexico, to J. B. Sanders from W. S. Johnson, personnel who worked without film badges 18 January 1956. EG&G, 25 January 1956 to W. R. Jones from W. R. Mitchell, requesting new film. Six letters from Dosimetry and Records Radsafe Laboratory, Mercury, Nevada, dated 20 January, February 29, February 28, February 15, February 10, and 8 February, listing film numbers with their corresponding dosages as compared with a  $^{60}\text{Co}$  standard.

Film Calibration Data: Los Alamos, July 5, 1956, film numbers 60001 to 61499 and 601500 to 604999, Du Pont type film packet 559, and UCRL curve calibration.

Film Calibration Data: Los Alamos film densitometer 17 May 1956 for film series 32,000 - 33,000, 37,000 - 38,000, Du Pont film 559\_\_\_ film component 502.

## Box 39

Pacific 1956: H&N film badge issue envelopes, TG 7.4 and 7.5

## Box 39A

Pacific 1956: Form 103-ps, 3x5 white cards: Film badge number with dose, numerical order.

## Box 39B

Pacific 1954, 1955, 1956: Badge issue records; filed by numerical badge number A1, B1, C1, D, E1, F1, G1, H1, J1, K1, L1, M1, N1, R1.

## Box 39C

Pacific 1956: Badge issue records, by numerical badge number.

## Box 39D

Pacific 1956: Badge issue records, by numerical badge number.

## Box 39E

Pacific 1956: Badge issue records, by numerical badge number.

## Box 39F

Pacific 1956: Badge issue records by numerical badge number.

## Box 39G

Pacific 1956: Badge issue records, by numerical badge number.

## Box 39H

Pacific 1956: White 5x8 cards, alpha order, cumulative personnel exposure records.

## Box 40

Continent 1957: DTL NTS, summary 1957 alpha listing with exposures, USAF-ADP Project - NTS, alpha listing with exposures.

1957, Quarterly report - first quarter and April by organization; Plumbbob quarterly personnel gamma radiation summary report for the period April 25, 1957 to July 31, 1957; Appendix I: discussion of the reporting system; Appendix II: List of organization code numbers; Appendix III: total to date 2R exposure list; Appendix IV: is the total report, currently contains dosage information on 8,353 individuals.

Plumbbob quarterly personnel radiation report, August 1 to October 9, 1957. Alpha, NTS dosage report, October to December, inclusive, 1957.

Monthly radiological exposure reports by organization, May thru June 1957.

Monthly radiation exposure report by organization for July.

Monthly radiation exposure report by organization for August.

Monthly radiation exposure report by organization for October 14, 1957, to December 31, 1957.

Monthly radiation exposures by organization for November 7 to December 31, 1957.

Box 41

Continent 1957: DTL NTS, Daily personnel gamma radiation exposure report, by organization, May 15 to June 15, 1957.

Daily personnel gamma radiation exposure report, by organization, June 15 to June 30, 1957.

Daily personnel gamma radiation exposure report, by organization July 1 to July 15, 1957.

Daily personnel gamma radiation exposure report, by organization, July 16 to July 31, 1957.

Daily personnel gamma radiation exposure report, by organization, August 1 to August 15, 1957.

Daily personnel gamma radiation exposure report, by organization, August 2 to August 15, 1957.

Daily personnel gamma radiation exposure report, by organization, August 15 to August 31, 1957.

## Box 42

Continent 1957: DTL NTS, Daily personnel and doses in excess of 2R, gamma radiation exposure report, by organization, August 19 to August 31, 1957.

Daily personnel gamma radiation exposure report, by organization, September 1 to September 15, 1957.

Daily personnel gamma radiation exposure report, by organization, September 15 to September 30, 1957.

Daily personnel gamma radiation exposure report, by organization October 1 to October 10, 1957.

Summary, personnel gamma radiation exposure report, by organization, May 1 to December, 1957.

Summary, personnel gamma radiation exposure report, by organization, July 8 to July 22, 1957, with the exception of REECo; exposures listed under "This YR mR" are accrued from January 1, 1957. Summary and total to date 2R list, personnel gamma radiation exposure report, by organization, September 7 to September 16, 1957. Summary, personnel gamma radiation exposure report, by organization, September 23, to October 2, 1957.

## Box 43

Continent 1957: DTL, NTS, 2 hard copies, Alpha, 1952-1957, REECo, total dosages. Alphabetical listing for non-returned film badges. Accumulation dosages for all Rad-Safe personnel for March, April, and May.

Estimated dose to offsite population Operation Plumbbob (Roscoe H. Geoke).

Special dosage report, December thru July with name, organization, film badge number, dosage mR, and batch number. Special dosage report, September thru July, with name, organization, film badge number, dosage mR, and batch number. Also report radiological safety exposure questionnaire/dosimeter and/or film badge mishap. Dosage correction and assignments (radiological safety exposure questionnaire), July thru September. Record of radiation exposures (film badge exposure), form R-101.

Area 11 personnel log (nose swipes), April thru February. Areas U3J, 13, 3, 7, and 9 personnel log, nose swipes. Area 11 personnel face and nose swipes, May, March, and April. Areas 13, 7, and 9, personnel swipes (nose), April and May. Project 57, personnel nose swipes, May and June. Areas 13 and Project 57, personnel nose swipes, September thru February.

Miscellaneous file 1957: Special processing request helicopter mission badges 97 TAU 3 September 1957. Radiological Survey Rad-Safe Division, Mercury, Nevada. RE telecom, Allaire to AEC Duty Officer: Two incidents involving possible internal exposure of personnel to pu occurred August 30. Sandia Corp. (letter) radiation exposure accruals in personnel qualified as Rad-Safety monitors for Operation Plumbbob, the following personnel have accrued exposures as stated below during the period of January 1, 1957. Letter August 29, 1957: The following personnel with high dosages are suggested for the body fluid samples to be sent to Walter Reed Hospital. Special assignments justification of time over the basic work week.

## Box 44

## Continent 1957: DTL NTS Calibrations:

August 15, master and duplicate curves 502/606, 555, SX -262. (Change-over to Du Pont process solutions), August 10 data and curves for 750,000 to 775,000 series; 502/606 - fourth shipment. August 10 data and curves for re-evaluation of Du Pont - 55 film and Du Pont - 834 film.

April 1, 1957, data and curves for 700,000 series 502/606 (first shipment - 5,000). May 13, 1957, data and curves for 700,000 series 502/606, second shipment - 20,000. August 1, 1957, data and curves for 725,000 - 750,000 series, 502-606 (third shipment). February 1, 1957, calibration curves and charts for 70,000 series 502/606. Original data and curves for Du Pont type 553 film evaluation program, February 1, 1957. Original and copies data and curves of Eastman Type 2 Du Pont type 555 evaluation program November 23, 1956, to January 17, 1957. Original data and curves for Du Pont type 559 - 502/606 response check program December 21, 1956, to January 17, 1957. Copies data and curves of Du Pont type 559 - 502/606 response check program December 21, 1956, to January 17, 1957.

LASL-NTS data exchange. Experiment with Du Pont chemicals.

September 25, 1957, Sandia-NTS data comparison. Data Du Pont type 555 field evaluation. May 13, 1957, evaluation Du Pont SX 260, 261, 262. Experimental directional shielding absorption, May 25, 1957. September 23, 1957, data and curves for 502/606 film numbers 775.00 to 999.999, combined with LASL/NTS evaluation data for 502/606 and 555/834. Original data and curves of Eastman type 2 Du Pont type 555 film, evaluation program November 23, 1956, to January 17, 1957. Office memorandums calibration in process.

Correction curves: (5 gray notebooks) 100 mR - 500 mR, 200 mR - 1,000 mR, 500 mR - 1,000 mR, 1,000 mR - 2,000 mR, 2,000 mR - 3,000 mR.

High Density calibration chart for Los Alamos film densitometer, model FD-2, serial no. 203, Mercury Nevada, May 13, 1957. Calibration chart for Los Alamos film densitometer, model FD-2, serial no. 203, Mercury, Nevada, July 30, 1957. Low density calibration chart for Los Alamos film densitometer, model FD-2, serial no. 203, Mercury, Nevada, August 18, 1957. Low density calibration chart for Los Alamos film densitometer, model FD-2, serial no. 203, Mercury, Nevada, September 26, 1957. Calibration chart for Los Alamos film densitometer, model FD-2, serial no. 203, Mercury, Nevada, September 26, 1957.

Miscellaneous File: Office memo, June 24, 1957, official observers assigned numbers. Personnel Dosimetry Branch report, shot (Boitzman) film badges May 28, 1957. Dosimeters information with name and dose. (Note) Film type used during "Smoky" by NTS-badged personnel Du Pont 301-4, 508 - low range, 534 - high range. Office memorandum August 21, 1957, to Floyd W. Wilcox from Jack S. Coogan, subject, George Chant Injury. Report General Monitoring Dosage Record. Quarterly dosage (13 week) 5/25 - 8/25. Certification of lost dosage device. Identification (ID) Application. Supplemental film badge issue slip. Office memorandum film badges/not turned in on Wilson 0-Day. Special dosage report.

## Box 45

Pacific 1957: Alpha listing with exposure. Roster of personnel exposed to radiation (fourth quarter and total exposure).

Quarterly radiation exposure reports from Eniwetok Branch (Redwing 1957 H&N).

RADEX area pre-entry data form (1A-50) H&N January 7, 1957 to March 9, 1957, entry record events: PEARL, TILDA, JANET, SALLY, URSULLA, YVONNE, VERA, BIKINI, RUBY, LUCY, MARY, OLIVE.

RADEX area pre-entry data form (1A-50) H&N, March 11, 1957, to August 31, 1957, entry record events: IRENE, ALICE, GENE, HELEN, YVONNE, URSULLA, KATE, VERA, WILMA, RUBY, FEARL, SALLY.

Radiological counting data sheets, January to December, H&N form (1A-58) sample data from fish.

## Box 46

Pacific 1957: 5x8 white cards, personnel exposure records.

## Box 48

Continent 1958: DTL NTS, Alpha USAF-ADP Project - NTS listing with exposures. Alphabetical listing with exposures. Summary of NTS-REECO, exposures 1952 thru 1958. NTS, Annual gamma radiation exposure summary 1958 by organization. NTS personnel gamma radiation exposures summary (the dosages are derived from film badges issued and processed during the period December 26, 1957, to August 31, 1958; also personnel dosage alert listing in excess of 2R per calendar quarter or 4R per calendar year, December 26, 1957, to August 31, 1958.

Two books, Daily radiological exposure records Operation Hardtack Phase II for the months of September and October, also personnel dosage alert listing.

Radiological exposure reports, monthly, January - July 1958. Radiological exposure reports summary October, November, and December.

Dosage report NTS, first quarter, December 26, 1957, thru March 31, 1958, by organization.

Dosage report NTS, second quarter, December 26, 1957, thru June 30, 1958, by organization; third quarter, December 26, 1957, thru September 30, 1958, by organization.

REECO Rad-Safe Counting Room log and laboratory data nasal and wound swabs.

## Box 49

Pacific 1958: Five books, radiation dosage roster Operation Hardtack Phase I.

Book 1, May 5 - May 20, 1958. Book 2, May 21 - May 31, 1958. Book 3, June 2 - June 18, 1958. Book 4, June 19 - July 15, 1958. Book 5, July 17 - August 1, 1958.

## Box 50

Pacific 1958: "Dose roster of personnel exposed to whole-body ionizing radiation." This report covers exposures to personnel at EPG for both the fourth quarter and the year 1958 (January 1, 1958, thru March 31, 1958, and last quarter 1957).

Hardtack Phase I, TG 7.5 dose roster of personnel exposed to whole-body ionizing radiation, April 1, 1958, thru June 30, 1958. Hardtack Phase I, TG 7.5 dose roster of personnel exposed to whole-body ionizing radiation, April 1, 1958, thru September 4, 1958.

Total dose report, 7.5 radiation record for Hardtack I, May 1958, by organization.

Total dose report 7.5 by organization June 3, 1958.

Total dose report 7.5 Hardtack I by organization July 2, 1958.

Total dose report 7.5 Hardtack I by organization, August 6, 1958.

Total dose report 7.5 Hardtack I by organization, September 4, 1958.

Total dosage roster Operation Hardtack I, June 16, 1958 (organization).

Total dosage roster Operation Hardtack I, June 27, 1958 (organization).

Total dosage roster Operation Hardtack I, July 15, 1958 (organization).

Total dosage roster Operation Hardtack I, August 1958.

## Box 51

Pacific 1958. Total dosage roster Operation Hardtack 1, Headquarters JTF-7 (TG 7.6) & Task Group 7.1. Total dosage roster Operation Hardtack 1, Task Group 7.2 and Task Group 7.4. Total dosage roster Operation Hardtack 1, TG 7.1, August 6, 1958. Total dosage roster Operation Hardtack 1, TG 7.2, August 6, 1958. Total dosage roster Operation Hardtack 1, TG 7.3. Total dosage roster Operation Hardtack 1, TG 7.4, August 6, 1958. Total dosage roster Operation Hardtack 1 August 6, 1958, TG 7.6. Radiation record for Hardtack 1, all organizations except TG 7.5.

## Box 52

Pacific 1958: Total Dose report, Hardtack Phase I (supplement October 1, 1958).  
Master dosage report Operation Hardtack Phase I, April 1, 1958, thru August 31,  
1958, for TG 7.1 thru 7.6. Final dose roster for TG 7.1, 7.2, and 7.3, July 3,  
1958. Total dose roster, TG 7.1 thru 7.6, August 5, 1958.

## Box 53

## Box 60

Pacific 1958: H&N film badge issue envelopes (badge number order) 04000 thru 07000.

## Box 61

Continent 1958: Previous exposure histories. Office memorandum: July and August, dosimeter readings area cleanup. Urinalysis data. Special incidents (accidents) and cases requiring monitoring. Radiological safety exposure questionnaire (dosimeter and/or film badge mishap). Certification of lost dosage device.

Correction curves 200 mR to 1,000 mR.

February 13, 1958, data and curves for 502 film periodic calibration film numbers 784.000 thru 790.000.

July 9, 1958, data and curves for 502 film periodic calibration film numbers 784000 - 790000.

October 12, 1958, calibration curves. Film calibration log.

Miscellaneous file and correspondence. Radiological survey report. Office memorandum dated 06/13/58, dose information on ORNL personnel assigned to CETG for Project 58-1.

Special dosage report: personnel of Area U-12-B received the following dosage on September 5, 1958.

Office memo: Attached list for Upshot Knothole exposures for UCRL, total gamma radiation dated 12/18/58. Report on Area 3 decontamination and underground site exploration.

Office memo: FC AFSWP and TAU received greater than 5R for Hardtack - Phase II, dated 11/26/58. Rough drafts on additional reports. Incoming and received communications messages.

Drawing, radiation telemetering system. Letters of acknowledge receipt of letters from various organizations. Letters to REECO from various organizations requesting and stating past histories of exposures and releases.

## Box 62

Continent 1959: USAF-ADP project NTS, alpha listing with exposures. NTS, alphabetical, annual radiation exposure summary. NTS annual radiation exposure summary, organizational. NTS, personnel radiation exposure quarterly summary, January to July. NTS, personnel radiation exposure quarterly summary August to December.

Laboratory data nasai or wound swabs. Total internal exposures. Laboratory data. Urine data from LRL or LASL, 1958 - 1959. Laboratory data urine. Bioassay data. REECO R/S counting room log, nasal and swipe December 11, 1958 to June 23, 1959 (Area 12). Previous exposure histories.

## Box 63

Continent 1959: Missing Source Cards, 900,000 - 930,373. Non-returns. Calibration of  $^{60}\text{Co}$  sources for use in Film Dosimetry by A. N. Tschaeche, February 1959. U.S. Department of Commerce Washington National Bureau of Standards Report on Calibration of Radioactive Cobalt-60, Department of the Army, Armed Forces Special Weapons Project, Sandia Base, Albuquerque, New Mexico.

Old calibration curves for 800,000 series 502 & 834 film. Comparison between FD-1 and FD-11 density readings. Calibration data, March 31, 1959. Personnel dosimetry (processing). Certification of lost dosage device. Acknowledge receipt of exposure histories letters.

Exposure history of John Van Derbeck. Exposure data (radioiodine).

Neutron badge cards (IBM). Summary of laboratory data for week ending June 28, 1959.

Correspondence: Acknowledge receipt of letters from various organizations requesting and stating past histories of exposures and personnel history releases.

## Box 64

Pacific 1959: EPG, alpha listing with exposures. H&N quarterly radiation exposure report, first quarter January 1, 1959 to March 31, 1959. Task Group 7.5, exposed to whole-body ionizing radiation during the period January 1 thru March 31, 1959. Task Group 7.2 and 7.3 personnel exposed to whole-body ionizing radiation during January 1 thru March 31, 1959.

Report: H&N exposed to whole-body ionizing radiation during the period of April 1 thru June 30, 1959.

Report: TG 7.1, 7.2, 7.3, 7.5 (personnel other than H&N) exposed to whole-body ionizing radiation during April 1 thru June 30, 1959.

Report: H&N, TG 7.1, 7.2, 7.3, 7.4, 7.5 personnel (other than H&N) exposed to whole-body ionizing radiation during July 1 thru September 30, 1959.

Report: All personnel exposed to whole-body gamma radiation at EPG for the period October 1 thru December 31, 1959 (fourth quarter), and also total for 1959: H&N, JTF 7, TG 7.1 - University of Dayton, 7.1 - University of Hawaii, TG 7.1 - University of Michigan, TG 7.1 - Sandia Corp., TG 7.1 - University of Texas, TG 7.1 - University of Washington, TG 7.2, TG 7.3, TG 7.4, and TG 7.5.

Radiological counting data sheets. RADEX area pre-entry data form: October 1958 thru February 1959; Yvonne, Leroy, Ursulla, Glen, Mary, Wilma, Janet, Irene, David, Bruce, Tilda. February 1959 thru October 1959, Janet, Wilma, Mary, Yvonne, Pearl, Ursulla, Tilda, Sally, Oscar, Peter. October 1959 thru November 1959, Alice, Belle, Mary, Clara, Edna, Mack, Janet, Tilda, Yvonne, Leroy, Irene, Glen, Helen.

H&N Pacific 1959, 5x8 white cards, cumulative personnel exposure records, box 1 of 2 and 2 of 2, alpha order.

## Box 65

Pacific 1960: H&N, report includes all personnel who were exposed to whole-body ionizing radiation at EPG during the period April 1 thru June 30, 1960. 1960 alpha listing with exposures (Pacific).

## Box 66

Continent 1960: 1960 Nevada, alpha listing with exposures. Summary dosage report (organization). Summary dosage report (alphabetical). NTS, personnel radiation exposure interim report, during the period December 21, 1959 thru July 22, 1960. NTS, personnel radiation report, December 21, 1959 thru July 31, 1960. NTS, personnel radiation exposure summary report, December 21, 1959 thru October 31, 1960. Monthly dosage report December 21, 1959 thru July.

Two monthly dosage reports, August 31, 1960 for alpha and organization. Monthly dosage report, September 30, 1960, organization. Monthly dosage report, October 1960, organization (30 mR or higher). Dosage report for November and December, alpha. Dosage report for December 1960, alpha.

Three radiation exposure reports, first quarter 1960, alpha, organization, and identification number listings. Two radiation exposure reports, second quarter 1960, organization and identification number listings.

## Box 66A

Continent 1960: First quarter non-returned film badges. First quarter damaged badges. Non-returned film badges.

Film calibration log, Du Pont #502 film June 8, 1960. Film calibration log, Du Pont type SX-301, components 508-834, September 1, 1960. Film calibration log, high range film calibration #2/3, September 19-21, 1960. Film calibration log #4, October 15, 1960. Density-dosage conversion calibration #2, September 1, 1960, FD-11, Serial #100 densitometer. Density-dosage conversion from October 17, 1960 for 508 film, read on FD-11 densitometer, serial #100. Density-dosage conversion from calibration #1, June 8, 1960, for 502 film, read on FD-11 densitometer, serial #104.

Effects of temperature on dosimetry film 1960 study. Bioassay Data. Lab data urine.

Certification of lost devices. Previous exposure histories. 5x8 white cards, lab Pu tracks.

## Box 67

Continent 1961: Nevada, alpha listing with exposures. Annual summary dosage report, alpha. Annual summary dosage report, organization. 1961 NTS personnel listing alpha by organization with additions. New master list, alpha, February 8, 1961 Rad-safe master file versus FSI master file, October 18, 1961. Unmatched rad-safe listing October 18, 1961. Unmatched FSI listing, October 18, 1961.

Monthly dosage report: two alpha and organization for January.

Monthly dosage report: two alpha and organization for February.

Monthly dosage report: two alpha and organization for March.

Monthly dosage report: three alpha and two organization for April.

Monthly dosage report: two alpha and organization for May.

Monthly dosage report: two alpha and organization for June.

Monthly dosage report: two alpha and organization for July.

Monthly dosage report: two alpha and organization for August.

Monthly dosage summary, January thru October 27, 1961, alpha. Monthly dosage summary, January thru November 30, 1961.

## Box 68

Continent 1961: Weekly summary dose report: two alpha and organization for September 16, 22, 29. Weekly summary dose report: two alpha and organization for October 6, 13, 20. Weekly summary dose report: two alpha and organization for November 3, 11, 17, 24, 31. Weekly summary dose report: two alpha and organization for December 1, 7, 9, 15, 22, 29.

First daily dose report, December 13 thru 27, 1961.

Laboratory data - urine. Rad-safe lab urine analysis records. Lab data - surface swipes. Lab swipes nose.

Special dosage report (Book #1).

## Box 69

Continent 1961: REECO NTS, Radiological Safety Division, permission sheets to obtain from past employers personal medical history relative to past radiation exposures. REECO Rad-Safe questionnaire (average liquid per day).

Film exchange and non-returns. Exposures over 100 mR, exposure assignments and experimental film. LASL/NTS data exchange, Du Pont 834 film. Du Pont 508 film. Du Pont 555 film. LASL/NTS data exchange, H-8 badge type 544 film (555 & 834) type 556-3 film (508 & 834) September 1961.

Density-dosage conversion for Du Pont 555 film (LASL - H-8) December 19, 1961, from calibration #10 FD-11, serial # 103 densitometer. Du Pont 508 film density-dosage conversion FD-11 densitometer, serial #103, calibration No. 11, October 14, 1961.

Master curve individual curves from Kodak type "A" neutron film calibrations. Polaroid and other commercial film experiments.

11-point calibration check June (film # 000001 to 020000). Calibration #5, April 15, 1961. Calibration #6, June 20, 1961. Calibration #6A, August 23, 1961. Calibration #6B, August 29, 1961. Calibration #7A, September 25, 1961. Calibration #9, 508 film, September 25, 1961. Calibration #10 LASL - H-8 badge, Du Pont 555 film.

$^{60}\text{Co}$  source calibration August 1961.  $^{60}\text{Co}$  source calibration August 1961 (file copy). Ansco densitometer, 508 film calibration.

Miscellaneous, density-dosage conversions.

## Box 70

Continent 1961: Preliminary rate and distance calculation for modified UDM-1 source fixture. Density-dosage conversion calibration #5, April 15, 1961, Du Pont 508 film, FD-11 densitometer #104. Calibration #6, June 20, 1961, Du Pont 508 film, FD-11 densitometer #104. Calibration #7A, September 25, 1961, Du Pont 834 film, FD-11 densitometer, serial #103. Calibration #9, September 26, 1961, Du Pont 508 film, FD-11 densitometer, serial #104. Calibration #11, October 14, 1961, Du Pont 508 film, FD-11 densitometer, serial #103. Calibration #11, October 14, 1961, Du Pont 508 film, FD-11 densitometer serial #104. Calibration #11, October 14, 1961, Du Pont 508 film, #30,000-50,000, FD-11 densitometer, serial #104. Calibration #11, October 14, 1961, Du Pont 508 film, FD-1 stand-by densitometer. Calibration #12, November 27, 1961, Du Pont 508 film, FD-11 densitometer, serial #103. Calibration #14, February 26, 1961, Du Pont 508 film, #100,000-125,000 FD-11 densitometer, serial #100.

Area access dosage register Carlsbad 1961 thru 1964.

Correspondence and miscellaneous reports: Tritium exposure calculation from urinalysis data (handwritten on various scrap paper).

Special dosage report: Externals, internals, plus estimates of dosages fourth quarter.

Miscellaneous IBM print-out sheets.

Mesa 1961 handwritten report on yellow scrap paper.

U.S. Department of Commerce, Weather Bureau computation and tabulation sheets.

Process damaged neutron film. Results on experimental film badge and results.

Dosage report on LASL - H-8 film badges from KIWI BLA run December 7, 1961.

Indian Springs Air Force Base film badges worn December 22 and 03, 1961.

Master changes for organizational coding May 22, 1961. Dosage corrections memorandums, also assigned dosages. Letters sent to REECO acknowledging various requests for past medical and radiation history. Misplaced issue cards memo.

Doses special process batches 1-282, 1-284, 1-285, 1-286.

Information on overburden and blowers for B Tunnel.

Current dosimetry procedures NTS, memorandums. Current dosimetry procedures.

Radiation safety master work cards (IBM - no punch).

ations," pp. 671-678 (Washington, DC:  
April 1962 Edition).

APPENDIX 3 to ANNEX B

## APPENDIX B

### ANNOUNCED NUCLEAR DETONATIONS

This appendix contains information concerning all announced nuclear detonations carried out by the United States, the U.S.S.R., the United Kingdom, and the Republic of France prior to January 1964.

The dates and times given in the list of U.S. shots are Greenwich Civil Time (GCT). The heights of burst are heights above the surface; the heights of the cloud and tropopause refer to mean sea level (MSL). The abbreviations T, KT, and MT are used to express the explosion yields in tons, kilotons (1,000 tons), and megatons (1,000,000 tons) TNT equivalent, respectively. The term "nominal" implies a yield of approximately 20 kilotons TNT equivalent.

The approximate latitudes and longitudes of the various test sites are as follows:

<b>UNITED STATES</b>	
Nevada Test Site, U.S.A.....	37° N. 116° W.
Eniwetok Proving Grounds, Pacific:	
Eniwetok.....	11° N. 162° E.
Bikini.....	11° N. 165° E.
Johnston Island, Pacific.....	17° N. 169° W.
Christmas Island, Pacific.....	2° N. 157° W.
<b>UNITED KINGDOM</b>	
Monte Bello Islands, Australia.....	20° S. 115° E.
Woomera, Australia.....	31° S. 137° E.
Maralinga Proving Ground, Australia.....	30° S. 131° E.
Christmas Island, Pacific.....	2° N. 157° W.
Nevada Test Site, U.S.A.....	37° N. 116° W.
<b>U.S.S.R.</b>	
Arctic Test Site.....	75° N. 55° E. (Novaya Zemlya).
Siberian Test Site.....	52° N. 78° E.
U.S.S.R.....	Denotes the explosion was in Soviet territory, but the test site was not identified.
<b>REPUBLIC OF FRANCE</b>	
Reggan, Algeria.....	27° N. 0°.
In Ekker, Algeria.....	24° N. 5° E.

## ANNOUNCED UNITED STATES NUCLEAR DETONATIONS

Name	Date (GCT)	Time (GCT)	Location of Shot	Height of Burst (Feet)	Type of Burst	Mean Sea Level (Feet)			Yield	Remarks
						Cloud Top	Cloud Base	Tropopause		
TRUCILLY:										
Trinity.....	16/7/45	1230	Alamogordo, N.M.....	100	Tower.....	35,000			19 KT.....	
WORLD WAR II.....	5/8/45	2316	Hiroshima, Japan.....	~1,000	Air.....				Nominal.....	First test of an A-bomb.
	9/9/45	0156	Nagasaki, Japan.....	~1,800	Air.....				Nominal.....	First combat use.
CROSSROADS:										Second combat use.
Abk.....	30/9/46	2201	Bikini.....	520	Air.....	35,000			Nominal.....	
Baker.....	24/7/46	2135	Bikini.....	-80	UW.....	8,000			Nominal.....

Arbury	14/11/63	1600	853	Underground	Alluvium	660, 45	Low	
Mirco	14/11/63	1650	644	Underground	Alluvium	125, 18	Low	
Greys	22/11/63	1628	998	Underground	Alluvium	470, 42	Low	
Recline	4/12/63	1628	825	Underground	Alluvium	650, 50	Low	
Engle	12/12/63	1612	641	Underground	Alluvium	440, 60	Low	

\* Depth is distance to nearest point at the earth's surface.

† Detonation is subsidence of earth into underground cavity, as distinguished from crater formed by throw-out of earth.

‡ Low yield means less than 20 kilotons; intermediate means 20 to 99 kilotons; high means 100 to several megatons.

§ For purposes of detailing announced detonations, and 23 underground U.S. weapons related tests at the Nevada Test Site as having been conducted between September 14, 1961, and August 20, 1963. No other data on the 23 tests are available for public use.

VELA UNIFORM SEISMIC DETONATION

## PLOWSHARE NUCLEAR DETONATIONS

Name	Date (UCT)	Time (UCT)	Depth (ft)	Medium	Yield	Location	Remarks
Channe	10/12/61	1900	1,184	Salt	8.1 KT	Near Carlsbad, N. Mex.	Multiple-purpose experiment; formed hemispheric cavity, 160-170 ft diameter, 60-80 ft high.
Redon	6/7/62	1700	635	Alluvium	100 KT	Nevada Test Site	Excavation experiment; formed crater about 1,200 ft diameter, 320 ft max depth; displaced about 6.5 million cu yd or 19.4 million tons of earth
Anacostia	27/11/62	1809	760	Tuff	Low	Nevada Test Site	Plowshare Device Development Test.
Kaweah	21/2/63	1947	760	Alluvium	Low	Nevada Test Site	Plowshare Device Development Test.
Tornillo	11/10/63	2100	890	Alluvium	Low	Nevada Test Site	Plowshare Device Development Test.

For the development of peaceful uses of nuclear explosives.

## SAFETY EXPERIMENTS

Since 1955, the U.S. Atomic Energy Commission has conducted a number of safety experiments at the Nevada Test Site to determine the safety of nuclear weapons in case of accident. The following list includes those experiments which resulted in a measurable nuclear yield.

Name	Date (UCT)	Time (UCT)	Location of Shot	Height of Burst (Feet)	Type of Burst	Mean Sea Level (Feet)			Yield	Remarks
						Cloud Top	Cloud Base	Tropopause		
1824 PLUMBIBID	10/1/56	2130	Nevada		Surface					
1825 Faisal A	2/27/57	0900	Nevada		UO	8,000				Flight nuclear yield.
1826 Goulomb B	6/9/57	2015	Nevada		Surface	18,000	60,000	60,000	0.3 KT.	
1827 Faisal C	6/12/57	2015	Nevada		Vertical shaft					Slight yield.
1828 Coulomb C	9/12/57	2000	Nevada		Surface				0.5 KT.	
1829 HARDTACK PHARE										
1830 Oleo	12/9/58	2100	Nevada	-900	UO	9,000	8,500		31 T.	
1831 Bernillo	17/2/58	1930	Nevada	-456	UO	7,800	8,500		15 T.	
1832 Luna	21/9/58	1900	Nevada	-461	UO			Low diffuse cloud	1.8 T.	
1833 Valencia	26/9/58	2000	Nevada	-984	UO	5,500			2 T.	
1834 Mars	26/9/58	1950	Nevada		UO			Low diffuse cloud	13 T.	Shot vented through tannin.
1835 Hidako	8/10/58	1410	Nevada	377	Balloon	12,000	8,000		77 T.

JOINT UNITED KINGDOM-UNITED STATES NUCLEAR DETONATIONS

Date	Type of Burst	Yield	Location	Remarks
1/3/62	Underground	Low	Nevada Test Site	Announced by AEC as a joint United States-United Kingdom test of a British nuclear device
7/12/62	Underground	Low	Nevada Test Site	

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
18 June 1978 to 14 July 1978

ANNEX C

Field Command, Defense Nuclear Agency, Kirtland AFB, Albuquerque, New Mexico  
United States Air Force Special Weapons Laboratory, Kirtland AFB, NMex  
Kirtland Air Force Base Technical Library, N Mex  
Dates of Visit: 28 June - 1 July 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr William Isengard, Field Command, Defense Nuclear Agency, Kirtland AFB
- b. Dr Ward A Minge, Historian, USAF Special Weapons Laboratory, Kirtland AFB
- c. Mrs Anna DeBlassie, Installation Records Management Officer, Kirtland AFB

2. BACKGROUND:

a. In 1937 Albuquerque, New Mexico, had a small municipal airport which possessed the potential for immediate and immense expansion. World War II saw this realized. Using a common runway system, Kirtland Air Force base came into existence during World War II. With the Manhattan Project and later Armed Forces Special Weapons Project, a small adjoining enclave named for the nearby Sandia Mountains was created. This was Sandia Base. A few miles further into the Sandia Mountains, the Manzano Tunnel Complex was created as a secured storage & extension of Sandia Base. Thus, three separate and distinct military installations were created in the environs of Albuquerque's original municipal airport.

b. All three installations still exist as operating activities, however, they have been consolidated into a single huge sprawling United States Air Force reservation. The Sandia Base and Manzano names have disappeared and all are now simply referred to as "East" or "West" areas of Kirtland Air Force Base. The only change in their original functions is the addition of the newly created Department of Energy. Both the Defense Nuclear Agency Field Command as successor to the original Armed Forces Special Weapons Project and the Department of Energy interests occupy tightly controlled compounds on Kirtland Air Force Base. A USAF Air Base Wing controls the installation and provides normal housekeeping support to all DOD and DOE activities located there. This move toward consolidation at the DOD level has had both good and bad effects.

c. Certain common functions have been consolidated; others have not. Prominent examples here of immediate concern to the field search were the records management functions and operation of the technical library. Records management functions as pertains to USAF and AFSWP/DASA/DNA activities have always been separate and are still separate today. Operation and maintenance of the technical libraries at Kirtland until recently were separate functions, i.e., the USAF Special Weapons Center operated its own technical library as did the Field Command of AFSWP/DASA/DNA. With consolidation of other installation support functions, both technical libraries were combined. This had both good

and bad effects as will be noted in the paragraphs following which deal separately with the Kirtland Technical Library.

### 3. CURRENT SITUATION:

a. Field Command, Defense Nuclear Agency. Despite change in the name of the agency, i.e., AFSWP, DASA, DNA, ETC., its operation at Sandia Base and more recently Kirtland Air Force Base has always been the Field Command. It is and has always been a tri-service headquarters. Manning has been on a pro rata basis divided between the military departments. In addition to the uniformed staff, it has a large and fairly stable civilian personnel complement of administrators, technicians, specialists and scientists. Since creation of the original parent organization (AFSWP) in 1947 by joint agreement between the Secretary of War and the Chief of Naval Operations, it has been equally concerned with tests within continental United States as well as the Pacific. It has generally taken the lead in the scientific and theoretical aspects of the test series leaving for the most part the purely military application of the test series to the military departments.

(1) Due largely to the more critical logistical demands, joint task forces were organized to conduct the Pacific tests. The most notable of these joint task forces were JTF-3, JTF-7, and JTF-132. Each figured repeatedly in the test series and the scientific leadership as well as much of the tactical direction came from the Los Alamos Scientific Laboratory. The joint task forces were organized internally into joint task groups identified in the following manner: JTF-3 was organized as JTG-3.1 (Scientific group); JTG-3.2 (Army group) JTG-3.3 (US Navy group); JTG-3.4 (US Air Force group); JTG-3.5 (Contractor group, e.g., Narver & Holmes, REECO, etc.). Each of the joint task forces were organized in the same manner.

(2) The Directorate for Weapons Effects Tests (DWET) of the Field Command generally took the scientific lead in the test series from the DOD point of view. Matters of purely Departmental interest were largely left to the appropriate military department. Thus, the Air Force took the lead in the development and testing of air doctrine, tactics and techniques for nuclear weapon employment; the Army for ground operations; and, the Navy for surface and underwater application. This probably worked well for the many diverse groups involved in the entire series of tests; it did not work well for the orderly creation and maintenance of any central radiation exposure dosimetry service. As with other scientific, ordnance or doctrinal interests, each major task group tended to do its own dosimetry. Hence, Field Command's approach to the NTPR Project is purely parochial. The Field Command Project Officer is tasked only to identify former Field Command personnel for dosimetry study !

(3) Despite this somewhat narrow view, Mr Isengard, the DNA NTPR Project Officer, has extended his explorations productively far afield. He had no data per se which would provide individual identification or dosimetry histories for Desert Rock Army troop participants, but he had carefully screened the assets of the Kirtland Combined Technical Library for materials germane to the overall NTPR Project. The results emerged as a splendid bibliography of technical publications held by the Kirtland Technical Library which are central to the end results of the Nuclear Test Personnel Review Project. The bibliography is arranged alphabetically by topic for general studies including a

reference section and concluding section dealing with reports and studies which are specifically identified with particular shots in the entire series by AEC code names, i.e., Tumbler-Snapper, Teapot, Hardtack, etc. The section on OPERATION PLUMBOB is especially impressive. A copy of this bibliography is appended to this Annex.

b. Kirtland Air Force Base Technical Library. It was not clear at the time of the visit if the total assets of the Sandia Laboratories Technical Library had been integrated into the combined Kirtland AFB Technical Library. In any event, Mr Isengard had included Sandia Laboratory Technical Library publications in a separate section of his bibliography. Even if not physically located in the Combined Library, these publications were thus identified and located for easy reference and use. For lack of formal title, Mr Isengard's bibliography will be referred to hereinafter as the DNA NTPR Bibliography.

(1) The DNA NTPR Bibliography had been constructed largely as a blueprint of studies, reports and publications dealing with the technical aspects of the nuclear test series. Of course, many were wholly concerned with military applications. This concern, however, was from a tactical, strategic or doctrinal overview for national interests of the United States. Troop involvement and employment per se had not been a primary focus in the construction of the DNA NTPR Bibliography. This, then, became the primary topic of our lines of investigation in the Kirtland AFB Combined Technical Library. From the Army viewpoint, this was a very disappointing line of inquiry. Rarely were more than the names of primary exercise staff or test directorory names found in the many technical publications which were reviewed. For the United States Air Force involvement, the resources of the Kirtland Technical Library were a veritable goldmine for positive troop participation identification.

(2) Contrary to Army practice during the Desert Rock Exercises, the Air Force committed what appear to be regular TO&E units as exercise participants. It was the Army practice during these years to commit a few regular TO&E support units (some up to the battalion or regimental levels but mostly at the unit, platoon, detachment and company levels) to the exercises. The vast majority of the Army troop participants were drawn from the unnumbered US continental Armies, e.g., from the organizations which were assigned geographically to each of the six numbered continental armies. Selection was largely left to unit command discretion in keeping with other mission requirements. These selected troops were then organized into Composite Units on arrival at the exercise site and subsequently appeared in the official after action reports as "Composite Unit, 1st Army," "Composite Unit, 2nd Army," etc. To date reliable and complete personnel rosters or name lists identifying the troops comprising these composite units have not been located. Air Force reliance on regular TO&E organizations (for the most part at the Air Force Wing level) completely avoided the monumental problem now faced by the Army.

(3) A simple Morning Report search of the Air Force units known to have participated in the nuclear test exercises could guarantee almost 100% accuracy in personnel identification. This would be far more complete than the Army's present search along these lines because the Air Force list of known unit participation is far more accurate. Then, the Air Force program of periodic historical reporting now greatly eases its search operations. These historical reports are quarterly, semi-annual and annual; required of all Air Force organizations and normally consolidated at the Wing or Base level.

They are essentially operational in nature. Many of the Air Force organizations participating in the nuclear test series were committed from Kirtland Air Force Base. Copies of the historical reports prepared by the participating Air Force organizations from Kirtland and elsewhere are on file with the Kirtland Technical Library. Some are complete to the point of identification of participating unit personnel. While splendid for Air Force exploitation in support of the current NTPR Project, they are of no help to the Army. As a matter of fact, there are no Army-counterpart publications of this nature in the Kirtland AFB Combined Technical Library.

(4) The Kirtland Air Force Base Combined Technical Library is "on-line" with the search bibliography computer of the Defense Documentation Center at Cameron Station. While at Kirtland, a routine computer search was made of DDC assets which might be contributory to the Army's search. These trial computer runs were limited to the Tumble-Snapper and Upshot-Knothole Exercises (Desert Rock IV and V). The results were unimpressive. They yielded only a few general studies held by DDC with cross-references to these descriptors and identifiers. One AEC publication dated 31 January 1971 was identified which provides an excellent index to the entire test series. This is the USAEC Publication (TID-9534), "Status of Nuclear Test Reports." It lists all known test reports developed in connection with the entire test series and arranges them in order of test shot by AEC designation, Trinity, Castle, Ivy, Dominic, Tumbler, etc. While extremely valuable to the overall NTPR Project, its SRD security classification makes it a bit awkward to work with in the absence of adequate safeguards.

c. USAF Special Weapons Laboratory. Throughout the period of the 1950 nuclear test series, the USAF Special Weapons Laboratory was known as the USAF Special Weapons Center. Despite changes in designation, its traditional home has been and continues to be Kirtland Air Force Base. It is the Air Force focus of air drop aspects of nuclear device employment. When Kirtland, Sandia and Manzano were consolidated, the USAF Special Weapons Laboratory Technical Library was consolidated with that of the Field Command of the Defense Nuclear Agency. Librarians from both activities are still indignant over this decision and some of the "purging of duplicatory matter" which followed. There may be some justification for the criticism which followed this action. While some convenience of arrangement might have been lost, it is highly doubtful that any real loss actually occurred.

(1) The Historian of the USAF Special Weapons Laboratory seized upon this opportunity to vastly augment his holdings of historical background materials by picking up most of this "purged duplication." Consequently, Dr Ward A Minge and his staff hold what undoubtedly is the world's second finest collection of materials dealing with nuclear device development and employment doctrine. Most of this, naturally, is keyed to the mission activity of the USAF Special Weapons Center/Library through the years. There are, in addition, considerable holdings in general materials dealing with overall DOD interests as opposed to purely Air Force interests. The exact size of this collection is not known. It currently occupies most of the ground floor and vault space of the headquarters building of the USAF Special Weapons Laboratory -- certainly, running some hundreds or thousands (?) of linear feet. Largely a one-man operation, we made no effort to unravel the arcane mysteries of its arrangement, indexing and finding aids but rather entrusted our search requests to its chief architect!

(2) Dr Minge immediately extended the Army's field search every professional courtesy. He suspended all other research activity and pressed his entire staff into a massive search of his holdings for materials bearing on the Army's personnel and troop participation in the Desert Rock Exercises. The results were negative. At the end of a full day, it became obvious that the materials he held which dealt with organizational and troop participation in the nuclear test were limited to Air Force units. Again, this is a veritable treasure trove for the USAF NTPR Project Officer, but of little immediate application to Army interests.

d. Kirtland Air Force Base Records Staging Area. At this point in the Kirtland Air Force Base phase of the field search for documentation dealing with the Desert Rock Exercises, we turned to the traditional apparatus for handling retired records. Devolving from the Army system, the Air Force has created a parallel installation-level collection, holding and shipping function for the handling of inactive, cut-off, and retired records. In view of other functional consolidations which had taken place at Kirtland, it was reasoned that records management might also have been handled in this manner in the near or distant past. Specifically, permission was requested to examine the control records of the Kirtland AFB Records Staging Area in an effort to determine whether or not it might have handled Army exercise, AFSWP Field Command, or DASA records due to its geographical proximity to the exercise test sites.

(1) Permission was readily granted for access to the Kirtland Air Force Base Records Staging Area's transmittal and shipping files. These files revealed a continuous operation since 1957 following traditional shipping lanes in being at that time, i.e., shipment of retired Air Force records to St Louis until roughly 1967 at which time they were directed to the newly constructed Washington National Records Center at Suitland, Maryland. Content of these shipments were limited solely to Air Force generated materials. At no time in the history of this activity's operation did it perform any records handling services for any non-Air Force organizations. This, then, finally eliminated the possibility of shipment of either AFSWP/DASA/DNA or Army materials through Air Force channels with possible erroneous diversification into Air Force Records Groups on arrival at GSA federal records centers.

(2) The materials which the Kirtland AFB RSA had handled were rich in references to nuclear test activity of the 1950's. Most of this appeared to have been put into records retirement channels by the USAF Special Weapons Center during and after conclusion of the atmospheric test series. Again, this appeared to be a marvelous collection of materials for Air Force interest and current exploitation, but of no real significance to Army interests. Particularly intriguing from the Air Force viewpoint were the transmittal documents for the following shipments to St Louis: 1087-57/23; 187-58/4; 770-60/29; 231-61/13; 62A682/9 and 63A1363/12 !

#### 4. CONCLUSIONS:

a. None of the records and materials physically located at Kirtland Air Force Base, whether in the hands of the Defense Nuclear Agency Field Command, the USAF Special Weapons Laboratory, the Kirtland AFB Records Staging Area, the Kirtland AFB Combined Technical Library or the Sandia Laboratory, are helpful to the Army's present search for troop participation identification data.

b. That USAF, DNA and DOE activities located at Kirtland Air Force Base hold a vast amount of technical data which will of great asistance to later phases of the Nuclear Test Personnel Review Project.

c. That no Army or AFSWP/DASA/DNA Desert Rock Exercise materials were processed by or shipped through Air Force records handling channels to GSA federal records centers for retirement and/or storage.

d. That records of the AFSWP/DASA/DNA Field Command already accesioned into the National Archives for the years 1947-71 are incomplete; that significant blocks of the Field Command's records are not accounted for in those materials held by the National Archives.

RECOMMENDATIONS:

a. That no further search be made of materials presently held by USAF, DNA and DOE activities at Kirtland Air Force Base for missing Army troop participation data.

b. That bibliographies of nuclear test data held at Kirtland Air Force Base be made available to all service teams participating in the NTPR Project.

c. That leads developed as to location of the AFSWP/DASA/DNA data missing from the 1947-71 collection held by the National Archives be pursued immediately in the St Louis National Personnel Records Center and Washington National Records Center.

APPENDICES:

PLUMBBOB WEAPON TEST REPORTS

The following Weapon Test Reports (WT) give references to useful information about each DOD Experiment as may be helpful in the NTPR:

WT-1401, Project 1.1 Basic Airblast Phenomena  
E. J. Bryant  
J. H. Keefer

- 1 - A blast and shock experiment that participated on 10 shots: Franklin, Wilson, Priscilla, Hood, John, Kepler, Owens, Sotkes, Shasta, Gallileo.
- 2 - No radiation was measured but recovery of records from close-in gages probably resulted in small exposures to project personnel. pg.31 gives gage locations on Priscilla - (most heavily instrumented).  
pg.96 " " " " on all events.

WT-1402, Project 1.2 Field Test of a System for Measuring Blast Phenomena by Airborne gages.  
P. Halon J.S. Ives U.S. Naval Ordnance Lab.  
S. E. Cooper G. S. Scholl

- 1 - Involved rocket & balloon borne pressure instruments and photo stations to triangulate gage positions on balloon tethers.
- 2 - Station layouts given in NTS coordinates-gages recovered after shot.
- 3 - Participated on two shots: Kepler and Owens.

WT-1403, Project 1.3 Airblast Phenomena in the High Pressure Region  
L.M. Swift SRI Field Party- V. E. Krakow  
D.C. Sachs C.M. Westbrook  
A.R. Kriebel R.V. Ohler  
Field Supervisor- W.M. Wells H.C. Waner  
" Chief - L.H. Inman R.E. Aumiller  
J. Milless

- 1 - Project participated on one event - Priscilla
- 2 - Gage layout given - gages hard-wired to recorders.

WT-1404, Project 1.4 Ground Acceleration, Stress, and Strain at High Incident Overpressures.  
L.M. Swift Field Chief= L.H. Inman J. Milless

PLUMBBOB WEAPON TEST REPORTS (CON'T)

D.C. Sachs  
F.M Sauer

Asst. Field Chief= W.M. Wells  
Field Party: R.E. Amiller  
V.E. Krakow

R.V. Ohler  
C.M. Westbrook  
H. Wuner

- 1 - Part of report included in WT-1407.
- 2 - Project participated on one event - Priscilla.
- 3 - Various stress & strain gages were hard-wired to central station.
- 4 Report gives gage layout from 450ft to 1350ft.

WT-1405, Project 1.5 Ground Motion Studies at High Incident Overpressure.  
W.R. Perret and Sandia Labs personnel.

- 1 - Participated on one event - Priscilla.
- 2 - Report gives gage range from GZ and depth.

WT-1406, Project 1.7 Loading on Simulated Buried Structures at High Incident Overpressures.

E.H. Bultmann ARDC

- 1 - Project participated on one event - Priscilla.
- 2 - Used buried instrument drums - no manned stations.
- 3 - Drums were recovered for data.

WT-1407, Project 1.8a and 1.8c Effects of Rough and Sloping Terrain on Airblast Phenomena.  
E. J. Bryant BRL/SRI  
L. M. Swift

- 1 - Project participated on one event-Smoky.  
pg.6 gives list of BRL personnel  
Fig 2.5 gives Field layout of gages relative to GZ.  
pg.201-208 Photos of tower and gage lines  
pg 131 - Map.

WT-1408, Project 1.8b Effects of Rough Terrain on Drag-Sensitive Targets  
E.J. Bryant BRL

- 1 - Project participated on one event-Smoky.
- 2 - Involved deployment of vehicles-layout given in report.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

WT-1413, Project 2.1 Neutron and Initial Gamma Shielding  
Robert C. Tompkins U.S. Army Chemical Warfare Laboratory  
Clayton F. Weaver  
Gerald A. Peterson

- 1 - Project participated on: Franklin, Lassen, Wilson, Priscilla, Hood & Owens.
- 2 - Measured Shielding afforded by trenches & shelters in NTS soil.
- 3 - Responsibilities: Ordnance Equipment - Edward J. Bryant-BRL  
Field Fortifications- William H. Van Horn-ERDL/Desert Rock  
Gamma Measurements-Gerald W. Carp-ESL  
Chemical Dosimetry-Sanford C. Sigoloff-SAM
- 4 - Project Personnel- Joseph C. Maloney 2nd LT. H. Craig Miller-ERDL  
Carl Crisco Pfc. L. Neil MacKinnon-BRL  
Capt. David W. Einsel, Jr. (CWL)
- 5 - Pg.15 gives shot participation & area of NTS.
- 6 - Pg.63 gives description of fortifications & shelters.

WT-1414, Project 2.5 Initial Gamma Radiation & Neutron-Induced Gamma Radiation of NTS Soil.  
C. Carp B. Markow U.S. Army Signal Research  
O. Johnson F. Lavicka & Development Laboratory  
T. Baldwin W. McAfee  
R. Larrick

- 1 - Project participated on: Boltzman, Franklin, Lassen, Wilson, Hood, John & Owens
- 2 - To determine initial gamma intensity vs time and distance from 1 msec to 20 Sec. Also to measure neutron-induced gamma as a function of time. Initial gamma on John shot is included
- 3 - Pg 15-87 = Initial gamma data.
- 4 - Pg 85-93 = Neutron-induced gamma data.

WT-1415, Project 2.6 Evaluation of New Types of Radiac Instruments  
A.W. Cohen W.J. Ramm U.S. Army Signal  
M.H. Jachter H.J. Reilly R&D Laboratory  
LT. D. K. Koehler, USA C.R. Siebentritt  
H.M. Murphy

- 1 - Project participated on Franklin, Lassen, Wilson, Priscilla & Hood.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

2 - Pg 19-20 describes recovery of dosimeters at H + 4Hrs. on all events- gives locations.

3 - Pg.31 -describes post-Hood Surveys using the IM-123 meter.

WT-1416, Project 2.7 Investigation of Effects of Nuclear Detonations on Electromagnetic Wave Propagation & Nuclear Radiation Detector Design.

T.D. Hanscome	W.E. Kunz	U.S. Naval Research Lab.
P.A. Caldwell	C.A. Pearse	
S.G. Gorbics	C.M. Stout	
E.C. Jones		

1 - Project participated on : Boltzman, Lassen, Wilson, Priscilla, Hood, Diablo, Kepler, Owens.

2 - Pg.29 gives instrument plan.

3 - Pgs 48, 59-63, 68-72 gives gamma ray data.

4 - Note-Should not have exposed project personnel to Radex areas.

WT-1417, Project 2.8 Evaluation of Military Radiac

E.J. DiIanni	U.S. Naval Material Laboratory
F.C. Riffin	

1 - Project participated on: Wilson, Priscilla, Hood, Diablo.

2 - Involved placement of instrumented masonite phantoms in high radiation fields ( 50 R/hr).

WT-1418, Project 2.9 Nuclear Radiation Received by Aircrews Firing the MB-1 Rocket

Capt. Kermit C. Kaericher, USAF	Air Force Special Weapons Center
Capt. Iedd P. Martin, USAF	
1st LT. James E. Banks, USAF	

1 - Project participated on the John shot.

2 - a/c instrumented for gamma & neutron dose.

3 - Crew received less than 5 Rep Neutrons & 3R Gamma.

WT-1419, Project 2.10 Initial Neutron & Gamma Air-Earth interface Measurements

Capt. E.N. York, USAF	Air Force Special Weapons Center
Capt. R.E. Boyd, USAF	
1st LT. J.A. Blaylock, USAF	

...

PLUMBBOB WEAPON TEST REPORTS (CON'T)

- 1 - Project participated on: Boltzman, Lassen, Wilson, Hood, Diablo, John, Kepler, Owens, Laplace.
- 2 - Pg.16 gives summary of gages & distances (and altitudes) from bursts.
- 3 - Personnel should not have been in radex areas.

WT-1420, Project 3.1 Blast Loading & Response of Underground Concrete-Arch Protective Structures

W.J. Flathaw	U.S. Army Engineer Waterways Experiment
R.A. Breckenridge	U.S. Naval Civil Engineering Laboratory
C.K. Wiehle	

- 1 - Project participated on Priscilla only.
- 2 - Although a structures experiment, effects of radiation on film and recording paper was measured in the 50-200 psi range of Priscilla.
- 3 - pg.123 gives table of results
- 4 - pg.18 gives project plot plan.

WT-1421, Project 3.2 Evaluation of Buried Conduits as Personnel Shelters

LT. JG. G.H. Albright, USN	Bureau of Yards & Docks
LCDR J.C. LeDoux, USN	&
LTJG R.A. Mitchell, USN	U.S. Naval Civil Engineering Lab.

- 1 - Project participated on Priscilla.
- 2 - Although a structures Experiment, buried conduits were instrumented with gamma film packets, chemical neutron dosimeters, and neutron threshold devices - pg.28.
- 3 - Results are tabulated on pg.66.

WT-1442, Project 3.3 Evaluation of Buried Corrugated Steel Arch Structures and Associated Components.

LTJG. G.H. Albright, USN	Bureau of Yards & Docks
LCDR J.C. LeDoux, USN	&
LTJG. R.A. Mitchell, USN	U.S. Naval Civil Engineering Lab.

- 1 - Project participated on Priscilla.
- 2 - Primarily a structures Experiment but buried structures were also instrumented for prompt gamma & neutron radiation.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

- 3 - Pg.12 gives a plot plan for the structures.
- 4 - Pg 100-106 describes interior and free-field radiation and summarize results.

WT-1423, Project 3.4 Blast Effects on Existing Upshot-Knothole and Teapot Structures.

Capt. E.H. Bultmann, Jr., USAF	Armor Research Foundation
Eugene Sevin	Structures Div., Research Directorate
T.H. Schiffman	AFSWC

- 1 - Project participated on Priscilla.
- 2 - Test of existing structures-no useful data on radiation.

WT-1424-1, Project 3.5a Isolation of Structures from Ground Shock  
R.B. Vaille, Jr. Stanford Research Institute

- 1 - Project participated on Priscilla.
- 2 - No useful information for NTPR.

WT-1425, Project 3.6 Full-Scale Field Tests of Dome & Arch Structures

Capt. E.H. Bultmann Jr, USAF	Mechanics Research Division
T.G. Morrison	American Machine & Foundry
M.R. Johnson	AFSWC

- 1 - Project participated on Priscilla.
- 2 - No useful NTPR information.

LTR-1426, Project 3.7 Instrumentation of Structures for Air-Blast and Ground-Shock Effects

J.J. Meszaros	Ballistics Research Laboratory
H.S. Burden	
J.D. Day	

- 1 - Project participated on Priscilla.
- 2 - Provided Air-blast and ground shock instrumentation in support of other structures experiments. No radiation measurements made.
- 3 - No useful NTPR data.

WT-1427, Project 3.8 Soil Survey & Backfill Control in Frenchman Flat.

T.B. Goode	R.W. Cunny	U.S. Army Engineer
W.G. Shockley	W.E. Strohm, Jr.	Waterways Experiment Station

- 1 - This project participated on Priscilla.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

2 - Project was in support of underground structures of Programs 1, 3, and 6, to assure that the backfill procedures assured pre-shot soil conditions.

3 - No data useful to the NTPR.

WT-1428, Project 4.1 Effects of Nuclear Detonations on a Large Biological Specimen

Lt.Col G. M. McDonald	Lt.Col Joseph T. Goldstein
Col William H. Crosby	Maj Kent Woodward
Col Carl F. Tessmer	Maj James N. Shively
Lt.Col William H. Moncrief, Jr.	Capt Harry W. Daniell
Lt.Col Hinton J. Baker	Capt Alexander Horava
Capt Harry A. Claypool	

Walter Reed Army Institute of Research

1 - Project participated on: Lassen, Wilson, Priscilla.

2 - Pgs 24-30 gives radiobiology detail

3 - Station locations are scattered throughout the report. Free-field and internal dosimetry was performed.

4 - Substantial numbers of personnel recovered specimens from Radex areas-dressed in Rad-safe gear.

WT-1429, Project 4.2 Evaluation of Eye Protection Afforded by an Electro-mechanical Shelter

Capt. Wayne E. Gulley, USAF	Aeromedical Laboratory,
Capt. Robert D. Metcalf, USAF	Wright Patterson AFB
Maj. Mathew R. Wilson, USAF	
Capt. Jerome A. Hirsch, USAF	

1 - Project participated on Boltzman, Wilson, Priscilla, Hood, Diablo.

2 - Project personnel not subjected to radiation-nor was it measured.

WT-1430, Project 5.1 In-flight Structural Response of an HSS-1 Helicopter to a Nuclear Detonation

J.H. Walls	BuAir
N.C. Heslin	Sikorsky Aircraft Div., United Aircraft Corp.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

- 1 - Project participated on Boltzman, Franklin, Wilson, Priscilla, Diablo, Kepler, Owens, Stokes.
- 2 - Report mentions no exposure of crew to radiation-nor was any ionizing radiation measured.

WT-1431, Project 5.2 Structural Response and Gas Dynamics of an Airship Exposed to a Nuclear Detonation.

D.A. Gilstad	BuAir
Christian G. Weeber	Aeronautical Structures Lab
Arnold Kviljord	U.S. Naval Material Center
Gordon W. Woods	

- 1 - Project participated on Franklin, Stokes
- 2 - Pg 62 gives distances from GZ, and were such as to receive little or no radiation. None was measured.

WT-1432, Project 5.3 In-flight Structural Response of the Model A4D-1 Aircraft to a Nuclear Detonation

J.H. Walls Douglas Aircraft Co.

- 1 - Project participated on Boltzman, Priscilla, Hood, Diablo, Shasta, Doppler, Smoky.
- 2 - pg.18 gives description of radiation data collection.
- 3 - pg.61 gives method used to interpret radiation data.
- 4 - pg.62 Gives radiation results for each event.

WT-1434, Project, Project 5.5 In-flight Structural Response of an F-89D Aircraft to a Nuclear Detonation

Capt. G. Stalk, USAF	Wright Air Development Center
1st LT. R.E. Gee, USAF	and Northrop Aircraft Co.
1st LT. J.P. Bednar, USAF	

- 1 - Project participated on: Boltzman, Franklin, Wilson, Priscilla, Hood, Diablo, John, Kepler, Owens, Stokes, Shasta, Doppler, Franklin, Smoky.
- 2 - Pg 15-16 Gives method of calculating radiation dose to aircrew and permitted dose to crew.
- 3 - Pg. 33 Gives table of radiation received per each of the events.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

WT-1435, Project 6.1 Mine-Field Clearance by Nuclear Weapons  
Capt. F.E. Deeds, USA                      Midwest Research Institute  
Felix W. Fleming    and  
Robert K. Stamp    U.S. Army Engineering R&D Lab.

- 1 - Project participated on Priscilla.
- 2 - No radiation measurements were made.
- 3 - pg.24 gives project layout drawing.
- 4 - Since the minefield was as close as 920ft, recovery operations could have been within the Radex field.

WT-1436, Project 6.2 Measurement of the Magnetic Component of the Electromagnetic Field Near a Nuclear Detonation.  
P.H. Haas  
F.N. Wimenitz                                      Diamond Ordnance Fuse Lab.  
J.C. Hoadley  
J.S. Wicklund

- 1 - Project participated on: Lassen, Wilson, Priscilla, Hood, Diablo, Owens.
- 2 - Pg.28 Gives station location and range for the events.
- 3 - No radiation data were recorded.

WT-1489, Project 6.2a- Effect of a Nuclear Detonation on Semiconductor Devices.  
P.H. Haas    Diamond Ordnance Fuse Lab.  
J.M. Schaul  
W.V. Behrens

- 1 - Project participated on same events as Project 6.2.
- 2 - Pg 12 gives diagram of instrument placement and flux levels.
- 3 - Components Exposed to  $4 \times 10^{14}$  n/cm<sup>2</sup> and 0.1-100,000 R of gamma.

WT-1437, Project 6.3 Attenuation of Electromagnetic Radiation Through an Ionized Medium.  
William S. Lee  
Howard D. Krumboltz  
George A. Gimber

U.S. Naval Air Development Center Johnsville, Pa.

PLUMBBOB WEAPON TEST REPORTS (CON'T)

- 1 - Project participated on: Franklin, Lassen, Wilson, Priscilla.
- 2 - Pg 17-19 gives flight track of a/c, GZ, and ground stations.
- 3 - No radiation was measured.

WT-1438, Project 6.4      Accuracy and Reliability of a Short Baseline  
                                 Naval System.  
Maj. Richard A. Houghten, USAF      Air Force Cambridge Research Center  
Richard B. Harvey

- 1 - Project participated on all shots but Shasta, Whitney, and Morgan.
- 2 - This was an off-site project and should not have received any ionizing radiation.

WT-1439, Project 6.5      Effects of Nuclear Detonations on Nike Hercules.  
G.E. Elder      Electro-Mechanical Labs, Ordnance Mission, WSMR

- 1 - Project participated on Boltzman, Franklin, Lassen, Wilson, Hood, Diablo, Kepler, Owens, Charleston.
- 2 - To study effects of neutron/gamma on N-II Guidance systems in high fluence areas.
- 3 - Pg. 14 gives layout of stations.
- 4 - Pg. 27 gives table of neutron & gamma flux at each station.
- 5 - Recovery of foils & data should have produced radiation exposure to project personnel.

WT-1440, Project 8.1      Thermal Protection of the Individual Soldier  
Frank H. Babers      U.S. Army Quartermaster R&E Command.  
Allan J. McQuade

- 1 - Project participated on Priscilla
- 2 - Pg 17 gives station designations & expected thermal Energy levels.
- 3 - Pg 18 gives recovery & ionizing radiation levels.

WT-1441, Project 8.2      Prediction of Thermal Protection of Uniforms, and  
                                 Thermal Effects on a Standard Reference Material.  
W.H. Dirksen  
T.L. Monahan      Naval Material Laboratory  
J. Bracciaventi  
J.A. Carter  
A. Hirshman

PLUMBBOB WEAPON TEST REPORTS (CON'T)

- 1 - Project participated on: Lassen, Wilson, Priscilla, Hood.
- 2 - Pg 13 gives distance of stations from GZ.
- 3 - Pg 22-24 gives thermal flux results.
- 4 - No ionizing radiation measured.

LTR 1442, Project 8.3a Performance of a High Speed Spectrographic System

William A. Plum	W.J. Parker	U.S. Naval Radiological
E.C.Y. Inn	R.J. Jenkins	Defense Laboratory

- 1 - Project participated on: Lassen, Wilson, Priscilla, Diablo, John Kepler.
- 2 - Report gives little data on instrument location-but implication is that the distance was 10 miles.

WT-1443, Project 8.3b Instrumentation for Measuring Effects Phenomena Inside the Fireball.

Charles J. Cosenza	Aircraft Lab., WADC
Richard G. Coy	University of Dayton Research Institute
Donald A. Kahle	" " " " " "
Thomas E. Pascoe	Allied Research Associates Inc., Boston, Ma.
Paul C. Iving	" " " " " "

- 1 - Project participated on Priscilla and Smoky.
- 2 - Pg. 57 Gives recovery & radiological data.

WT-1445, Project 9.1 Support Photography

Included in WT-1445-No individual report issued-(No personnel listed.

Contractors-Lookout Mountain Laboratory-USAF  
Edgerton, Germeshausen, & Grier, Inc.

- 1 - Project participated in all events of Plumbbob.
- 2 - Project provided technical photography on: Franklin, Lassen, Wilson, Priscilla, Hood, John, Owens, Smoky, Stokes
- 3 - Project performed documentary still & motion picture photography from manned stations on all events.

PLUMB BOB

<u>TITLE</u>	<u>LIBRARY LOCATION</u>
AFSWC - Nuclear Radiation Received By Aircrews Firing the MB-1 Rocket	WT-1418
ASROL - Operations of the Fallout Group of Project 50.3	SRDL TR-2088

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
18 June to 14 July 1978

ANNEX D

Los Alamos Scientific Laboratory, New Mexico  
Date of Visit: 30 June 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr. James Lawrence, Senior Health Physicist, Los Alamos Scientific Lab
- b. Mr. George Littlejohn, Chief, Dosimetry and Records Section, LASL
- c. Mr. Karl Lyon, Chief Administrative Officer, J-Division, LASL

2. BACKGROUND:

a. Since the Manhattan Project, three scientific laboratories have been dedicated to the evolution of the Atomic Age by American scientists. These are the Los Alamos Scientific Laboratory at Los Alamos, New Mexico; the Lawrence Livermore Scientific Laboratory at Livermore, California; and, the Sandia Scientific Laboratory at (the former Sandia Base) Albuquerque, New Mexico. All three have continuous operation since at least the formation of the Armed Forces Special Weapons Project and Atomic Energy Commission. The same symbiotic partnership which existed between the AFSWP and AEC for the operation, supervision and funding of these activities is still reflected in the current accords between the Department of Defense and the Department of Energy.

b. These laboratories were originally chartered as quasi-public, non-profit corporations. The moral aspects of making a monetary profit from nuclear development were not acceptable to corporate American thinking at the close of World War II; hence, the non-profit, public corporation character of the primary developers of nuclear energy for both war and peace applications. The Sandia Laboratories were created and operated by Western Electric; Los Alamos and Lawrence Livermore by the University of California. This basic corporate concept has not changed through the years. All three laboratories operate today as government-owned, contractor-operated (GOCO) installations. In this context, the term "laboratory" is somewhat misleading. The traditional preception of a small, cluttered room filled with sinks, tables, test tubes and Bunsen Burners is quickly dispelled on first view of the physical setting of these laboratories. Each is a massive installation in its own right with a full-blown complement of the paraphernalia normally associated with a small municipality, military post or industrial complex.

c. The mission relationship between these three laboratories is also highly sophisticated. While the term "think-tank" may be a simplistic application, it certainly applies with respect to the working relationship of the Los Alamos and Lawrence Livermore Scientific Laboratories to the Sandia Laboratory. Los Alamos and Lawrence Livermore work in the theoretical area of nuclear research and development. Their concepts and theoretical blueprints are then

turned over to Sandia for manufacture of the prototype device for testing. According to one of the Los Alamos scientists, Sandia's prototype models are often held together by " . . . little more than Elmer's Glue and Scotch tape, but they usually get the job done !" The resulting tests determine the practicality of the conceptualized device. Favorable tests, of course, result in stockpiling in the United States nuclear inventory or the generation of precise specifications for subsequent manufacture. Stockpile manufacture is not done by Sandia; this is accomplished by contract with qualified and certified American industrial interests.

d. In addition to the civilian corporation employees who compose the vast majority of the personnel complements of the scientific laboratories, uniformed members of the military departments regularly perform tours of liaison duty at Los Alamos, Sandia and Lawrence Livermore. The scientific observers at the Nevada tests and the scientific complement of the joint task forces in the Pacific are drawn from this source. Consequently, a small but significant number of Army personnel who have been assigned to tours of duty with the scientific laboratories during the past 25 years possess radiation dosimetry histories which are not currently reflected in either the general data banks of Lexington or REECO. As with other agencies and activities, the scientific laboratories provided their own dosimetry service

### 3. CURRENT SITUATION:

a. GOCO records generated by the Los Alamos Scientific Laboratory are retired to the Federal Archives and Records Center-Denver. Prior to the date of this visit, the LASL Records Manager, Mr. George Littlejohn, had identified LASL retired records dealing with the nuclear tests of the 1950's. These materials had been withdrawn from the Denver FARC and were available for examination. As would be expected, the content of these materials was generally limited to purely LASL matters. Such personnel identification data that they contained reflected only indigenous LASL or LASL-administered contractor employees. The LASL records transmittal documents reflecting all transactions with the Denver FARC were also audited but failed to produce any additional leads to materials not already withdrawn and returned to Los Alamos.

b. The LASL "J-Division" has been responsible for field testing activities of LASL developed concepts. Some long time employees who had had personal experience with some if not all of the test exercises -- continental as well as the Pacific -- were still on active service at Los Alamos. Their institutional memory supported the conclusion that LASL's dosimetry records were good but limited to direct LASL employees, military personnel on liaison duty with LASL, and employees of contractors directly administered by LASL. LASL's handling of dosimetry service and record keeping generally mirrors the system pioneered and administered by REECO. Central files of hardcopy data were maintained in more or less chronological order. Individual dosimetry reports and histories were filed in the health/employee/pay records of employees or of military personnel if held by LASL. For those employees, contractor personnel, or liaison military personnel whose health records were held by other organizations or at other geographical locations, the LASL dosimetry data was forwarded on a regular basis to the known custodians of those files. This was no more successful than as it currently is at this time. Quite often, this "forwarded dosimetry data" is returned via postal channels as "not deliverable." REECO, too, experiences the sa

c. REECO has taken the lead in the past few weeks to integrate the dosimetry data held by the scientific laboratories into its data banks. At the time of the visit, negotiations had been completed with Sandia and LASL for computerization of their individual dosimetry data into a program that would be compatible with REECO's existing base. Presumably this base is also compatible with Lexington's. No estimate was available at the time of the visit as to when this project would be completed; negotiations with Lawrence Livermore were still pending at that time. On completion of the planned computerization of the data held by the three scientific laboratories (and presumably that also held by the Field Command, DNA), REECO will realize control of all known dosimetry data not directly generated or maintained by the military departments. REECO will make this data available to DOD in due course.

#### 4. CONCLUSIONS:

a. The dosimetry procedures followed by the Los Alamos Scientific Laboratory are typically representative of all three of the scientific laboratories and are generally limited to indigenous, military liaison and contractor personnel associated with the laboratories.

b. That the dosimetry records of the scientific laboratories are conclusive for their limited scope of applicability, but are of no assistance to the present search for troop participation identification.

c. That the current REECO sponsored project to computerize dosimetry data of the three scientific laboratories and to integrate it into the REECO dosimetry data base will provide conclusive identification of all Army personnel who have been assigned to such liaison duties since 1947.

#### 5. RECOMMENDATIONS:

a. That records of the scientific laboratories be considered non-productive for any further identification of Army Troop personnel participating in the Desert Rock Exercises.

b. That effort to identify Army personnel performing liaison duties with the scientific laboratories who might have dosimetry histories be deferred until completion of the current REECO Project to automate and integrate the dosimetry data of the scientific laboratories into the REECO dosimetry data base.

Chief, Declassification  
Operations Branch

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
18 June to 14 July 1978

ANNEX E

USA Letterman Army Medical Center, The Presidio of California  
Headquarters, 6th United States Army, The Presidio of California  
Post Headquarters, The Presidio of California  
Federal Archives and Records Center-San Francisco (at San Bruno)California  
Dates of Visit: 2 July to 5 July 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr Jack Loohoo, Command Records Administrator, 5th US Army
- b. Mr Harold Elliott, Director, GSA FARC-San Francisco
- c. Major Edward J Boland, MSC, Letterman AMC, Chief Administrative Officer

2. BACKGROUND:

a. Commanding General, 6th United States Army, with headquarters at the Presidio of (San Francisco) California, was Exercise Director for the entire series of Desert Rock Exercises, I through VIII, 1951 through 1958. While command emanated from the Presidio, day to day management of the exercise was performed by the on-site deputy Exercise Director from Camp Desert Rock a few miles distant from the Mercury, Nevada, test site. Over an eight-year period, a rotating exercise staff appears to have been institutionalized. How much of this exercise was drawn from the field and how much came from the 6th Army staff at Presidio is unclear at this time.

b. The question which arose immediately with the Army portion of the NTPR Project was: "What happened to the Army's records of the Desert Rock Exercises?" They were not retired through regular records management channels although the field generated records of other exercises conducted by Army elements during the decade of the 1950's and 1960's were properly retired to the St Louis federal records center and may be found there today. Logic would dictate that the administrative apparatus of the 6th United States Army and the Presidio would have in some manner been concerned with the records that a more or less 8-year long exercise would create.

3. CURRENT SITUATION:

a. Telephonic inquiries to 6th Army Headquarters which included the Command Records Administrator, G-3 Records Management Officer, and the Presidio Post Records Holding Area had not been satisfactory. It was then determined that an on-site investigation would be necessary. Following the initial notification that a representative of The Adjutant General on loan to the Chief of Staff's NTPR Project Task Force would visit the Presidio, the 6th Army Command Records Administrator conducted a survey of the headquarters. Focus of the survey was operational records of the Desert Rock Exercise series that might have been retained by action officers and never formally committed to normal records retirement channels. The results of this survey were negative. Nor was institutional memory of any assistance. All of the "oldtimers" were gone. No current

members of the staff had had any personal involvement in the original exercise series.

(1) During the course of the visit, a careful audit was conducted of the records retirement transmittal documentation (SF 135 files) still retained by the headquarters. Special emphasis was placed on the DCS/Operations (G-3) files. Despite the fact that these files are probably the single set of papers which should be retained "Permanently" by any records generating activity, the 6th Army files barely reached back to the early 1960's! None of the documentation examined contained any leads to the Desert Rock Exercise Series. As a matter of fact, none of the documentation examined gave any indication that the 6th US Army had ever had any involvement with the Desert Rock Exercise Series. In view of the paramount role which the 6th US Army played in direction and execution of this exercise, this became very difficult to explain.

(2) Institutional memory from other sources had produced rumors of an indeterminate quantity of records, variously described as a "roomful," a "wall stacked solid," and marked "Desert Rock-Do Not Destroy," which as late as the early 1970's had occupied office/storage space in the 6th Army G-3 area. However, no one currently assigned to the G-3 staff had any recollection of this. Careful re-construction from other sources now indicates that these materials may have been dosimetry materials which were shipped to Lexington. Positive of what these materials may have been and what actually happened to them is still up for conjecture. Other rumors that this collection was finally retired to an ". . . archives or records depository." The identification of this elusive destination has never been determined. Independent investigations of West Coast GSA regional federal archives and records centers by REECO employees as well as HQDA Records Management personnel have failed to trace or identify these materials positively there or in Washington.

b. On conclusion of the Headquarters 6th US Army phase of the investigation, attention was turned to the Presidio Records Holding Area. Here again telephonic inquiries from Chief of Staff's NTPR Project Task Force had not produced satisfactory responses. At the time of the visit, the Post Records Manager was on annual leave. He had only recently been transferred to this post as a priority DOD (USAF) placement on closing of Hamilton Air Force Base at nearby San Rafael, California. As such, he had no institutional memory reaching back to the Desert Rock Exercise series of the 1950's. As a matter of fact evidence was strong that Mr Stavali (Sp ?) was still in the job orientation stage of learning Army records management procedures.

(1) Presidio Post Adjutant personnel familiar with operation of the Records Holding Area were available and assisted with our inspection of the available documentation. Here, again, the records shipping documentation (SF 135 files) were found to be inadequate and disappointing. The earliest extant records of operation of the Presidio Records Holding Area dated from 1959. In view of The Presidio's long and illustrious history as a major Army western installation, this is very difficult to explain. It becomes even more discouraging when point is made of the fact that the HQDA Records Management Division has better documentation in Washington on the records management operations of the 6th US Army and the Post Presidio than either of those activities have in the field. Clearly, long-standing Army records management procedures have not been followed. More discussion on this point will be found in Annex H (National Personnel Records Center, St Louis) following.

c. On the outside chance of possible involvement due to command and geographical relationship, the search for Exercise Desert Rock documentation was extended to Letterman Army Medical Center (also located at The Presidio). Discussion with medical administrators of Letterman revealed, however, that despite the 6th US Army role, Letterman itself had had no general or overall tasking for the nuclear test series. Its only official involvement to date arose from general media announcements of the JAYCOR portion of the NTPR Project. Letterman medical officers had received and passed on some 4-5 responses from individuals claiming troop participation in the exercises. This closed the Headquarters 6th US Army and Presidio phases of the field search for Desert Rock Exercise documentation.

d. The sole remaining agency to be contacted in the San Francisco area was the GSA Federal Archives and Records Center at San Bruno. In connection with Phase III of the Master Survey of US Army Records Held by Regional Federal Records Centers (March-May 1976), all US Army field command records held by the FARC-San Francisco had been inventoried. None of these inventories revealed any Desert Rock Exercise documentation retired to the FARC-San Francisco. Primary focus of the current search was non-Army retired records. With prior authorization of the controlling agencies, Records Group 181 (US Navy), Records Group 342 (US Air Force), Records Group 374 (Defense Nuclear Agency) and Records Group 430 (GOCO Contractor) documentation and records held by the FARC-San Francisco were examined.

(1) The results of this examination were generally negative. Some references were found to dosimetry data and radiological studies in Records Group 181. These were materials retired by the US Naval Radiological Defense Laboratory to FSRC-San Francisco and dealt with the 1950 nuclear test series from the Navy viewpoint. Physical examination of these materials revealed them to be very general in nature and of no moment to the Army's present search. Some of these materials had been withdrawn or loan by the Air Force Surgeon General's NTPR Project Officer (Lt Colonel George S Kush) and were available for further study in his Forrestal Building offices.

#### 4. CONCLUSIONS:

a. That no significant Desert Rock Exercise documentation or leads to the identification and location of such documentation exists either in Headquarters 6th US Army or in The Presidio Post Records Holding Area.

b. That no Exercise Desert Rock documentation of any moment to the Army's current field search presently is held by the FARC-San Francisco. This includes records retired into Records Groups 181, 342, 372 and 430.

c. That the records management program of the Headquarters 6th Army and the Post Presidio revealed glaring historical weaknesses which have been allowed to develop over a 25-year period and which institutional memory cannot satisfactorily explain away at this time.

d. That Letterman Army Medical Center at The Presidio played no operational or after action role in the Desert Rock Exercise series and neither holds correctly or has retired previously any such documentation central to the Army's field search.

5. RECOMMENDATIONS:

a. That the San Francisco phase of the field search for Exercise Desert Rock documentation be closed negatively.

b. That maintenance and preservation of historical records processing, storage, holding and retirement documentation of Army Records Holding Areas be may a standing item on future field surveys conducted by the HQDA Records Management Division.

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
18 June 1978 to 14 July 1978

ANNEX F

Headquarters 7th Infantry Division and Fort Ord, Monterey, California  
Dates of Visit: 6 July 1978

1. PERSONNEL AND ORGANIZATIONS CONTACTED:

- a. Mr George Ausderau, Post Records Management Officer
- b. Mr. Robert Richards, Force Development, 7th Infantry Division
- c. Mr. John Robotti, Directorate of Maintenance, 7th Infantry Division

2. BACKGROUND:

a. A complex of mid-California US Army forts and installations acted as staging areas and contributed massive numbers of participation troops to the 1950 nuclear tests and Desert Rock Exercise series. Most important among these installations were Camp Irwin, Fort MacArthur and Fort Ord. As the atmospheric nuclear test series ended and Army operational need changed, closure and consolidation eliminated this connected complex. In addition to the troop personnel contributed and staged by the Army Infantry Training Center then operating there, Fort Ord was also the home of the short-lived US Army Combat Developments Command Experimentation Center.

b. Known retirements of records created by the Experimentation Center dealt with various phases of Desert Rock. This however was largely in an after-action fashion wherein data collected during the exercise series was later studied and exploited by the Experimentation Center. This made the record audit trail sufficiently clear to view Fort Ord as a possible starting point for search for the missing documentation. Moreover, the consolidation of Camp Irwin with Fort MacArthur as Irwin closed and the subsequent consolidation of MacArthur with Ord on MacArthur's closure made the possibilities of this audit trail even brighter.

3. CURRENT OPERATIONS:

a. Fort Ord is now the home of the 7th United States Infantry Division; both the former Infantry Training Center and USACDC Experimentation Center have long since disappeared via re-organization and consolidation. The Records management function at Ord has successfully escaped the ravages of time and holds a consistent, continuous history of operation pre-dating the 1950 test and exercise series. As both Irwin and MacArthur closed, their records holding areas together with control documentation and stored records were consolidated and eventually were merged with the Ord function. This is a splendid example of how the historical control function should operate in the field in stark contrast as to how it happened at The Presidio. Unfortunately, no significant mention of Desert Rock was found in any of this documentation.

b. There were references to claims and litigation arising from the test exercises in the Fort MacArthur documentation. Though not examined physically at the time as not being responsive to the immediate thrust of the search, this documentation still exists and could be of assistance in possible legal

actions arising from later phases of the NTPR Project. If required, this trail may be pursued directly with the Fort Ord Records Management Officer. The real significance of the audit of the Fort Ord Records Holding Area was again to verify the suspicion and tentative conclusion that Desert Rock Exercise records generated in the field and at Camp Desert Rock did not move through normal records retirement channels.

c. In the area of institutional memory, contributions to the field search by Fort Ord personnel were far more promising. Several present members of the 7th Infantry Division staff had been directly involved in several of the different shots and exercises. Mr Ausderau, Hq 7th Infantry Division and Post Fort Ord Records Management Officer, arranged an informal seminar which many of these oldtimer staff members attended and made valuable contributions. Most helpful along these lines were Mr Robotti's remarks and explanations as to how certain administrative details were handled.

d. Early in the exercise series, the practice developed of requiring the exercise staff to remain in place at Camp Desert Rock and the Mercury Test Site until the After-Action Reports had been completed and final drafts had been approved. Drafting and final typing were accomplished at the exercise site. The finished masters for printing were then sent to the post printing and reproduction facility at The Presidio for printing and distribution. Mr Robotti was certain that few of the exercise records per se ever left the site -- at least, not within the scope of his experience and memory. This might well explain the gradual erosion and dissipation of the Desert Rock record collection over an 8-10 year period of administration by a rotating and constantly shifting exercise staff. As the exercise series continued, older materials still on-site which had been used to prepare the official record of the exercises -- the all-important After Action Reports -- would gradually lose importance in the eyes of each succeeding crop of exercise staffers.

e. Moreover, much of the material generated in the field was disposable. Disposal standards even then allowed for destruction of much of this material in the current files area -- which in this case could have easily been the tents of Camp Desert Rock. The inference is strong that a great deal of disposal took place in the field. This could have been in the shape of destruction of clearly identified disposable materials and the donation of other materials, such as the dosimetry data, to the contractor operating the AEC (Camp Mercury) Test Site. Mr Robotti had no personal knowledge of any of this actually happening nor did he make any such positive statement. However, the evidence at hand certainly leads to such a conclusion.

#### 4. CONCLUSIONS:

a. That neither directly nor on the basis of consolidation and succession to other closed post functions Fort Ord has had no involvement in handling, processing, storing or retirement of Exercise Desert Rock documentation.

b. That institutional memory of the working of the administrative apparatus developed to manage the Desert Rock Exercise series is excellent at Fort Ord and has contributed valuable leads and inferences to the current field search for long-missing Exercise Desert Rock documentation.

c. That the historical continuity of the internal management files and documentation of the Fort Ord Post Records Holding Area is excellent and that it currently enjoys superior management under the present Records Management Officer and Staff.

5. RECOMMENDATIONS:

a. That the Fort Ord portion of the current field search for Exercise Desert Rock documentation be closed negatively, but that certain leads developed at Fort Ord be pursued in the St Louis collection of retired US Army field commands records.

b. That the Post Records Management Officer for Hq 7th US Infantry Division and Fort Ord be officially commended for excellence of his management of this function.

Conducted by Representatives of The Adjutant General  
18 June 1978 to 14 July 1978

ANNEX G

Federal Archives and Records Center-Los Angeles (at Laguna Niguel, CA)

Dates of Visit: 7 July to 8 July 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr Robert Cornell, Director, FARC-Los Angeles
- b. Mr James Mouat, Chief Accession/Disposal Branch, FARC-Los Angeles

2. BACKGROUND:

a. The Federal Archives and Records Center-Los Angeles is located in the Laguna Niguel hills about 40 miles south of the Los Angeles International Airport. It current occupies space in the former Rockwell Industries building which was acquired by GSA under the Nixon Administration when planned NASA and aerospace expansion never took place. The FARC-Los Angeles had previously been located at Bell, California; it was probably moved to Laguna Niguel in thinly-disguised justification for the government bail-out of Rockwell Industries. Its present location certainly offers little regional or geographical convenience to its clients.

b. While located at Bell, California, the FARC-Los Angeles had been designated as the regional federal records center to receive and service the retired GOCO records of both the Reynolds Electrical & Engineering Company, Inc., and Narver and Holmes, Inc. This center has served both of these clients since approximately 1957. Except for possibly the withdrawal and shipment mishap noted in Annex A, this arrangement has been generally mutually satisfactory. US Army assets held by the FARC-Los Angeles were completely inventoried in connection with Phase III of the Master Survey of US Army Records Held by Regional Federal Records Center, March-May 1976. This inventory failed to identify any records generated as a result of participation in the Desert Rock Exercises by Army field commands.

c. No effort was made during the Master Survey of USA Records to examine other assets held by the Los Angeles FARC in Records Groups 181 (USN); 342 (USAF); 374 (DNA); or 430 (GOCO). In connection with complete prosecution of the field search for Desert Rock documentation, arrangements were made with the affected agencies to examine these holdings in much the same manner as had been done at the San Francisco FARC.

3. CURRENT OPERATIONS:

a. All records held by the Los Angeles are now administered under the computerized NARS-5 control system. This made possible a double audit of the assets of the Records Groups under consideration. In this manner, computer runs for each records group were manually screened against the hardcopy files

of original transmittal documents on which retired the records from the generating-shipping activity to the depository. While the controls were excellent, the audit failed to reveal any additional documentation germane to Army interests.

b. The USN, USAF and DNA records held by the Los Angeles FARC were exclusively of fairly recent origin and all generally disposable. Certainly, nothing from the decade of the 1950's was discovered in these retired collections. Records Group 430 for Government-owned, contractor-operated assets told a different story. Both Narver and Holmes and REECO had retired several hundred feet of records over the years dealing with the atmospheric tests of the 1950's. The division again was fairly clear-cut throughout: REECO's retired records dealt with continental US testing; Narver and Holmes were concerned with the Pacific Test Sites and results. Nothing in the Narver and Holmes retired collection appeared to be of significance to the Army's current field search.

c. On the otherhand, the REECO retired collection held paramount concern for the Army ! These records were withdrawn from the Los Angeles FARC by REECO about one year ago as detailed in Annex A. Since this withdrawal action had been accomplished by telephone and correspondence from the Mercury Test Site, a definite possibility of inadvertent omission or failure to ship existed. Accordingly, a careful audit was made of the REECO account, i.e., the bookkeeping records of what REECO had requested compared with what the Center files showed to be onhand at the time of the shipment and the balances remaining in the FARC-Los Angeles after the shipment. This procedure brought one significant block of 1947-55 dosimetry records to notice which appeared not to have been requested by REECO or shipped by FARC-Los Angeles.

d. Unfortunately, this turned-out to be a bookkeeping error -- of the sort that we were not looking for ! When we went to the shelves to withdraw these records for examination, we found the shelves bare. This collection had, in fact, been shipped to REECO and had been included in the 188-box shipment which arrived at the Mercury Test Site in such discouraging disarray. REECO later verified that these materials had been shipped, had been received, had been included in the microfilm project, and were currently in process of being listed in the hardcopy inventory of the microfilmed collection. FARC-Los Angeles accounting records were subsequently corrected to show this transaction.

#### 4. CONCLUSIONS:

a. The FARC-Los Angeles currently holds no Desert Rock Exercise documentation in Records Groups 181, 338, 342, 374 and 430 of any significance to the Army's present needs. GOCO records in RG 430 deposited by Narver and Holms are largely limited to Pacific Test Sites, but could be of marginal utility to later aspects of the NTPR Project.

b. All materials previously deposited with the FARC-Los Angeles by REECO and of significance to current Army interests have been withdrawn and returned to the Mercury Test Site. A complete microfilm of this collection along with a hardcopy index will be made available to the Army by REECO in due course.

3. RECOMMENDATIONS:

a. That the field search for Desert Rock Exercise documentation in the holdings of the GSA Federal Archives and Records Center-Los Angeles be closed negatively.

b. That complete copies of the microfilm of the REECO Dosimetry data collection along with the hardcopy index thereto be procured at the earliest possible date for exploitation by the Army NTPR Project Task Force.

JOHN HENRY HATCHER, PHD  
Chief, Declassification  
Operations Branch

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of the Adjutant General  
18 June 1978 to 14 July 1978

ANNEX H

National Personnel Records Center, St Louis, Missouri

Dates of Visit: 9 July to 14 July 1978

1. PERSONNEL AND AGENCIES CONTACTED:

- a. Mr Warren Griffin, Director, National Personnel Records Center
- b. Mr J D Kilgore, Chief, Military Records Division
- c. Mr Thomas Helfrich, Chief, Military Operations Branch
- d. Mr Arnold Essenpreiss, Archives Technician
- e. Mr Eugene Herbig, Archives Technician

2. BACKGROUND:

a. Contrary to implications of its name, the National Personnel Records Center at St Louis holds considerable organizational as well as personnel records. After passage of the Federal Records Act of 1950, lengthy negotiations between the Army and the General Services Administration resulted in the Army ceding its records, facilities and trained personnel at St Louis, Kansas City and Alexandria to the National Archives and Records Service. Specifically, these functions and assets were placed in the custody of the Assistant Archivist of the United States for Federal Records Centers. Steady and unilateral erosion of these services over the past 23-24 years finally resulted in the Army's all but complete loss of intellectual control over its retired records inventory.

b. This process commenced circa 1955-56, when the first shipments of Army field command records arrived at St Louis with consignment to the GSA federal records center instead of the Army records center. The GSA center continued to operate in former Army space and initially followed procedural handling patterns developed by Army Records managers. Kansas City ceased Army-wide records center operations and became a regional federal records center. The HQDA Departmental Records Branch suspended operations in the old WWI torpedo factory in Alexandria and became the forerunner of the GSA Washington National Records Center. The Kansas City records center virtually went out of business and shipped the vast majority of its military holdings to Alexandria. This point assumes great importance in later tracing and locating the retired records of the Armed Forces Special Weapons Project. St Louis continued its normal functions associated with the administration of official personnel files for both military personnel and civilian employees following long-standing Army procedures.

c. From the period 1956 through 1968 -- at which date the Washington National Records Center building was completed at Suitland, Maryland -- all Army field command records were shipped to St Louis. After 1967-68, instructions were issued to Army field commands to re-direct their retired records to the Washington National Records Center at Suitland, Maryland. Naturally, this word never got to everybody in the field at the same time. Further complicating the handling of the records of the Army field commands was an esoteric division

in the handling of organizational records. All personnel jackets would go to St Louis; all organizational records of a personnel supportive nature, i.e., personnel orders, clinical hospital records, special orders, courts-martial documentation, etc., would go to St Louis; and, finally, all other organizational records would go to Suitland, Maryland. For some years, mixed shipments continued to arrive at both St Louis and Suitland. When this happened, GSA Center personnel segregated the shipments and automatically forwarded the misshipped materials to the proper center.

d. This practice continued through the period of the Vietnam War but not with 100% consistency. Consequently, some mixing of these materials still exists in both GSA Centers. This introduces another confusion factor in the records management picture at the Army Departmental level which results in considerable lost motion and duplication of effort. This service is no longer even partially furnished by the federal records centers. Currently, shipments which arrive from the field at any of the GSA federal records centers which do not meet Center arrangement standards precisely are simply refused and returned to the shipper -- quantity notwithstanding -- at the original shipper's expense. Moreover, at the close of the Vietnam War, the GSA federal records centers completed their transformation from a records service center to a records storage warehouse. No longer did they perform any appreciable reference service for any of their clients -- the Army included.

e. Faced with the enormous burden of overnight responsibility for reference, research and retrieval service on its entire retired records inventory, a project was launched in 1974 to enable the Army to regain intellectual control of its retired records inventory. A one-year trial project which used the Vietnam War retired records collection (40,000 linear feet) as a pilot model was used to develop the techniques which might later be used to control the total Army inventory. The pilot model was successful. The Vietnam War Collection was brought under sufficient intellectual control to allow for effective research and retrieval service by Army personnel -- unassisted by GSA personnel -- old agreements notwithstanding! The same techniques were then applied to the Master Survey of Retired US Army Records Held by Federal Records Centers.

f. Fortuitously, Phase II and Phase IV of the Master Survey concerned themselves with the Army's organizational records held by the National Personnel Records Center at St Louis. Both phases had been completed at the time the NTPR Project demanded a field search for Desert Rock Exercise documentation. Consequently, when tasked with the field search requirement, the Records Management Division had a better inventory in hand of the St Louis Collection than had been preserved in the field by the original shipping and creating activities. Headquarters 6th US Army is a prime example of this. However, real depth of this condition was not known until on-site surveys and visits to the field had been completed. The Master Survey inventories showed only scattered references to Exercise Desert Rock. It also identified appreciable blocks of exercise records of the late 1950's and early 1960's which had been retired as EXERCISE RECORDS BY EXERCISE DIRECTORS. Such was not the case with Desert Rock.

g. Knowledge of this situation shaped the nature of the field search for Desert Rock Exercise documentation. Emphasis throughout the field search was on positive identification of military organizations which played any role in the exercises either in direct support or troop participatory activities. It

was reasoned that in the absence of an identifiable, discrete collection of retired Desert Rock Exercise documentation, such a collection might be pulled together even at this late date from the individual retirements of involved and participating organizations. The Master Survey had relied to a major degree on extant control and transmittal documentation (DD 111, DA 2172, SF 135 Files, etc.) with only some sampling examination of the records. This was mainly to test the reliability of the control documentation. Hence, the hidden existence of a piecemeal collection scattered through the St Louis holdings offered a most attractive line of inquiry for testing when the field search again centered on the St Louis collection.

### 3. CURRENT SITUATION:

a. On completion of the more westward portions of the field search, a special ad hoc search team was formed at the National Personnel Records Center in St Louis. Dr Hatcher was joined by Dr Robert P. Smith from the HQDA Records Management Division in Washington and Mr. Arnold Essenpreiss, Archives Specialist, Military Organizational Records, National Personnel Records Center, St Louis. Immediate attention of the search team was a re-check of all Desert Rock Exercise primary and cross-references contained in the Military Organizational Records Index. These records were then examined physically for content and applicability to immediate requirements of the Army NTPR Project Team. This had been done previously by other searchers at an earlier stage of the quest for Desert Rock Exercise troop participation data. No discrepancies were noted from the earlier search; no new data was located.

b. Search was then centered on the retired records of the special list of involved organizations which had been developed during the first two weeks of the field search. Identification of these organizations and units came from two main sources: (1) Institutional memory of individuals located at various points of the field search itinerary who had firsthand knowledge of or who had participated in various Desert Rock Exercises; and, (2) from study of various technical publications and studies held by the Combined Technical Library of Kirtland Air Force Base. A representative list of these organizations follows:

- (1) US Army Chemical Center
- (2) US Army Edgewood Arsenal
- (3) US Army Chemical Corps School, Fort McClellan, Alabama
- (4) Armed Forces Special Weapons Project
- (5) Camp Irwin, California
- (6) Fort MacArthur, California
- (7) US Army Dugway Proving Ground
- (8) US Army Evans Signal Corps Laboratory
- (9) US Army III Corps
- (10) US Army 1st Armored Division
- (11) US Fourth Army
- (12) US Second Army
- (13) US Sixth Army
- (14) US Army 1st Radiological Safety Support Unit
- (15) US Army 9778th Technical Support Unit, Fort McClellan
- (16) US Army Armor and Desert Training Center, Fort Irwin
- (17) US Army Combat Developments Command Experimentation Center
- (18) US 16th Armored Group

- (19) US Army 84th Engineer Battalion
- (20) US Army 26th Truck Transportation Battalion
- (21) US Army 43rd Medical Group
- (22) US Army Redstone Arsenal
- (23) US Army Post Fort Polk
- (24) US Army Post Fort Sam Houston
- (25) US Army Post Camp Roberts
- (26) US Army Post Camp Desert Rock
- (27) US Army Post Fort McClellan
- (28) US Army Post Fort Ord
- (29) US Army Post Fort Monmouth
- (30) US Army Post Presidio of California
- (31) US Army 216th Chemical Service Company
- (32) US Army 232nd Signal Company
- (33) US Army Signal Corps Research and Development Laboratory
- (34) US Army Signal Corps Engineering Laboratory
- (35) US Army Signal Corps Center

c. Extensive and conclusive search of the retired records of each of these organizations held by the National Personnel Records Center failed to produce more than scattered, fragmentary and general references to Desert Rock. Because of their overriding importance, decision was taken at that time to extend the field search for three of these organizations into the Washington National Records Center. These were the Armed Forces Special Weapons Project, Headquarters Sixth United States Army, US Army Post Presidio of California. Results of this extended search are discussed below. Search then centered on the units and military organizations known to have participated in the Desert Rock Exercises. Identification of these units was taken from the official after action reports and for the purposes of this search were limited to Desert Rock IV and Desert Rock V.

d. Desert Rock IV and Desert Rock V were singled out due to relative paucity of troop participation data which had been located from other sources for them up until this search. Two lines of archival investigation were followed. The first of these was the traditional identification of all known retired records from each of these organizations from the St Louis Index. All mission records located in this manner were then "pulled off the shelf" and examined physically. This failed to produce any Desert Rock data of consequence. The second line involved the Special Orders of each of these organizations which would logically document all temporary duty assignments. This was a difficult and complex procedure. Many of the participating military organizations did not have special orders issuance authority; hence, the next superior element in the chain of command with such authority AT THAT TIME had to be identified and the special Orders which it issued had to be manually screened.

e. While tedious and time-consuming, identification of superior special orders issuing authority could usually be determined by content of the retired records of the unit under investigation. A trial block of Special Orders for one participating organization was examined and found to contain multiple references to "Desert Rock TDY's." All existing record sets of such publications for all known participating organizations in Desert Rock IV and Desert Rock V were then ordered for permanent withdrawal and shipment to Washington for detailed examination. This amounted to some six linear feet of material. The

rationale here was that if this exercise proved fruitful, then similar orders would be given the National Personnel Records Center to pull and ship the appropriate annual record sets of special orders for ALL PARTICIPATING ORGANIZATIONS IN ALL EIGHT DESERT ROCK EXERCISES. Recent handling of this series of orders raises grave doubt, however, as to the bottom line value of such a line of inquiry.

f. Three things happened in the past five years whose combined weight drastically impairs the integrity and value of this series of records. First came the disastrous 1973 fire in the National Personnel Records Center which resulted in complete loss of its 6th floor. This contained about 25% of the Center's available storage space and probably 85% of the Army's World War II vintage personnel records. Space became a pressing problem for the Center. Coincidentally, an Army Records Management study in the area of personnel related records indicated that existing disposal standards for the special orders series were unrealistic. This standard was then reduced from "Permanent" to FIVE YEARS which was quite in keeping with GSA-NARS desires but which was later discovered to be entirely too liberal for Army requirements. This standard has since been revised to require retention for 15 years, but too late to halt the damage to probable NTPR Project utility.

g. In 1973, the National Personnel Records Center was about 25 years behind in its disposal work. The fire and loss of storage space propelled GSA into a drastic effort to catch up on its long-overdue disposal and thus free up critically needed storage space. The Army's change in disposal standard placed all Army special orders held by the National Personnel Records Center in an overage category and thus eligible for immediate destruction. Still, the impact would not have been too severe if normal GSA inventory procedures had prevailed. Special Orders record sets would have been routinely destroyed as they were located by the on-going systematic inventory -- a process which would probably run some 3-5 years. Unfortunately, some items contained in Army Special Orders assumed transcendent importance in reconstructing official personnel files destroyed by the fire. Prominent among these were announcements of enlisted discharges, officer appointments, resignations, promotions, etc. Any of these personnel actions have the legal weight of establishing proof of military service -- at least, so far as the Veterans Administration and claims for benefits are concerned.

h. Commencing in 1976 a concerted effort was made by the NPRC Reconstitution Unit to locate ALL record sets of Army Special Orders held in the St Louis collection. As these blocks of records were located, they were withdrawn and manually screened by the Reconstruction Unit. All special orders which announced personnel action that tended to establish proof of military service were withdrawn from the record sets. In many cases, these single pieces of paper became the entire "201 File" of an effected former service member. Those special orders which were devoid of this type of personnel action (which did not include temporary duty assignments) were routinely destroyed. Thus, the vast majority of these record sets of Army Special Orders were deliberately mined-out of the main collection by GSA personnel legally and for good purpose. Unfortunately this just happens to run counter to the needs of the NTPR Project at this time. However, some undisturbed sets of these orders still exist; some were located and shipped to Washington; and a contingency freeze was placed on any further destruction during the field search. Again, the fates seem to have smiled on

the Air Force. The Air Force record sets of Special Orders are still held on permanent retention at St Louis and theoretically have never been disturbed. Hence, Air Force NTPR Project investigators might well follow this line of inquiry with conclusive results. This might also serve US Navy ends very well. For Army needs, it is at best only a possible contributory source of data.

i. As a result of information received from the Lexington-Bluegrass Army Depot Activity health physicists, a special investigation was opened into the availability of student and class records of the US Army Chemical Corps School at Fort McClellan. Here the picture is much brighter. Service school records have traditionally been considered as supportive of the individual personnel records and as such are shipped to the National Personnel Records Center as either "Permanent" or for long retention periods. At this time, it appears that the National Personnel Records Center holds a virtually mint-set of individual academic records with class and faculty files for the total operation of the school at Fort McClellan. A name list was located which appears to identify a large number of students who completed Radiological Defense training. This roster is appended to this Annex for record purposes in the event the NTPR Project investigation dictates action along this channel. For safety, a contingency freeze was placed on all known retired records of the Chemical Corps School until final decisions are forthcoming.

j. An extremely promising line of investigation was opened at St Louis into the records of the Armed Forces Special Weapons Project. A single transmittal document was located in the St Louis Index which described a 44-linear foot shipment of the 1950-53 AFSWP records. This document was found mis-filed with some other minor "Armed Forces" activity indices. It was unclear whether these materials had ever been to St Louis or whether they might have been handled through Kansas City. Hand annotation on the transmittal document indicated shipment to Alexandria probably sometime after 1962. Previously examined AFSWP records held by the National Archives did not account for the materials described by this document. However, by matching pages of the St Louis transmittal document with Washington National Records Center files, this shipment was located. It was part of approximately 600 linear feet of AFSWP materials which are still retained in federal records center channels in Records Group 374. This collection appeared to account for most of the missing AFSWP materials from the fragmentary collection held by the National Archives. Arrangements were made immediately with the Defense Nuclear Agency to examine this material for Army interests. Air Force and Navy NTPR Project officers were invited to join in this effort. A computer inventory of these materials along with a NARS inventory of other DNA materials already in the National Archives are appended to this Annex.

k. An essential extension of the overall NTPR Tasking assigned to The Adjutant General involves the US Army Reserve Components and Personnel Administration Center. USARCPAC coincidentally is located in the same building in St Louis as the National Personnel Records Center. On conclusion of essential search activities in the St Louis Collection of field command retired records, a brief orientation visit was paid the USARCPAC NTPR Unit. The primary concern of this unit is correlation of troop identification data developed by the HQDA NTPR Project Team with extant official personnel files held by the National Personnel Records Center. Discussions centered on current operations plans for the future, and other problems of mutual interest. It was an invaluable sidelight of the field search for the HQDA representatives.

#### 4. NPRC RESEARCH NOT RELATED TO THE NTPR PROJECT:

a. There are no disposal standards for official personnel files at this time. This not only affects the Army but all OSD activities as well as the entire federal government -- military as well as civilian employees. Theoretically, personnel records, once created for whatever period of federal service, become "Permanent" records. The proliferation and growth of such record collections is unbelievable. Already, this collection has grown beyond the holding capacity of the National Personnel Records Center main building on Page Avenue in St. Louis. Several years ago, a division was made between military and civilian personnel records by the National Personnel Records Center. Military records were retained in the Page Avenue building and civilian records were re-located in a second building on Winnebago Street in another section of St. Louis. Currently, both of these buildings are commencing to strain at the seams in their struggle to cope with the brushing volume.

b. Obviously some device or standard is urgently required to allow for more effective management of these files. All of these records possess one common characteristic and justification for retention FOR A PERIOD. This period should be a statistical measurement as to how long such files should be preserved in order to guarantee earned benefits and entitlements under the law to the service member and his immediate dependents. This period should be definitely stated in term of years, i.e., 25 years, 56 years, 75 years, etc. After individual entitlements had been fully met, disposal standards could then come into play. This is not viewed as a serious or insurmountable problem. Moral and legal agreement on a specific term of years for retention could put this ever-mounting volume on a manageable and programmatic basis. This, however, is but one aspect of the problem.

c. Aside from the purely intrinsic value to the individual to which it pertains and specifically for whom it was created, there is also an extrinsic value to be considered. This takes the form of archival and historical interest. Some official personnel files are clearly more important to the history of the nation and the American people than others. Here the decision is not so clear cut or obvious. The military career, i.e., OPF, of General Henry A. (Hap) Arnold is far more important to the history of American airpower than the OPF of a World War II Army Air Corps recruit who didn't make it through basic training. Yet both files are currently considered permanent. Nor does adequate administrative machinery exist for doing anything with each file except to store it in St. Louis. Separation of the famous from the unsung is not the only problem. What is to be done with the infamous? The Lee Harvey Oswalds? The Private Eddie Sloviks? Certainly the famous bad guys as well as the famous good guys have their measured impact on American history. Who is to make the decision of which OPF's are added to the National Archives and which are sent to the paper re-cycling mills?

d. Up until this time, GSA officials of the National Personnel Records Center have made a decision of sorts in this area. Using selection criteria based broadly on rank, position and newspaper notoriety, certain OPF's have been segregated at the National Personnel Records Center. This "VIP Section" is maintained under special security conditions to prevent idle perusal or pilfering by the general work force of the Center. Internal GSA memoranda defining the selection criteria for OPF addition to the VIP File is appended

to is Annex along with a computer list of the OPF's currently included in the VIP File.

e. A broad sample of OPF's from the VIP File were examined during the field search both for content as well as condition. Many were found to be fire and water damaged from the 1973 fire. None are maintained under controlled humidity conditions; all show increasing ravages of normal deterioration. Many are in desperate need of preservation at this time. Special projects were recently mounted to attend to the OPF's of General Eisenhower and General Patton. While the end results were eminently satisfactory, these projects were too narrowly conceived to be of general utility and value. A broad, general, systematic preservation program should be initiated at once which would attend to the damages resulting from the 1973 fire as well as normal storage deterioration.

f. The term OPF as applied in its present context to these files is very misleading. This is especially true of the "Big Name" files of World War II and earlier vintage. The files examined revealed an overriding preponderance of non-personnel related papers. Probably less than 10% of the general content of these files consist of forms, qualification statements, personal, health, financial or family data normally associated with personnel administration. The far larger portion of these files deals with day-to-day matters, decisions, actions, operations, etc., that the individual was involved in pursuit of his official duties. Hence, a relatively small part of these files might be considered closed to historical inquiry under Privacy Act implications. And even this is questionable. The larger portion of these files would be more correctly characterized as "personal papers." And here again is a question as to whether or not many of these "personal papers" might not in fact be official federal records. The fact remains that a considerable amount of national history is contained in these files which may be missing from the National Archives.

## 5. CONCLUSIONS:

a. That the general collection of retired field command records held by the National Personnel Records Center at St Louis contains no appreciable concentrations of Desert Rock Exercise documentation.

b. That the surviving record sets of Special Orders still available in the St Louis Collection may contain contributory increments of troop participation data from the Desert Rock Exercises.

c. That leads to the missing AFSWP retired records of the 1950's which were developed in connection of examination of the St Louis collection may be the most valuable find of the entire field search.

d. That retention and disposal standards could be developed which would cope effectively with the ever-increasing volume of official military and civilian personnel records being retired to the National Personnel Records Center.

e. That the Army portion of the VIP Personnel File maintained by the National Personnel Records is urgently in need of preservation and might well be used as the vehicle for developing OPF disposal standards.

6. RECOMMENDATIONS:

a. That the field search for Desert Rock Exercise documentation in the National Personnel Records Center US Army Field Command retired records collection be closed negatively except for possible further screening of surviving record sets of special orders.

b. That the approximately 600 linear feet of Armed Forces Special Weapons Project retired records discovered in the Washington National Records Center as a result of leads from St Louis be manually examined immediately for troop participation data required by the Army NTPR Project Team.

c. That the Army portion of the VIP Personnel File maintained by the National Personnel Records Center be offered to the National Archives for permanent accessioning thus precipitating a record appraisal which may lead to formal disposal standards for official personnel files throughout the federal government.

Records of the Defense Atomic Support  
Agency (and the Armed Forces Special  
Weapons Project) Held by the National  
Archives in Record Group 374

APPENDIX #1 to ANNEX H

## RECORDS OF THE DEFENSE ATOMIC SUPPORT AGENCY

### (RECORD GROUP 374)

The Defense Atomic Support Agency (DASA) succeeded on May 6, 1959, the Armed Forces Special Weapons Project (AFSWP) that, in turn, had replaced the Manhattan Engineer District in 1947. DASA is an interservice agency whose director is responsible to the Secretary of Defense through the Joint Chiefs of Staff. DASA administers Defense Department nuclear weapons policy and programs and the nuclear stockpile, coordinates policy with the Atomic Energy Commission and advises the Joint Chiefs of Staff on nuclear weapons matters, performs research and testing, inspects installations associated with nuclear activities, and conducts training and educational programs. DASA also maintains and operates the Joint Nuclear Accident Coordinating Center and provides support for the Joint Atomic Information Exchange Group. The agency maintains a headquarters in Washington, a joint task force, a test command, a field command in Albuquerque, N. Mex., an Armed Forces Radiobiology Research Institute in Bethesda, Md., and military units at certain storage locations.

There are 456 cubic feet of records dated between 1943 and 1971 in this record group.

#### GENERAL RECORDS. 1947-55. 181 lin. ft.

Almost all general records are in classified decimal correspondence files, 1947-55, and relate to policy and programs for organization, administration, and operation of nuclear weapons programs. The files consist of issuances, intraoffice communications, reports of investigations and inspections, correspondence, and reference material.

#### RECORDS OF OFFICES, DIVISIONS, AND BRANCHES. 1943-55. 45 lin. ft.

These include a subject correspondence file, 1945-54, of the Office of the Deputy Chief; records of the Office of the Technical Director, including minutes, reports, and correspondence of the Armed Forces-Atomic Energy Commission Panel on Radiological Warfare and the Ad Hoc Committee on underwater atomic weapons testing, 1947-54; reports concerning the evaluation and analysis of research and development projects, 1943-48, of the Office of the Historian; the special projects file of the Analysis Branch, Weapons Effects Division, consisting of correspondence and other records relating to the collection of atomic weapon effects and the development of radiological defense procedures, 1950-53; logs and journals of the Radiation Branch, 1947-54; technical publica-

tions of the Technical Library Branch, 1946-50; records of the Security Division, consisting of the counterintelligence investigative file, 1947-52, and material relating to security clearances and the exchange of information with foreign countries, 1952-54; a Budget and Fiscal Division subject file of correspondence relating to budget estimates and justifications, 1947-55, and the subject file of reports, contracts, correspondence, and other records relating to construction of facilities at test sites, 1948-51; records of the Plans Division, consisting of the organizational planning records of the Manpower and Organization Branch, 1952-55; records of the Special Field Projects Division, consisting of reports, budgetary records, correspondence, and records relating to Operation Wigwam, 1953-55; records of the Test Division, consisting of the special operations file of orders, reports, and correspondence relating to special atomic weapons test operations, 1948-53; and records of the Weapons Development Division, relating to development, production, and administrative practices concerning nuclear and thermonuclear weapons, 1948-53.

#### RECORDS OF SPECIAL DETACHMENTS. 1943-52. 4 lin. ft.

AFSWP personnel served on occasion in facilities of the Atomic Energy Commission to collaborate on matters relating to military application of Commission work. Records of special detachments consist of the file of general and special orders relating to military personnel assigned to the detachment at Oak Ridge, Tenn., 1943-52, and the administrative subject decimal file of the 8453d Antiaircraft Unit, Special Weapons Detachment, 1946-52.

#### RECORDS OF JOINT TASK FORCES. 1946-55. 230 lin. ft.

For each AFSWP nuclear test operation a specific joint task force was established, composed of a task group from each service. The groups were identified by a decimal added to the number designating the task force. Special technical groups associated with a specific operation were also identified in this manner.

Records of Joint Task Force 1 relate chiefly to Operation Crossroads and subsequent followup activities. The records include a numeric-subject correspondence file, 1946-47, the numeric file of the Bikini Scientific Resurvey Group, 1947-48, and records of the Office of the Director of Ship Material relating to the planning, preparation, and execution of all nonscientific matters in the operation. Other records include incoming and outgoing messages, 1946, civilian and military orders, 1946, personal history data, 1946, a commendation file,

1945-46, and letters, formal petitions, and other records relating to protests against the testing, 1946. Records of the Army Ground Group at Bikini consist of Operation Plan 1-46 with attached organization charts, annexes, appendices, and photographs, 1946; a reading file relating to quarter-master activities during the operation, 1946; and test crew reports on the effects of radioactivity, heat, pressure, and blast on certain equipment, 1946.

Records of Joint Task Force 3 relate to Operation Greenhouse and include general correspondence relating to organization and administration, 1949-51; a personal name file of orders and other records relating to the assignment, travel, and relief of personnel, 1950-51; cost control reports relating to expenditures, 1949-51; a general topic file of orders, memorandums, reports, and journals; and a supply administrative file, 1950-52. Records of Task Group 3.2 (Army) consist of incoming messages, 1950-51. Records of Task Group 3.3 (Navy) consist of correspondence logs and copies of outgoing messages, 1950-51, and a numeric file of correspondence relating to the Navy's role in the operation, 1950-52. Records of Task Group 3.4 (Air Force) consist of a decimal correspondence file, 1950-51; a general file of orders, plans, and diaries, 1950-51; transcripts of teleconferences, 1950-51, and reports, summaries, and procedural instructions.

Joint Task Force 7 participated in both Operation Sandstone and Operation Castle. Records of this joint task force consist of the general records, with index, of Operation Sandstone, 1947-48; the decimal correspondence file of the Intelligence and Security Section of the Intelligence Division, 1947-48; and correspondence and other records relating to participation of the joint task force in Operation Castle, 1952-54. Records of Task Group 7.2 (Army) consist of the decimal administrative correspondence file, 1953-55, and memorandums, letters, and court-martial orders, 1953-55. Records of Task Group 7.3 (Navy) consist of messages, 1952, a numeric-subject file relating to Operation Ivy, 1952-53, and histories, 1948-53. Records of Task Group 7.6 (Joint Radiological Safety Group) consist of a subject file relating to conduct of radiological safety operations performed as part of Operation Sandstone, 1947-48.

Joint Task Force 132 participated in Operation Ivy and in Operation Windstorm. The records include general decimal correspondence relating to Operation Windstorm, 1950-52, and histories and other papers of previous operations, 1949-52, of Task Group 132.2 (Army); and the decimal file, 1952, and general file, 1951-52, relating to the participation of Task Group 132.4 (Air Force) in Operation Ivy.

AUDIOVISUAL RECORDS, 1947-71, 122 items.

Training films (20 reels), used by the Nuclear Weapons School, 1969-71, made by the U.S. Air Force during the period 1954-62, pertain to various phases of atomic weaponry, including inspection, safety precautions, radiological detection, shipping, prefiring preparation, firing, and radiological anticontamination procedures.

Photographic prints (102 items) of Operation Sandstone (A-Bomb tests at Eniwetok Atoll, 1947-48).

Trip Report of Field Search  
for Exercise Desert Rock Documentation  
Conducted by Representatives of The Adjutant General  
18 June 1978 to 14 July 1978

Retired Records of the US Army  
Chemical Corps School, Fort Mc-  
Clellan, Alabama, 1953-1969

APPENDIX #3 to ANNEX H

DEPARTMENT OF THE ARMY  
OFFICE OF THE ADJUTANT GENERAL AND THE ADJUTANT GENERAL CENTER  
WASHINGTON, D.C. 20314

DAAG-AIR-D

12 July 1978

Director  
National Personnel Records Center  
Attn: Mr Kilgore  
St Louis, Mo 63132

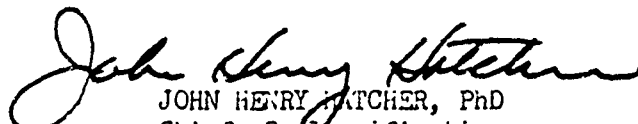

Dear Mr. Kilgore:

As a result of our current investigation of possible radiation over-exposure of military personnel in the 1950's, the USA Chemical Corps School at Fort McClellan has been identified as a highly probable source.

Please freeze all disposal action on records of this organization that you presently hold. It may be necessary for us to conduct a similar search for graduates of this school as is currently underway for EXERCISE DESERT ROCK participants.

We will advise you as soon as possible as to our search requirements into the class records of the Chemical Corps School.

Sincerely,

  
JOHN HENRY HATCHER, PhD  
Chief, Declassification  
Operations Branch

ARMY RECORDS CENTER, TAGO

NPRC MEMORANDUM

SUBJECT: Civilian and military records of VIP's

1. Purpose. This memorandum contains instructions designed to insure the preservation of the records of any person achieving the status of VIP before, during, or after his or her recorded dates of service. These VIP records shall include certain government officials, celebrities, and persons receiving notoriety or adverse publicity. These records are to be withdrawn from the open files and stored in the NPRC vaults, at CPR or MPR as appropriate, to protect them from possible destruction or compromise.
2. Cancellation. NPRC 1864.99 is canceled.
3. Applicability. The provisions of this memorandum are applicable to all NPRC employees.
4. Background. Presently at NPRC only MPR has an established policy for handling such records. The revised policy and procedures established herein are published with the approval and at the direction of the Assistant Archivist for Federal Records Centers and apply to both CPR and MPR.
5. When records are to be placed in the vault. The Civilian and/or Military personnel and medical records of an individual will be placed in the vault when the government official takes office or when the records meet other applicable criteria contained in this memorandum.
6. Retention period. All records placed in the vault under the provisions of this memorandum will remain there on a permanent basis (or until the records are transferred or required elsewhere).
7. Procedures.
  - a. President of the United States. A silver negative master microfilm copy and one diazo microfilm copy of the civilian and/or military service records will be prepared. ~~The diazo microfilm copy will be retained in the appropriate MPR or CPR vault.~~ The silver negative master microfilm copy will be placed in the National Archives; and the original record will be deposited in the appropriate Presidential Library or manuscript depository. A request will be submitted to NC in order to obtain permission from the appropriate Military Service prior to the microfilming of the military records.

Distribution: M, O, P, Q

June 20, 1975

b. Vice President of the United States. The original records will be retained in the appropriate MPR or CPR vault and a silver negative master microfilm copy will be placed in the depository chosen to house the Vice Presidential papers. A request will be submitted to NC in order to obtain the permission of the Vice President; when military records are involved, the consent of the appropriate Military Service also will be obtained prior to microfilming.

c. Government officials. The records of government officials holding any of the following offices will be placed in the appropriate MPR or CPR vault:

(1) Legislative Branch

- (a) U. S. Senators
- (b) U. S. Representatives

(2) Judicial Branch

- (a) Justices of the Supreme Court of the United States
- (b) Judges of the U. S. Court of Appeals

(3) Executive Branch

(a) Secretaries, Deputy Secretaries, and Under Secretaries of each cabinet department

(b) All staff members of the White House Office listed in the GOVERNMENT ORGANIZATION MANUAL

(c) Members of the Council of Economic Advisors

(d) Director and Deputy Director of the Central Intelligence Agency

(e) Director and Deputy Director of the Office of Management and Budget

(f) Special Representative and Deputy Representative for Trade Negotiations

(g) Members of the Council on Environmental Quality

January 20, 1976

NPRC 1864.99A CIGE 1

- (h) Director and Deputy Director of the Office of Telecommunications Policy
- (i) Chairman and members of the Joint Chiefs of Staff
- (j) Top official of each independent agency, commission and board
- (k) All ambassadors requiring confirmation by the United States Senate

d. Persons other than government officials. It is not possible to formulate definitive guidelines for determining which individuals are celebrities or persons of note deserving to have their records placed in the vaults at NPRC. Examination of the various news media may help to identify persons considered currently as celebrities or those who receive significant notoriety. Since the selection process will often be based on subjective criteria, special judgment will be required in each case. Every effort should be made to keep this group to a minimum consistent with insuring compliance with the provisions of this memorandum.

8. Responsibilities. The above procedures will be achieved through the mutual efforts of personnel at CPR and MPR. Any information that will aid in the identification and location of any VIP record should be made available for use at either MPR or CPR.

a. Librarians (MPR & CPR).

(1) The MPR librarian will identify all government officials currently holding the positions listed in par. 7, and prepare GSA Form 7208, VIP Control Card (Figure 1) in duplicate for each selected individual. The librarian will continue this process as new appointments of government officials are made, ensuring that all reference information used is noted in the "Remarks" section of the control card. This information appears in various sources such as the WEEKLY COMPILATION OF PRESIDENTIAL DOCUMENTS. One copy of the prepared GSA Form 7208 will be forwarded to the MPR vault attendant and the second copy will be sent to the CPR librarian.

(2) Upon receiving GSA Forms 7208 from the MPR librarian, the CPR librarian will fill in any additional information needed to complete each card. The CURRENT BIOGRAPHY YEARBOOKS, as well as various other source documents, will be helpful in providing this information. A duplicate should be made of each completed card. The original card should be kept in an alphabetic index, and the copy forwarded to the Chief, Civilian Operations Branch.

January 20, 1976

b. Key operating official (MPR & CPR). Key operating officials at all levels constantly should be aware of the responsibility for recommending vault storage for the records of VIP's (other than Government officials). When a key operating official has located the record of a potential VIP, he should transmit the record directly to the branch chief with the suggestion that the record be sent to the vault for storage. When a key official does not have physical access to a record he considers deserving of VIP treatment, he will furnish his branch chief the name, position, status, etc., of the individual, with a suggestion that action be taken to remove the record from open storage.

c. Branch Chiefs (MPR & CPR). Each branch chief, after determining that a record concerning a VIP (other than Government officials listed in par. 7) is in the branch's files, shall prepare an appropriate search request, including a charge-out and GSA Form 7208, as shown in Figure 1. These records, along with the completed control card should be forwarded to the vault attendant (MPR) or the Chief, Civilian Operations Branch, as appropriate. When information concerning civilian or military service is not available and a record cannot readily be located, the branch chief shall complete as much of the control card as possible, and submit it to the Chief, Military Operations Branch (MPR), or the Chief, Civilian Operations Branch, as appropriate, for necessary action. These officials should discuss any doubtful cases with their respective Assistant Director, who will make the final decision in such cases.

NPRC 1864.99A

June 20, 1975

(2) Twice each year, on or about January 1, and July 1, request the Director, Federal Data Processing Center, St. Louis, Missouri, to prepare a new computer prepared list of the records in vault storage. A separate list shall be prepared in original and four copies for records in vault storage at each location.

(3) Distribute one copy of the computer prepared lists to each of the following: MPR List - NC; NCP; NCPM; MPR Vault Attendant; and MPR Librarian. CFR List - NC; NCP; NCPC; NCPCO; and CFR Librarian.

  
WARREN B. GRIFFIE  
Director

June 20, 1973

NPRC 1864.99A

d. Vault Attendant (MPR) and Chief, Civilian Operations Branch. The vault attendant (MPR) and the Chief, Civilian Operations Branch are responsible for receiving VIP records for deposit in the vault at their respective buildings and administering the documentation involved.

When either official receives control cards without records attached, he first will determine if the individual's record is already in the vault. If it is not, he will prepare and circulate a search request to determine whether the record is still in the open files. Records located in the open files will be charged-out to the vault on a permanent basis. If evidence of military service (MPR) or civilian service (CPR) cannot be found, the control card will be maintained in an alphabetic file to avoid repetitious searching.

As control cards with records attached are received, the records will be placed in the vault and the corresponding control card will be forwarded for keypunching either to the Chief, Data and Records Input Section (MPR) or to the Chief, Request Data and Records Input Section (CPR), who will also receive control cards for any individual known to have had military service (MPR) or civilian service (CPR) but for whom records have not been received.

These cards will be keypunched with a combination ~~index-flag~~ input card. In both instances, the control cards will be returned after keypunching either to the vault attendant (MPR) or the Chief, Civilian Operations Branch who will retain the cards until verification appears on the computer print-out, at which time they may be destroyed.

e. Chief, Military Office Services and Disposal Branch and Chief, Civilian Operations Branch. When information concerning military and/or civilian service is not available and a record of service cannot be located readily, these officials will establish whether or not a person has either past or present civilian or military service.

f. Chief, Data and Records Input Section (MPR) and Chief, Request Data and Records Input Section (CPR): These officials will:

(1) Insure that identifying information contained on control cards (figure 1) for VIP records has been keypunched properly. These cards will be keypunched to identify either a record in vault storage or a vault index-flag, and entered into the computer index using a special header card ("Vault") to identify specifically this records collection. He shall also arrange for the necessary keypunching of cards to delete, for this special VIP "vault" series, all index references to those NPRC record groups to which these special records formerly belonged before their removal to vault storage.
