quadrature spring rate (tuned rotor gyro) When the case of a tuned rotor gyro is displaced with respect to the gyro rotor through an angle about an axis perpendicular to the spin axis, a torque proportional to and 90 degrees away from the displacement acts in a direction to reduce this angle and to align the rotor with the case The torque is usually due to windage, a squeeze-film force, or flexure hysteresis This spring rate results in a drift rate coefficient having dimensions of angular displacement per unit time per unit angle of displacement about an input axis.

radio duct A rather shallow, almost horizontal layer in the atmosphere through which vertical temperature gradients are such as to produce an index of refraction lapse rate of greater than -48 N-units per 305 m (1000 ft). Strong temperature and/or moisture inversions are necessary for the formation of radio ducts. The resulting super-standard propagation is such as to cause the curvature of rays travelling through it to be greater than that of the Earth. Radio energy which is radiated from antennas within the duct at angles near the horizontal may thus be trapped within the layer.

side (or sideways) looking radar (SLR) An airborne reconnaissance and weapon-aiming radar, now usually centimetric, whose aerial polar diagram has two principal lobes, each of which is narrow horizontally and wide vertically. Each lobe points out on one of the aircraft's two beams, and is depressed below the horizontal, so that it intersects the terrain on either side of the aircraft's track in what is ideally a line. spin/input rectification drift rate (gyro) The drift rate in a single-degree-of-freedom gyro resulting from coherent oscillatory rates about the spin reference axis (SRA) and input reference axis (IRA). spin/output rectification drift rate (gyro) The drift rate in a single-degree-of-freedom gyro resulting from coherent oscillatory rates about the spin reference axis (SRA) and output reference axis (ORA). It occurs only when gyro and loop dynamics allow the float motion to lag case motion when subjected to a rate about the output reference axis, resulting in a cross-coupling of the spin reference axis rate. V/STOL operations Abbreviations as given below are used for the various modes of take-off (TO) and landing (L) of V/STOL aircraft: C for conventional, the required lift is derived primarily from forward speed alone; S for short, the ground run is reduced substantially by powered lift or other means; V for vertical, powered lift alone is used with no intentional ground run; RV for rolling, essentially vertical but with a slow forward speed to avoid ingestion of hot gases or debris. These letters are placed at the beginning with TO and or L added thus: VTOL, VTO, VL; STOL, STO, SL; CTOL, CTO, CL; RVTOL, RVTO, RVL.
