Preface

In late 1976, a study to produce a wave climate for U. S. coastal waters was initiated at the U. S. Army Engineer Waterways Experiment Station (WES). This Wave Information Study (WIS) was authorized by the Office, Chief of Engineers, U. S. Army, as a part of the Field Data Collection Program which is managed by the U. S. Army Coastal Engineering Research Center. The U. S. Army Engineer Division, South Atlantic, and the U. S. Army Engineer Division, New England, also authorized funds during the initial year of this study (FY 1978) to expedite execution of the Atlantic coast portion of this program.

This report, the second in a series, presents hindcast, deepwater, significant wave data for the U. S. Atlantic coast. The study was conducted in the Hydraulics Laboratory under the direction of Mr. H. B. Simmons, Chief of the Hydraulics Laboratory, Dr. R. W. Whalin, Chief of the Wave Dynamics Division, Mr. C. E. Chatham, Jr., Chief of the Wave Processes Branch, and Dr. D. T. Resio, Research Physical Scientist and Project Manager. This report was prepared by Mr. W. D. Corson, Dr. D. T. Resio, Mrs. R. M. Brooks, Mr. B. A. Ebersole, Mr. R. E. Jensen, Mrs. D. S. Ragsdale, and Mrs. B. A. Tracy. During the preparation of this report, Mr. J. E. Main was especially helpful in programming the plotting routines.

Commanders and Directors of WES during the conduct of the study and the preparation and publication of this report were COL John L. Cannon, CE, and COL Nelson P. Conover, CE. Technical Director was Mr. F. R. Brown.

ATLANTIC COAST HINDCAST, DEEPWATER, SIGNIFICANT WAVE INFORMATION

Introduction

1. The Atlantic Coast Wave Information Study (ACWIS) separated the wave climatology of the U. S. Atlantic coast into three phases:

Phase I - Numerical hindcast of deepwater wave data from historical surface pressure and wind data.

Phase II - Derivation of wave data which have been subjected to refraction, diffraction, shoaling, and bottom friction.

Phase III - Transformation of Phase II wave data into shallow water and inclusion of long waves.

Figure 1 presents a schematic of the relationships of the three phases and their approximate boundaries.

2. Phase I wave data have been computed for points in a spherical orthogonal grid which covers the North Atlantic Ocean (Figure 2). Although wave data were hindcast for locations throughout the Atlantic, primary interest is in the area adjacent to the U. S. Atlantic coast. Thirteen locations (stations) have been selected for data analysis (Figure 2, Table 1). The 13 stations have 20 years (1956-1975) of hindcast, deepwater,* significant wave data (height, period, and direction) stored at 3-hr intervals. Waves generated from tropical storms were excluded in the analyses of this report. Water levels and wave heights from tropical storms will be analyzed in a separate section of the ACWIS. The purpose of this report is to present various analyses of the ACWIS Phase I hindcast, significant wave data. This report also serves as an example of the format of forthcoming reports describing the data available from Phase II and Phase III of the ACWIS.

---

* Since a deepwater wave model was used to calculate the results presented in this report, all wave parameters represent deepwater conditions. In the cases where the actual grid point location is in shallow water, the data should be regarded as estimates for a point farther offshore in deep water.

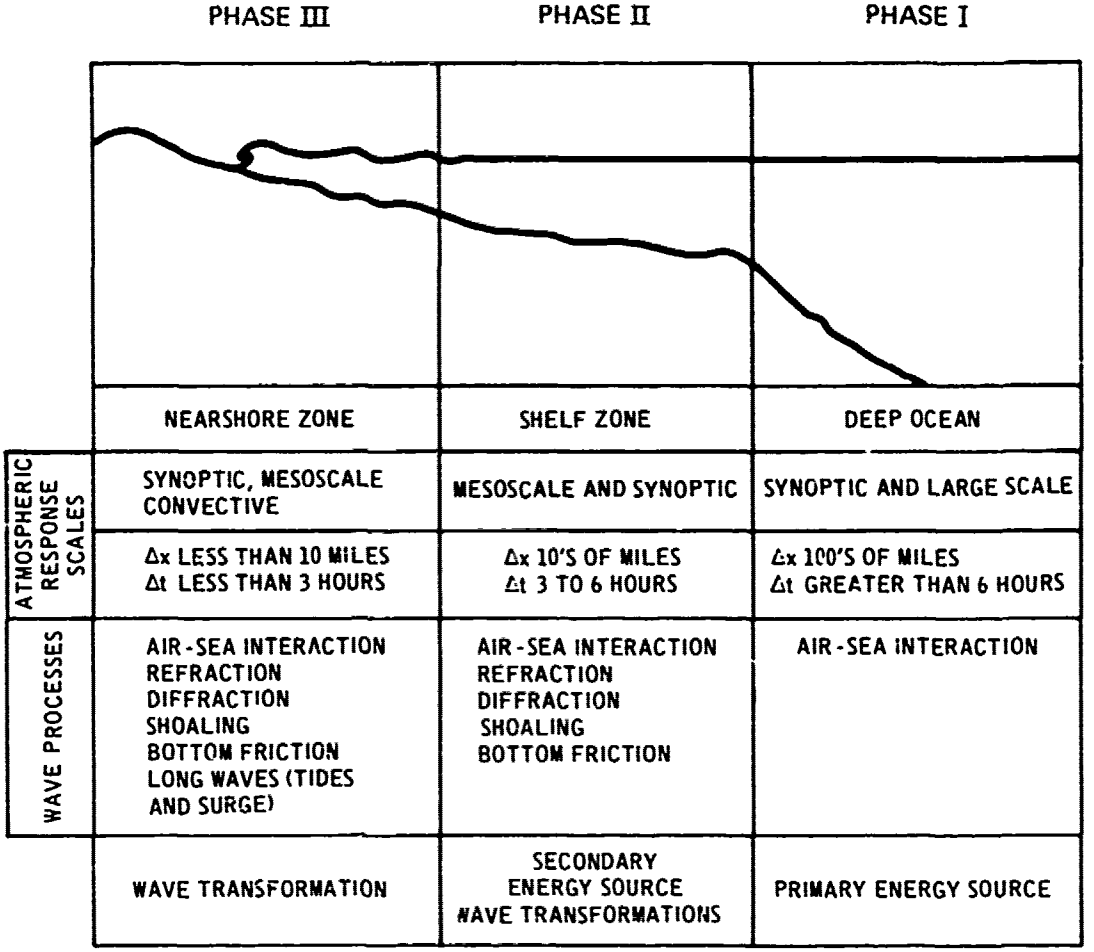

Figure 1. Conceptual diagram of the three phases of the Wave Information Study (WIS)

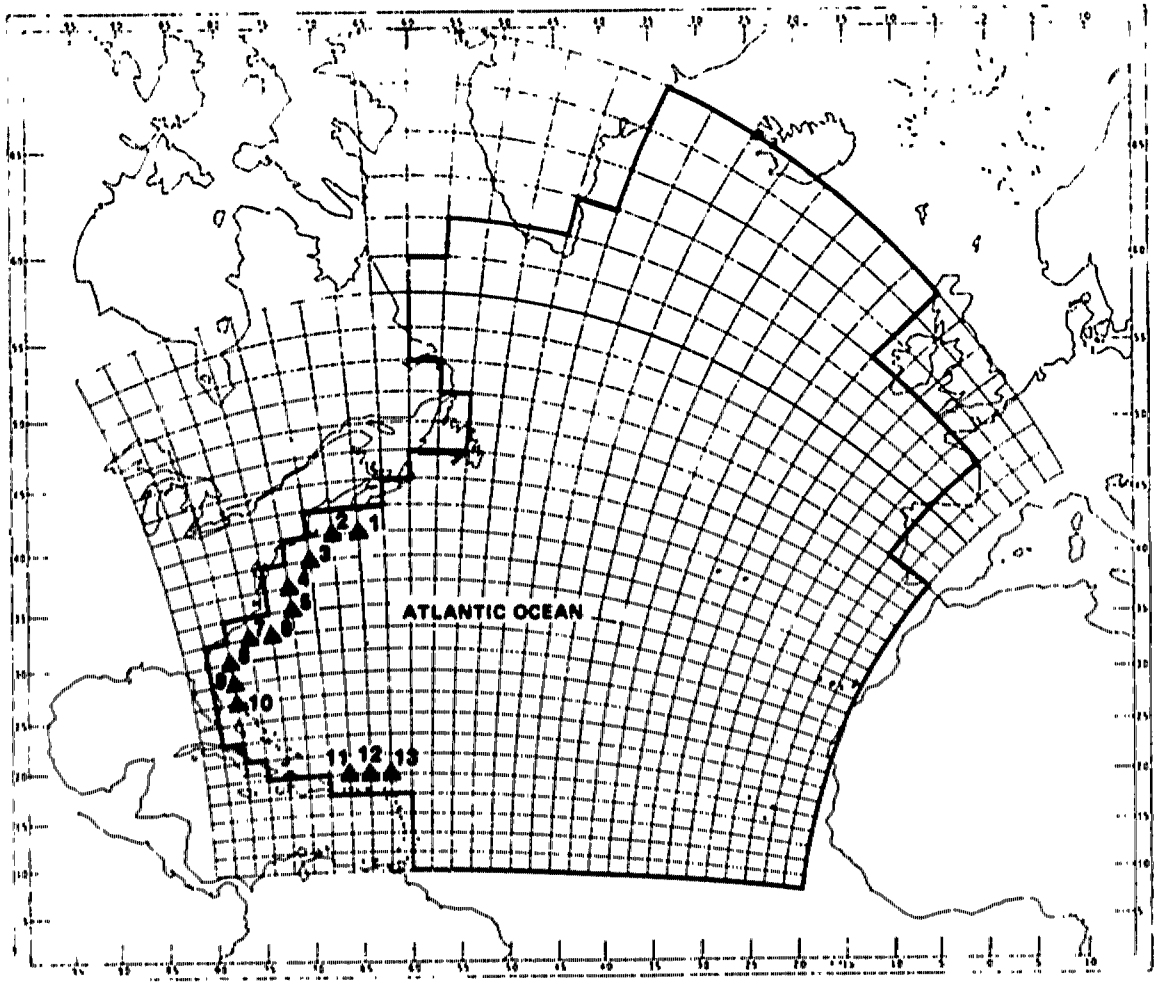

Figure 2. Locations of Phase I stations for deepwater wave information along Atlantic coast

Table 1
WIS Phase I Sites

No.	Lat	Long.
1	41.87	65.40
2	41.72	68.07
3	39.53	70.42
4	37.32	72.63
5	35.37	72.31
6	33.16	74.40
7	32.86	76.76

9	28.73	78.34
10	26.83	78.01
11	19.89	66.40
12	19.95	64.27
13	19.99	62.15

3. This report is intended only to serve as a general description of simple wave characteristics such as height, period, and direction. More detailed analyses of one- and two-dimensional spectral properties and interrelations among various wave parameters related to storm characteristics will follow in later reports. Separate reports describing technical facets of the effort involved in these wave calculations have been or shortly will be published. Of particular interest to most users, Report 3 of this series contains a detailed set of comparisons between hindcast waves and measured waves at several locations throughout the Atlantic Ocean.

4. The significant wave height (H_s) analyzed represents the combined sea and swell; that is, the square root of the sum of the squares of the sea and swell significant wave heights $\left(H_s = H_{sea}^2 + H_{swell}^2\right)$. The wave period (T) and direction (Ψ) are of the dominant wave. If the sea H_s is larger, then the sea T and Ψ are given; and if the swell H_s is larger, then the swell T and Ψ are given. The period is the period of the spectral peak. The value of the wave direction is the direction from which the waves are coming (Figure 3). Azimuths are measured clockwise in degrees from True North (0).

5. Eight products are presented:

   a. Percent Occurrence Tables.

   b. Percent Exceedance Diagrams.

   c. Duration Table.

   d. Wave Rose Diagrams.

   e. Height, Period, Direction Histograms.

   f. Return Period Diagrams.

   g. Steepness Diagrams.

   h. Mean H_s and Largest H_s Tables.

A brief description of each product is given and some sections on use of the products, including examples, are provided. The appendices for this report are arranged by Phase I stations. Each product, except the duration table, is provided for the specified station in the appropriate appendix. The duration table provides information for all stations, and is presented as a separate appendix.

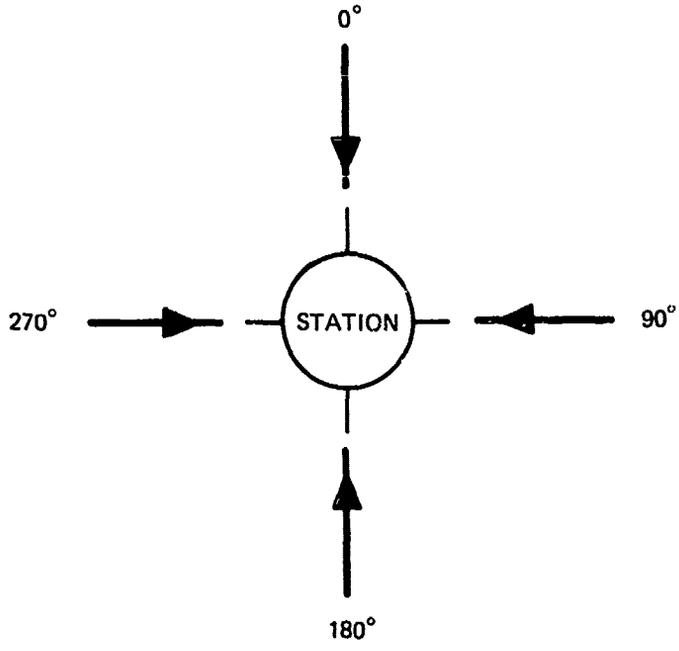

Figure 3. Diagram indicating wave directions

Percent Occurrence Tables

Description

6. Two types of tables are printed: seasonal azimuth tables and seasonal tables for all directions. The azimuth tables give the percent occurrence of significant waves in height and period ranges for specified stations, seasons,* and directions. The title to each table identifies the station, season, and azimuth range. The period ranges are in 2-sec intervals, and the height ranges are in half-metre increments. Values in the azimuth tables represent the percent of the season that waves occur from the specified azimuth range for the indicated height

* Season 1 is January through March, Season 2 is April through June, Season 3 is July through September, and Season 4 is October through December.

and period ranges. The values have been multiplied by 1000 to allow more accuracy with less printing space. Summations of period and height ranges are provided in the last column and row of each table. The summations are also multiplied by 1000. The last line in each azimuth table contains the following information for the specified azimuth range and season:

a. The average H_s .

b. The largest H_s .

c. The number of cases (wave occurrences computed at 3-hr intervals).

d. Percent of waves occurring in the specified season from the indicated azimuth range.

7. The all-directions table for each season is printed after the 350-359.9° azimuth table for the specified season. These tables give the percent occurrence of significant waves within specified height and period ranges coming from all directions for the indicated season and station. Values in the all-directions tables are multiplied by 100. The parameters listed in the last line of the seasonal tables are derived from all directions of the specified season, and the seasonal percent is the percent of waves occurring in the indicated season of the total 20 years analyzed.

8. The all-directions tables have wave steepness curves plotted over the percent occurrence values for additional information.

Use of the tables

9. The tables have been developed to produce reliable information when seasonal intervals are employed.

Examples

10. In order to find the number of hours that waves of 3.5 to 3.9 m and 7.0 to 8.9 sec are expected to occur from 0.0 to 9.9 deg at Station 1 in Season 1 (January, February, March) for a 20-year interval, the value read in the table for the specified station, season, azimuth, height, and period should first be divided by 1000, which for this example yields 0.124 percent (Appendix A, Plate A1). Then 0.124 is divided by 100 to give the probability, and multiplied by the number of

hours in Season 1 for the 20-year interval to yield the number of hours that the specified wave is expected to occur. The simple conversion process is:

$$\left(\frac{\text{value read in table}}{1000}\right) \div 100 \times \text{number of hours in time interval} = \text{number of hours specified wave is expected to occur}$$

For this example:

$$\frac{124}{1,000} \div 100 \times 43,320 \cong 54 \text{ hours}$$

The following table lists the approximate number of hours in each season for one year:

Season	No. of Hours in Season for One Year
1 (J,F,M)	~2166
2 (A,M,J)	~2184
3 (J,A,S)	~2208
4 (O,N,D)	~2208

Therefore, the total number of hours in the time interval for a specified season can be found by multiplying the number of years times the number of hours listed in the above table.

11. The all-directions tables can be used in a similar fashion. To find the number of hours a 9.5- to 9.9-m wave is expected to occur within a year for Station 1 in Season 1 for all directions and periods, divide the value in the total column for the specified H_s range by 100, which yields a percent of 0.13 (page A1). Divide 0.13 by 100 to get the probability; then multiply by the number of hours in one year of Season 1. That is:

$$\frac{13}{100} \div 100 \times 2166 \cong 3 \text{ hours}$$

Percent Exceedance Diagrams

Description

12. The percent exceedance diagrams were constructed from all months in the 20 years of hindcast significant wave-height data. The diagrams have a log scale percent axis to allow greater accuracy for the larger wave-height categories.

Example

13. To find the percent of time that a 7-m wave is exceeded at Station 1, locate the 7-m intersect with the curve supplied in the diagram and read the percent exceeded from the percent axis (for this example, 1 percent, (page A53)).

Duration Table

Description

14. This table contains H_s duration information for all Atlantic deepwater stations. The values given in the table are the mean duration in hours ($\bar{x}$) and the maximum duration in hours (mx). Duration is defined as the length of time a wave height persists once the wave height has been exceeded. The computations used data from all months of the 20-year hindcast wave data.

Use of the table

15. For deepwater sequences of wave heights, discretized sets of durations are formed of wave heights above a specified level after that level is exceeded. Each element of an individual set is a single duration event and the expected duration above a specified level is equal to mean of all elements in the set. Thus:

$$\bar{x}_j = \sum_{i=1}^{n_j} x_{ij}$$

where the subscript j is an incremented wave-height counter for wave height H_j, i is a counter for duration events, n_j is the number of

times that a particular wave height was exceeded, and x_{ij} is the duration of a single event with wave heights above level H_j. In this formulation a number of other useful duration parameters from the 20-year sample can be estimated:

a. x_{jmax} - the maximum duration of waves above H_j.

b. x_{jmin} - the minimum duration of waves greater than H_j.*

c. $p(x_j)$ - the probability of occurrence of a particular duration of wave heights greater than H_j.

d. $F(x_j)$ - the cumulative probability of occurrence of durations less than x for a particular H_j category.

e. $F'(x_j)$ - the cumulative probability that a duration event in category H_j will exceed length x.

16. In particular, the parameter $F'(x_j)$ plays a significant role in the assessment of design criteria when such criteria are based on expected damage as a function of duration of given wave conditions. For example, if the wave height associated with a 20-year return period has an expected duration of 3 hr, and it takes a 6-hr duration to significantly damage a structure, it becomes relevant to determine the probability of a 6-hr (or greater) duration at this wave height. In this sense, the design wave height would become a function of both wave height and duration, and optimization of design would require the consideration of both $F(H_j)$ and $F'(x_j)$.

Example

17. To find the mean and maximum duration for waves greater than 7 m and less than 7.5 m for Station 1, look up Station 1 in the table and read the values in the >7.0-m row. For this example, 16 hr is the mean and 60 hr is the maximum (Appendix N).

---

* Since this is calculated only when H_j is exceeded, this number is not zero; however, for most intermediate to high wave heights, the value of x_{jmin} is equal to the duration associated with one sample. Only for small waves does this parameter have some significance.

Wave Rose Diagrams

Description

18. The wave rose diagrams utilize H_s and Ψ and present seasonal as well as combined all-months analyses of the 20 years of hindcast data. The seasonal diagrams show the percent occurrence of H_s ranges from eight direction ranges and the percent of waves occurring from the separate directions for specified seasons. The combined all-months diagram gives the same parameters for January through December of the 20 years hindcast.

19. Similar to most wave rose diagrams, the width of each bar segment indicates the H_s range and the length of the bar segment indicates the percent occurrence of waves from the specified direction. The distance between each circle in the diagram is 10 percent. Each leg of the diagram represents 22.5 deg to either side of the primary direction of the leg. For example, the leg to the north represents waves coming from 337.5 deg (NNW) through 0 deg (N) to 22.5 deg (NNE).

Use of the diagrams

20. The diagrams are intended as visual aids and are not appropriate for detailed analyses.

Example

21. The wave rose diagram for Station 1 indicates that in the January-February-March season 5 percent of the waves were from the east, 67.5 to 112.5 deg (moving east to west), and of the 5 percent, approximately 12 percent were greater than 4.99 m, nearly 6 percent were 4.5 to 4.99 m, about 9 percent were 4.0 to 4.9 m, etc. (page A54). The total for each leg is 100 percent for the specified direction.

Height, Period, Direction Histograms

Description

22. Histograms for each station were drafted for seasonal and all-months data. The histograms show the percent occurrence of significant waves as a function of the three basic wave parameters (H_s , T , Ψ).

Use of the diagrams

23. Similar to the wave rose diagrams, these diagrams are intended for use as visual aids and relatively close estimations.

Example

24. For all months of Station 1, approximately 19 percent of the waves were 0.5 to 1.0 m in height (H_s), about 25 percent of the waves had periods of 6 sec (T_s), and more waves came from 210 to 220 deg (Ψ) than any other direction category (page A63).

Return Period Diagrams

Description

25. Since extreme wave conditions are important in most coastal design procedures, a careful analysis of extreme wave heights was performed. In order to obtain a reasonably homogeneous, independent sample of wave heights for the analysis of wave extremes along the east coast, wave heights are first separated into events associated with particular meteorological conditions. Basically, the concept here is to obtain representative groupings of storm conditions before proceeding with the usual kind of statistical analysis of the extremes. The return period diagrams show the results of applying this procedure to isolate extreme waves from "northeasters" along the east coast. Since extreme wave heights in the areas of Stations 11, 12, and 13 are a function of tropical storms and are not related to extratropical storm activity, and since data analyzed in this report do not include waves generated in tropical storms, return period diagrams for extreme significant wave heights were not drafted for Stations 11, 12, and 13. Also, it should be noted that tropical storms must be considered in terms of design conditions along much of the Atlantic coast. When the tropical storm hindcasts are complete, a combined probability of extremes from extratropical and tropical storms will be formulated, using a mixed population technique.

Use of the diagrams

26. One type of error that could affect the results of extreme

analysis would be a bias between the hindcast waves for a station and waves actually occurring at that site. Additionally, bias in the results can be expected in the extremal distribution if the random error in the numerical hindcast model is large compared with the expected natural variation in wave height. However, comparisons have shown that the hindcast wave extremes appear quite unbiased with respect to the measured wave heights; and the random error is not large relative to the natural wave-height variation. Thus, it is expected that the hindcast extremes shown in the diagrams provide a valid representation of deepwater wave extremes produced by northeasters along the U. S. Atlantic coast. For points south of Cape Hatteras, tropical storms will probably dominate the extremal wave-height distribution, and along the entire Atlantic coast south of Cape Cod tropical storms should be considered along with northeasters in any design consideration.

Steepness Diagrams

Description

27. Two types of wave steepness diagrams are presented. One type shows three steepness curves (1:20, 1:40, and 1:80) plotted on data from the percent occurrence "all-directions" tables. This type of diagram is presented for each season (20 years analysis) of each station (page A13). The other type of wave steepness diagram is the percent occurrence versus steepness histogram (page A65). The steepness histogram presented for each station was constructed from data from all months of the 20-year hindcast analysis for each station.

28. Wave steepness was computed from the relation:

$$\text{Steepness} = \frac{H_s}{L}$$

where L = wavelength = $1.56T^2$

Use of the diagrams

29. The diagrams are intended to further display the wave climate of a specified station. The steepness-curves diagram can be used for

seasonal interval analyses, whereas the steepness histograms are more general descriptors of the wave steepness. Although there may be some slight misplacement of the steepness curves on the all-directions percent occurrence tables due to plotting of categorized values, the diagram is still useful as a reference for wave steepness distribution. It is interesting to note that in most of the steepness plots separate sea and swell populations can be seen.

Mean and Largest H_s Table

Description

30. Two tables which summarize the mean and largest H_s for each month and year are provided for each station. The mean table also provides a mean monthly value and mean yearly value of H_s. The largest H_s table provides the largest H_s hindcast for each year and month, as well as the largest H_s hindcast for the specified station.

Use of the tables

31. The tables can be used as a quick reference in determining gross estimates of the wave climate of an area. Due to extreme variations in wave heights, the mean H_s value is of little use beyond gross estimates. The largest H_s value provides an idea of what extreme significant wave heights might occur; however, other data products presented in this report can assist in determining how often to expect extreme values and how long they are expected to occur.

Example

32. To determine the mean H_s for January 1956, simply read the value in the specified column and row (page A66). The mean H_s for 1956 is given in the mean column opposite 1956. The mean H_s for all January's is given in the mean row under JAN. For this example:

a. The mean H_s for JAN 1956 = 3.9 m.

b. The mean H_s for 1956 = 2.4 m.

c. The mean H_s for all JAN's = 3.2 m.

The largest H_s table can be read in a similar fashion, and by scanning the columns and rows, additional information can be determined:

a. The largest H_s for JAN 1956 = 10.3 m.

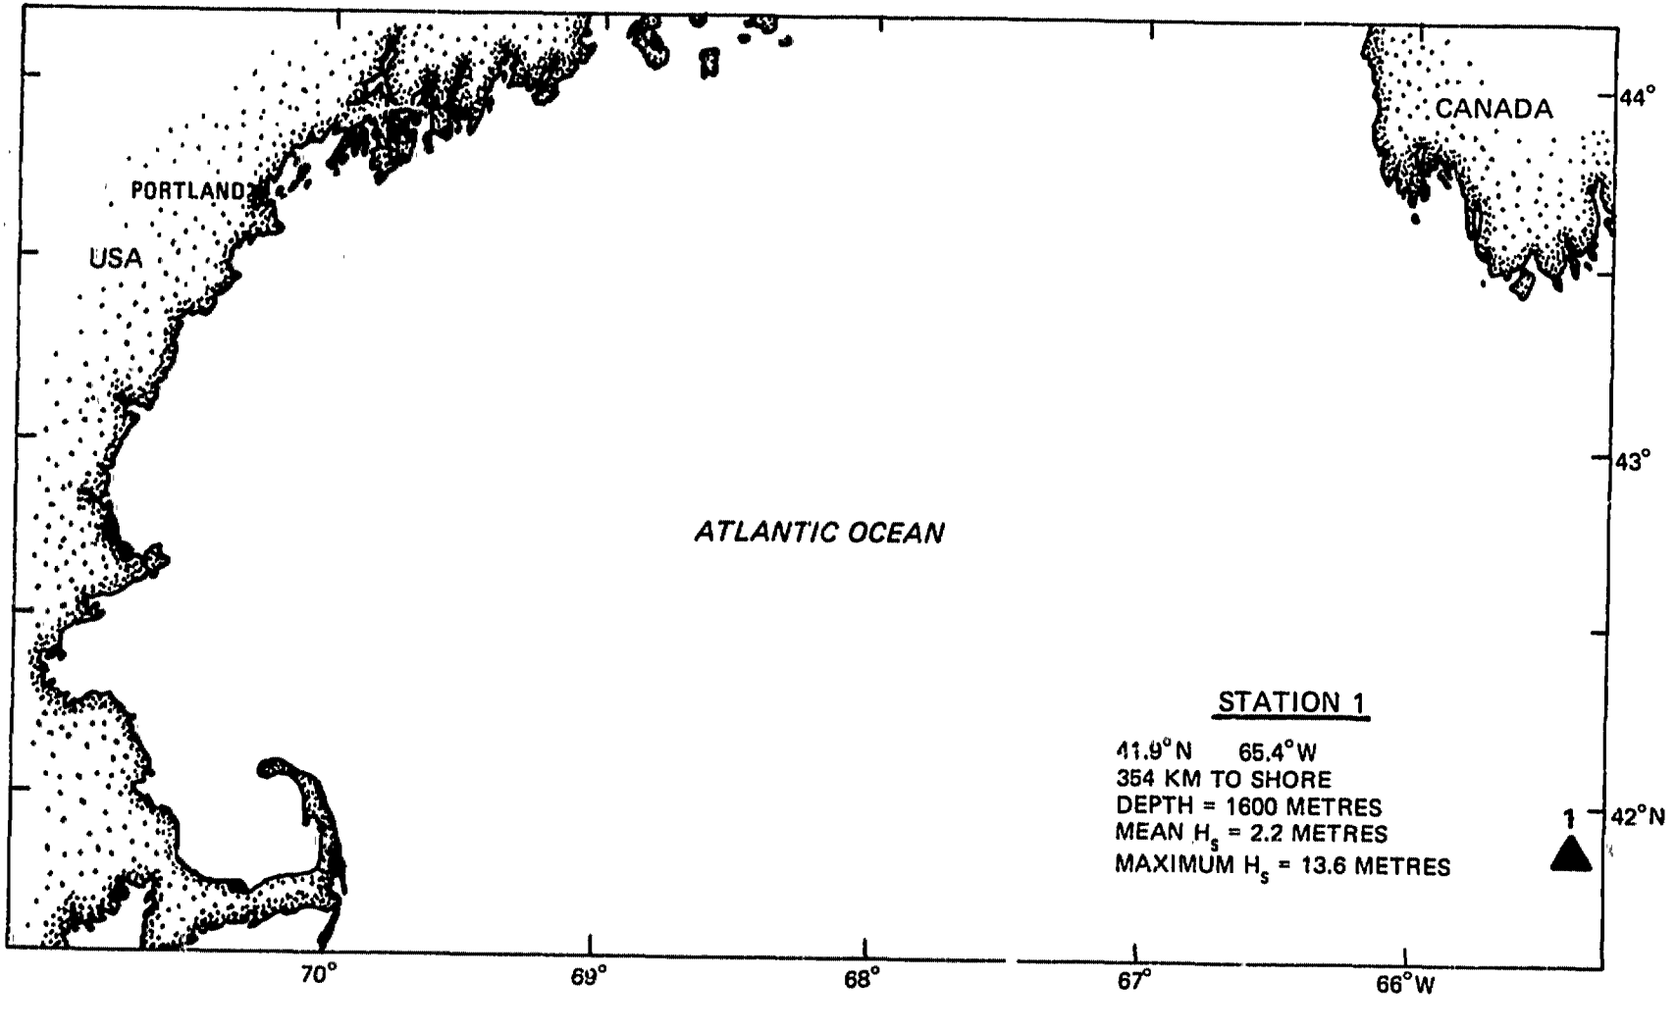

b. The largest H_s for 1956 = 10.3 m.

c. The largest H_s for all JAN's = 13.6 m.

Summary

33. The wave data presented in this report were produced by numerical simulation of wave growth, propagation, and decay under historical wind fields. There were four basic steps in the calculation of waves from past meteorological data. First, the pressure data were assimilated into a pressure field that depicted all important synoptic weather features. Gradients of pressure in time and space, along with certain thermal characteristics of the planetary boundary layer, were then used to construct an estimate of a quasi-geostrophic wind speed and direction at some level where it is assumed that the frictional effects of the ocean surface on the atmosphere are negligible. Next, an analysis of the vertical variation of the planetary boundary layer was used to reduce this wind to a common 19.5-m level. These surface winds were input into a numerical wave model to simulate wave generation, propagation, and decay.

34. It is our belief that numerical modeling of surface waves represents an evolution toward a more reliable means of obtaining wave information for climatological purposes. Coupled with the concurrent evolution of statistical methods, data processing technology, and planning and design capabilities, this tool offers vastly improved ability to deal with coastal problems. Furthermore, by relating data to physical processes, an underlying understanding of the wave phenomena is gained. This can increase confidence in recognizing trends, distributions, and correlations among various data elements, which can, in turn, increase confidence in many basic planning, design, construction, operation, and maintenance decisions.

Errata Sheet

No. 1

ATLANTIC COAST HINDCAST, DEEPWATER,
SIGNIFICANT WAVE INFORMATION

WIS Report 2

January 1981

1. Page 7, paragraph 4, line 3 should be changed to read:

   of the sea and swell significant wave heights $\left(H_s = \sqrt{H_{sea}^2 + H_{swell}^2}\right)$.

2. In all "Percent Occurrence" tables:

   One half of the value read in 0- to 0.49-m and 7- to 8.9-sec category should be manually shifted to 0- to 0.49-m and 5- to 6.9-sec category. Change total for 5- to 6.9-sec and 7- to 8.9-sec column accordingly.
