ABSTRACT

Surge and longitudinal displacement at a cable tow position are predicted for a Submarine Rescue Ship (ASR) in long- and short-crested seas. Results are presented in the form of speed polars, but interpretation must be approached with caution in light of highly restrictive assumptions.

ADMINISTRATIVE INFORMATION

This investigation was funded by the Naval Ship Engineering Center (NAVSEC) under Work Request N6519779WR91556. The work is identified at the David W. Taylor Naval Ship Research and Development Center (DTNSRDC) as Work Unit Number 1-1568-820.

INTRODUCTION

In an effort to determine the excursion of a Submarine Rescue Ship (ASR) at an aft tow position, DTNSRDC implemented its Ship-Motion and Sea-Load Program[1*] (SMSL) and the SHREDS[2] program to obtain a root mean square (RMS) ship motion data base for all headings and speeds. Both long-crested and short-crested seaways were investigated for significant wave heights of 10, 15, and 20 feet and a modal period of 9 seconds.

The predicted results are presented in the form of speed polar plots of longitudinal tow point motion and RMS tables of the ship motion data base. It is noted that the assumptions relating limiting longitudinal tow point motions to the calculated RMS longitudinal motions are of questionable validity. These assumptions are particularly questionable in seas aft of the beam at the higher sea states. Inadequacies in the present ship motion theory do not permit more accurate longitudinal ship motion predictions to be made. Similarly, the measurement accuracies of transducers for longitudinal ship motions have made typical full-scale data unavailable.

The use of the longitudinal displacement speed polar plots for determining operating limits in speed or heading for cable tension loads is subject to the above-mentioned assumptions. Furthermore, it should be pointed out that for the case of "impact" cable loading, the longitudinal

---

velocity and acceleration needs to be considered because the ship tow point does not move instantaneously.

Caution in the interpretation of tow point motions in the horizontal plane is therefore recommended.

CALCULATION CONDITIONS

Because of the inability to obtain the most recent modifications to the hull of the ASR-14, an earlier version of the hull lines was used. Table 1 presents the computed ship particulars and Figure 1 the computed ship lines for this version of the ASR.

Three long-crested and short-crested Bretschneider[3] seaways based on worldwide heavy weather operations (Reference 4) were selected. These seaways, identified as Sea States 5, 6, and high 6, correspond to significant wave heights of 10, 15, and 20 feet, respectively, and a modal period of 9 seconds. Short-cresting was represented by a cosine square spreading function as recommended in Reference 5.

The RMS data base calculated by SHREDS includes surge and the longitudinal displacement at a tow location 8 feet aft of the aft perpendicular, on centerline, and 26.07 feet above the keel.

ASSUMPTIONS

It is understood that tow point motions affect the tension in the cable, although the individual x,y,z components of these motions do not equally influence cable tension. In fact, based on a discussion with NAVSEC personnel, it is understood that the x-component or longitudinal tow point motion is the only significant component of ship motion that affects cable tension. As a result, only this component is presented in polar plot form.

Motions were calculated for a ship traveling on a fixed course without rudder activity. Thus a critical assumption affecting the interpretation of the results is that the ship's horizontal excursions are isolated from and independent of helm control. Thus, the ship is assumed to travel without yaw or course correction on the selected heading relative to the

sea. Clearly, this assumption becomes unrealistic* once seas of sufficient height are encountered at headings other than head or following seas.

Operator control of the rudder in trying to maintain a base ship course, particularly for the seaways investigated, produces significant yaw motion. Figure 2 illustrates such operator control on a 3000-ton USCG cutter of typical destroyer hull form in mild 5 to 7-foot, 7-second modal period beam seas. Such operator-induced yaw motion in turn modifies the ship's forward speed and longitudinal motion response as well as the other ship responses. Rudder or helm control thus results in yaw-surge motion coupling, the importance of which increases as sea state increases, particularly when ship heading is aft of the beam.

It has been assumed that the operator steering activity represents one-half of the total longitudinal tow point motions for the very large response amplitudes of interest. These large motion amplitudes, in turn, represent limiting motion levels. Furthermore, it has been assumed that the limiting motion level of concern is statistically related to the calculated RMS motion. The highest expected value in 1000 successive motion amplitudes is this assumed limiting design motion level.

The limiting longitudinal motions presented in the speed polar plots represent a value twice the highest expected value in 1000 successive longitudinal motion amplitudes, i.e., 2 x 3.72 x RMS.

RESULTS

Figures 3 through 8 present the speed polar plots for the aft tow position, while Figures 9 through 14 present the surge speed polars. Long-crested results for each point are presented first, followed by the short-crested polar plots. Note that all speed polar contours are dimensioned in feet.

The appendix contains the ship motion data base in the form of RMS/TOE tables for unit significant wave height and modal periods of 7, 9, 11, . . , 21 seconds. The tables present the displacements, velocities, and accelerations for the six-degrees-of-freedom at the origin and for longitudinal, lateral, and vertical motions at the aft tow position.

---

*See Figure 2 time between 650 and 725 seconds.

DTNSRDC ISSUES THREE TYPES OF REPORTS

1. DTNSRDC REPORTS, A FORMAL SERIES, CONTAIN INFORMATION OF PERMANENT TECHNICAL VALUE. THEY CARRY A CONSECUTIVE NUMERICAL IDENTIFICATION REGARDLESS OF THEIR CLASSIFICATION OR THE ORIGINATING DEPARTMENT.

2. DEPARTMENTAL REPORTS, A SEMIFORMAL SERIES, CONTAIN INFORMATION OF A PRELIMINARY, TEMPORARY, OR PROPRIETARY NATURE OR OF LIMITED INTEREST OR SIGNIFICANCE. THEY CARRY A DEPARTMENTAL ALPHANUMERICAL IDENTIFICATION.

3. TECHNICAL MEMORANDA, AN INFORMAL SERIES, CONTAIN TECHNICAL DOCUMENTATION OF LIMITED USE AND INTEREST. THEY ARE PRIMARILY WORKING PAPERS INTENDED FOR INTERNAL USE. THEY CARRY AN IDENTIFYING NUMBER WHICH INDICATES THEIR TYPE AND THE NUMERICAL CODE OF THE ORIGINATING DEPARTMENT. ANY DISTRIBUTION OUTSIDE DTNSRDC MUST BE APPROVED BY THE HEAD OF THE ORIGINATING DEPARTMENT ON A CASE-BY-CASE BASIS.
