20. ABSTRACT (Continue on reverse side if necessary and identify by block number) The Geometric Information for Targets (GIFT) code is a FORTRAN languaged code used to mathematically describe the geometry of a three-dimensional vehicle such as a tank, truck or helicopter. The geometric data generated by the GIFT code is merged in vulnerability computer codes with the energy effects data of a selected munition to simulate the probabilities of malfunction or destruction of components when it is attacked by the selected munition.		

To simulate the geometry of a vehicle, the GIFT code uses combinatorial geometry (COM-GEOM) data. The COM-GEOM data consists of three tables: a Solid Table, a Region Table, and a Region Identification Table. The GIFT code contains numerous tests and checks to ensure that COM-GEOM data listed in these three tables is correct.

The GIFT code options include those which graphically display the vehicle, those which check the correctness of the geometry data, those which compute physical characteristics of the vehicle, and those which generate the geometric data used by vulnerability codes.

This report is a User Manual which describes the tests made on the COM-GEOM data, the output options and the output generated by the GIFT code.

I. INTRODUCTION

This report is a user's manual describing the output options and the output of the Geometric Information For Targets (GIFT)¹ computer code. The GIFT code mathematically simulates the geometry of a three-dimensional physical entity such as a tank, truck, helicopter, etc., for the computer. The bulk of the data used by the GIFT code is called combinatorial geometry (COM-GEOM) target description data. These data have been described in the Ballistic Research Laboratory Report No. 1802 and will not be discussed in this report. Reading Report 1802 prior to this one is suggested for those not familiar with COM-GEOM data.

Computer target simulation codes such as GIFT can compute the physical properties of a prototype (concept) or a foreign vehicle before the physical vehicle is available for empirical measurements. These codes can compute many of the properties of a target with less cost and time than they can be measured via empirical test procedures. For these reasons, the Air Target Vulnerability Subgroup of the Joint (Army, Navy, Air Force) Technical Coordinating Group for Munitions Effectiveness (JTTCG/ME) evaluated, selected and sponsored the detailed documentation of the MAGIC² and SHOTGEN³ computer codes. These two codes use different techniques to prepare target description data, but they both supply the angular and spacial coordinates of the target which are used as input by the "vulnerability analysis" computer codes. The techniques employed within these and other codes, plus the comments and suggestions received and the needs of potential users, influenced the development of the GIFT code.

There are various output options of the GIFT code, each of which may be subdivided into groups of subroutines. Each output option consists of one or more subroutines which perform one general function. The output options generally are under one of the following three categories when classed by the general function they perform: those options called CHECK and TESTG that check the COM-GEOM description for correctness and accuracy; those options called PICTUR, XSECT and PLTRPP that produce visual representations of the COM-GEOM description; and

³ NWC TN #4565-3-70, VOLS I and II: "SHOT GENERATOR Computer Program VOL I, User Manual; VOL II, Analyst Manual," Armament Systems, Inc., and Propulsion Development Department, July 1970 (available from Department of the Navy, Naval Weapons Center, China Lake, CA 93555).

those options called GRID, RIP, MOMENT, VOLUME and AREA that produce data used in vulnerability analysis.

II. DISCUSSION

A. Card Deck Set-Up

The input data of the GIFT code normally consists of a Control card, the COM-GEOM description data (which consist of a Title card, a Target Specification card, Solid Table cards, Region Table cards, Region RPP Table cards (optional), and Region Identification Table cards), a Declaration card stating the output option desired; and a set of input cards for the declared option. The cards containing the Declaration card and the set of input cards for the declared option can be repeated for as many output options as desired. Figure 1 depicts the order of the card input for the GIFT code. The general structure of the input data of the GIFT code is not expected to change. However, new options are periodically added to the GIFT code which may require changes to the input data. The input defined in this report exemplifies the input needed for the GIFT code as of 1 October 1978.

B. Control Card

The Control card, depicted in Figure 2, is the first data card read by the GIFT code. It sets some of the general variables used throughout the execution of the GIFT code and options executed during the input processing of the COM-GEOM data via the GENI portion of the GIFT code. It should be noted that the Control card described in this report is different than the one described in BRL Report 1802.

When the COM-GEOM description data is read by the GENI portion of the GIFT code, it is stored in a large equivalenced array called MASTER-ASTER. If a non-zero number is in Column 2 of the Control card, the GIFT code will write this MASTER-ASTER array and some constants in binary form on FORTRAN Unit 4 after the COM-GEOM data has been processed by the GENI portion of the GIFT code. After the data is written, the following message is printed: "PROCESSED GEOMETRY WRITTEN ON TAPE 4."

In subsequent computer runs, the data written on FORTRAN Unit 4 may be used instead of the unprocessed COM-GEOM description as input for the GIFT code. A non-zero number in Column 1 of the Control card indicates that binary data on FORTRAN Unit 4 containing processed COM-GEOM description data is to be used as input. The computer run time and printing is reduced by using this option. However, the binary data on FORTRAN Unit 4 is difficult to change, and should be created only after it is reasonably certain that the COM-GEOM description does not contain any errors.

Figure 1. Order of the Card Input for the GIFT Code

1	2	3-5	6	7	8	9	10	11-30	31-40	41-50	51-55	56-60	66-80
IRDTP4	IWRTP4	IN	IPRNT	ITEMPR	IMNMX	ISOLEQ	NOPRNT		TOL	TOLLOS	IVOID	IFANTM	

- IRDTP4 - If not zero, read processed geometry from FORTRAN Unit 4.
- IWRTP4 - If not zero, write processed geometry on FORTRAN Unit 4.
- IN - FORTRAN unit **containing the** COM-GEOM description (Default 5).
- IPRNT - If not zero, print MASTER-ASTER arrays containing the processed COM-GEOM description.
- ITEMPR - If not zero, print the Region Identification Table ordered by item code.
- IMNMAX - If not zero, print an ordered Region RPP Equivalent Table.
- ISOLEQ - If not zero, print the Solid RPP Equivalent Table.
- NOPRNT - If not zero, do not print COM-GEOM description but only summary storage information.
- TOL - Specify overlap tolerance (Default = 0.0001).
- TOLLOS - Specify the minimum line-of-sight (Default = 0.0001).
- IVOID - Specify the void space code (Default = 1).
- IFANTM - Specify the phantom item code (Default = 111).
- IEND - Specify the code to signal end of components along ray (Default = 9).

Figure 2. Control Card for GIFT Code

Columns 3-5 of the Control card specifies the FORTRAN unit number of the tape (or equivalent) containing the (COM-GEOM description data. A numeric zero or a "5" in card columns 3-5 indicates the COM-GEOM description data is to be read from FORTRAN unit 5.

If Column 6 of the Control card is not zero, the contents of the MASTER-ASTER array will be printed. This option is primarily used by a computer programmer to "debug" the GIFT code. Table II is an example of the MASTER-ASTER array printout for the COM-GEOM description of the sample target depicted in Figure 3 and listed in Table I.

If Column 7 of the Control card is not zero, a Region Identification Table ordered by Region Identification (Item) Code numbers is printed. The regions with no Item Code number are printed first, followed by those with Air Space Code numbers and then those with an Item Code number. This option is particularly useful for locating a region or regions when only an Item Code is known or locating regions with wrong Item Code numbers or without Item Code numbers. Table III is the ordered Region Identification Table for the COM-GEOM description of the Sample Target.

If Column 8 of the Control card is not zero, an ordered Region RPP (rectangular parallelepiped) Equivalent Table is printed. An RPP equivalent for a region is that smallest RPP solid which would completely enclose it. Table IV is an ordered Region RPP Equivalent Table for the COM-GEOM description of the Sample Target. Referring to Table IV, the heading "COUNT" is a series of consecutive integers starting from 1 and ending with the number of regions in the Region Table (20 for the Sample Target). The x, y, and z minimum (XMIN, YMIN, and ZMIN) coordinate values of the enclosing RPPs of the regions are ordered from the largest to the smallest. The x, y, and z maximum (XMAX, YMAX and ZMAX) coordinate values are ordered from the smallest to the largest. The integers in the columns under letters A through F are the region numbers that are associated with the preceeding XMIN, XMAX, YMIN, YMAX, ZMIN, ZMAX columns. Therefore, the order of the regions from the top to the bottom of the sample target are listed in the column associated with the ZMIN coordinate values (labeled E). Likewise the order of the regions from front to back of the Sample Target are listed in the XMIN associated column (labeled A) and the order of the regions from left to right are listed in the YMIN associated column (labeled C).

If Column 9 of the Control card is not zero, a Solid RPP Equivalent Table is printed. The Solid RPP Equivalent Table displays an RPP solid which would completely enclose each solid of the COM-GEOM description. Table V is a Solid RPP Equivalent Table for the COM-GEOM description of the Sample Target. Solid 12 in Table V never appears in the Region Table preceeded by a plus (+) sign (solid 12 appears in the description of region 11 as "-12"); therefore, the Equivalent Solid RPP is not calculated.

If Column 10 of the Control card is not zero, the Solid, Region, Region RPP Equivalent and Region Identification Tables are not printed. Table VI is an example of the output (compressed for display) when this option is used with the COM-GEOM description of the Sample Target.

The tolerance for overlaps (TOL) and the tolerance for line-of-sight (TOLLOS) are specified in card columns 31-40 and 41-50, respectively, of the Control card. Tolerance for overlaps is the maximum distance along a ray two or more regions can occupy the same location without generating an error. Tolerance for line-of-sight is the maximum distance along a ray or gap between two components will be ignored. Previously stated in BRL 1802, these variables were fixed at .0001 and could only be changed by altering the GIFT code.

The Void Space Code, the Phantom Item Code and the Signal Code for end of components along a ray are specified in card columns 51-55, 56-60 and 61-65, respectively. If the value of these numbers is equal to zero, the values of 1, 111 and 9 are assigned to the Void Space Code, the Phantom Code and the Signal Code for end of components along a ray, respectively. These variables will be discussed in more detail later in this report.

C. GENI Output

The GENI portion of the GIFT code reads, performs geometry tests, processes and stores the COM-GEOM target description data. Table VII contains the output of GENI for the Title card, the Target Specification card and Solid Table of the COM-GEOM description of the Sample Target. Large capital letters (A-F) are added to the printout to identify sections. The first line labeled "A" is a print of the first 60 card columns of the Title card of the COM-GEOM description. The second line labeled "A" between parenthesis is a print of Columns 79 and 80 of the Title card. The data in columns 79 and 80 of the Title card represent the units (IN = inches) that the COM-GEOM description data is described and is not mentioned in BRL Report 1802. The three lines to the right of "B" are the number of solids, regions and "surrounding RPPs" specified by the Target Specification card.

The heading "DESCRIPTION OF SOLIDS" labeled "C" precedes the lines of the printout containing the Solid Table data. The solid numbers punched on the Solid Table input cards are printed next to a sequential number generated by the GIFT code (1 1, 2 2, 3 3, ..., 20 20). When a generated number differs from the solid number, an error in the numbering or in the ordering of the Solid Table cards exist.

The two lines preceded by "D" are storage location numbers. The three lines preceded by "E" display the storage requirements for each solid type in the Solid Table. For example, in the "RPP" column, the number of RPPs is 1 and the number of words of storage for the RPPs is 6.

Table VII. Output of GENI for the Title Card, Target Specification Card and Solid Table of the Sample Target (continued)

D.	LOCATION OF SOLID POINTERS											
	LOCATION OF SOLID DATA											
E.		RPR	BOX	SPH	RCC	RCC	TRC	ELL	RAW	APR	REC	THR
	NUMBER	1	1	1	4	1	2	2	1	3	2	1
F.	STORAGE	8	15	4	24	12	16	24	12	63	30	11
												288
F.	STORAGE FOR SOLID DATA											
	STORAGE FOR SOLID POINTERS											
	TOTAL STORAGE FOR SOLIDS											

The RCC column may be interpreted as: "4 RCCs were used which required 28 words of storage; therefore, 28 divided by 4 or 7 words of storage is required for each RCC."

The three lines following "F" display the storage requirements for the Solid Table. The "TOTAL STORAGE" which is probably the only one of interest to most users, states that 529 words of storage were required for the Solid Table of the COM-GEOM description of the sample target.

Table VIII displays the Region Table for the COM-GEOM description of the Sample Target as printed by GENI. The twenty lines following the line "REGION COMBINATION DATA" is the Region Table data. The GIFT code generates a number which is printed next to the region number as they appear on the input cards. A difference between a generated number and an inputted region number indicates errors in the numbering of the Region Table.

The Region Table data is followed by storage and location numbers. The total storage for the Region Table of the COM-GEOM description of the Sample Target is 54 words.

Table IX displays the Region RPP Table created for the COM-GEOM description of the Sample Target. In the far right column of Table IX, the word "COMPUTED" is printed when the RPP values for the region was computed by the GIFT code. The word "INPUTTED" is printed when the XMIN, XMAX, YMIN, YMAX, ZMIN and ZMAX values are read from an inputted Region RPP card. The line for region 12 contains values too large for the format which indicates that it is a null region. The RPP values for any purposely defined null region are meaningless; however, if the null diagnostic message is unexpectedly printed for a region, either the recorded values of solids referenced by the region or the data within the region's description is in error. The values within the region RPP Table provide the x, y, and z location of each region. The user should review this table to ensure that every region is correctly located. The two lines after the heading "ENCLOSING RPP" provide the dimensions of an RPP which encloses or contains the entire target: the minimum x is -100.0, the maximum x is 100.0, the minimum y is -36.0, the maximum y is 36.0, the minimum z is 0.0 and the maximum z is 63.0. The x, y and z values for the "ENCLOSING RPP" are the smallest XMIN, YMIN, and ZMIN, and the largest XMAX, YMAX, and ZMAX in the Region RPP Equivalent Table; thus, these values appear in the last row of the Ordered Region RPP Equivalent Table (Table IV, row where "COUNT" is 20).

Table X displays the Region Identification Table of the COM-GEOM description of the Sample Target. A review of the figure is recommended because it can help detect air space and item code numbers that are incorrectly recorded in the Region Identification Table.

Table XI is the Storage Summary Table for the COM-GEOM description of the Sample Target. The Storage Summary Table lists the storage and

location of the different tables of the COM-GEOM description. The storage numbers can be used to determine the minimum number of computer words required for the MASTER-ASTER array to store the target description input data. Three values must be computed to determine the minimum memory size required for the target description input data. The first minimum storage value is equal to the value of LDES minus one. For the sample target, the first value is 909. The second minimum storage value is equal to the product six times (x) the number of solids plus the value of LREGON minus one. For the sample target, the second value equals $6 \times 20 + 704 - 1 = 823$. A computer constant (K) is required to compute the third value. For the CDC computer, K equals 5; for the UNIVAC computer, K equals 8; and for the IBM computer, K equals 11. The third value is equal to the product of the constant K times (x) the number of regions plus the value of LRIN minus one. The third minimum storage value for the COM-GEOM description of the sample target using the CDC computer equals $5 \times 20 + 850 - 1$ or 949. The largest of the three values is the minimum value that the variable NDQ and the ASTER array (discussed in BRL Report 1802) can be assigned when the Ordered Region Identification Table option (Column 7 on Control card) is specified. When the Ordered Region Identification Table option is not used, the variable NDQ and ASTER array must be equal to or larger than the maximum of the first two values. If the storage of the alphanumeric data (Columns 41-80) of the Region Identification Table is desired, the minimum value of NDQ is equal to LDES plus K-1 times the number of regions minus one. The minimum storage value for the alphanumeric data of the Region Identification Table of the COM-GEOM description of the sample target using the CDC computer is $910 + (5-1) \times 20 - 1$ or 989.

D. GENI Checking Process

As the GENI portion of the GIFT code checks the COM-GEOM description, a warning or error message may be printed. A warning message notifies the user of a potential problem in the COM-GEOM data and that a change may be necessary. A warning does not terminate the execution of the GIFT code. However, an error will terminate the execution of the GIFT code and the COM-GEOM description will necessarily have to be changed.

Table XIII contains a printout of a Solid Table listed in Table XII which has errors introduced to display warning messages. Comparing the code generated solid numbers to the input solid numbers (1 12, 2 18, 3 17, ..., 8 4) reveals that the input solid numbers are not consecutive. The code generated and input solid numbers can differ only when the purpose of a run is to test the Solid Table for errors. The remaining messages printed in Table XIII are explained in the paragraphs which follow.

The message "WARNING IN DESCRIPTION OF RAW SOLID NUMBER 1. VECTOR 11.0000 11.0000 11.0000 IS NOT PERPENDICULAR TO VECTOR 40.0000 0.0000 0.0000 WITHIN .5 DEGREES. ERROR IS 35.264 DEGREES" means that the angle between the two vectors which represent the leg and the depth of the right angled wedge (RAW) is equal to $90.0 - 35.264$ or 54.736 rather than the required value of $90 \pm .5$ degrees. This warning message is printed whenever the right-angled vectors of a RAW, BOX or REC solid are more than .5 degrees from being perpendicular. If the error was only one degree, would it be necessary to change the input of the solid? An experienced user can determine the answer to this question on how the errant solid is used to model a component and the values of the overlap (TOL) and the gap tolerances (TOLLOS) specified on the Control card for the GIFT code. However, a large error such as 35.264 degrees indicates that either the parameters of the errant solid are incorrect or the solid type should be changed.

"RADIUS OF BASE. EQ. RADIUS OF TOP -- CYLINDER" means that the top radius of the TRC solid is equal to the base radius. If the input parameters for the TRC solid are correctly recorded, it is recommended but not required that the TRC solid be changed into an RCC solid to shorten the computer run time.

"RADIUS OF BASE. LT. RADIUS OF TOP - - CONE IS UPSIDE DOWN" means that the top radius of the TRC solid is larger than the base radius. The GIFT code assumes that the specified vertex is defined at the top of the cone instead of the base.

"AXES OF BASE. LT. AXES OF TOP -- CONE IS UPSIDE DOWN" means that the top ellipse of the TEC solid is larger than the base ellipse. If the ratio of the semi-major axis of the base to the semi-major axis of the top of the TEC is less than 1, the TEC cone is assumed to be upside down. The GIFT interchanges the base and the top of the cone. Although the interchanging performed by the GIFT code may be correct for the errant TRC or TEC solid, it is recommended that the input cards be corrected.

"RADIUS OF TOP, EQ. 0" means that the radius of the TRC is equal to zero. It may indicate that some data is missing from your input. However, if the data is correct, there is no need to change it.

"MAJOR AXIS. EQ. MINOR AXIS -- BASES ARE CIRCULAR" means that the base of the REC and TEC is a circle instead of an ellipse. If the solid is an REC and the input data is correct, it would be better to define the solid as an RCC because the computer run time and storage is less. If the solid is an TEC, the input data is correct and the height vector is perpendicular to the base, it is possible to define the solid as an TRC solid. The TRC solid would be preferred because the computer time and storage is less.

"HEIGHT VECTOR IS PERPENDICULAR TO BASE" means that the height vector of the TEC solid is perpendicular to its base. If the data is correct and this warning message stands alone, no change of solid type can be made.

"AXES of BASE, EQ. AXES of TOP -- CYLINDER" means that the length of the semi-major axis of the base of the TEC solid is equal to the length of the semi-major axis of the top and the length of the semi-minor axis of the base is equal to the length of the semi-minor axis of the top. If the height vector was also perpendicular to the base, the TEC solid could possibly be changed to an REC solid.

"WARNING IN DESCRIPTION OF ARB SOLID NUMBER 8 WARNING IN DESCRIPTION OF FACE 4 (2376) FACE IS PROCESSED AS (2376) FOUR POINTS NOT IN A PLANE DN = 3.369" means that the last vertex (6) of four vertices (2,3,7,6) which define the face of an ARB solid does not lie in the plane generated by the first three (2,3,7) vertices, the distance the fourth vertex is from the plane is the value of the variable DN (3.369). This warning is also printed for the 6th face (vertices 4,3,7,8) of solid "8 4ARB8" and is printed whenever the value of the variable DN is greater than 0.005 units. It is recommended that the vertex for errant ARBs be computed and recorded accurate enough to pass the 0.005 tolerance since it is difficult to determine values of DN that can be ignored and still have an accurate COM-GEOM description.

Table XV depicts the error messages for a Solid Table printed by GENI using the input listed in Table XIV.

"ERROR ITYPE...ARS" is printed when the input read by the GIFT code does not contain one of the solid symbols (RPP, BOX, SPH...ARS) the code required in columns 4 through 6 of the first card of each solid.

Other solid errors are prefixed by the following message: "ERROR IN DESCRIPTION OF (solid type: TOR, BOX, etc.) SOLID NUMBER (solid number)." The solid errors printed in Table XV may be interpreted as follows:

"RADIUS.EQ.0" means that a radius is equal to zero. In Table XV, this message is printed for the TOR solid. This message may also be printed for the SPH, REC or the TRC solids.

"R1.LT.R2" means that length of the radius which runs from the center of the TOR solid to the mid-point of the circular cross-section is less than the radius of the circular cross-section.

"MAGNITUDE OF VECTOR (integer number) IS 0" means that the length of the vector is zero. The number printed after the word "VECTOR" indicates the recorded position of the errant vector. In Table XV, "VECTOR 2" means that the second (width) of the three vectors of the

BOX solid is errant. This error is printed for any solid which uses a vector to define its shape.

"ZMIN.GE.ZMAX means that the minimum Z (ZMIN) of the RPP solid is greater than or equal to the maximum Z (ZMAX). This error message is also printed if XMIN is greater than or equal to XMAX or YMIN is greater than or equal to YMAX.

"MINOR AXIS.EQ.0" means that the minor axis of the ELL solid is equal to zero.

"MAJOR AXIS.LT.MINOR AXIS" means that the length of the major axis of an errant REC or TEC solid is less than the length of the minor axis.

"RATIO.EQ.0 means that the ratio of the semi-major axis of the base to the semi-major axis of the top of the TEC solid is equal to zero.

"ERROR IN DESCRIPTION OF FACE (face number)" identifies a face of an errant REC or TEC solid is less than the length of the minor axis which describe the errant face: "FACE IS PROCESSED AS (vertices of errant face)." This message is printed for two faces of the ARB4 in Table XV: the second and third faces of ARB4 which are composed of vertices (4,1,2,0) and (4,2,3,0), respectively. The error indicated for both of these faces is "FACE IS A LINE" which means that all of the vertices defining the face lie on the same line, thus a plane or face is undefined. The "FACE IS PROCESSED AS (1 2 0 0)" and "FACE IS PROCESSED AS (2 3 0 0)" messages indicate that the fourth vertex is equal to another vertex because it does not appear in the "FACE IS PROCESSED AS" message. The second vertex is the only vertex common to both errant faces; thus, the values of the fourth vertex must be equal to the values of the second vertex. The error message printed for ARB5, faces 3 and 5 is another example. The "ERROR IN SIDE...DO NOT LIE ON THE SAME SIDE OF THE FACE" message states that the vertices of face 3 (5,2,3,0) define a plane which has the remaining vertices (1,-4,0,0) of ARB5 on opposite sides of the defined plane. Every vertex of a ARB solid which is not used to define the face (plane) should lie on the same side of the face.

Table XVI illustrates the error messages for a Region Table printed by GENI using the input listed in Table XIV. "ERROR IN DESCRIPTION OF REGION (the region number) IN FIELD (the field number)" identifies the errant region and the position (field) on the card defining the region where the error occurs. The error message in Table XVI states that the third descriptor (field) of region number 1 contains two errors:

- (1) "ILLEGAL OPERATOR" ("XX" is printed where only the "OR" operator symbol or blank columns should be located.
- (2) "SOLID NUMBER.GT.NSOLID" indicates that the solid number (13) is greater than the number of solids in the Solid Table.

Table XVI. GENI Output of a Region Table Containing Error Messages

REGION COMBINATION DATA												
1	1	1	3	XX	13	OR	2	0	0	0	0	
ERROR IN DESCRIPTION OF REGION				1	IN FIELD		3					
ILLEGAL OPERATOR												
ERROR IN DESCRIPTION OF REGION				1	IN FIELD		3

NUMBER OF DESCRIPTORS								5				
STORAGE FOR REGION POINTERS								1				
TOTAL STORAGE FOR REGIONS								6				
TERMINATION ON GEOMETRY INPUT ERROR												
IERR=				20								

"NEED (OR) WITH FIRST DESCRIPTOR" indicates that an "OR" is used in the description of the region; however, the required "OR" is used in Columns 7 and 8 was not recorded.

"ERROR NUMBER OF REGIONS.GT.NRMAX" indicates that number of regions specified on the Target Specification card (Columns 21 to 30) is less than the number of regions contained in the Region Table.

The Region RPP Equivalent Table has one warning and one error message. "***DIAGNOSTIC**REGION (region number) IS NULL REGION" is a warning message indicating that a region has no volume. This can be desirable especially when a one-to-one correspondence between the solid and region numbers is maintained. This warning message changes to "***DIAGNOSTIC**THE FOLLOWING REGIONS ARE NULL: followed by a list of null regions when the No Print Option (Column 10) is specified on the Control card. The error message "REGION (region number).GT.MAX REGION (maximum number of Regions)" is printed whenever the region number in Columns 1-10 of Region RPP Equivalent Table is larger than the maximum number of regions specified in Columns 21-30 of the Target Specification card.

Table XVII contains the warning and error messages that are generated by GENI for the Region Identification Table listed in Table XIV.

"ERROR IN IDENTIFICATION OF REGION (region number) ILLEGAL TO INPUT SPACE CODE (number)" means that the air space code used is the same as the Signal Code for end of components along a ray (columns 61-65) specified on the Control card.

"WARNING IN IDENTIFICATION TABLE REGION (region number).GT.MAXIMUM NUMBER OF REGIONS (maximum number of regions)" means that a specified region number is greater than the number of regions described in the Region Table. This message is usually printed when fewer regions were described in the Region Table than was intended.

As previously stated, the processed COM-GEOM data is stored in a large common equivalenced array in the GIFT array code called the MASTER-ASTER array. Stated in BRL Report No. 1802, the size of MASTER-ASTER is stored in a variable called NDQ. Also stated in BRL Report No. 1802, good estimation of the amount of storage required for a COM-GEOM description is 45 words of storage for each solid described. Table XVIII contains the formula to compute an accurate value for the MASTER-ASTER array and NDQ. If enough storage is not allowed at any particular point in the processing of the COM-GEOM description by GENI, an error message will be printed and normally execution of the code will be terminated.

"NO ROOM FOR SOLID DATA. LSOLID.GE.LRPPEQ NDQ (the value of LSOLID, the value of LRPPEQ, and the value of NDQ)" is printed if the variable NDQ is less than or equal to seven times the number of solids plus one.

Table XVII . GENI Output of a Region Identification
Containing Warning and Error Messages

STORAGE FOR IDENT TABLE 2			
LOCATION ALPHA REG DESCRIPTION LDES = 46			
STORAGE FOR ALPHA REGION DESCRIPTION 8			

Table XVIII. Formula to Compute Storage Requirement
for MASTER-ASTER Array

$$\begin{aligned}
 \text{MASTER-ASTER Storage} = & 4 * \text{number of Solids} + 7 * \text{number of RCCs} \\
 (* = \text{times}) & + 12 * \text{number of RECs} + 8 * \text{number of TRCs} \\
 & + 15 * \text{number of TECs} + 4 * \text{number of SPHs} \\
 & + 11 * \text{number of TORs} + 12 * \text{number of ELLs} \\
 & + 6 * \text{number of RPPs} + 15 * \text{number of BOXs} \\
 & + 12 * \text{number of RAWs} + \text{ARB storage} \\
 & + \text{non-convex ARS storage} + \text{convex ARS storage} \\
 & + 14 * \text{number of Regions} \\
 & + \text{number of Region Descriptors} \\
 & + 6 \\
 & + \text{alphanumeric storage}
 \end{aligned}$$

$$\text{ARB Storage} = \sum_{1}^{\text{number of ARBs}} 4 * \text{number of faces per ARB} + 1$$

$$\text{Non-Convex ARS Storage} = \sum_{1}^{\text{number of non-convex ARSs}} 88 + 4 * (L + 2 * N * (M - 1))$$

where

L = number of points read directly

M = number of curves

N = number of points per curve

$$\text{Convex ARS Storage} = \sum_{1}^{\text{number of convex ARSs}} 4 * \text{number of non-degenerate faces per ARS} + 1$$

Number of Region Descriptors is the number of non-zero numbers in columns 7 through 69 of Region Table.

Alphanumeric storage (optional) = N * number of Regions.

N = 4 for CDC computers, 7 for UNIVAC computers, and 10 for IBM computers.

"NO MORE ROOM FOR SOLID DATA

LOCDA = (location) LRPPEQ = (location) NDQ = (value of NDQ)" is printed whenever the variable LOCDA is greater than or equal to the variable LRPPEQ. LOCDA is the location in the MASTER-ASTER array of the solid currently being stored. LRPPEQ is the location in the MASTER-ASTER array of the temporary Solid RPP Equivalent Table. The storage required for the Solid RPP Equivalent Table is released after the Region RPP Equivalent Table is computed. If GENI has processed over three quarters of the Solid Table at this point, doubling the size of the MASTER-ASTER array and the variable NDQ is a good rule of thumb for correcting this error.

"NO MORE ROOM FOR REGION DATA

LOC = (location) LRPPEQ - (location) NDQ - (value of NDQ)" is printed when there is not enough room in the MASTER-ASTER array to store the region descriptors. LOC is the location in the MASTER-ASTER array of region descriptor currently being stored. The number of region descriptors is the count of all the non-zero numbers in columns 9 through 69 of the Region Table. Increasing the size of the MASTER-ASTER array and NDQ by fourteen times the number of regions plus the number of descriptors remaining to be processed should correct this error.

"NO ROOM FOR IDENTIFICATION TABLE

LIRFO (location) NRMAX (number of regions) NDQ (value of NDQ)" is printed when there is not enough room in the MASTER-ASTER array for the Region Identification Table. LIRFO is the location of the starting point of the storage for the Region Identification Table in the MASTER-ASTER array. Increasing the size of the MASTER-ASTER array and the variable NDQ to equal the value of the number printed next to "LIRFO" plus the number printed next to "NRMAX" in the error message plus three times the number of solids will correct this error.

"NOT ENUF STORAGE TO PRINT IDENTIFICATION TABLE BY ITEM - OPTION IGNORED

LITEM (location) LAST (location) NDQ (value of NDQ)" is printed whenever the Ordered Identification Table Option is specified on the Control card (column 7) and there is not enough room in the MASTER-ASTER array to store the region number - space code - item code packed word and the alphanumeric description for each region. The number next to "LAST" in the warning message is the minimum size required for the MASTER-ASTER array and the variable NDQ in order to perform this option. The GIFT code does not terminate execution because of this error.

"NO ROOM FOR WORKING STORAGE

LEGEOM (location) NDQ (location)" is printed when not enough room is made available in the MASTER-ASTER array for temporary storage which is used while the GIFT code is tracing a ray. The number next to LEGEOM is the minimum size required for the MASTER-ASTER array and the variable NDQ in order to correct this error.

"NO ROOM TO STORE ALPHA REGION DESCRIPTION" is printed when there is not enough room in the MASTER-ASTER array to store the alphanumeric description of the regions in the Region Identification Table. If there is not enough room in the MASTER-ASTER array, the GIFT code does not terminate execution but the columns in the output which would contain the alphanumeric description of a region will be left blank. The alphanumeric description of a region can be particularly helpful to an analyst when he is debugging a COM-GEOM description. Increasing the size of the MASTER-ASTER array and the variable NDQ to equal the number printed next to the value "LEGEOM" printed in the Storage Summary Table plus N times the number of regions where N=4 for the CDC computers, N=7 for the UNIVAC computers, and N=10 for the IBM computers will ensure that the alphanumeric description of the regions is stored.

E. GIFT Basics

To understand the output options of the GIFT code, a discussion of the Azimuth and Elevation Angle Reference System and the grid is presented. The x, y, and z cartesian coordinate system defined in BRL Report 1802 is used to reference the spacial location of the parameters recorded in the COM-GEOM description, an azimuth and elevation angle is used by the output options of the GIFT code to specify a view plane (attack aspect) of a target. Figure 4 displays the relationship between the Azimuth and Elevation Angle Reference System associated with the output options and the x, y and z coordinates associated with target description data.

In Figure 4, the "TOP VIEW" of the simplified tank illustrates different angular values of the azimuth angle. The dashed circumscribed circle around the "TOP VIEW" may be interpreted as the top view of the path that an individual would make on the ground as he walked around the tank. The point R is the point where the x-axis intersects the circumscribed circle and the point O is the origin of the x, y and z coordinate system of the COM-GEOM description. An individual at point R looking toward point O is at the reference position where the azimuth angle is zero degrees. The angle formed at the points R, O and P is 45 degrees; therefore, an individual standing at point "P" looking toward O is at the position where the azimuth angle is 45 degrees. The azimuth angle then varies from 0 to 360 degrees as an individual moves from point R counterclockwise around the tank on the dashed line.

Figure 4. An Illustration of Azimuth and Elevation Angles

The "SIDE VIEW" of Figure 4 of the tank is used to illustrate the different angular values of the elevation angle. The points O and R are in the same position as in the "TOP VIEW" of Figure 4. The view from point R towards point O is then the view where the elevation angle is zero. The angle between points R, O and Q is 90 degrees; therefore, the elevation angle of the view from point Q towards point O of the tank is 90 degrees. The elevation angle varies from 0 to 360 degrees as the point of view circles the tank from point R in a clockwise direction. The Azimuth and Elevation Angle Reference System allows viewing the target from any desired aspect.

A COM-GEOM description is enclosed in a rectangular parallelepiped (RPP) whose sides are parallel to the three coordinate axes. The smallest XMIN of the Region RPP Table becomes the XMIN of the enclosing RPP, the smallest YMIN becomes YMIN of the enclosing RPP, and the smallest ZMIN becomes the ZMIN of the enclosing RPP. Likewise, the largest XMAX of the Region RPP Table becomes the XMAX of the enclosing RPP, etc.

A view plane containing the origin of the COM-GEOM description is generated for a given azimuth and elevation angle. A line which extends through the origin of the COM-GEOM description and the point from which the target is being viewed is perpendicular to this view plane. For example, the y-z plane is the view plane when the azimuth and elevation angle is zero. The enclosing RPP is then projected onto the view plane forming a two-dimensional shape which is then enclosed by a rectangle called a grid. A grid is divided into equal squares or rectangles called grid cells. These grid cells are situated so that the origin of the COM-GEOM description is located in the center of one of the grid cells. Figure 5 depicts a grid and its parameters.

A grid has a horizontal (H) length and a vertical (V) length. A grid cell also has a horizontal and vertical length which is called cell size. Figure 5 has three equal horizontal grid cell lengths and five equal vertical grid cell lengths.

Each grid cell can be identified by its matrix position. The grid cell containing the origin of the COM-GEOM description is identified as (0,0) grid cell. The grid cells are numbered positive in the positive vertical direction and positive towards the right in the horizontal direction. Therefore, the top-right grid cell in Figure 5 is identified as the (1,2) grid cell. Similarly, the remaining grid cells can be uniquely identified by their matrix indices.

A ray (line) is traced through the target perpendicular to the view plane in each grid cell. The location of the ray within the grid cell may be either the center of the cell or a "random" location. To determine the random location of the grid cell, the grid cell is further divided into a ten by ten cell matrix or 100 cells as depicted in Figure 6. These "little" cells are numbered from zero to nine in

Figure 5. A Grid and Its Parameters

Figure 6. Locating "Random" Point in Grid Cell

the horizontal direction from left to right and in the vertical direction from bottom to top. One of these "little" cells is picked at random and the ray is traced through its center.

The GIFT code uses a grid to generate the data for most of the output options. The rays that are generated through the grid cells contain starting points in a plane which is parallel to the view plane and lies completely exterior to the COM-GEOM description. The distances from the starting point of the ray to the points of intersection of a region with the ray is computed. This is compared with the distances to the points of intersection of other regions with the ray. Whenever two or more regions have entrance and exit distances that overlap, an error message is printed by the GIFT code. Table XIX is an example of an error message.

The error message is printed so that an analyst can determine why the overlap occurred. Table XIX is divided into three sections labeled A, B and C. Section A describes the ray and regions intersected by the ray in a general form. Section B presents the two or more regions that overlap. Section C describes the overlapping regions in more detail.

Section A contains the x, y and z coordinates of the "STARTING POINT OF THE RAY," the "DIRECTION COSINES OF RAY" (a normalized vector with the same direction as the ray) and a subsection which contains a list of all regions that the ray intersected (ray history). This ray history lists from top to bottom the regions in the order they are intersected as the ray proceeds from the starting point. The second column labeled "ITEM" is the item code number for the region listed in column one. If the item code is zero, it is likely that the region is an air space. The third column labeled "DIST IN" is the distance along the ray from the starting point of the ray to the point where the ray enters the region. If the value of "DIST IN" is extremely large such as 1×10^{35} (may be printed "****..."), the starting point of the ray is inside the region. The column labeled "DIST OUT" is the distance along the ray from the starting point to the point where the ray exits the region. The column labeled "LOS" is the distance along the ray from the point where the ray enters the region to the point where it exits the region. The columns labeled "SOL SURF" are the solid and surface numbers of the solids at the entrance and exit points of the intersection of the ray and the region. Table XX identifies the surfaces of solids by their surface code numbers. If a surface code number is negative, the solid is being exited by the ray at the entrance or exit points. The columns labeled "X IN...X OUT" are the x, y and z coordinates of the entrance and exit points of the region.

The information in the section marked B in Table XIX is similar to the information printed in the ray history portion marked A. The total ray history is edited to pinpoint the regions that overlap.

Table XIX. Example of an Error Message Printed When Two or More Regions Overlap

ARS Given a surface number P of an ARS with M curves and N points per curve:

The curve in which a vertice of the surface is located = $1 + [(P + I - 1)/2N] + \text{Mod}(P + I - 1, 2)$

The point in the curve = $1 + \text{Mod}[(P + I - 1)/2, 2]$

where I = 1, 2, 3 and Mod is equal to the remainder of the first argument when it is divided by the second argument.

Section C describes the overlapping regions in more detail. Each region description consists of two parts, a part which supplies specific information about the ray and the region's solids and a part which gives a summary of the ray and region interaction. The first part contains an identification line ("REGION 19...ELL1" is the identification line for Region 19 in Table XIX) which supplies the item code and the alpha-numeric description of the region. The GIFT code will print an error message if the regions that overlap have item codes or different air space codes. Regions 21 and 22 in Table XIX are two overlapping regions which have item codes. Regions 19 and 23 are two overlapping regions which have different air space codes. The lines that follow the identification line define the solids which are intersected by the ray that are used to describe the region. The column under "OP" is the operation (+,-,"OR") performed in the Region Table as described in BRL Report 1802. The column under "TYPE" is the type of solid. The remainder of the information printed is similar to the information previously discussed. The portion of the total ray history which the region contributes to is the second part of each overlapping region description. It also contains information previously discussed.

III. OUTPUT OPTIONS

The output options such as AREA, CHECK, etc. may be categorized by the general type of computing they perform. Each of the output options has parameters which can be adjusted to the particular job performed. The set of cards for a particular output option can be a subset of cards containing a number of output options. An output option is randomly accessed by the GIFT code and can be referenced more than once in the same card deck. To gain access to an output option, the GIFT code requires a Declaration card which contains a left adjusted code word such as AREA, CHECK, PICTUR, etc. in Columns 1 through 6. Table XXI contains the code for the output options and a brief description of the tasks they perform.

A. AREA Option

The AREA option computes the presented area of the visible exterior regions of the COM-GEOM description from any set of azimuth and elevation angles. The centroid of the presented area and the centroid of the perimeter of the COM-GEOM description are also computed. A pictorial representation of the grid cells hit, missed or on the perimeter can also be plotted on the printer or plotter or both. Figures 7 through 9 describe the input cards for the AREA option.

If the error message "**** ERROR IN AREA **** NUMBER OF REGIONS (number of regions) EXCEEDS SIZE OF ARRAY AREA AND ARRAY ITEM (size of arrays)," the arrays called AREAS and ITEM and the variable MAXREG have to be changed to equal or exceed the number of regions in the COM-GEOM description.

Table XXI. Description of GIFT Output Options

<u>Code Word</u>	<u>Description</u>
AREA	Computes presented area of regions.
BRANDX	A user defined subroutine.
CHECK	Checks regions for overlap errors and plots silhouettes of regions on the printer.
GRID	Produces parallel ray data used for vulnerability analysis.
MOMENT	Computes weights and the moment of inertia about the center of gravity.
PICTUR	Generates a line drawing of the COM-GEOM data with hidden lines removed.
PLTRPP	Printer plots region RPP Equivalents.
RIP	Produces burst point ray data for vulnerability analysis.
TESTG	Tracks a ray and prints a detailed history.
VOLUME	Computes volumes and center points of regions.
XSECT	Plots intersection of COM-GEOM description with a plane.

1-10	11-20	21	22-23	24-25	26-27	28-30
NVIEW	MAXERR	TGTRPP	TGTUN	AREAUN	CENTUN	

FORMAT (2I10,L1,3A2)

- NVIEW - Specify number of views for the AREA Option
- MAXERR - Specify the maximum number of overlap errors that will be tolerated for each view
- TGTRPP - "T" Read a Target Enclosing RPP card
 "F" Don't read a Target Enclosing RPP card
- (Default = "F")
- (Allowable codes for following options are:
- IN = inches, FT = feet, CM = centimeters,
 M = meters, MM = millimeters)
- TGTUN - Specify the code to denote units in which the COM-GEOM description is described. (Default = IN)
- AREAUN - Specify the code to denote units in which areas are to be printed (Default = IN)
- CENTUN - Specify the code to denote units in which centroids are to be printed (Default = IN)

Figure 7. Control Card for AREA Option

1-10	11-20	21-30	31-40	41-50	51-60	61-80
XMIN	XMAX	YMIN	YMAX	ZMIN	ZMAX	

FORMAT (6F10.01)

The minimum (min) and the maximum (max) values of the x, y and z coordinates which bound the rectangular parallelepiped that encloses the COM-GEOM description. (Default is the computed Enclosing RPP located at LENRPP in ASTER.)

Figure 8. Target Enclosing RPP Card for AREA Option (Optional, read only if TGTRPP = "T" on Control Card for AREA)

1-10	11-20	21-30	31	32	33	34	35	36-37	38	39	40	41-80
A	E	CELSIZ	PLOT	PLPR	CENTER	GRID	VARSIZ		SYMMIS	SYMHIT	SYMPER	

FORMAT (3F10.0,5L1,2X,3A1)

A - Specify the Azimuth Angle in degrees

E - Specify the Elevation Angle in degrees

CELSIZ - Specify the grid cell size (Default = 4.0)

PLOT - "T" Plot picture of hit, missed and perimeter grid cells on plotter

PLPR - "T" Plot picture of hit, missed and perimeter grid cells on printer

CENTER - "T" Rays are tracked through the center of the grid cells in the viewing plane

9 - "F" Rays are tracked through a random point in the grid cells in the viewing plane

GRID - "T" and PLOT = "T" Draw grid squares on plotter

VARSIZ - "T" and PLPR = "T" Distort the vertical length of the grid cell to present a true picture of the COM-GEOM description on printer. This option normally sets vertical length of the grid cell to be 10/6 times CELSIZ

SYMMIS - PLPR = "T" Symbol to print for missed grid cell (Default = blank)

SYMHIT - PLPR = "T" Symbol to print for hit grid cell (Default = "1")

SYMPER - PLPR = "T" Symbol to print for perimeter grid cell (Default = "2")

Figure 9. View Card for Area Option

Table XXII is an example of the printout of the AREA option using the input of Figure 10 and the sample target COM-GEOM description of Table I. The portion of Table XXII labeled A with heading "TARGET PARAMETER..." describes the enclosing RPP of the target. The portion of the labeled A section with the heading "VIEW PLANE" describes the grid of the target for the selected azimuth and elevation angles. The "HORIZONTAL LENGTH" defines size of a box which would contain the enclosing RPP of the target whose horizontal and vertical sides would be parallel to the view plane. The "BACK OFF DISTANCE" is the distance the starting points of the rays are from the view plane which contains the origin of the COM-GEOM description. The "CENTER" is the horizontal (H) and vertical (V) coordinates of the center of the grid. The "HORIZONTAL RANGE" and "VERTICAL RANGE" are the H and V minimums and maximums of the grid which have been extended to accomodate the grid cell size.

The scale that is automatically generated by the GIFT code for any plotter plots is eight times the grid cell size. If a different scale is desired, the variable CELL in subroutine AREA has to be changed.

The rectangle labeled B in Table XXII is a pictorial representation of the grid. "M" represents those grid cells in which the ray missed the target. "H" represents those grid cells in which the ray hit the target. "P" represents those ray hit the target which also lie on the border (perimeter) between those hit and those missed.

The portion of Table XXII labeled C contains the presented area for each visible exterior region. For example, the presented area for Region 3 is 2864.5104 square centimeters. The second portion is a table of presented areas of each visible exterior region sorted by identification code. Those regions with zero presented areas cannot be seen from this view. The portion labeled D in Table XXII displays the centroid of the presented areas in Table XXII as "H=.0370 meters and V = .7544 meters."

The portions labeled E and F in Table XXII displays the same azimuth and elevation angles as in the first view but the option to distort grid cells to give a true picture of the COM-GEOM description on printer was chosen. The vertical cell size was changed to 3.333 in the section labeled E by the GIFT code because the printer is set to six vertical lines per inch. The default printer characters were chosen for the pictorial representation of the grid in the section labeled F.

An example of the plotter pictorial representation of the AREA option is displayed in Figure 11. The grid cell size does not have to be distorted to display a true picture of the COM-GEOM discription on the plotter.

Figure 11. Plot from AREA Option Using the Sample Input

B. CHECK Option

The CHECK option's basic task is to search for overlapping regions. It also provides silhouettes, presented areas and volumes of regions from the front, side and top views. It can search for the phantom armor that is generated by the GIFT code when two adjacent regions described as air use different air space codes. It can compute the normal thicknesses of the region at the entrance and exit intersection points of selected rays and the rotation and fallback (azimuth and elevation) angles of a vector normal to the entrance and exit surfaces.

The CHECK option uses a free form type of input which consists of a left adjusted code word in columns 1 through 10 and additional data in columns 11 through 80. All of the code words are optional except "REGION". "REGION" initiates the execution of the CHECK option. The code word "REGION" will be assumed on any input card which has columns 1 through 10 blank. Figures 12 through 20 describe the input for the CHECK option.

Table XXIII depicts the output of the CHECK option obtained by using the sample target COM-GEOM description contained in Table I and the input data for the CHECK option in Figure 21. The CHECK option output for each region consists of three parts. The first part consists of an identification line. The identification line contains the Region Identification Code number or Air Space Code and (if enough room has been allowed in the MASTER-ASTER array) the alphanumeric description of the region. The second part consists of four lines. The first line describes the grid cell and the last three lines describe the region enclosing RPP. The third portion depicts the front, side, and top views consisting of the computed presented area and volume and a printed silhouette of each view of the region. The completed volume of region 6 in Table XXIII is 5287.7 for the front, 9891.1 for side and 20031.0 for top. The volumes for all three views should be roughly equivalent but, in this case, the region is basically a hollow box and those plates describing the sides, top, and bottom are missed by the rays in the front view; similarly plates are missed in the side and top views. In this case, the volume of the region should be the sum of all three views. The character printed depicts the number of pairs (one entering, one exiting) of intersections the ray made with the region. This technique helps to better visualize the region. The top view of region 6 in Table XXIII depicts a hollow shell apparent by the printer character "2" with an elliptical hole in the top or bottom side apparent by the printer character "1". If the number of pairs of intersections is greater than 9, an "M" is printed. If an error is encountered by the ray, a "*" is printed. The front view depicts the 0 degree azimuth and elevation, the side view depicts the 270 degree azimuth and 0 degree elevation, and the top view depicts the 270 degree azimuth and 90 degree elevation aspect angles of the COM-GEOM description. The horizontal axis of the printer plot is numbered from the minimum to maximum value of x or y of the region RPP. The vertical axis of the printer plot is numbered from the maximum to minimum of y or z of the region RPP.

1-10	11-20	21-80
'CELL SIZE'	CELSIZ	

FORMAT (A6,A4,F10.0)

CELSIZ - Specify the vertical length of the grid cell (horizontal length of grid cell is the number (usually 6) of vertical lines per inch divided by 10 times CELSIZ)

(Default = 0.0)

Figure 12. CELL SIZE Card for CHECK Option

1-10	11-20	21-80
'INCREMENT'	CELINC	

FORMAT (A6,A4,F10.0)

CELINC - Specify the number of lengths one of the dimensions of a region RPP is divided

(Default = 10.0)

Figure 13. INCREMENT Card for CHECK Option

1-10	11-20	21-80
'MIN AREA'	AMIN	

FORMAT (A6,A4,F10.0)

AMIN - Specify the minimum area allowed for a grid cell.

(Default = 1.0)

Figure 14. MIN AREA Card for CHECK Option

1-10	11-80
'ALLDEP'	

FORMAT (A6,A4)

Print the normal depths, rotation and fallback angles for all regions.

Figure 15. ALLDEP Card for CHECK Option

1-10	11-15	16-20	21-80
'ARMDEP'	ILWR	IUPR	

FORMAT (A6,A4,2I5)

Print the normal depths, rotation and fallback angles for armor regions only.

ILWR - Specify lower limit of the armor region's item codes.

IUPR - Specify upper limit of the armor region's item codes.

(Default "ILWR" = 100, "IUPR" = 199)

Figure 16. ARMDEP Card for CHECK Option

1-10	11-20	21-30	31-40	41-80
'VIEW'	VIEW(1)	VIEW(2)	VIEW(3)	

FORMAT (A6,A4,3(A5,5X))

VIEW(I) - Specify codes that designate which views are to be checked.
Left adjusted codes are:

"FRONT" = Azimuth 0°, Elevation 0°
"SIDE" = Azimuth 270°, Elevation 0°
"TOP" = Azimuth 270°, Elevation 90°
"ALL" = All three previous views

(Default = "ALL")

Figure 17. VIEW Card for CHECK Option

CARD(1)		CODES(1)	CODES(2)	CODES(3)	CODES(4)	CODES(5)	CODES(6)	CODES(7)

FORMAT (A6,A4,7(A3,7X))

CARD(1) - "OPTION" Specify options to use
 - "NO" Specify options not to use
 CODES(I) - Left adjusted codes with one word for every 10 columns.
 Only the first three characters of each code word is required.
 Codes are:

"CHK" or "CHECK" - Check regions for overlapping
 "PICTUR" - Plot silhouettes of regions on printer
 "AIR CHECK" - Check air regions for holes or voids
 "DESCRIPTION" - Print solids of region and ray intersections
 "REGIONS" - Print ray and intersections
 "RAY" - Print ray history by region
 "COMPONENT" - Print ray history by item code

(Default "OPTION" = "CHECK" and "PICTUR" ; "NO" = all others)

Figure 18. OPTION Card for CHECK Option

1-10	11-80
'RESET'	

FORMAT (A6,A4)

Reset all default values:

"VIEW" = "ALL"
 "OPTION" = "CHECK" and "PICTUR"
 "NO" = "REGION", "RAY" and "COMPONENT"
 "INCREMENT" = 10.0
 "CELL SIZE" = 0.0
 "MIN AREA" = 1.0
 "ALLDEP" = False
 "ARMDEP" = False
 "ILWR" = 100
 "IUPR" = 199

FIGURE 19. RESET Card for CHECK Option

1-10	11-15	16-20		71-75	76-80
'REGION'	LIST(1)	LIST(2)	...	LIST(13)	LIST(14)

FORMAT (A6,A4,14A5)

LIST(I) - Signify which regions are to be checked and/or pictured. Region numbers or code words are allowed. Allowable code words are:

"ALL" - Do all regions

"ALL EXCEPT" - Check or picture all regions except those listed

"THRU" - Through, "100 thru 150" means do regions 100 thru 150

"END" - Last region number, "100 THRU END" means do regions 100 through the last region

(If Cols 1-80 are all blank, terminate CHECK Option)

Figure 20. REGION Card for CHECK Option

The horizontal and vertical grid cell lengths are the same for all three views and are adjusted to present a "true" picture on the printer. The grid cell lengths can be determined a number of different ways. The default method for determining the grid cell lengths is accomplished by finding the smallest of either the maximum vertical dimension or the maximum horizontal dimension of all three views and dividing it into ten equal segments. If the area of the grid cell is less than the default (1.0) or a specified minimum area, then the grid cell lengths are adjusted to equal the minimum area. If the region would take more room than allowed on the printer page, the grid cell lengths will be adjusted so that it will fit. The printout contained in Table XXIII portrays the default as well as some manual methods of selecting the grid cell size. The vertical cell length (6.0) specified in the second check of region 6 is overridden because the printer plot would not fit the page.

The lines labeled B through G in Table XXIII are an example of the printout obtained by using the input card whose printout is labeled A. The line labeled B is a header line denoting the grid cell location in the matrix of the region silhouette. The lines labeled C through G contain information similar to the error print for overlapping regions previously discussed in Section II.E, GIFT Basics. The lines labeled C

U.S. ARMY
FACILITY
BRL, APO, MD. 21005

were printed for the "REGION" code word, lines labeled D were printed for the "DES" code word, lines labeled F were printed for the "COM" code word, and lines labeled G were printed for the "RAY" code word on the input card labeled A. The lines labeled E are printed whenever either "COM" or "RAY" option is specified.

The lines labeled H are printed when the "ARMDEP" or "ALLDEP" option card is used. The lines contain the rotation (azimuth) and fallback (elevation) angles for the view from which one would observe the surface perpendicularly at the entrance and exit points of the ray, the ray distance (LOS) through the region for the first and last pair of intersections, and a normal distance through the first and last pair of intersections. The normal distance is computed by using the LOS times the cosine of the angle between the normal vector and the ray. The line indicated in Table XXIII by an arrow defines the normal distances, rotation and fallback angles, etc. for a ray in grid cell 12-3 (the one circled in the silhouette) of the front view of region 4. The rotation ("ROT(IN)") and fallback ("FB(IN)") angles at the entrance point are both zero; therefore, the first surface is perpendicular to the front view. The "LOS(IN)" is equal to the "LOS(OUT)" because there is only one pair of intersections for this ray.

The section of the printout in Table XXIII starting with the line "1 1 1 ... WARNING - PHANTOM ARMOR GENERATED FOR RAY ... 1 1 1" is generated whenever phantom armor is encountered by a ray used to check a region defined with an air space code in the Region Identification Table and the "OPTION" card contains "AIR CHECK" in the appropriate columns. The integer ("1" in the example) is the number of legitimate phantom armors that were generated. The data printed which follows the phantom armor warning is similar to the data in an error print for two overlapping regions.

C. GRID Option

The GRID option produces parallel ray data generally used for vulnerability analysis. The data is generated using a grid previously described in Section II.E. GIFT Basics, and consists of ray distances through components, normal distances through components, obliquity angles and ray distances through air spaces. The GRID output can also be used to check the COM-GEOM description for adjacent air spaces with different air space codes. Figures 22 through 24 describe the input for the GRID option.

Table XXIV is the output of the GRID option using the sample target COM-GEOM description in Table I and the GRID option input of Figure 25. The portion of the printout labeled A describes the enclosing RPP of the target. The portion of the printout labeled B describes the grid for this view.

The output from the GRID option can be printed and written on FORTRAN units 1 and 10. The data on FORTRAN unit 10 can be written in two forms but both are written in binary (unformatted). The

1-10	11-20	21-30	31-40	41-50	51-60	61	62-70	71-80
NOAA	IWOT	NOPRNT	NFORM	IRPP	NVEH	NORMV	IFORM	NOPRV

FORMAT (6I10,I1,I9,I10)

- NOAA - Specify number of aspect angles.
- IWOT - If not zero, write grid cell data on FORTRAN Unit 1.
- NOPRNT - If zero, write grid cell data on printer.
- NFORM - Specify form of output desired on FORTRAN Unit 1.
- 1 or 4 - Output one component per line. Compute obliquity angle and normal distances through component at the entrance and exit point of intersection of a ray and component.
- 0 or 2 or 5 - Output two components per line. Compute obliquity angle and normal distances through component at the entrance point of intersection of the ray and the component.
- 3 or 6 - Output three components per line. Compute obliquity angle of the component at the entrance point of intersection of the ray and the component.
- (4, 5, 6 have a slightly different format. See the discussion of the output for details)
- IRPP - If not zero, read a Target Enclosing RPP card.
- NVEH - If not zero, generate VAREA type output. If greater than zero, write VAREA type output on FORTRAN Unit 10. If less than zero, do not write VAREA type output on FORTRAN Unit 10.
- NORMV - Can only be used if VAREA output is specified. If equal zero, compute the obliquity angle at the entrance point of the intersection of a ray and a component. If not equal zero, compute the obliquity angle and normal distance through component at the entrance point of the intersection of a ray and component.
- IFORM - Specify the form of the VAREA output. If zero, output in documented VAREA format. If not zero, output in packed format.
- NOPRV - If not zero, do not print VAREA output.

Figure 22. Control Card for GRID Option

1-10	11-20	21-30	31-40	41-50	51-60	61-80
XMIN	XMAX	YMIN	YMAX	ZMIN	ZMAX	

FORMAT (6F10.0)

The minimum (min) and the maximum (max) values of the x, y and z coordinates which bound the rectangular parallelepiped that encloses the COM-GEOM description. (Default is the computed Enclosing RPP located at LENRPP in ASTER)

Figure 23. Target Enclosing RPP Card for GRID Option (Optional, read only if IRPP not zero on Control Card)

1-10	11-20	21-30	31-40	41-50	51-60	61-80
A	E	CELSIZ	GROUND	MAXERR	ICENTR	

FORMAT (4E10.3,3I10)

- Specify azimuth angle in degrees.
- Specify elevation angle in degrees.
- CELSIZ - Specify grid cell size (Default = 4.0).
- GROUND - Specify z-coordinate for the ground of the COM-GEOM description. A ray will not be traced from any location which is less than GROUND. Specifying a value for GROUND should only be considered when a negative elevation angle (E) is specified. (Default = ZMIN of the Target Enclosing RPP)
- MAXERR - Specify the maximum number of overlap errors that will be tolerated for each view.
- ICENTR - If zero, rays are tracked through a random point in the grid cell. If not zero, rays are tracked through the center of the grid cell.

section of Table XXIV labeled C is an example of the output generated for the documented VAREA⁴ code as it would exist on FORTRAN Unit 10. The section labeled D is an example of the output generated for the packed form of input for the VAREA code. Table XXV explains the data generated for VAREA. The value of D, H, and V in Table XXV is for the entrance point of the ray intersections with the component (item). If the value of D is negative, the entrance point is behind the view plane from the direction of target is viewed. The end of the view for both forms is flagged by a filemark. The end of the last block of information for both forms may be filled with zeros if not enough data were generated.

The section of Table XXIV labeled E is an example of the form of output as it would exist on formatted FORTRAN Unit 1 with a "6" specified in columns 31-40 of the Control card for GRID option. Table XXVI is a listing of a sample with a "0" or "2" specified in columns 31-40 of the Control card for GRID option. Figures 26 through 34 explain the output generated on FORTRAN Unit 1. The output generated on FORTRAN Unit 1 when "4", "5", or "6" is specified in columns 31-40 of the Control card for GRID option, is basically similar to "1", "2", or "3" being specified, respectively. The formats for "4", "5", and "6" are specified in the second parenthesis after "FORMAT" in Figures 28 through 33.

D. MOMENT Option

The MOMENT option of the GIFT code computes the center of gravity, the moments of inertia about each of the three coordinate axes, the weight of each component and the total weight, total volume of all components and all air spaces, the total presented area and the average angle between the ray and the normal vector for the first components hit for each view. The MOMENT option of the GIFT code estimates the volume and the centroid of a rectangular parallelepiped which simulates a portion of the individual components intersected by a ray from three grid planes (front view, azimuth 0°, elevation 0°; side view, azimuth 90°, elevation 0°; and top view, azimuth 0°, elevation 90°). Figure 35 depicts the model simulation of the MOMENT option. The top line of the figure shows the grid cell projected through components of a hypothetical target and indicates a random but reproducible location within the grid cell of the representative shotline and where it enters and exits each component. The middle row of objects depicts the true shape of the volume intersection of the ray cylinder and the various target components. The bottom line portrays the set of rectangular parallelepiped volumes which are simulated by and located by the MOMENT option. The mass of each simulated ray component is obtained from the

⁴ VAREA Computer Program, VOL I, User Manual, 61JTCG/ME-71-6-1, Joint Technical Coordinating Group for Munitions Effectiveness, Falcon Research and Development Company, Denver, CO, Feb 1971.

Table XXV. VAREA Input Generated by GRID Option on FORTRAN Unit 10

Record 1 View Information (for both forms of VAREA input)

A - Azimuth angle in degrees
 E - Elevation angle in degrees
 CELSIZ - Grid cell size in viewing plane
 NVEH - Vehicle number
 HMAX - Maximum horizontal coordinate in grid
 HMIN - Minimum horizontal coordinate in grid
 VMAX - Maximum vertical coordinate in grid
 VMIN - Minimum vertical coordinate in grid

Documented VAREA Output (Blocks of 170 components with 6 words per component)

SHOT(1) (D) Distance from view plane
 SHOT(2) (H) Horizontal coordinate in view plane
 SHOT(3) (V) Vertical coordinate in view plane
 SHOT(4) Packed word (NNNN NNNN IIII) containing the integer value of the normal distance through item from entrance point times 100 (N) and the item code number (I)
 SHOT(5) Distance ray travels through item
 SHOT(6) Packed word (SSSS BB LL) containing the code for the air space following items (S), the integer value of angle between normal vector and ray at entrance point (B) and the integer value of the angle between normal vector and ray at exit point (L)

Table XXV. VAREA Input Generated by GRID Option on
FORTRAN Unit 10 (continued)

Packed form of input for VAREA

(Blocks of 42 components with three words per component)

- PSHOT(1) - Packed word (DDDDDDDDDD NNN IIII) containing integer value of the distance from viewing plane times 100 (D), integer value of the normal distance through item from entrance points times 100 (N) and the item code number (I).
- PSHOT(2) - Packed word (HHHHHHHHHH DDD.DD) containing integer value of the horizontal coordinate in viewing plane times 100 (H) and the distance ray travels through item (D).
- PSHOT(3) - Packed word (VVVVVVVVVV S BB LL) containing the integer value of the vertical coordinate in view plane times 100 (V), the code for the air space following item (S), the integer value of angle between normal vector and ray at entrance point (B) and the integer value of the angle between normal vector and ray at exit point (L).

(for all forms)

Figure 35. Visualization of the Simulation of the Intersection of a Grid Cell with Target Components

computed volume and the estimated density data of the Item Density Table. The moments of inertia, center of gravity and total vehicle mass are calculated for axes passing through $x=0$, $y=0$ and $z=0$. The moments of inertia are then computed by using the Parallel Axis Theorem for a set of axes centered at the coordinates of the corresponding computed center of gravity. The final estimate of the moments of inertia, center of gravity, component masses and total vehicle mass are the computed averages of all three views. Figures 36 through 38 describe the input for the MOMENT option.

If the message "**** ERROR IN MOMENT **** ... NUMBER OF ITEMS (number) EXCEEDS ARRAY SIZE (number)" is printed, the variable MXITEM and the arrays ITEMS, CINF and CWT in the MOMENT subroutine would have to be changed to be equal to or greater than the number after "NUMBER OF ITEMS."

Table XXVII is the output generated using the COM-GEOM description in Table I and the MOMENT option data located in Figure 39. The portion of the output with header line "ENTER MOMENT" describes the Enclosing RPP of the target. The first line under "XMIN...ZMIN" is the Enclosing RPP of the target. The second line is the RPP expanded so that an even number of grid cells on each face is established. The next three portions in the printout contains the data generated by the MOMENT option for the front, side and top views. The last two portions of the printout contain averages of the three views. The portion beginning with the line "ITEM...DESCRIPTION" supplies an averaged weight for each item (component) of the target. The item code number, density and an alphanumeric description of each component is also supplied. The last portion contains an averaged center of gravity, moments of inertia, mass and volumes for the three views.

E. PICTUR Option

The PICTUR option generates a line drawing (may be plotted on a Calcomp plotter) of the COM-GEOM description as it appears from any azimuth and elevation combination. Lines not visible from the selected aspect angles are not drawn. The plot drawn can be either isometric or perspective. Selected regions or cross-sections of the COM-GEOM description can be plotted. The main purpose of the PICTUR option is to generate a visual representation of the COM-GEOM description for reports and presentations but it can also be used to check the location and shape of the described components. Figures 40 through 44 describe the input for the PICTUR option.

The plot generated by the PICTUR option is obtained by basically a search technique. The grid is constructed for the selected view of the COM-GEOM description with the cell size specified. An initial scan is made by dividing the horizontal and vertical lengths of the grid into approximately 10 segments each. Rays are traced through the

FORMAT (4E10.3,L5,I5,I10,F10.0,2I5)

- A - Specify azimuth angle in degrees
- E - Specify elevation angle in degrees
- SMESH - Specify grid cell size for plotting (Default = .25)
- SCALE - Specify scale for plotting on one inch of graph (Default = 10.0)
- SPECTV - If "T", plot a perspective picture
- IRPP - If not zero, read a Target Enclosing RPP card
- MAXERR - Specify the maximum errors allowed per view (Default = 25)
- DEYE - Specify the distance the eye is from the target for perspective picture (Default = the vertical length of the grid divided by .725)
- IDLKP - If not zero, plot only selected regions
- IXSECT - If less than zero, plot only the portion of the COM-GEOM description not in the box. If greater than zero, plot only the portion of the COM-GEOM description in the box

FORMAT (6F10.0)

P(I) - Specify the vertex of the box.

V(I,I) - Specify the vectors defining the length, width and depth of the box.

Figure 44. Cross Section Cards for PICTUR Option (Optional, read only if IXSECT of View Card is not zero)

corners of each of the segments from starting points located outside the COM-GEOM description to the first surface of the COM-GEOM description encountered. Adjacent horizontal rays are compared to determine if they intersect the same first surfaces. If two different surfaces are encountered by the two adjacent rays, a ray is traced halfway between the two adjacent rays. Each set of adjacent rays is compared again to locate which side has two different surfaces. A ray is traced halfway between the two rays which have the two different surfaces and compared. This process is repeated until the distance between adjacent rays is equal to the grid cell size (SMESH). The data associated with grid cell is then stored in an array (MA). Figure 45 depicts the procedure used by the Initial Scan of the PICTUR option.

The sample target is projected onto a grid in Figure 45. This grid is divided into 11 segments across and 11 segments down. Rays are traced through the corners of each of the segments from starting points located outside the sample target to the first surface of the sample target. Rays are traced through points 0,0 and 0,67 and compared to determine if they intersect the same first surfaces. They both miss the target so a ray through point 0,134 is traced and compared with the ray through point 0,67. The initial scan continues in the same manner until it reaches point 21,335. The ray traced through point 21,268 misses the target but the ray traced through point 21,335 hits a surface indicating a line is located between them. The area with the loosely spaced dots in Figure 45 depicts the next portion of the initial scan procedure. A ray is traced through point 21,301 which is located approximately halfway between points 21,268 and 21,335. The rays traced through points 21,301 and 21,335 hits the same first surface so another ray is traced through point 21,284 which is located approximately halfway between points 21,260 and 21,301. This procedure is repeated until the line to be plotted is located within one grid cell length between points 21,271 and 21,272. The area containing packed dots in Figure 45 depicts the grid cell which is stored. Rays are first traced through points 22,271 and 22,272 then the first surfaces (identified by region, solid and surface numbers) encountered for each of the four corners of the grid cell, the location (21,271) of the upper left corner of the grid cell and a flag indicating the sides of the grid cell crossed by lines are stored. The initial scan continues until the whole grid has been covered.

After the initial scan, the grid cell data stored in array MA is accessed and used to compute the starting point (node) for a plotted line approximating the line located between two surfaces. The side of the grid cell intersecting the plotted line determines which adjacent grid cell will be computed next. If the adjacent grid cell has not been previously referenced, rays are traced through the two corners which haven't previously been computed. The remaining side of the adjacent grid cell which intersects the plotted line is determined. The plotted line is computed from the midpoint of the side where the plotted line enters the adjacent grid cell to the midpoint of the side where the plotted line leaves the adjacent grid cell. Adjacent grid

Figure 45. The Initial Scan of PICTUR Option

cells are computed until the plotted line intersects a grid cell previously computed. If a grid cell has more than two sides intersected by lines, the data associated with it is stored. This grid cell data is used as a starting point later. Figure 46 depicts the method of computing the plot of the COM-GEOM description.

Plotting a line drawing portrayed in Figure 46 begins at a grid cell stored in MA with the point 58,81 in the upper left hand corner. The adjacent grid cell with point 57,81 in the lower left hand corner is located above cell 58,81 is then computed because the line between the surfaces intersects the top side of cell 58,81. Rays are traced through points 57,81 and 57,82 of the adjacent grid cell 57,81. The line between the surfaces passes through the right side of the grid cell 57,81. The plotted line is then drawn from the midpoint of the line between points 58,51 and 58,82 to the midpoint of the line between points 58,82 and 57,82. Adjacent grid cell 57,82 is then done, then 55,82, etc. A continuous line is plotted until it intersects a grid cell previously stored in array MA. Grid cell 53,83 has more than two sides intersected by lines, so the data associated with it is stored in array MA.

If the message "NUMBER OF NODES.GT.(value of MAXNOD) - STOP" is printed, the variable MAXNOD and the array MA must be increased.

Table XXVIII is the printout generated by the PICTUR option using the COM-GEOM description listed in Table I and the input for the PICTUR option listed in Figure 47. The section labeled A in Table XXVIII contains information on the Enclosing RPP of the COM-GEOM description. The section labeled B describes the view plane, starting points of the rays, and cell size and the scale for the plot. "HORIZONTAL" and "VERTICAL" are the horizontal and vertical lengths of the grid in the view plane. "MESH SIZE" is the grid cell size. "SCALE" is the number of target units per inch of plotter paper. The portion of the printout labeled C describes the grid in the view plane. The coordinates of the four corners of the grid are specified in the actual x, y and z coordinates of the COM-GEOM description. "DIRECTION OF RAYS" is the normalize vector parallel to the rays traced through the target. "DIRECTION LEFT TO RIGHT" and "DIRECTION UP TO DOWN" are the vectors which are parallel to the viewing plane whose length is equal to the grid cell size. "MESH ACROSS" and "MESH DOWN" are the number of grid cells in the horizontal and vertical direction of the grid. The portion labeled D indicates the amount of rays traced and the number of starting points (NODES) stored as a result of the initial scan. The portion labeled E describes the plot. "HORIZONTAL PAGE" and "VERTICAL PAGE" describes the size of the plot (inches). The portion of the printout labeled F indicates the number of rays traced for this view and the amount of starting points (NODES) stored. Note that 25 more starting points were located in the first view of the sample run after initial scan. Figure 48 is the plot for this view of the PICTUR option. The section labeled G is printed when Columns 75 through 80 (IXSECT) of the View card for the PICTUR

(Normal Mode)

option is not zero and the cross section cards are inputted. If the value of IXSECT is greater than zero, those regions whose region RPPs do not overlap the RPP which encompasses the box will be temporarily deleted from the COM-GEOM description. Figure 49 is the plot for the view using the Cross Section option. The section of the printout labeled H is printed when Columns 71 through 75 (IDLKP) of the View card is not zero and a list of selected regions is inputted. Figure 50 is the plot for the view using the Delete Selected Regions option. The section labeled I is printed when Columns 51-60 (SCELZ) of the Control card of the PICTUR option is not equal to zero. The "HORZ/VERT DIST OF SMALLEST REGION" is size of the rectangle in the view plane which encompasses the projection of the smallest region of the COM-GEOM description onto the view plane. The "HORZ/VERT CELL SIZE" is the horizontal and vertical grid cell lengths selected for the initial scan. The selected grid cell lengths for the initial scan is the largest of three values: one-half of the length of each side of the rectangle in the view plane which encompasses the projection of the smallest region onto the view plane, the value of the variable SCELZ or five times the value of grid cell size (SMESH). The option to use fine scan does require more computer run time for the initial scan of the PICTUR option. The section labeled J is printed when a perspective picture is desired. Figure 51 is the plot generated for the view containing the Perspective Picture and Fine-Scan options.

Figures 52 through 56 describe the output generated on FORTRAN Unit 2 when that option is specified in Columns 11-20 of the Control card for PICTUR option. Table XXIX contains an example of the plot data written on FORTRAN Unit 2. If the message "RESTART VALUES STORED ON TAPE 2" is printed, the execution of the PICTUR option can be resumed where it stopped by specifying the number of files to skip given in the message in Columns 21-30 and specifying a non-zero number in Columns 41-50 of the Control card for PICTUR.

F. PLTRPP Option

The PLTRPP option plots the three basic views (front, side and top) of the region RPP equivalents of the COM-GEOM description on the printer. The plotted RPPs are labeled so they can be identified. The PLTRPP option provides a quick method of locating regions and their approximate size. Figures 57 through 60 define the input for the PLTRPP option.

Table XXX is the output generated by the PLTRPP option when the COM-GEOM description in Table I and the PLTRPP data in Figure 61 were used as input. The section of Table XXX labeled A depicts the front view of the region RPPs of the COM-GEOM description of the Sample Target. The rows and columns containing the letter "A" (which forms a rectangle) in the graph of the region RPPs is referenced in the table in the column labeled "SYMBOL" and denotes RPP of Region 1 of the COM-GEOM description. Plotted lines which are common to more than one region RPP will alternate between the two different printer characters which

0

1-60	61-70	71-80
ITITLE		DAY

FORMAT 6A10, 10X, A10)

ITITLE - Title of COM-GEOM description.

DAY - Date this view was written.

Figure 52. Title Line of PICTUR Output on FORTRAN Unit 2

1-12	13-24	25-36	37-48	49-60	61-80
A	E	HORZ	VERT	SMESH	

FORMAT (5F12.4)

A - Azimuth angle in degrees.

E - Elevation angle in degrees.

HORZ - Horizontal length of the grid.

VERT - Vertical length of the grid.

SMESH - Grid cell size

Figure 53. View Line of PICTUR Output on FORTRAN Unit 2

1-10	11-80
'1'	

FORMAT (I10)

1-12	13-24	25-36	37-48	49-80
H	V	XPLOT	YPLOT	

FORMAT (6F12.4)

- H - One-half the horizontal length of the grid.
- V - One-half the vertical length of the grid.
- XPLOT - Horizontal distance in the view plane the origin of the COM-GEOM is from the lower left corner of grid.
- YPLOT - Vertical distance in the view plane the origin of the COM-GEOM is from the lower left corner of grid.

Figure 54. Center of Target Lines of PICTUR Output on FORTRAN Unit 2

1-10	11-80
LINC	

FORMAT (I10)

- LINC - Number of points that follow.
If zero, end of view.
If less than zero, restart information follows.

Figure 55. Number of Points Line of PICTUR Output on FORTRAN Unit 2

1-12	13-24	25-36	37-48	49-60	61-72	73-80
X(L)	Y(L)	X(L)	Y(L)	X(L)	Y(L)	

FORMAT (6F12.4)

X(L) - Horizontal distance of plotting point from the lower left corner of grid.

Y(L) - Vertical distance of plotting point from the lower left corner of grid.

Figure 56. Plotter Point Lines of PICTUR Output on FORTRAN Unit 2

1-10	11-15	16-20	21-80
'VIEW'	NOP(3)	NOP(4)	

FORMAT (4A5)

NOP(I) - Specify code to denote which views are desired. Allowable code words are:

"FRONT" - Azimuth 0°, Elevation 0°

"SIDE" - Azimuth 270°, Elevation 0°

"TOP" - Azimuth 270°, Elevation 90°

"ALL" - All three views

Figure 57. VIEW Card for PLTRPP Option

1-10	11-15	16-80
'NUMBER'	NCH	

FORMAT (2A5,I5)

NCH - Specify the number of regions to be depicted per plot
(Range = 1 - 35, Default = 20)

Figure 58. NUMBER Card for PLTRPP Option

1-10	11-80
'END POINT'	

FORMAT (A5)

Only the end points of the region RPPs are plotted.

Figure 59. END POINT Card for PLTRPP Option

1-10	11-15	16-20	...	71-75	76-80
'REGION'	NOP(3)	NOP(4)		NOP(15)	NOP(15)
'ITEM'					

"REGION" - List regions whose RPP equivalents are to be plotted.

"ITEM" - List item codes whose region RPP equivalents are to be plotted.

NOP(I) - Specify which regions or item codes whose region RPP equivalents are to be plotted. Integer numbers or code words are allowed. Allowable code words are:

"ALL" - Plot region RPP equivalents of all regions.

"THRU" - Through, "REGION 100 THRU 150" means plot region RPP equivalents of regions 100 through 150.

(Blank card signals end of the list of regions or item codes)

LEAVE PLUT REGION RPP

denote a region RPP. For example, letters "A" and "O" alternate along the left side of the rectangle denoting the RPP of Region 1. The approximate values of the region RPP can be calculated by using the "HMIN", "VMIN", "HTICS" and "VTICS". In Table XXX, for example, the YMIN(HMIN) of the RPP for Region 1 is approximately -9.14 (HMIN plus the number of columns from HMIN times HTICS or $-38 + 37 \times .78$). The sections of Table XXX labeled B and C are for one set of region RPPs; however, the number of region RPPs to each plot is limited to five so two plots were required. Only the endpoints of the region RPPs were plotted in plots B and C.

G. RIP Option

The RIP option produces data used for vulnerability analysis which simulates the geometry of a spall producing penetrator. Figure 62 depicts the simulation scheme used by the RIP option. The inherent scheme in the RIP option allows generation of a primary ray by either of two methods: one similar to the GRID option and the other similar to the TESTG option. This primary ray is traced through the COM-GEOM description and locates the first intersection of the ray with armor (Item Code 100-199) having interior air (Space Code 2 or 5) or a fuel tank (Item Code 230-239) following it. A burst point (B) is computed at the intersection of the inner surface of the selected armor with the primary ray. A selected number of spall rays are randomly directed toward the RPP of each vulnerable region (Item Code greater than 999) from the burst point. Those vulnerable regions are ignored that lie outside a specific cone (half angle = 60 degrees) whose height vector lies on the primary ray. Next RIP computes the intersections of the shielding regions between the burst point and the vulnerable region along a spall ray. If the number of shielding regions located between the burst point and the vulnerable region along a spall ray exceeds a maximum allowed (MRBVC), computing terminates and no output is given for that spall ray. Figures 63 through 67 describe the input for the RIP option.

Tables XXXI through XXXIII are generated when the COM-GEOM description listed in Table I and the input for the RIP option in Figure 68 is used. The section labeled A in Table XXXI describes the Enclosing RPP of the Target. The section labeled B describes the grid for this view. The section labeled C contains the output for the primary ray. Figures 71 and 72 describe the information in these lines. Figure 73 describes the burst point data contained in the line labeled D. The section labeled E contains the summary information for each vulnerable region associated with the burst point defined in the line labeled D.

Figure 62. The Spall Simulation Scheme
Used by the RIP Option

1-10	11-20	21-30	31-40	41-50	51-60	61-80
NOAA	NRVC	NOPRNT	IRPP	NOGRID	IONLY	

FORMAT (S110)

- NOAA - Specify the number of aspect angles or primary rays.
- NRVC - Specify the number of rays to be directed toward each region defined as vulnerable (Default = 10).
- NOPRINT- If not zero, do not write burst point summary data on printer.
- IRPP - If not zero, read a Target Enclosing RPP card.
- NOGRID - If zero, a grid is used to generate primary rays. If not zero, each primary ray is specified.
- IONLY - If not zero, do not compute normal distances through regions.

Figure 63. Control Card for RIP Option

1-10	11-20	21-30	31-40	41-50	51-60	61-80
XMIN	XMAX	YMIN	YMAX	ZMIN	ZMAX	

FORMAT (6F10.0)

The minimum (min) and maximum (max) values of the x, y, and z coordinates which bound the rectangular parallelepiped that encloses the COM-GEOM description. (Default is the Englosing RPP located at LENRPP in the ASTER array.)

Figure 64. Target Enclosing RPP Card for RIP Option (Optional, Read Only if IRPP Not Zero on Control Card)

1-5	6-8	9-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80
MAXT	TIMEUN		HCENTR	VCENTR	IHORZ	IVERT	ISEED	NFILE	

FORMAT (I5,A3,2X,2F10.0,FI10)

MAXT - Specify the maximum time that is indicated for the computer run.

TIMEUN - Specify a code to denote the units used for the maximum time.

Allowable codes are: "HR" = HOURS, "MIN" = MINUTES, "SEC" = SECONDS (Default = "MIN")

The remainder of the variables are specified only if this run is a continuation of a previous run. They are obtained from the printout of the previous run.

HCENTR - Specify the horizontal location of the center of the grid cell.

VCENTR - Specify the vertical location of the center of the grid cell.

IHORZ - Specify the vertical cell matrix position.

ISEED - Specify seed for random number generator.

NFILE - Specify the number of files to skip on FORTRAN Unit 2.

Figure 65. Restart Card for RIP Option

1-10	11-20	21-30	31-40	41-50	51-60	61-80
A	E	CELSIZ	GROUND	MAXERR	ICENTR	

FORMAT (4E10.3,3I10)

- A - Specify azimuth angle in degrees.
- E - Specify elevation angle in degrees.
- CELSIZ - Specify grid cell size (Default = 4.0)
- GROUND - Specify z-coordinate for the ground of the COM-GEOM description. A primary ray will not be traced from any location which is less than GROUND. Specifying a value for GROUND should only be considered when a negative elevation angle (E) is specified. (Default = ZMIN of the Target Enclosing RPP).
- MAXERR - Specify the maximum number of overlap errors that will be tolerated for each primary ray (Default = 25).
- ICENTR - If equal zero, rays are traced through a random point in the grid cell. If not zero, rays are traced through the center of the grid cell.

Figure 66. View Card for RIP Option (Optional, Read Only If NOGRID on Control Card is Zero)

1-5	6-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80

	Iray = 1				XE(1)	XE(2)	XE(3)	
	Iray = 2				WB(1)	WB(2)	WB(3)	
	Iray = 3				A	E		

FORMAT (2I5,6F10.4)

- MAXERR - Specify the maximum number of overlap errors that will be tolerated for each primary ray (Default = 25).
- IRAY - Specify a code number which indicates the method of describing the primary ray. If IRAY equals 1, track a ray between two points. If IRAY equals 2, track a ray from a starting point with a direction specified by a unit vector. If IRAY equals 3, track a ray from a starting point with a direction specified by azimuth and elevation angles.
- XB(I) - Specify the starting point of the ray.
- XE(I) - Specify the end point of the ray.
- WB(I) - Specify a unit vector giving the ray direction.
- A - Specify the azimuth angle in degrees.
- E - Specify the elevation angle in degrees.

END OF RUN

"SUMMARY VULNERABLE REGION 2 ITEM 2701 CELL (02) NUM RAYS TO VC 3 NUM RAYS HIT VC 2 NUM RAYS HIT.LE.3 BEFORE VC 2" means that vulnerable region 2 has a region identification code number of 2701; region 2 was located in the cone generated around the primary ray located in a grid cell whose horizontal matrix position is 0 and whose vertical matrix position is 2; three rays were directed toward region 2 from the burst point and two rays intersected it, and the number of rays from the burst point which intersected region 2 and had less than or equal to three regions between it and the burst point is 2. The line labeled F is printed after each primary ray and burst point is computed. It contains the information needed to start a RIP run from a previous RIP run which had been terminated due to "AN ALMOST MAX TIME ABORT." "COUNT 1. CELTIM .02 CELAVG .02 CUMTIM 5.59" means that one burst point was computed so far, the time required to compute the burst point was .02 seconds, the average time required for each burst point is .02 seconds and the time used by the run is 5.59 seconds. Table XXXII is the RIP output generated on FORTRAN unit 2 connected with the printout in Table XXXI. Figures 69 through 75 describe the data written on FORTRAN Unit 2 by the RIP option illustrated in Table XXXII. Table XXXIII is the printout generated when the "SUPPRESS PRINTER OPTION" is used (non-zero number in columns 21-30 of the Control Card for RIP) and when each primary ray is specified (non-zero number in columns 41-50 of the Control Card for RIP).

H. TESTG Option

The TESTG option is primarily used to debug the COM-GEOM description. Its purpose is to generate and print as much ray intersection data as possible. Care must be taken in selecting a ray to be printed because no jiggling of the ray's starting point occurs. Therefore, it is possible that it may be traced in the crack between two adjacent solids. If a ray is traced in the crack, the GIFT code would either compute the intersection of both solids which may cause an overlapping region error message to be printed or compute the intersection of neither solid which may cause the generation of phantom armor. Figure 76 describes the input for the TESTG option.

Table 34 contains the output from the TESTG option using the COM-GEOM description of Table I and the TESTG option data in Figure 77. The data in Table XXXIV is similar to that generated for the overlapping region error message previously described in section II.E GIFT Basics except for the sections labeled A and B. Section A presents the ray and solid intersection data. The data is similar to that contained in the other parts of the printout of the ray. "RIN" is the distance from the starting point of the ray to the entrance point of the solid. "ROUT" is the distance from the starting point of the ray to the exit point of the solid. "LOS" is the distance the ray traveled through the solid. "SURFI" and "SURFO" are the numbers of the surfaces intersected at the entrance and exit points

- HCENTR - Horizontal coordinate of center of grid cell. If the horizontal coordinate is equal to 999.9, this is the end of the view.
- VCENTR - Vertical coordinate of center of grid cell.
- IHIV - Two digit random number representing the location within the grid cell where the ray intersects the view plane.
- DFIRST - Distance from first intersection with the ray to the view plane.
- DLAST - Distance from last intersection with the ray to the view plane.
- NCOMP - Number of components intersected by ray.
- IH - Vertical cell matrix position of the grid cell.
- H - Horizontal coordinate of the projection of the starting point of the ray onto the view plane.
- V - Vertical coordinate of the projection of the starting point of the ray onto the view plane.
- A - Azimuth angle in degrees.
- E - Elevation angle in degrees.

Figure 71. Cell Identification Line of RIP Output on
FORTRAN Unit 2

ITEM(I)	CLOS(I)	CNORMI(I)	CANGI(I)	KSPAC(I)	SLOS(I)	IH	IV	I	

FORMAT (I4,2F7.2,F6.1,I3,F7.2,I4,I3,I5)

ITEM - Item code number.
CLOS(I) - Distance ray travels through item.
CNORMI(I) - Normal distance through item from entrance point.
CANGI(I) - Angle between normal vector and ray at entrance point.
KSPAC(I) - Code for air space following item.
SLOS(I) - Distance ray travels through air space.
IH - Horizontal matrix position of grid cell.
IV - Vertical matrix position of grid cell.
I - Cumulative number of items.

Figure 72. Ray Intersection Lines of the RIP
Output of FORTRAN Unit 2

1-7	8-14	15-21	22-28	29-35	36-42	43-49	50-56	57-63	64-73	74-76	77-80

FORMAT (9F7.2,I10,I3)

AA(I) - The point intersection of ray with the exterior surface of the spalling component. If AA(I) is equal to 999.99, no burst point is computed.
B(I) - The point from which spall rays are traced.
C(I) - The point of intersection of a normal vector from point AA(I) with the interior surface of the spalling component.
IH - Horizontal matrix position of the grid cell.
IV - Vertical matrix position of the grid cell.

Figure 73. Burst Point Header Line of the RIP Output
On FORTRAN Unit 2

I REG	IDENT	PC(1)	PC(2)	PC(3)	A	MREG	I HORZ	I VERT

FORMAT (I5,I7,4F10.2,I5,2I4)

- I REG - Region number. If the region number is equal to "54521", there are no more vulnerable regions for this burst point.
- IDENT - Item code number for region.
- PC(I) - Point where the spalling ray enters the region.
- A - Presented area of region associated with ray.
- MREG - Number of regions between burst point and vulnerable region.
- I HORZ - Horizontal matrix position of the grid cell.
- I VERT - Vertical matrix position of the grid cell.

Figure 74. Vulnerable Region Lines of the RIP
Output on FORTRAN Unit 2

FORMAT (2I5,2F7.1,F5.1,I3,F7.1)

- COMP(1,I) - Region number .
- COMP(2,I) - Item code number for region.
- COMP(3,I) - Distance ray travels through region.
- COMP(4,I) - Distance normal vector travels through the region from the entrance point of the spalling ray.
- COMP(5,I) - Angle between normal vector and the ray.
- COMP(6,I) - Code for air space following region.
- COMP(7,I) - Distance ray travels through air space.

FORMAT (I10,6F10,I1,I4,I5)

- IRAY - Specify a code number which indicates the method of describing the ray. If IRAY is less than or equal to 0, end of TESTG data. If IRAY equals 1, track a ray between two points. If IRAY equals 2, track a ray from a starting point with a direction specified by a unit vector. If IRAY equals 3, track a ray from a starting point with a direction specified by azimuth and elevation angles.
- XB(I) - Specify the starting point of the ray.
- XE(I) - Specify the end point of the ray.
- WB(I) - Specify a unit vector giving the ray direction.
- A - Azimuth angle in degrees.
- E - Elevation angle in degrees.
- NORM - If not zero, computes obliquity angles and normals.
- NOSOL - If not zero, do not print intersections of the ray with solids.
- NOREG - If not zero, do not print intersections of the ray with the regions.

of the solid in the coordinate system of the COM-GEOM description. The section labeled B is printed when column 71 of TESTG Input Card is not zero. "NORM I" is the distance a vector normal to the surface at the entrance point of the ray travels through the component. "ANG I" is the angle between the normal vector and the ray. "NORMO" is the distance a vector normal to the surface at the exit point of the ray travels through the component. "ANG O" is the angle between the normal vector and the ray.

I. VOLUME Option

The volume option computes the volumes of regions. The volumes of air regions may not be accurate because this option does not subtract the allowable overlapping regions from the region defining the air. Therefore, the volume of air in a COM-GEOM description may appear to be much larger than actually exists. Figures 78 and 79 explain the input for the VOLUME option.

Table XXXV contains the output from the VOLUME option using the COM-GEOM description in Table I and the data for the VOLUME option in Figure 80. The portion of the VOLUME output with the header line "REGION... DESCRIPTION" is a table which contains the volumes and center of volumes for each region. The center of volume of the region is the location in the COM-GEOM description coordinate system of the point where the sum of all distances from the center of volume times a constant small incremental volume is zero or the center of gravity of a uniform dense region.

"TOTAL VOLUME 497241.55 IN.**3" and "CENTER OF VOLUME -4.9907 .000 30.2458 IN" means that the total volume for those regions selected is 497241.55 cubic inches and the center of volume of those regions is $x = 4.9907$, $y = 0$, and $z = 30.2458$ inches. The total volume is in error since it includes the volume of two regions defined as air spaces which have not subtracted the volume of the solid regions contained in them.

The second portion of the printout of Table XXXV is generated when item codes (region, identification codes) are chosen. The portion containing the volumes for each region is then ordered by item code. The total volume and the center of volume include only these five regions.

1-2	3-4	5-10	11-20	21-80
TGTUN	VOLUN		CELSIZ	

FORMAT (2A2,6X,10.0)

- TGTUN - Specify the units of which the target is described.
VOLUN - Specify the units in which the volumes are to be printed.
CELSIZ - Specify the grid cell size.

'REGION'		CARD(1)	CARD(2)		CARD(13)	CARD(14)
'ITEM'						

FORMAT (A6,4X,4A5)

- "REGION" - List regions whose volumes are computed.
"ITEM" - List item codes for regions whose volumes are computed.
CARD(I) - Specify which regions or item codes whose volumes are to be computed. Integer numbers or code words are allowed.
Allowable code words are:
"ALL" - Compute the volume for all regions.
"THRU" - Through, "REGION 100 THRU 150" means compute volumes of regions 100 through 150.
"END" - Last region number, "REGION 100 THRU END" means compute volumes of regions 100 through the last region.

J. XSECT Option

The XSECT option produces printer and plotter plots of the intersection of a plane and the COM-GEOM description. The XSECT option is particularly useful in plotting the thickness and placement of components in the COM-GEOM description. The plotted thicknesses of components are more accurate using the XSECT option than those obtained by using the cross section option of the PICTUR option. Figures 81 through 84 describe the input for the XSECT option.

Table XXXVI depicts the printout generated by the XSECT option using the Sample Target contained in Table I and the XSECT option data in Figure 85. The portion of the printout labeled A defines the rays and the size of the rectangle in the plane in which the target is displayed. "DIRECTION COSINES OF RAYS" are the x, y, and z components of a normalized vector parallel to the rays which are traced through the COM-GEOM description. "DIRECTION COSINES OF STARTING PTS" are the x, y, and z components of a normalized vector which is parallel to the line on which the starting points of the rays lie. The "HORIZONTAL" and "VERTICAL DISTANCE" defined the size of the rectangle in the plane in which the target is displayed.

The section with the heading "OPTION SET TO PLOT ON CALCOMP" define the parameters associated with the plotter graphics. "UPPER LEFT CORNER", "LOWER LEFT CORNER", and "LOWER RIGHT CORNER" is the x, y, and z coordinates of the COM-GEOM description which are located in their respective corners. "MESH SIZE" is the distance between adjacent rays or the distance on the target between plotted points. It is a measure of the accuracy of the plot. With the scale equal to 25, the distance between points on the plot is 1.25 divided by 25 or .05 inches.

The section of the printout with the heading "OPTION SET TO PLOT ON PRINTER" defines the parameters associated with the plot on the printer. The "UPPER RIGHT CORNER", "UPPER LEFT CORNER", and "LOWER LEFT CORNER" are the x, y, and z of the points in the COM-GEOM description which are represented by the upper right (B), upper left (C) and lower left (D) corners of the printer plot. The "SCALE PER INCH OF PAGE" may not be the same as the scale requested if a plotter plot is requested. It is readjusted so that distance between the rays used to generate the printer plot is an integer multiple of the distance between rays used to generate the plotter plot. In the example, the "VERTICAL MESH" which represents the distance between rays for the printer is 5.00 and the "MESH SIZE (for plotter plot)" is 1.25, therefore, the integer multiple is 4. The "HORIZONTAL MESH" and "VERTICAL MESH" is horizontal and vertical dimensions of a portion of the COM-GEOM description that the printer character represents. The printer in the example is set to six lines per vertical inch. The variable NVLPI in subroutine XSECT would have to be changed if the printer was set to any other value.

1-10	11-20	21-30	31-40	41-80
NXSECT	ITAPE	NFILE	MAXERR	

FORMAT (8I10)

- NXSECT - Specify the number of cross sections.
- ITAPE - If not zero, write the computed points on FORTRAN Unit 2.
- NFILE - Specify the number of files to skip before writing on FORTRAN Unit 2.
- MAXERR - Specify the maximum number of overlap errors that will be tolerated for each cross section (Default = 25).

Figure 81. Control Card for XSECT Option

1-10	11-20	21-30	31-40	41-80
SCALE	NOPPTR	ICLCMP	IDLKP	

FORMAT (F10.4,I10)

- SCALE - Specify scale for plotting on one inch of graph.
- NOPPTR - If not zero, do not plot cross section on printer.
- ICLMP - If not zero, plot cross section on plotter.
- IDLKP - If not zero, plot only selected regions.

Figure 82. Cross Section Card for XSECT Option

IDH		NKARD(1)	NKARD(2)	...	NKARD(13)	NKARD(14)

FORMAT (A6,4X,14A5)

- IDH - If "KEEP", the regions listed are those to remain in the cross section. If "DELETE", the regions listed are those not to be in the cross section (Default = "KEEP")
- NKARD(I) - Specify the regions to be or not to be in the cross section. Region numbers or code words are allowed. Allowable code words are:
 "THRU" = Through, "100 THRU 150" means regions 100 through 150 are to be considered.
 "END" - Last region number, "100 THRU END" means regions 100 through the last region are to be considered.

Repeat as many times as needed to list all the regions. A blank card is needed to signal end of the list.

The printer plot (bordered by labeled B, C, D, and E) contains a printer character wherever the plane generated by the XSECT option intersects the selected regions of the COM-GEOM description of the Sample Target. The printer character printed denotes which item code hundred series the region display belongs. The item codes between 0 and 999 are denoted by the printer characters 0 through 9. The region identification codes between 1000 and 9999 are denoted by printer characters A through J. In the printout, printed character "1" denotes that the region displayed has an item code between 100 and 199 and "C" denotes that the region displayed has an item code between 3000 and 3999.

The second portion of the printer plot (labeled F) is the same plane as the first portion; however, the "DIRECTION COSINES OF RAYS" and the "DIRECTION COSINES OF STARTING PTS" are interchanged. This is done to achieve a better plotter plot; the printer plot is just a by-product. Figure 86 is the line plot for the cross-section specified.

USER EVALUATION OF REPORT

Please take a few minutes to answer the questions below; tear out this sheet and return it to Director, US Army Ballistic Research Laboratory, ARRADCOM, ATTN: DRDAR-TSB, Aberdeen Proving Ground, Maryland 21005. Your comments will provide us with information for improving future reports.

1. BRL Report Number _____
2. Does this report satisfy a need? (Comment on purpose, related project, or other area of interest for which report will be used.)

3. How, specifically, is the report being used? (Information source, design data or procedure, management procedure, source of ideas, etc.) _____

4. Has the information in this report led to any quantitative savings as far as man-hours/contract dollars saved, operating costs avoided, efficiencies achieved, etc.? If so, please elaborate.

5. General Comments (Indicate what you think should be changed to make this report and future reports of this type more responsive to your needs, more usable, improve readability, etc.) _____

6. If you would like to be contacted by the personnel who prepared this report to raise specific questions or discuss the topic, please fill in the following information.

Name: _____

Telephone Number: _____

Organization Address: _____
