16. Abstract

Busy hour estimates are obtained from periodic counts of 60 minutes in duration. These counts are made during known high activity periods for each traffic category. From this sample, tower personnel select a count which is representative of daily busy hour activity for each category.

The statistical tables in this publication contain traffic estimates for each airport at which an air traffic control tower operated during all of FY 1977 and FY 1978. Provided with peak day and busy hour counts are average day and hour operations computed from the annual operations counts. Measures of peaking characteristics are given by the ratios peak day to average day and busy hour to average hour by individual airport by size group.

PREFACE

"Current Aviation Statistics" is prepared periodically to provide a summary of current aviation statistical information.

This report is prepared in the Office of Management Systems, Information and Statistics Division, Information Operations Branch.

DISTRIBUTION: ZMS-348G; A-FAT-0; FAS-1; FFS-1/2/3/5/7; FIA-0 (limited)

TERMINAL AREA RELATIONSHIPS

The basic source of data for this report is RIS: AT 7230-16. Each tower is requested to report the peak daily traffic count during the previous fiscal year for air carrier, itinerant (including air carrier), total aircraft operations (including local) and total instrument operations. Peak counts for the various categories need not occur on the same day. These peak days are identified from the daily counts recorded on FAA Form 7230-1.

Busy hour estimates are obtained from periodic counts of 60 minutes in duration. These counts are made during known high activity periods for each traffic cotegory. From this sample, tower personnel select a count which is representative of daily busy hour activity for each category.

The statistical tables in this publication contain traffic estimates for each airport at which an air traffic control tower operated during all of FY1977 and FY1978. Provided with peak day and busy hour counts are average day and hour operations computed from the annual operations counts. Measures of peaking characteristics are given by the ratios peak day to average day and busy hour to average hour by individual airport by size group.
