PREFACE

The Rocketry Dictionary was compiled under the STEP project which was chartered in 1960 by the Library of Congress to support the Foreign Technology Division (FTD) of the Air Force Systems Command in the area of lexicography by developing Chinese-English desk-top dictionaries, translating Chinese documents and abstracting Chinese language open literature pertaining to science and technology. In 1968 FTD commenced the direct funding and management of the project. The purpose of the lexicographic efforts in this STEP project was to prepare a series of Chinese-English technical dictionaries for rapid reference. During the ensuing years, technical dictionaries for the Nuclear and Physics, Aviation and Space, and Electronics and Telecommunications areas of interest were published. This series of Chinese-English technical dictionaries is considered a very useful reference tool for translators, abstractors, and research analysts concerned with scientific and technical materials from Mainland China. FTD terminated the STEP project in June 1976 and by direction of the Assistant Chief of Staff for Intelligence, United States Air Force, the 7602nd Air Intelligence Group reactivated it in April 1977 to complete the series, making use of the already prepared term cards left over by the former STEP office on subjects of Rocketry, Automation and Computer Technology, Mechanical Engineering, Electrical Engineering, Meteorology, and Surveying and Mapping.

The Rocketry Dictionary is the fourth in the series but the first produced by the 7602nd Air Intelligence Group. Due to its large content, this dictionary will be published in three volumes, containing about 60,000 terms selected from sources published in Mainland China. The terms included relate not only to rocket engineering, missiles, space technology, etc., but also incorporate vocabulary from the basic sciences and the auxiliary technologies closely associated with rocketry, such as mathematics, chemistry, telecommunications, control systems, metallurgy, welding, machinery, etc. Other subject areas may be published in the future depending on factors such as feedback from recipients of this publication, availability of fiscal and manpower resources, etc.

The special features of this dictionary include an abridged STC index in each volume covering the terms presented in that volume; conformity with Mainland China practice in regard to (1) terminology, (2) style of the Chinese characters, and (3) complete alphabetical look-up by means of the "pinyin" spelling. Characters in some of the terms have been regrouped for optimum clarity and suitability for computer processing.

Following this preface is an errata sheet correcting and updating previously published dictionaries. We will continue this practice with each succeeding dictionary so that the entire series may be kept as correct and current as possible. We are fully aware that this dictionary is far from being perfect. We welcome corrections and suggestions and request they be sent to Detachment 3, 7602 AINTELG, Box 37, APO San Francisco 96263 so that we may include them in future publications.

ARRANGEMENT OF CHINESE ENTRIES

The Chinese written language is undergoing an evolution toward simpler forms, i.e., individual characters with reduced numbers of strokes. This process is in effect eroding the traditional classification of a character by its radical with a fixed number and the residual stroke count. As a result Chinese-English dictionaries published in Mainland China and elsewhere are resorting to a system of alphabetic lookup. The basis of this system is the "pinyin" spelling of Modern Standard Chinese as established in Mainland China. With a standardized spelling, a Chinese dictionary now resembles more nearly one of an alphabetic language.

In the dictionaries of this series, the Chinese entries are ordered in accordance with the transcription of the first character of the term. Homophones are arranged in order by syllable, tones 1 to 4, total stroke count, radical, and residual strokes. Succeeding syllables of an entry are in alphabetic order and where homophones in second place occur the one with the lower stroke count precedes.

A character index is provided for users less familiar with the pinyin spelling. It is a "total stroke" index with a visual radical column, the purpose of which is to eliminate tedious and time-consuming radical identification and subsequent counting of residual strokes before locating the desired character. A character located in the INDEX refers the reader to the page where terms beginning with this character are listed.

It is confidently expected that the presentation of Chinese technical terminology in an alphabetic lookup system will reduce access time for Chinese dictionaries to that of any other alphabetic language.
