20. ABSTRACT (Continue on reverse side if necessary and identify by block number) ARR, ARO (19) 13088.9-C, 16013.4-C This constitutes the final technical report on a project which has dealt with the photochemical and photophysical consequences of interaction between two or more nonconjugated functional groups in an organic molecule. 		

Final Report

1. Problem: Statement and Summary

This project has been concerned with the photochemical and photophysical consequences of interaction between two or more nonconjugated functional groups upon electronic excitation, i.e.

During the period of time encompassed by this grant, we have specifically examined nonconjugated aryl-olefins and aryl-chlorides. The former results have been summarized in a review: "Photochemistry of Organic Bichromophoric Molecules", Acc. Chem. Res., 12, 383 (1979). The latter were published in preliminary form in J. Am. Chem. Soc., 102, 372 (1980).

In sum, we have shown that (1) there are a number of ways in which one functionality in a molecule can interact with the excited state of a second group (2) among these are activation and reactivity of the group not initially excited by the incident light as well as deactivation of the absorber and (3) some of the modes of interaction so far uncovered are subject to appreciable stereoelectronic restrictions.

In addition to the above, we have uncovered a new indene phototransposition reaction, the details of which have been communicated (cf. J. Am. Chem. Soc., 99, 3507 (1977) and J. Am. Chem. Soc., 100, 7109 (1978)).
