REPLY TO
ATTENTION OF:

DAEN-CWE-DS

23 February 1981

SUBJECT: Instruction Reports K-80-6, K-80-7, and K-81-3: The Basic User's Guide, User's Reference Manual, and Validation Report for a Computer Program for Design and Analysis of Inverted-T Retaining Walls and Floodwalls (TWDA)

All Corps Elements with Civil Works Responsibilities

1. The subject reports document a computer program for analyzing and designing reinforced concrete retaining walls and floodwalls. This computer program was developed according to specifications provided by the members of the Computer-Aided Structural Engineering (CASE) Task Group for T-Walls. As is the goal with all CASE tasks, the intent is to make an organized, cost-effective computer solution available to the Corps' designers for use when the need arises.
2. Engineers will be readily able to tell by the description of the program and by the examples given in the reports of the applicability toward their needs. Detailed documentation of the program may be obtained from the Engineering Computer Programs Library (ECPL) of the U. S. Army Engineer Waterways Experiment Station (WES), Vicksburg, Miss.
3. We strongly encourage the use of this program where applicable throughout the Corps.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Computer program TWDA (T-wall design/analysis) is a user-oriented conversationally interactive, modular time-sharing program system for computer-aided structural design of inverted-T retaining walls and floodwalls founded on earth or rock. Its essential characteristics include: a. List-directed input with prompting available on request or as shown to be needed. Data lists may be entered interactively or in a data file. (Continued)

20. ABSTRACT (Continued)

- b. Design for minimum cost including excavation, backfill, slab concrete, and stem concrete, with inputted unit costs. Default is to design for minimum concrete volume.
- c. Multiple soils strata may be used as existing and/or backfill earth. Either Coulomb's equation or trial wedges may be used to get active earth pressures.
- d. Multiple slopes may be used to model existing and/or finished grade surfaces.
- e. Time-sharing printout is limited to the minimum needed by the user to make his design decisions. A full analysis report is available in an optional output file that may be listed on any terminal.
- f. The program is structured to permit easy updating as criteria change.
- g. Up to 10 load cases may be used. The user does not need to reenter any data by hand into subsequent runs.
- h. The 1977 edition of ACI code 318 is used. Default procedures conform to the Corps of Engineers' Engineer Manuals in effect in 1980. The user may, however, direct the program to change many of the standard procedures as needed.
- i. Earthquakes may be considered using an acceleration factor that is applied to the static load.
- j. Input data and output results may be displayed on a Tektronix 4014 terminal.
- k. Multiple surcharges may be included in the data.

The program is divided into three major sections: the executive command phase, the stability group of modules, and the structural group of modules:

- a. The executive command phase is where the program starts executing and where it returns to after running the computational modules. Commands and data are entered in this phase of the program.
- b. The stability group of computational modules computes active earth pressures and determines overturning and sliding stability.
- c. The structural group of computational modules performs a stress analysis of the wall or designs for minimum slab thicknesses.

→ The philosophy of TWDA is to (a) ensure minimum-cost adequate design based on current codes and criteria, independent of the user's experience, and to (b) promote the use of personal judgment and imagination through man-machine interaction.

PREFACE

This user's guide describes the basic use of TWDA, a computer program for design and analysis of inverted-T retaining walls and floodwalls. The program is a product of the Computer-Aided Structural Engineering (CASE) Project of the Office, Chief of Engineers, U. S. Army (OCE), and of the Computer-Aided Structural Design (CASD) Project of the U. S. Army Engineer Division, Lower Mississippi Valley (LMVD).

Mr. William A. Price, Chief, Computer-Aided Design Group (CADG), Automatic Data Processing (ADP) Center, U. S. Army Engineer Waterways Experiment Station (WES), provided the overall design of the program and led the program development team. The program and this user's guide were written by Mr. Price and Messrs. Robert L. Hall, H. Wayne Jones, Reed L. Mosher, and Michael E. George, all of the CADG. The work was managed and coordinated by Dr. N. Radhakrishnan, Special Technical Assistant, ADP Center, assisted by Mr. Paul K. Senter, CADG. Mr. Donald L. Neumann was Chief of the ADP Center. Mr. Donald R. Dressler was the point of contact in OCE.

The program was written according to specifications provided by the members of the CASE Task Group on T-Walls and of LMVD's CASD Committee and by other Corps personnel:

CASE Task Group on T-Walls

Victor M. Agostinelli, LMVD (Chairman)
Terry C. Cox, LMVD
Alvis Eikstrems, North Atlantic Division
Stacey Anastos, North Atlantic Division
Joseph V. Milliorn, formerly with New Orleans District
Raymond Veselka, Galveston District

LMVD's CASD Committee

Victor M. Agostinelli, LMVD (Chairman)
Arvis R. Dennis, Vicksburg District
Clifton C. Hamby, Vicksburg District
Sefton B. Lucas, Memphis District
Joseph Barber, Memphis District
James G. Bigham, New Orleans District
Joseph V. Milliorn, formerly with New Orleans District
James J. Smith, St. Louis District
Thomas J. Mudd, St. Louis District
James Cronin, St. Louis District
Carlton Smith, St. Louis District

Keith O. O'Donnell, former Chief, Structural Engineering Section
(retired)
Donald R. Dressler
Lucian G. Guthrie

Carl E. Pace, Structures Laboratory, WES
William A. Price, ADP Center, WES
James D. Wall, South Atlantic Division

A user's reference manual and a program verification report will also be published on TWDA. Documentation of the program specifications is available from LMVD.

Directors of WES during the development of this program and the publication of this user's guide were COL J. L. Cannon, CE, and COL N. P. Conover, CE. Technical Director was Mr. F. R. Brown.

CONVERSION FACTORS, Inch-POUND TO METRIC (SI)
UNITS OF MEASUREMENT

Inch-pound units of measurement used in this manual can be converted to metric (SI) units as follows:

Multiply	By	To Obtain
cubic yards	0.7645549	cubic metres
feet	0.3048	metres
inches	2.54	centimetres
pounds (force)	4.448222	newtons
pound (force)-feet	1.355818	newton-metres
pounds (force) per foot	14.5939	newtons per metre
pounds (force) per square foot	47.88026	pascals
pounds (force) per square inch	6.894757	kilopascals
pounds (mass) per cubic foot	16.01846	kilograms per cubic metre
square inches	6.4516	square centimetres

ELECTRONIC COMPUTER PROGRAM ABSTRACT

TITLE OF PROGRAM FWDA - I-Wall Design Analysis (CORPS No. X0053)		PROGRAM NO 713-F3-R0-027	
PREPARING AGENCY U. S. Army Engineer Waterways Experiment Station, ADP Center, CADG			
AUTHORS: William A. Price, Robert L. Hall, H. Wayne Jones, Reed L. Mosher, Michael E. George		DATE PROGRAM COMPLETED June 1980	STATUS OF PROGRAM PHASE Operational
A. PURPOSE OF PROGRAM Analysis or design of an inverted-T wall subjected to retaining wall and/or floodwall loadings. Design comparisons for finding the most economical combination of base embedment, key length, base width, and base slope are based on construction cost of excavation, concrete, and backfill. Performs stability analysis or design and structural analysis or design. Conforms to Engineer Manual 1110-2-2501, EM 1110-2-2505, and other Corps of Engineers standards.			
B. PROGRAM SPECIFICATIONS The program is written in FORTRAN IV. The graphics display option uses the Graphics Compatibility System (GCS).			
C. METHODS Active earth pressures may be calculated by Coulomb's equations or by the incremental wedge method. The program is highly interactive, following a computer-aided design methodology. The analysis procedure considers overturning, sliding, and bearing pressure, relative to the soil immediately adjacent to the wall. Earthquake effects are included. Stress design includes determination of reinforcement.			
D. EQUIPMENT DETAILS Time-sharing mainframe computer (overlaid for 49k words of main memory). Time-sharing terminal--Tektronix 4014 needed for graphic display option. Rest of program may be run on any interactive terminal. Remote high-speed job entry terminal (COPE, etc.).			
E. INPUT-OUTPUT Input is by time-sharing keyboard, either directly or via data files. Intermediate data are stored in disc files. Output is to the time-sharing terminal and/or to a high-speed computer terminal.			
F. ADDITIONAL REMARKS This program was written under the auspices of the OCE Computer-Aided Structural Engineering (CASE) Project Task Group on T-Walls and the LMVD Computer-Aided Structural Design (CASD) Committee. Call W. A. Price, FTS: 542-3645, for more information. Available publications include the Basic User's Guide, the User's Reference Manual, and the Program Validation Manual. They are available from the ECPL of the WES Technical Information Center. Documentation of the program specifications is available from LMVD.			

BASIC USER'S GUIDE: COMPUTER PROGRAM FOR DESIGN
AND ANALYSIS OF INVERTED-T RETAINING
WALLS AND FLOODWALLS (TWDA)

CHAPTER 1: INTRODUCTION

1-1 PURPOSE OF PROGRAM TWDA AND THIS BASIC USER'S GUIDE

1-1-1 TWDA is a computer-aided structural design system for analysis and/or design of inverted-T cantilever walls founded on earth or rock. Multiple load cases allow the wall to act as a floodwall or a retaining wall.

1-1-2 This user's guide describes basic capabilities of TWDA. Users are referred to the User's Reference Manual* for a complete description of capabilities and interpretation of the output.

1-2 SCOPE. Chapters 2 through 6, 10, and 11 constitute the basic instructions. Once the user has become familiar with these chapters, Chapters 7 through 9 serve as a step-by-step data preparation checklist. Chapter 12 is furnished as a data reminder list that can be used as a quick reference for coding. Chapter 13 describes the use of the graphics display capabilities. Chapter 14 presents examples of how the program can be used.

* Price, W. A. et al. 1980. "User's Reference Manual: Computer Program for Design and Analysis of Inverted-T Retaining Walls and Floodwalls (TWDA)," Instruction Report K-80-7, U. S. Army Engineer Waterways Experiment Station, Vicksburg, Miss.

CHAPTER 2: DESCRIPTION OF BASIC PROGRAM CAPABILITIES

2-1 GENERAL. TWDA uses a problem-oriented command language with data grouped into named lists that may be entered in any order convenient to the user. Data and most commands may be entered interactively or via data file. Program output includes graphic display of data and results. See the documentation of the program criteria specifications* for details on structural criteria used in TWDA.

2-1-1 Unit Slice. Stability and stress analysis and design are for a unit slice of straight wall 1 ft long.**

2-1-2 Basic Command Language. The basic command language enables the user to control:

- a. Type of program start: INIT or RESTore. INIT = fresh start with all new data. REST = restart from old update file.
- b. Starting a computation procedure ("module") after the required data have been entered.
- c. Review and editing of data already entered using the LOOK command.
- d. Resetting (updating) the update file for future use of the REST command.
- e. End of a program run.
- f. Requests for information about a data item or what data items are required for a given computation module.

2-1-3 Load Cases. Up to 10 load cases may be entered in each program run. Data may be designated to be for all load cases or for any 1 load case.

2-2 ACTIVE EARTH PRESSURES. The active earth pressures for basic use of the program are calculated according to Coulomb's equation for active earth pressure, as described in Engineer Manual 1110-2-2502.+

2-2-1 Basic use of TWDA to determine floodwall stability assumes a vertical crack in the earth cover at the end of the heel, precluding use of active pressures but allowing the consideration of additional,

* Copies of the documentation are available from the U. S. Army Engineer Division, Lower Mississippi Valley, Vicksburg, Miss.

** A table of factors for converting inch-pound units of measurement to metric (SI) units is presented on page vii.

+ Headquarters, Department of the Army. 1961. "Retaining Walls," with Change 3, 25 Jan 1965, Washington, D. C.

optional external applied water pressure in the vertical crack due to wave force base pressures.

2-2-2 Basic use of TWDA to determine retaining wall stability assumes active earth pressures at the end of the heel with no crack in the earth cover.

2-2-3 TWDA calculates active earth pressures on the stem for use in stress analysis/design.

2-3 PASSIVE EARTH PRESSURES FOR SLIDING. Passive earth pressures for sliding calculations are from Coulomb's equation, as described in EM 1110-2-2502.

2-4 HORIZONTAL EARTH RESISTANCE FOR OVERTURNING. Horizontal earth resistance for overturning calculations depends on several factors:

2-4-1 With a key, the net horizontal unbalanced force is resisted by passive pressure distributed as shown below:

Because the wall is independently checked against sliding, there is no arbitrary limit applied to the passive pressure calculated in the overturning calculations. See the User's Reference Manual for more detailed information.

2-4-2 Without a key, the net horizontal unbalanced force is resisted by friction on the base, up to a value of

$$N \tan \phi + cA$$

where

N = resultant force normal to the base slab
 ϕ = angle of sliding friction between the slab and the subgrade
c = adhesion between the slab and the subgrade, psf
A = base area in contact with the subgrade

Above this limit, the excess force is resisted by passive pressure as for a key.

2-5 SLIDING CALCULATIONS. Sliding calculations in the basic use of the program depend on the status of the key. Three conditions can be handled:

- a. No key.
- b. Key under the stem.
- c. Key under the end of the heel.

See chapter 10 of this user's guide and Chapter 4 of EMVD's documentation of the program specifications for more information on sliding computations.

2-5-1 Sliding for gravity walls is calculated according to Engineer Technical Letter 110-2-15** using the shear friction concept of the safety factor being the ratio of resisting capability to driving forces. All seepage pressures are considered as a driving force. The minimum allowable safety factor in design (Module FD) is 2.0, which can be changed (see the User's Reference Manual).

2-5-2 Sliding for floodwalls is calculated according to the allowable soil strength procedures described in EM 1110-2-2.01** using the multiple-plane failure surface shown in the diagram in chapter 10. The allowable strengths are calculated according to

$$\tan \phi' = \frac{\tan \phi}{FS}$$

and

$$c' = \frac{c}{FS} + 2c'$$

where

- ϕ = angle of internal friction in soil from tests
- ϕ' = allowable angle of internal friction at equilibrium
- c = test cohesive strength, tsf
- c' = allowable cohesive strength, tsf
- FS = trial factor of safety

FS is varied until a value is found to make the driving and resisting forces equal. The minimum allowable safety factor in design (Module FD)

* Headquarters, Department of the Army. "Gravity Dam Design--Stability," Washington, D. C.

** U. S. Army Corps of Engineers. "Flood Walls," with Change 3, 25 Jan 1967, Washington, D. C.

is 1.5, which can be changed (see the User's Reference Manual).

2-6 UPLIFT. Uplift is calculated by the line of creep method described in EM 1110-2-2001. Different creep path descriptions are used for the three purposes described below. Other methods are available (see the User's Reference Manual).

2-6-1 OVERTURNING CALCULATIONS. Overturning calculations are exactly as shown in EM 1110-2-2001.

When the vertical resultant force lies outside the kern (resultant ratio less than one third or more than two thirds), and the effective portion of the base width (the portion in bearing contact) included in the creep path and in sliding adhesion strength, the toe-side face of the keel is always included in the creep path. Basic use of the program assumes that floodwalls have a vertical crack in the cutoff cover at the end of the heel and that retaining walls do not. See EMV's documentation of the program specifications for illustration.

2-6-2 SLIDING CALCULATIONS. Sliding calculations are similar to those for overturning except that the creep path follows the failure surface under the neutral piers. This is along the pier-to-subgrade interface and, when there is no keel, the maximum possible angle OMBA is being considered for the sliding resistance coefficient.

2-6-3 SOIL CONTROL. Soil creep calculations in the basic use of the program use a creep path similar to that used for overturning. See paragraphs 3-4-3 of the User's Reference Manual for more information on soil control calculations. Basic use of the program is not the actual creep ratio but does not control it. For additional information, see the User's Reference Manual.

2-7 LOCATION OF VERTICAL RESULTANT FORCE. The vertical resultant force location is controlled during overturning static design so that it is kept within the middle third criterion resultant ratio 1/3 for load cases where the water level over the heel is more than 1.05 ft below the top of stem and within the middle half criterion resultant ratio 1/2 for load cases where the water level over the heel is within 1.05 ft of the top of the stem.

2-8 GRAPHICS OUTPUT. Graphics output include input data, resulting pressures, and member forces and moments. See Chapter 13 for details.

2-9 EARTHQUAKE EFFECTS. Earthquake effects are included in the calculations in IWDA but are beyond the scope of this user's manual. See the User's Reference Manual and EMV's documentation of the program specifications for more information.

CHAPTER 3: PROGRAM ORIENTATION

3-1 GENERAL. When the user starts program TWDA running, it is in the command-data entry phase. After an initialization sequence of questions and answers, the program will accept either commands or data lists when the prompting message

COMMAND
?

is printed at the time-sharing terminal. When enough data lists have been entered to define the data required for a particular computation module, the command

RUN Module-Name

may be entered, to start the named module running. The data lists may be entered in any order so long as the items in each list are in the order prescribed for that list.

3-2 OPTIONS. There are four computation modules available in the basic use of the program:

Group	Module-Name	Action
Stability	FA	Foundation investigation
	FD	Foundation design
Stress	WA	Stress analysis
	WD	Stress design

In the basic use of the program, either module FA or module FD must have been completed with the message

UPDATE FILE RESET
#

where module WA or WD will run.

3-3 PROGRAM FILES. Module one of the program includes the three different types of computer files defined below:

3-3.1 Update File. The update file must be new for each new program run. The name entered for this file must not already be in use. The file contains the execution status (data and intermediate information) of the program at the first time the message

UPDATE FILE RESET

was printed at the user's time-sharing terminal. The file may be used only for future use with the REST command to restart after a program termination. It cannot be listed in time-sharing and can be created only by TWDA.

3-3-2 Data File. A data file contains data lists and commands that were typed and saved into a file instead of being entered interactively. It is created by the user before starting TWDA. This file is used as input only and is not updated or changed by the program. Its use is described in detail in Chapter 6.

3-3-3 Report File. The program creates a temporary report file that the complete output is written to (only a summary output is printed to the time-sharing terminal). When the user uses the END command to stop the program, he is given the options of directing the report file to a high-speed batch terminal, saving the file as a permanent file, or destroying the file. The user must be ready with a station code if he is running on the U. S. Army Engineer Waterways Experiment Station (WES) or Office of Personnel Management, Macon, Ga., (Macon), computers. The station code is obtained from the user's ADP Center. A saved permanent report file may not be used with the REST command or as a data file. All the user can do with it is list it at a terminal. See paragraph 4-7 for instructions on how to control the amount of information written to the report file.

CHAPTER 4: BASIC COMMANDS

4-1 GENERAL. These commands may be entered interactively after a

COMMAND

?

prompt or may be placed in a data file.

4-2 INIT COMMAND. INIT tells the program to set itself for a fresh start on a new problem and cancel all existing data values, if any. This command must be used in the program initialization sequence and may be used anytime to cancel all data previously entered.

4-3 REST COMMAND. REST tells the program to restore the data status set into an existing update file. This command cannot be used with an old report file or a data file.

4-3-1 The form of this command is

REST Old-File-Name

For example, if the name given to an update file of a previous program run were WPUL and if a later run were to be to restore the data and intermediate answers from that previous run, then the later run would use the command

REST WPUL

at the command prompt in the initialization sequence of the later run.

4-3-2 The most common use of this command is to pick up where an earlier program run ended. This permits a "recess" in the computer-aided design process. Such a recess might be to study the computations from one module before running the next module to be used, to redo an earlier run with changed data, or to stop for any other reason.

4-4 UPDATE COMMAND. UPDATE tells the program to reset the update file (see paragraph 3-5-10). A common use of this command is at the end of a calculation or after saving data (see paragraph 5-10), just before returning to the source with the REST command. That way, if communication with the computer should cause a disconnect, the REST command would be available for recovery.

4-5 STOP COMMAND. STOP has several forms:

4-5-1 The command STOP

LOOK Data-List-Name

causes a listing of the current values in the named data list, for all load cases, if applicable. For example, the command

LOOK SPH1

will cause the following information to be printed to the user's time-sharing terminal:

DATA LIST	SPH 1	
VARIABLE	VALUE	(LC)
PHI1 =	15.000	1
COH1 =	400.00	1
GAMAS1 =	125.00	1
DELTA1 =	0.	1
PHI1 =	15.000	2
COH1 =	400.00	2
GAMAS1 =	125.00	2
DELTA1 =	0.	2
HCMIN =	VALUE UNDEFINED	

COMMAND
?

4-5-2 The command form

LOOK Module-Name

where "Module-Name" is FA, FD, WA, or WD, will cause the LOOK Data-List-Name command form to cycle through all of the LOOK Data-List-Name printings required to show the current status of all data that can be used by the module. Many of the data lists shown are described in this basic user's guide only in Chapter 12. See the User's Reference Manual for complete information.

4-5-3 The command form

LOOK ALL

will cause the LOOK Data-List-Name command form to cycle through all of the data variable lists used by the entire program. This can take almost 15 minutes to print at the time-sharing terminal.

4-5-4 The command form

LOOK XY

will cause a table of X- and Y-coordinates for the corners of the concrete outline to be printed, followed by the current values of all of the data variables that may be used to describe the outline. X-coordinates are positive toward the end of the heel from the toe-side face of the top of the stem (basic working point), and negative toward the end of the toe from the basic working point. Y-coordinates are elevations above some datum below the wall. Any one of the modules must have been executed (RUN) before this command will work.

4-6 RUN COMMAND. The command form

RUN Module-Name

starts the named module executing. This is entered after the data are ready. It is recommended that the UPDATE command be entered just before the RUN command, so that the program will be easy to restart if something happens while the module is executing. This command may be in a data file if the user does not need the summary output normally printed to the user's time-sharing terminal. Report file output is not affected.

4-7 TRCE COMMANDS. The command

TRCE 3

adds information to the report file. The command

TRCE 0

cancels this additional information and is in effect when the program is started running or after the LALT command is used. The following table furnishes guidance:

<u>Purpose of Run</u>	<u>Do This</u>
General design memo or survey report	After the END command, let the program destroy the report file. Do not use the TRCE 3 command
Feature design memo	Get the report file output, either at your ADP Center high-speed printer or as a permanent file. Do not use the TRCE 3 command
Contract plans files	Use the TRCE 3 command before the RUN command and get the report file

4-8 ? ENTRY. The ? requests information about commands and which data lists are associated with which modules (see paragraphs 5-4 and 5-5). See paragraph 5-3-4 for other use of the ? entry.

- 4-9 END COMMAND. END tells the program to stop execution after asking the user for instructions on what to do with the report file. Have a station code (get it from your ADP Center) ready to enter when requested, if using the computers at WES or Macon. See also paragraph 3-3-3.
- 4-10 OTHER COMMANDS. Other commands are described in the User's Reference Manual.
- 4-11 COMMAND ERROR RECOVERY. Many of the commands have procedures built in for using question and answer sequences to recover from illogical or unexpected supplemental information. These sequences are not shown in this user's guide but are believed to be self-explanatory. A response of END will end the run; a null response (just a carriage return) will return to the COMMAND ? prompting message.

CHAPTER 5: DATA LIST RULES

5-1 GENERAL. A data list is a line of input containing the name of the list, then one or more blanks, then the data items in the list, separated by one or more blanks. Do not use any commas. Data lists may be used to edit (change) as well as to enter data. The first use of a particular list will define values for the input variables in the list. A later use of the same list, for the same load case if LC is in the list, will substitute new values. Data lists may be entered interactively, or they may be on one line of a data file.

5-2 LOAD CASE NUMBER. Many of the data lists have a variable called "LC." This means, with occasional specially labeled exceptions, that the rest of the items may have different values for different load cases. Entering a load case number of zero will designate the rest of the list to be for all possible load cases. For example, the data list SPT7 contains the variables LC, PH17, COH7, and GAMAS7, in that order. The data entry lines

```
SPT7  0 25  500 125
SPT7  2 20  600 120
```

would result in the following values being used by the program:

<u>Load Case</u>	<u>PH17</u>	<u>COH7</u>	<u>GAMAS7</u>
1	25	500	125
2	20	600	120
3-10	25	500	125

while the lines

```
SPT7  2 20  600 120
SPT7  0 25  500 125
```

would result in all 10 load cases using the values

<u>PH17</u>	<u>COH7</u>	<u>GAMAS7</u>
25	500	125

5-3 SPECIAL IDENTIFIERS. Special identifiers D, S, C, and ? may be used for any data variable except load case (LC), reinforcing steel layer number (LN, LNA, or LNB), and location code (LOC). (These letters are used in a data list instead of the numeric value.)

5-3-1 Special Identifier D (default) will instruct the program to insert the default value. Some data variables have more than one default

value, depending on the user's answers to questions in the program run initialization sequence. If the data value is printed before the default value is inserted, it may show as the number -0.1432E30 or as the message "DEFAULT VALUE REQUESTED."

5-3-2 Special identifier S (same) tells the program to not change whatever value that data variable already had. This is used when data are being edited by re-entering a data list, to skip having to re-type the numbers that are not to be changed.

5-3-3 Special identifier C (calculate) is used to tell the program to calculate the value from other data. This has two purposes:

- a. To designate which one of several items in a mutually interdependent data set is to be calculated from the other values in the set. For example, the data set for defining the toe width (TW2), stem location (STR), stem base thickness (TSTB), and heel width (HEELW) must have one of the following sets of values in proportioning the base for analysis (modules FA or WA). Any two of the four items (TW2, STR, TSTB, HEELW) must be defined. The other two, if defined, must be consistent within 0.01 ft.

Set Number	TW2	STR	TSTB	HEELW	To Be Calculated
1	value	C	C	value	STR, TSTB
2	value	C	value	C	STR, HEELW
3	C	value	C	value	TW2, TSTB
4	C	value	value	C	TW2, HEELW

These items are found in data lists WLA and WLAS for analysis or in data list WLD for design.

- b. To tell modules FA or FD whether to use an input value of the active earth pressure coefficient or to calculate it from the internal friction angle PH11 and the stem face batter and backfill soil surface slope. If the calculation is wanted, use the letter C for RKAL. Use the desired value for RKAL if that specific value is to be used.

Variables identified with a C are calculated in different parts of the program. If the variable's value is printed before the calculations are completed by the program, it may show as the number -0.1234E30 or as the message "VALUE NOT DEFINED."

5-3-4 Special identifier ? indicates that the user wants information about the definition or units of the data variable(s). The action will be like this:

COMMAND
?WLD 100.0 10.0 ? C D S

VARIABLE	UNITS	-	DEFINITION
STR	RATIO		STEM RATIO (TOE WIDTH TW2/BASE WIDTH BW)

TRY AGAIN ENTER VALUE FOR - STR
?

The kind of information available with repeated use of the ? response depends on the location in the program of the prompting or question being responded to. If ? is repeated where additional prompting is not available, the program will repeat the input request.

5-4 REQUESTING PROMPTING ABOUT A PARTICULAR DATA LIST. Entering only the name of a data list without anything else after it will cause the program to print out a description of what data variables are included in the list and what their definitions and units are.

5-5 REQUESTING PROMPTING ABOUT WHAT DATA LISTS ARE USED BY WHICH MODULE. Entering ? as a command will cause printing of the names of all data lists that are required and optional for all modules. This prompting will name data lists that are not described in this basic user's guide. See the User's Reference Manual for complete information. This list of modules and their associated data list names will be followed by a table of all of the commands and their functions. See Chapter 12 for a list of all data lists.

5-6 Omitted data lists are assumed by the program to contain all D's or C's, as appropriate to the type of variable.

5-7 Truncated data lists (where only part of the list is entered) are assumed to have all of the missing values after the furnished values and to have D's or C's for all of the missing values, as appropriate to the type of variable.

CHAPTER 6: DATA FILES

6-1 CONTENT. A data file, sometimes called a command-data file, contains the two sections described below. Each line of the file is made up of a line number followed by one or more blank spaces, then either a command and its supplemental information (see Chapter 4) or a data list (see Chapter 5).

6-1-1 Part 2 of the program run starting sequence described in paragraph 7-3:

a. For a new run:

```
1000 INIT
1010 I
1020 F
1030 H
```

b. For a restart of an old run that had its update file named EDCS2:

```
1000 REST EDCS2
```

6-1-2 As much of the rest of the program input as desired. This normally includes the input data lists followed by the UPDATE command. It may, however, include all of the rest of the run including the END command. But see paragraph 6-3.

6-2 END OF DATA FILE. There are two ways to end a data file: by using the END command or just letting it run out of commands and data lists. It is strongly recommended that the last line be the UPDATE command to reset the update file so that it will contain the data in the file. It is much faster to restore from an old update file than to re-read a data file.

a. Letting the data file run out without END on the last line will cause printing of the message

```
#
#DATA FILE PROCESSING DONE
#
#RETURN TO INTERACTIVE INPUT
#
```

before the command prompt

```
COMMAND
?
```

- b. The END command in the last line will cause a normal program termination with report file destination questions and answers. Be careful to have the RUN commands or at least an update command before the END command, or the program run is wasted. Placing the END command in a data file eliminates the user's capability to edit data and rerun a module while the program is still running.

6-3 EFFECT ON OUTPUT. Much output that would normally be printed to the time-sharing terminal as well as to the report file is printed only to the report file when the program is running from a data file. This may or may not be a problem to the user, depending on the circumstances of the program run. If answers are needed as soon as possible, the user should end his data file just before the first RUN command. If minimum operator time is important and the engineer can wait for the report file from his ADP Center, then the RUN commands should be in the data file.

6-4 DATA ERROR RECOVERY. An invalid data list line or command will cause one of several interactive error recovery procedures, one of which is illustrated below:

- a. Data list line no. 1080 with too many items:

1080 CASE 2 1 3 4

- b. Error recovery:

ERROR IN DATA FILE-RETURN TO KEYBOARD ### BAD LINE FOLLOWS:

CASE 2 1 3 4

TOO MANY VALUES ENTERED IN DATA LIST - CASE
COMMAND IGNORED - TRY AGAIN
?CASE 2 1 3

- c. Control returned to the data file after the corrected line was typed in. If the user had typed the command KEY instead of the corrected data list, control would have remained with the keyboard, and the erroneous line and the rest of the data file would have been ignored. Note that the line number was not reentered, just the data list. Similarly, with a misspelled command word or missing supplemental information.

CHAPTER 7: STARTING A PROGRAM RUN

7-1 GENERAL. The beginning portion of a run can follow any of several scenarios, depending on whether a data file is to be used and whether the INIT or REST commands are used. See paragraph 6-1 for the meaning of "data file." A data file is not the same as an update or a report file.

7-2 STARTING SEQUENCE, PART 1. The update file in this example is to be named "WP07091"; the report file is to be identified by "WESKD-WAP."

PROGRAM TWDA -- 713-F3-R0- 027

T-WALL DESIGN/ANALYSIS

REL 1.0 JAN 79

(RESPOND WITH ? FOR ANY HELP)

ENTER UPDATE FILE NAME (7 CHAR MAX)

?WP07091

FOR REPORT FILE,

ENTER NAME TO BE USED ON REPORT FILE IDENT CARD, 12 CHAR. MAX.

?WESKD-WAP

ENTER YOUR MACON ACCOUNT NUMBER

?BBBBBBBB

ENTER NAME OF COMMAND-DATA FILE OR

ENTER A CARRIAGE RETURN IF COMMANDS ARE TO BE

ENTERED INTERACTIVELY

?

7-3 STARTING SEQUENCE, PART 2. Part 2 of the starting sequence depends on the answer to the last question of part 1. Three options are available, each option ending with the program ready to accept data lists and commands:

- a. Data file used, with last line in the file not containing END command (the data file used in this example was named "XIBITX"). The data file must contain the rest of the program initialization sequence (see paragraph 6-1).

ENTER NAME OF COMMAND-DATA FILE OR

ENTER A CARRIAGE RETURN IF COMMANDS ARE TO BE
ENTERED INTERACTIVELY
?XIBITX
PROCESSING DATA FILE ...

END OF FILE ON COMMAND DATA FILE
RETURN TO KEYBOARD ENTRY.

COMMAND
?

- b. Data file not used; all input to be interactive at the keyboard. In this example, this is a new start, there will be one load case, and the wall is a hydraulic floodwall:

ENTER NAME OF COMMAND-DATA FILE OR
ENTER A CARRIAGE RETURN IF COMMANDS ARE TO BE
ENTERED INTERACTIVELY
?

IS THIS AN INITIAL RUN OR A RESTART OF A PREVIOUS RUN?
ENTER 'INIT' OR 'REST'

COMMAND
?INIT

#- ALL DATA RESET FOR FRESH START -#
ENTER NUMBER OF LOAD CASES (1 TO 10)
?1

-
IS THE WALL GENERALLY A FLOOD WALL OR A RETAINING WALL?
ENTER 'F' OR 'R'
?F
IS STRUCTURE HYDRAULIC OR NON-HYDRAULIC?
ENTER 'H' OR 'N'
?H

COMMAND
?

- c. Data file not used; a restart of a previous run. In this example, the file being restarted from is named "WAP1101":

ENTER NAME OF COMMAND-DATA FILE OR
ENTER A CARRIAGE RETURN IF COMMANDS ARE TO BE
ENTERED INTERACTIVELY
?

IS THIS AN INITIAL RUN OR A RESTART OF A PREVIOUS RUN?
ENTER 'INIT' or 'REST'

COMMAND
?REST WAP1101

#- ALL DATA RESET FOR FRESH START -#
#- COMMON DATA RESET FROM RESTART FILE WAP1101 , UPDATE FILE RESET -#

COMMAND
?

CHAPTER 8-1 DATA LIST PREPARATION

8-1-1 INTRODUCTION

8-1-1-1 Required and Optional Data Lists: There are two types of data lists: required and optional. All of the required data lists, when entered into the model, will run properly. As many of the optional data lists are needed to set data input values to what the user wants instead of the default values. An omitted optional list will result in all "0" or "0", as appropriate (see parameters 1-3 and 1-4).

8-1-1-2 Toe and Heel:

- a. The back-springing Point (BWP) is the toe side of the top of the stem. A vertical line through the BWP forms the horizontal reference for locating surcharges and earth surfaces.

- b. Elevations are above some datum that must be at or below the wall.
- c. Data variable LC, if included in a data list, is the load case number to which the values in the list apply. See paragraph 5-2 for more information.
- d. All units are feet unless otherwise noted.
- e. All forces and pressures are positive when they tend to move the wall (1) in the direction of the end of the toe or (2) downward.

8-1-3 Data List Preparation Sequence:

- a. The order in which a group of data lists is entered is generally immaterial as long as the individual items in any one list are in the order shown for that list. Note, however, that entering the same list more than once will have the effects described in paragraphs 5-1 and 5-2.
- b. A suggested sequence for entering the data list for basic program use is to define the following things in the order shown, after completing the starting sequence described in Chapter 7:

(1) Soil surfaces:

- (a) The desired finished grade cross section, based on project requirements, using data lists SST and SSHC to define the soil surfaces:

- (b) The existing grade cross section soil surface, using data list SSEE in paragraph 8-3-2 and Figures 8-1 and 8-2. This list is required only if quantities are to be figured for structural excavation and backfill.

(2) Soil properties:

- (a) Subgrade; may also be used for backfill as described in paragraph 8-4-2. Use data list SPE3 in paragraph 8-4-1.
- (b) Heel backfill, only if different from subgrade soil data list SPE3. Use data list SPH1 in paragraph 8-4-2a.
- (c) Toe backfill, only if different from subgrade soil data list SPE3. Use data list SPT7 in paragraph 8-4-2b.
- (3) Water elevations, if any, using data list SEEP in paragraph 8-6-1 if there is any water on the wall.
- (4) Surcharges and direct forces, if any, using the data lists described in paragraph 8-7 and Figure 8-3.
- (5) Wall geometry, using the data lists described in paragraph 8-8 and Figures 8-4 and 8-5.
- (6) If the problem includes stress analysis of an existing wall, code the reinforcing steel description using the data lists described in paragraph 8-9. If the problem includes stress design, use the information in paragraphs 8-9-2 through 8-9-4 to interpret the output.

(7) If the problem includes stress design, read and follow paragraph 8-10.

(8) If data list SSF1 has been used to define an existing soil surface, then the data lists described in paragraph 8-11 may be used to define unit costs.

8-2 SUMMARY OF DEFINITIONS. See Chapter 12 for a summary of the contents of all data lists, arranged in alphabetical order.

8-3 SOIL SURFACE. Data List 1 beginning with the letters SS:

8-3-1 Separated Backfill Data List 1 to SSBC and SS1:

- a. SSBC (soil surface over the heel). Data List SSBC defines the finished backfill grade over the heel for use of Coulomb equation for active earth pressure.

NOTES: The soil surface must touch the heel-side face of the stem, below the top and above the bottom.

Slope HS3 is positive upward leaving the wall; negative if downward.

HS3 = 100.0 if level.

SSHC LC ESHW HS3

SSHC = name of list: soil surface on heel side of stem, Coulomb earth pressures

LC = load case number. See paragraph 8-1-2.

ESHW = elevation of surface where the slope intersects a vertical line through the BSF. No default value.

HS3 = slope of finished grade over the heel. 100.0 if level. No default value.

b. SS1 (soil surface over the toe). Data List SS1 defines the finished backfill grade over the toe.

NOTES: Slope SST is positive upward leaving the wall; negative if downward.

SST = 100.0 if level.

SST LC ESTW SST

SST = name of list: soil surface on toe side of pier

LC = load case number

ESTW = elevation of surface where the slope intersects a vertical plane through the BWP. No default value.

SST = slope of finished grade over the toe. 100.0 if level.
No default value.

NOTE: Soil Surface Data List SST (soil surface on existing earth and structural excavation). This list is optional and is provided when a station is wanted at the left end of the structure. If not provided, the left end of the bottom toe is assumed to be at the center of the structure. If a station is wanted at the right end of the structure, the station should be provided. If the station is not provided, the station will be assumed to be at the center of the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

NOTE: The BWP is the water level in the structure.

Backfill soil surface

Excavation side slope

ELTS5W = elevation of existing ground under basic working point

ELTS5H = elevation of existing surface at a distance DTS5H on the heel side from the BWP, feet. Default = same as ELTS5W

DTS5H = horizontal distance from the BWP to ELTS5H, feet.
Default = 0.0

HSS5H = existing surface slope beyond distance DTS5H, heel side, feet horizontal per foot vertical, 100.0 = level. Positive upward leaving the stem. Default = 100.0

8-4 SOIL PROPERTIES. Data Lists beginning with SP:

8-4-1 Required Data List SPE3 (Soil Properties of Existing Soil). This data list is not load case dependent. It defines the subgrade soil plus backfill earth if not separately defined:

SPE3 PHI3 COH3 GAMAS3 PHIS3 ADHS3 ABP3TN ABP3BN ABP3TW ABP3BW ELBS3

SPE3 = name of list

PHI3 = angle of internal friction, degrees. No default value.

COH3 = cohesive strength, psf. No default value.

GAMAS3 = unit weight, including weight of water if submerged, pcf.
No default value

PHIS3 = maximum angle of friction along soil-concrete interface for sliding on subgrade, degrees

ADHS3 = adhesive strength along soil-concrete interface for sliding, psf

(NOTE: The rest of this list may be omitted if bearing pressure is not to be checked.)

ABP3TN = allowable bearing pressure under a wall with base width = BW1 (narrow base) as defined in paragraph 8-8-4, psf, at the top of this soil (no overburden). No default value

ABP3BN = allowable bearing pressure under a wall with base width = BW1 (narrow base), psf, at the bottom of existing soil, including weight of overburden. (At elevation ELBS3.)
No default value

ABP3TW = allowable bearing pressure under a wall with base width = BW2 (wide base), psf, at the top of this soil. No default value

ABP3BW = allowable bearing pressure under a wall with base width = BW2 (wide base), psf, at the bottom of existing soil, including weight of overburden. (At elevation ELBS3.)
No default value

ELBS3 = elevation of bottom of soil layer 3, feet. Basis for ABP3BN and ABP3BW. Default = 10 ft below the lowest concrete elevation

8-4-2 Optional Data Lists:

- a. Data list SPH1 (soil properties of heel backfill, layer number 1). This list is not needed for a particular load case if the following conditions are true for that load case:

- (1) The basic properties of internal friction angle, cohesion, and saturated earth unit weight are the same for the heel backfill as for the subgrade data list SPF3.
- (2) The user is willing to use the default values shown below for data variables RKA1, DELTA1, RKAEL, and HCMIN:

Data Variable	Units	Default Value
RKA1	ratio	C (see paragraph 5-3-3)
DELTA1	degrees	0.0
RKAEL	ratio	C
HCMIN	feet	$3 + 0.1[ETS - ESHW(LC)] \geq 5.0$

The default values listed below are applicable when SPH1 is used for a particular load case or all load cases:

SPH1 LC PHI1 COH1 GAMAS1 RKA1 DELTA1 RKAEL HCMIN

SPH1 = name of list

LC = load case number for this set of values

PHI1 = angle of internal friction, degrees. Default = 0.0

COH1 = cohesive strength, psf. Default = 0.0

GAMAS1 = unit weight, including weight of water if submerged, pcf. No default value

(NOTE: The list may be truncated here.)

RKA1 = horizontal active earth pressure coefficient. Will be used instead of Coulomb calculations based on PHI1, DELTA1, and stem face batter, if defined. Use of the letter C as the value will cause it to be calculated. Default = C

DELTA1 = wall friction angle for Coulomb's equation for active earth pressure coefficient, degrees. See RKA1 above. Default = 0.0.

RKAEL = Mononobe-Okabe earthquake active earth added pressure coefficient. Will be calculated from RKE and REV in data list SOLP if the letter C is used as a value for RKAEL

HCMIN = minimum earth backfill cover over the heel, feet.
Used only by module FD. Default = $3 + 0.1[ETS - ESHW(LC)]$ 0.0. This is the only data variable in this list that is not load case dependent

- b. Data list SPT7 (soil properties of toe backfill, layer number 7). This list is not needed for a particular load case if the data for internal friction angle (PHI3), cohesion (COH3), and saturated unit weight (GAMAS3) of data list SPE3 are also valid for the toe earth backfill, for that load case. The default values listed below are applicable when SPT7 is used for a particular load case or all load cases:

SPT7 LC PHI7 COH7 GAMAS7

SPT7 = name of list

LC = load case number for this set of values

PHI7 = angle of internal friction, degrees. Default = 0.0

COH7 = cohesive strength, psf. Default = 0.0

GAMAS7 = unit weight, including weight of water if submerged, pcf. No default value

8-5 FOUNDATION DESIGN PARAMETERS

8-5-1 Optional Data List SOLP (Soils Design Parameters). This list contains the major stability design/analysis control parameters. It is described in detail in the User's Reference Manual and is not needed for basic use of the program. The summary definitions in this user's manual are included only to show the possible versatility of the program. Chapter 2 describes the programmed action when data list SOLP is not used:

SOLP LC IFWOC NODE IFSOM NPPD RKH RKV CFMA

SOLP = name of list: soil design parameters

LC = load case number for this set of values

IFWOC = wedge method or Coulomb's method for active earth pressures

NODE = how many nodes are used to specify active earth pressures

IFSOM = wedge method control parameter

NPPD = passive pressure diagram shape control for overturning calculations

RKH = earthquake horizontal acceleration factor

RKV = earthquake vertical acceleration factor

CFMA = correction factor for active earth pressure moment arm,
to include arching active

8-5-2 Optional Data List RRD (Used in Module FD Only). This list controls the limits placed on resultant vertical reaction force location in the foundation stability design calculations. It is described in detail in the User's Reference Manual and is not needed for basic use of the program. The summary definitions shown in this user's manual are included only to show the possible versatility of the program. Paragraph 2-7 describes the programmed action when data list RRD is not used:

RRD LC RRMIN

RRD = list name: resultant ratio for design

LC = load case number for this value of RRMIN

RRMIN = minimum allowable resultant ratio for stability design

8-6 WATER. Both of these lists are optional, so go on to paragraph 8-7 if there is no groundwater or pool.

8-6-1 Required Data List SEEP. The first three variables in data list SEEP define water elevations; most of the other data variables in this list are beyond the scope of this basic user's guide. Only the names of the variables are shown herein. See the User's Reference Manual for information on these variables concerning alternate methods for determining seepage pressures:

SEEP LC ELWT ELWH HGSW ISLC ISFT KRACK

SEEP = list name

LC = load case number for this set of values

ELWT = elevation of water on the toe side of the stem, feet.
Default = C for "no water"

ELWH = elevation of water on the heel side of the stem, feet.
Default = C for "no water"

(NOTE: The list may be truncated here.)

HGSW = use a value of C

ISLC = use a value of C

ISFT = use a value of C (for line of creep method)

KRACK = use a value of C. The programmed action is described in Chapter 2

8-6-2 Optional Data List BOIL. This controls calculation of the boil control creep ratio. The list is described in detail in the

User's Reference Manual and is not needed for basic use of the program. The summary definitions shown herein are included only to show the possible versatility of the program. Paragraph 2-6-3 describes the programmed action when data list SOLP is not used:

BOIL ELSPT CRMIN IPATH

BOIL = list name

ELSPT = elevation of tip of impervious sheet pile below the key or at the end of the heel if there is no key

CRMIN = the value of average creep ratio to be used in calculating the highest allowable cutoff wall tip elevation. Default = C for "no cutoff wall"

IPATH = use C or I for this item. See the User's Reference Manual for more information

8-7 SURCHARGES AND DIRECT FORCES ON WALL

8-7-1 All Surcharge Data Lists Are Optional:

- a. Surcharge data lists SCFD, SCFH, and SCWH may be used in Modules WA and WD.
- b. Surcharge data lists SCFV and SCWV are not used by Modules WA or WD.

8-7-2 Data Item Definitions. See Figure 8-3 and paragraphs 5-6 and 5-7:

List Name	Variable Name	Units/Values	Default Value	Definition (See Note 1)
SCFD				Vertical forces on concrete
	LC	0,1-10	1	Load case number
	PVS	lb/ft	0.0	Line load centered on top of stem
	PVB	lb/ft	0.0	Line load on base slab at X-coordinate value DVB from vertical line through the BWP
	DVB	ft	0.0	X-coordinate from BWP to PVB. Negative if PVB is on toe
SCFH				Horizontal forces on concrete
	LC	0,1-10	1	Load case number
	PHI	lb/ft	0.0	Line load at elevation ELPHI. Must be negative if on toe

(Continued)

8-7-2 Data Item Definitions (Continued):

List Name	Variable Name	Units/ Values	Default Value	Definition (See Note 1)
SCFH	ELPH1	ft	--	Elevation of force PH1. May be at any elevation on or above bottom of toe
	PH2	lb/ft	0.0	Line load at elevation ELPH2
	ELPH2	ft	--	Elevation of force PH2. Must be above base; on stem only
SCFV				Vertical line loads on soil surface
	LC	0,1-10	1	Load case number
	PV1	lb/ft	0.0	Line surcharge at X-coordinate DV1
	DV1	ft	0.0	X-coordinate at line load PV1. See note 2
	PV2	lb/ft	0.0	Line surcharge at X-coordinate DV2
	DV2	ft	0.0	X-coordinate at line load PV2
	PV3	lb/ft	0.0	Line surcharge at X-coordinate DV3
	DV3	ft	0.0	X-coordinate at line load PV3
	PV4	lb/ft	0.0	Line surcharge at X-coordinate DV4
	DV4	ft	0.0	X-coordinate at line load PV4
	PV5	lb/ft	0.0	Line surcharge at X-coordinate DV5
	DV5	ft	0.0	X-coordinate at line load PV5
SCWH				Horizontal pressures
	LC	0,1-10	1	Load case number
	W1	psf	0.0	Pressure on any portion of stem above finished grade
	ELW1T	ft	--	Elevation of top of W1. Must be between the top of stem and ELW1B
	ELW1B	ft	--	Elevation of bottom of W1. Must be below ELW1T
	W3	psf	0.0	Pressure at finished grade elevation over end of heel. See note 2

(Continued)

8-7-2 Data Item Definitions (Concluded):

List Name	Variable Name	Units/ Values	Default Value	Definition (See Note 1)
SCWH	W4	psf	0.0	Pressure at bottom of key if key is at end of heel (KFLAG = 0) or at bottom of end of heel if no key or if key is under the stem (KFLAG is positive)
SCWV				Vertical surcharge pressures on soil surface
	LC	0,1-10	1	Load case number
	WT	psf	0.0	Area surcharge, over a portion of toe only
	WWT	ft	0.0	Width of WT
	DWT	ft	0.0	Horizontal distance from basic working point to stem-side edge of area covered by WT. Always entered positive; over toe only
	WH	psf	0.0	Area surcharge, over a portion of heel only
	WWH	ft	0.0	Width of WH
	DWH	ft	0.0	Horizontal distance from basic working point to stem-side edge of area covered by WH. Always positive; over heel only
WIND	LC	0,1-10	1	Load case number
	W	psf	0.0	Wind pressure (+ from heel, - from toe) on exposed surface of stem not covered by pressure W1 in data list SCWH

- NOTES: (1) All forces and pressures are positive downward or acting toward the toe from beyond the heel.
- (2) Used only for flood walls, ignored for retaining walls. Pressures W3-W4 are in addition to all seepage pressures; they are intended for use to model the momentary increase in hydrostatic pressure caused by the rise in mean water level as a wave approaches the stem. Pressures W3-W4 act instead of active earth on the neutral block for floodwalls in the basic use of the program.

Figure 8-3. Illustration of applied loads and surcharges

8-8 WALL GEOMETRY DATA

8-8-1 Internal Coordinate System. A system of orthogonal coordinates is calculated internally and used to define locations of corners of the concrete outline, as well as of the soils system and sliding failure planes. See the circled numbers in Figure 8-4.

- a. X-coordinates are measured horizontally from an origin along the Y-axis which runs vertically through the BWP. Positive values are toward the heel; negative values are toward the toe.
- b. Y-coordinates are elevations. All values must be positive.

8-8-2 Data Redundancy. The data items are more than sufficient to describe a wall. This redundancy gives the user more flexibility in how a wall can be described, or verifies the consistency of a description calculated elsewhere. Major redundant data sets are described below:

- a. Stem location on base. The location of the stem (toe side of stem at base) can be established by defining any one of the following sets of data. See paragraph 8-8-4 for definition of the variables. It is assumed that the base width (BW) has already been established (See also paragraph 5-3-3a):
 - (1) TW2 (toe width).
 - (2) BW, STR (BW times stem ratio).
 - (3) TSTB, HEELW (toe width is remainder of BW).
- b. Heel thickness at stem. The possibilities here are based on the fact that the program always completes the definition of the toe width and thicknesses first. Alternate sets are listed below:
 - (1) Toe description, IBSAME = 1, HEELT2.
 - (2) HELT1, HEELT2.

HEELT2 is set to its default value of TMINB if undefined.
TMINB is determined from the following rules if undefined.
HEELT1 and HEELT2 cannot be less than TMINB; TMINB must be entered if it is to be less than the default value:

ETS - BTEI	TMINB and TMINS Default Values
< 15.0 ft	12.0 in.
> 15 ft	18.0 in.

- c. Heel-side bottom panel batter of stem. This value (BSBPB) is always calculated by the program as it closes the perimeter description of the wall cross section. The calculated value is printed in the report file.

8-8-3 Data Lists. Many of the wall geometry data items appear in more than one list to aid the user in entering the fewest number of lists possible. In general, there are two types of lists: those describing the wall for analysis, and those describing the wall for design. The first two letters of the list names are "WL" for "wall." The third letter is either "A" for "analysis" or "D" for "design." The fourth letter, if used, is "B" for "base," "H" for "heel," "K" for "key," "S" for "stem," or "T" for "Toe."

a. Lists for analysis

*WLA ETS TW2 STR HEELW
*WLAB BW BW1 BW2 BS
*WLAH HEELT2 HEELW HEELT1
WLAH KFLAG DKEY WKEY BKTF
*WLAS TSTT TSB TSTB HSTPH HSTPB HSBPB
*WLAT BTE1 TOEHT TS2 TW1 TS1
WLBR BASER

b. Lists for design

*WLD ETS TW2 STR HEELW TSTB TMINB
*WLDB BW1 BW2 BS1 BS2 (needed only for stability design)
WLDH HEELT2
WLDK KFLAG BKTF DKEY1 DKEY2
WLDS TMINS TSB HSTPH HSTPB HSBPB
*WLDT BTE11 BTE12 TOEHT TW1
WLBR BASER

Note that TMINB in list WLD must be used for slab thicknesses below the default for TMINB and TMINS in list WLDS must be used for stem thickness less than the default for TMINS. Note that this list may not be terminated after TMINS because the rest of the list must be "S," not "D."

* Denotes a required list.

8-8-4 Data Item Descriptions. (See Figure 8-4.) Wall parts are listed in the approximate order that they are used in the program.

Variable Name	Units	Default Value	Definition
Stem Description			
TSTT	in.	TMINS	Stem thickness at top. (See note 1.)
ETS	ft	(1)	Elevation of top of stem.
TSB	in./ft	0.0	Toe-side batter, inches horizontal per foot vertical.
TSTB	in.	(10)	Stem thickness at base. (See note 11.)
TMINS	in.	(3)	Minimum allowable stem thickness. (See paragraph 8-8-23(2).)
HSTPH	ft	(2)	Heel-side top panel height. (See note 4.) 0.0 if no top panel. (See note 1.)
HSTPB	in./ft	0.0	Heel-side top panel batter, inches horizontal per foot vertical. (See note 4.)
HSBPB	in./ft	(3)	Heel-side bottom panel batter, inches horizontal per foot vertical. (There must be a bottom stem thickness at base (vertical projection). See notes 10 and 13.)
Toe Description			
TW1	ft	0.0	Width of part 1 of toe (at stem).
TS1	ratio	100.0	Slope of top of part 1 of toe, 1.0 vertical to TS1 horizontal, 100.0 = level. Must always be positive.
TW2	ft	(4)	Width of entire toe. (See note 10.)
TS2	ratio	100.0	Slope of top of part 2 of toe (at end), 1.0 vertical to TS2 horizontal, 100.0 = horizontal. Must always be positive.
TOEHT	in.	TMINS	Toe thickness at end. Always vertical. See note 12.
BTE1	ft	(1)	Elevation of bottom of toe at end.
BTE11	ft	(1)	Lowest value of BTE1 in module FD.
BTE12	ft	(5)	Highest value of BTE1 in module FD.
STR	ratio	None	Stem ratio (Design value for TW2/BW).

[illegible]
$$(1) \quad \text{if } \mathbf{A} \in \mathbf{M}_n(\mathbb{C}) \text{ then } \mathbf{A}^* = \mathbf{A}^T \text{ and } \mathbf{A}^* \mathbf{A} = \mathbf{A} \mathbf{A}^* = \mathbf{0} \text{ if and only if } \mathbf{A} = \mathbf{0}.$$

Figure 8-1. Hydraulic structure with illustration of all default values for hydraulic structure. (default values are taken from Mullis, 1994, and are not to be used)

8-9 REINFORCING STEEL. Reinforcing steel data lists are required for module WA only; they are not used in modules FA or FD. They will be generated by module WD so that module WA can be used to spot check stresses after running module WD.

8-9-1 Reinforcement Description. Reinforcement data are stored in the program in arrays ASTLK for the key, ASTLST (location code) for the toe-side face of the stem, ASTLSH (location code, layer number) for the heel-side face of the stem, ASTLBT (location code, layer number) for the top face of the base slab, and ASTLBB (location code, layer number) for the bottom face of the base slab. The location code (called LOC herein) and layer number (called LN, LNA, or LNB) are defined in the sketches following this discussion. Only significant locations along the wall need be defined; the program will fill in the intermediate locations. Significant locations include the outer end of each slab and any intermediate locations where bars are cut off (theoretical cutoff). Detailed instructions follow this summary.

COVR COVHS COVTS COVTB COVBB SPABL

STLB LOC LNA ASTLBT(LOC,LNA) LNB ASTLBB(LOC,LNB)

STLK ASTLK (may be omitted if no key)

STLS LOC ASTLST(LOC) LN ASTLSH(LOC,LN)

8-9-2 Bar cover (optional data list COVR) from surface to center of the bar layer closest to the surface (layer number 1); units are inches:

Data Item	Location	Default Values	
		Hydraulic (IHVD = 1)	Nonhydraulic (IHVD = 2)
COVHS	Heel side of stem	3.5 in.	2.5 in.
COVTS	Toe side of stem	3.5	2.5
COVTB	Top of base slab	3.5	2.5
COVBB	Bottom of base, key	4.5	3.5
SPABL	Spacing between layers, normal to face, center-to-center bars	MAXBAR's Diameter (in Data List S110 = 1.0) If data list S110 has not been entered, then the default value for "SPAB" is 2.3 in. for the diameter of a #11 bar + 1 in. clearance	

8-9-3 Stem:

* Must be defined at all significant locations.

** Must be zero at LOC = 1 if reinforcement in this layer does not extend to the end of the member.

Example ASTLSH:

Layer 1 has 0.66 in.²/ft at top of stem, changing to 1.32 in.²/ft 4 ft down.

Layer 2 begins 2 ft down with 0.66 in.²/ft.

No layer 3 used.

Example ASTLSH:

0.66 in.²/ft for entire height. Stem is 10 ft high.

Four data lines will be needed to describe this stem pattern:

STLS	LOC	ASTLSH(LOC)*	IN	ASTLSH(LOC,IN)	
STLS	1	0.66	1	0.66	Note 1
STLS	1	0.66	2	0.0	Note 1
STLS	3	0.66	2	0.66	Note 1
STLS	3	0.66	1	1.32	Note 1

NOTE: (1) All layers to be used anywhere in member must be defined (even if zero at this point) at end of member.
(2) LOC = 3 at 2 ft down.
(3) LOC = 3 at 4 ft down.

* LOC = "1" need not be entered.

8-9-4 Key:

This list may be omitted if DKEY = less than 0.02 ft long or if data lists WLAK and WLDK were not used.

Example for $ASTLK = 1.32 \text{ in.}^2/\text{ft}$:

STLK 1.32

8-9-5 Toe and Heel:

a. Sketch of toe:

NOTE: Steel definition rules in data list

STLB LOC LNA ASTLBT(LOC,LNA) LNB ASTLBB(LOC,LNB)

are the same as those for a stem with LOC = 1 at the end of the toe.

b. Sketch of heel:

Rules are the same as for stem and toe, except that the "first" element in the heel sketch has the same special rules as element LOC = 1 for the stem and toe. Element P in the heel sketch is the "last" element for heel reinforcement. All this means that the heel reinforcement is entered working inward toward the stem from the end of the heel. The "first" location code LOC is used as being at the lowest numbered whole foot mark, measured from the toe, at or just beyond the end of the heel. The procedure for getting the LOC value for the "first" location code at the end of the heel is:

- (1) Calculate $BW + 1.9999$.
- (2) Discard (truncate) the decimals.

For example,

BW	BW + 1.9999	LOC at First Element for Heel
15.0	16.9999	16
15.5	17.4999	17

c. Example of base slab reinforcement (toe and heel):

Data List STLB contains LOC, LNA, ASTLBT(LOC, LNA),
LNB, ASTLBB(LOC, LNB)

TOE REINF	{	STLB	1	1	0.66	1	1.56
		STLB	1	1	S	2	0.00
		STLB	3	1	S	1	2.56
		STLB	4	1	S	2	0.44
HEEL REINF	{	STLB	12	1	0.66	1	1.00
		STLB	12	1	S	2	0.44

8-9-6 Changing Steel Description After a Module Has Been Run:

- a. After module WA. Module WA fills in the intermediate location values for the reinforcing steel arrays in data lists STLB and STLS, working from the data entered by the user. It will therefore be necessary to change the intermediate locations, one at a time, as well as the significant locations if the description is to be changed. This can be a lengthy process. A simpler procedure for changing the description in a particular layer is to first enter the letter C for the steel area at location code LOC = 1 in that layer. This will cancel all of the values in that layer. Then, enter the complete (first location and significant locations) new description. For example, to cancel the old toe-side steel in the stem and substitute a new description, do this:

..... List	LOC	ASTLS1(LOC)	LN	ASTLSB(LOC, LN)
Cancel old STLS	1	C	1	S (no change)
Enter new STLS	1	0.44	1	S (no change)
Enter new STLS	5	0.66	1	S (no change)

- b. After module WD. The reinforcing steel description produced by this module is listed at the end of the module's report file. The description may be edited by entering the appropriate data list(s) just as any other data edited. Or, the procedure described in paragraph 3-9-6a can be used.

8-10 CONCRETE ANALYSIS/DESIGN PARAMETERS. Data lists CND and CNWD are used in both module WA and module WD. Data list STLH is used only in module WD. All of these lists are optional. Default values are based on whether the first load case (No. 1 unless data list CND is used to designate another number as the "first") is hydraulic or nonhydraulic.

CND RATION FPCON ESTL IFEM

CNWD RATIOF FYSTL FSTLMX IBSAME IFDR

STLD MAXBAR SPAMIN

Data List	Variable Name	Units	Default Values		Description
STLD	MAXBAR	ASTM size number	11		Maximum bar size allowed in design (3-11, 14, or 16 only)
	SPAMIN	in.	MAXBAR's diameter $\times$ 2 or MAXBAR's diameter + 2.25, whichever is larger		Minimum allowable clear spacing between bars in slab. Used with MAXBAR to determine maximum steel allowed in one layer, in one inch per foot
CND	RATION	ratio	Hydraulic (1)	Nonhydraulic (1)	$\frac{f_c}{f_y}$
	FPCON	psi	3,000.0	3,000.0	Concrete ultimate strength
	ESTL	psi	29,000,000.0	29,000,000.0	Elastic modulus

(Continued)

Data List	Variable Name	Units	Default Values		Description
			Hydraulic	Nonhydraulic	
CND	IFEM	0 or 1*	1	1	1 to implement the alternate special loadings of paragraph S-21 on page S-23 of EM 1110-2-2501 0 to use loads as described in load case*
CNWD	RATIOF	ratio	0.35**	0.45**	Allowable f_c/f'_c , EM 1110-1-2101
	FYSTL	psi	40,000.0 [†]	40,000.0 [†]	Reinforcing yield strength
	FSTLMX	psi	20,000.0	(2)	Allowable maximum f_s
	IBSAME	0 or 1	(3)	(3)	1 to force the top of heel at stem to the same elevation as the top of toe at the stem 0 to allow them to vary independently

(Continued)

* See paragraph 9-1-2 for more information on IFEM = 1. 1 is Corps of Engineers default; others may prefer 0.

** Set for hydraulic/nonhydraulic status of the "first" load case. The "first" load case is number 1 unless data list CND has been used to designate another number as "first."

[†] 20,000.0 is the Corps of Engineers' limit for hydraulic structures; nonhydraulic structures may use the default 50 percent of FYSTL.

Data List	Variable Name	Units	Default Values		Description
			Hydraulic	Nonhydraulic	
	IFDR	0 or 1	1	1	1 to conform to ACI 318-77, Appendix B, para. B.2.3 (in Module WA, report dead and live stresses separately if of opposite sign; in Module WD, use 80 percent of dead load moment if in opposition to live load moment) 0 to use total D+L stress

NOTES: (1) E_c is calculated from the expression in ACI 318-77 code paragraph 8-5-1:

$$E_c = (GAMAC + 5.0)^{1.5} \cdot 33.0 \sqrt{f'_{CON}}$$

(GAMAC is the weight with reinforcing steel, in kpcft, is deducted to get to unreinforced concrete.)

- (2) ESTLMX is taken at one half of ESTH for nonhydraulic structures.
- (3) IBSAME generally defaults to zero but will be used as one for analysis of a level base of constant thickness.

8-11 COST DATA

8-11-1 Use of Cost Data:

- Cost data are all optional. Default values will be used if not entered (it is not necessary to enter a list, but to use the "0" option).
- The stability analysis module (SA) and HD calculate the estimated construction cost of the completed wall, in dollars per linear foot, if cost data are entered.
- The stability design module (DL) uses the construction cost estimated by module SA as an input for optimization.

d. Cost data are illustrated in Figure 8-1.

8-11-2 Data Item Definitions:

List Name	Variable Name	Units	Default Value	Definition
CSTB*				Structural backfill unit costs*
	UCBFFZ	\$/ft ³	0.0	Unit cost of filter zone
	UCBFS1	\$/ft ³	0.0	Unit cost of soil layer 1
	UCBFS2	\$/ft ³	0.0	Unit cost of soil layer 2
	UCBFS6	\$/ft ³	0.0	Unit cost of soil layer 6
	UCBFS7	\$/ft ³	0.0	Unit cost of soil layer 7
CSTC				Unit costs of reinforced concrete
	UCWB	\$/ft ³	1.0	Unit cost of concrete in base slab
	UCWS	\$/ft ³	1.0	Unit cost of concrete in stem
	UCWK	\$/ft ³	1.0	Unit cost of concrete in key
CSTE*				Unit costs of structural excavation*
	UCEXS3	\$/ft ³	0.0	Unit cost of excavation in soil layer 3
	UCEXS4	\$/ft ³	0.0	Unit cost of excavation in soil layer 4
	UCEXS5	\$/ft ³	0.0	Unit cost of excavation in soil layer 5
	UCEXWK	\$/ft ³	0.0	Unit cost of key excavation

* Excavation and backfill volumes are set to zero when data list SSEE is omitted; hence, data lists CSTB and CSTE are immaterial when SSEE is omitted.

CHAPTER 9: SPECIAL NOTES ON MODULES WA AND WD

9-1 AUTOMATIC ALTERNATE LOAD CASES FOR MAXIMUM STRESS

9-1-1 These automatic load cases are controlled by the data variable IFEM in data list CND in paragraph 8-10. Their purpose is to add conservatism to make sure that the uncertainties of data and reaction assumptions do not cause an unsafe design.

9-1-2 These alternate load cases are generated automatically when IFEM = 1, as described in paragraph S-21 of EM 1110-2-2501. They are described below:

- a. Stem. Total load case only, no alternates.
- b. Toe:
 - (1) Total load case.
 - (2) Alternate load case: vertical forces only (to yield more tension in the bottom face reinforcement).
- c. Key:
 - (1) Total load case.
 - (2) Alternate load case: vertical forces plus horizontal resisting forces only. Driving forces (from beyond heel) are omitted. This is to yield more tension in the toe-side face reinforcement.
- d. Heel (applicable only if there is a key at the end of the heel):
 - (1) Total load case.
 - (2) First alternate load case: ignore passive pressure, to get more tension in the top face at the stem. This is an approximation of the requirements in paragraph S-21a(1) of EM 1110-2-2501. To get the full implementation, a special load case must be prepared, as described in the User's Reference Manual.
 - (3) Second alternate load case: ignore all horizontal forces and pressures, to get maximum tension in bottom at stem.
 - (4) Third alternate load case: ignore driving forces and pressures, to get maximum tension in bottom at the key (if DKEY is at least 0.02 ft long).
 - (5) Note that paragraph S-21a(3) of EM 1110-2-2501 implies that the top of the heel at the key must not have less reinforcement than is determined for the toe-side face of the key.

9-2 The combination of IFDK = 1 and IFEM = 1 in module WA can lead to an extensive output. For example, in the toe, each load case

fills five lines to print: total load case dead load, total load case live load, heading for the alternate loading, alternate load case dead load, and alternate load case live load. In the case of the heel, one load case could fill 11 lines (total load case plus three alternates). See paragraph 8-10 for data lists CND (containing the variable IFEM) and CNWD (containing the variable IFDR).

Figure 1. With OFF-A, the normal and tangential friction forces F_n and F_t do the work of all external friction forces F_{ext} (rolling friction, sliding friction and viscous).

10.6. While with a small number of observations, the effect of your "X" is not statistically significant, the effect of your "X" is statistically significant when you increase the number of observations.

that depends on the value of KFLAG (data list WLAK or WLDK).

10-6-1 With KFLAG = 0 (key at end of heel), the computation will be as described in LMVD's documentation of the program specifications. The bottom of the neutral block will be like the sketch below for a level base:

And like this for a sloping base:

10-6-2 With KFLAG = 1 (key under stem), the computations will be similar to the KFLAG = 0 situation, but will be based on the descriptions given in LMVD's documentation of the program specifications and diagrammed below. Surfaces 1 and 2 are always both considered:

10-7 All situations with OMEGA greater than zero also include the resisting force of the parallel component of the weight of the neutral block, along the inclined failure surface.

10-8 Uplift calculations for sliding include a line of creep that goes along the bottom of the neutral block and up vertically at each end of the base. Buoyant earth weights are used in the active and passive wedge calculations.

CHAPTER 11: OUTPUT SIGN CONVENTION

11-1 MODULES WA AND WD

11-1-1 Axial Force. Compression is positive.

11-1-2 Positive Shear:

11-1-3 Positive Moment:

11-2 MODULES FA AND FD. All pressures and forces are positive when they push the wall toward the end of the toe or downward. Thus, passive and bearing pressures are negative. For example, a positive value for RKH in data list SOLP causes inertial forces and an increase in active earth pressure acting to push the wall toward the end of the toe; a positive value for RKV in data list SOLP causes inertial forces acting to move the wall downward. The report file frequently shows absolute values for pressure.

CHAPTER 12: SUMMARY OF DATA LIST CONTENTS

DATA LIST	DATA ITEM	UNITS	DEFINITION
ACTIVE			Active earth limited forces over and above
	1	EAFT	LOAD CASE NUMBER 1 TO 10 FOR ACTIVE EARTH
	2	EAFT	SEQUENCE NUMBER OF VALUES OF ϕ , δ , α , β , γ , γ_1
	3	EAFT	ACTIVE EARTH ϕ DEGREE (MAXIMUM ϕ = 30 DEGREE)
	4	EAFT	DYNAMIC EARTH δ DEGREE (NUMBER OF VALUES OF δ = 10)
	5	EAFT	VALUE OF δ DEGREE (MINIMUM δ = 0 DEGREE)
	6	EAFT	ACTIVE EARTH α DEGREE (MAXIMUM α = 15 DEGREE)
	7	EAFT	SEQUENCE NUMBER OF VALUES OF α , β , γ , γ_1
	8	EAFT	DYNAMIC EARTH β DEGREE (MAXIMUM β = 15 DEGREE)
	9	EAFT	VALUE OF β DEGREE (MINIMUM β = 0 DEGREE)
	10	EAFT	ACTIVE EARTH γ DEGREE (MAXIMUM γ = 15 DEGREE)
	11	EAFT	SEQUENCE NUMBER OF VALUES OF γ , γ_1
	12	EAFT	DYNAMIC EARTH γ_1 DEGREE (MAXIMUM γ_1 = 15 DEGREE)
	13	EAFT	VALUE OF γ_1 DEGREE (MINIMUM γ_1 = 0 DEGREE)
DELT			Load lateral data
	1	DELT	LOAD CASE NUMBER 1 TO 10 FOR DELT
	2	DELT	SEQUENCE NUMBER OF VALUES OF ϕ , δ , α , β , γ , γ_1

CHAPTER 13: GRAPHICS DISPLAY OF DATA AND RESULTS

13-1 GENERAL. Module FA has the capability of displaying the input data and computed applied and reactive pressures in graphical form on a Tektronix 4014 graphics display terminal. Output examples are shown later in this Chapter. The program may be run without graphics, on any kind of terminal.

13-2 EQUIPMENT VARIATION EFFECTS. The nongraphics portion of the time-sharing terminal printout from the program does not keep track of how much has been printed on a page. It keeps on printing line after line in typical paper copy fashion. Allowing for this makes the following alternate procedures necessary, depending on which type of Tektronix 4014 terminal is available.

13-2-1 Tektronix 4014 terminal with option 40-41 installed. Use these switch settings:

- a. OFF key to setting 1.
- b. AUTO PRINT key to the left, for automatic printing of each page.

The screen will automatically be printed, then cleared for the next page as the printout continues with nothing lost. Use the program in the usual way, getting a stack of page copies in the hard copy unit hopper. Answer the question at the end of module FA

ENTER 1 TO SEE PLOTS OF THE DATA AND ANALYSES
(MAKE HARD COPY BEFORE CARRIAGE RETURN)
(NOTE: DO NOT ENTER 1 IF YOU ARE GOING TO RUN MODULE WD.)
OR 0 TO OMIT THE PLOTS

with a 1. The screen will be erased and execution will proceed as described in paragraph 13-3.

13-2-2 Tektronix 4014 terminal without the 40-41 option installed. Use a regular paper copy printing terminal such as Teletype, Texas Instruments Silent 700, DECKRITER, etc., and answer the question at the end of module FA with a zero. When module FA is complete, either stop the program run with the END command or let the terminal sit waiting for the next command while you move to a Tektronix 4014 terminal. Start the program running on the 4014 and restore (REST command in the program starting sequence) from the UPDATE file from the printing terminal program run. Note that this will not interfere with the program still running on the printing terminal provided that it is waiting for a command. Then RUN module GA, ignoring the printout until the question appears. Answer it with a 1 and proceed to paragraph 13-3. This process may be repeated each time the UPDATE file is reset in the run in the printing terminal using the REST command as described above.

13-2-3 No Tektronix 4014 terminal available. Plots are not possible.

13-3 DISPLAY OPTIONS. After the user responds to the first question with a 1, the screen is erased and the following is written:

NOTE --- A BELL WILL RING AT SELECTED TIMES
TO ALLOW YOU TO MAKE A HARDCOPY IF
YOU SO DESIRE. TO RESUME EXECUTION
SIMPLY ENTER A CARRIAGE RETURN

ENTER 1 TO PLOT INPUT DATA
2 TO PLOT FORCES AND MOMENTS
* TO TERMINATE GRAPHICS
?

13-4 INPUT DATA. Responding to the above question with a 1 starts the input plotting portion of the code. The user then must enter the number of the load case he wants plotted:

ENTER DESIRED ACTIVE LOAD CASE
OR AN * TO RETURN
?

13-4-1 If the user responds with a load case not available, the following message is written:

YOUR LOAD CASE SELECTION
HAS NOT BEEN PROCESSED
WANT TO TRY AGAIN (Y-OR-N)
?

If the user responds with Y, the load case question is repeated. A response of N terminates the graphics portion of TWDA.

13-4-2 If the user responds with a load case number that has been processed, the screen is erased and the following pictures are output:

a. Earth and water data and resulting pressures:

TEST DATA FILE 'XIBITH' TAKEN FROM CRITERIA DOCUMENT Ex. A LOAD CASE 1

LEGEND

PVS (0.75) = 100 0000 PSF
 PH1 (00.00) = 75 0000 PSF
 PH2 (02.00) = -75 0000 PSF
 PH3 (5.00) = 100 0000 PSF
 U1 = 50 0000 PSF
 U2 = 98 0000 FEET
 U3 = 95 0000 FEET
 U4 = 100 0000 PSF
 U5 = 50 0000 PSF
 U6 = 40 0000 PSF

b. Surcharges and direct loads. If any loads have been applied to the structure or the top soil layer, the following graphs are output:

13-4-3 The user is then given the opportunity to plot the input for another load case:

ENTER 1 TO PLOT ANOTHER LOAD CASE

Ø TO CONTINUE

?

Responding with a Y returns the user to the question in paragraph 13-4. A response of N terminates the input plotting section of the code and returns the user to the question in paragraph 13-3.

13-5 COMPUTED MEMBER FORCES AND MOMENTS

13-5-1 If the user responds with a 2 to the question in paragraph 13-3, the output portion of TWDA is invoked. The available load case numbers are output and the user is then given the opportunity to select a load case to be processed:

ACTIVE LOAD CASES

=====

1

ENTER DESIRED ACTIVE LOAD CASE

?

If the user selects a load case other than the ones output, the following is output:

YOUR LOAD CASE SELECTION HAS NOT BEEN PROCESSED

ENTER AN * TO RETURN OR ANY NUMBER TO TRY AGAIN

?

If the user enters an *, the output graphics portion of the code is terminated. If the user enters any number other than $1 \leq n \leq 10$, the following message is output:

YOU HAVE MADE A MISTAKE

TYPE EITHER 1, 2, 3, 4, 5, 6, 7, 8, 9, 10

?

The user then makes another selection.

13-5-2 Once a correct load case has been selected, the user then must choose which member of the wall he wants output displayed for:

TYPE IN MEMBER NUMBER (1-4)

STEM --- 1

TOE --- 2

KEY --- 3

HEEL --- 4

?

If the user responds with any number other than $1 \leq n \leq 4$, the following is output and the user is given another chance to input a member number:

MEMBER SELECTION MUST BE 1, 2, 3, 4

13-5-3 If the user selects a member that is not defined for the particular problem, either the 'KEY' or 'TOE', the following is output:

THE 'TOE' IS NOT DEFINED FOR THIS GEOMETRY

The user is then given the opportunity to select another member or return:

ENTER 1 TO PLOT ANOTHER MEMBER

0 TO CONTINUE

?

A response of '1' returns the user to the question in paragraph 13-5-2. A response of '0' returns the user to the load case selection question (para 13-5-1). Any other response repeats the question. The user must enter either '0' or '1'.

13-5-4 If the selection of a member (paragraph 9) is successful, the screen is erased and the plot selection is displayed to the user:

WHAT PLOT DO YOU DESIRE

TYPE 1 --- AXIAL FORCE

2 --- SHEAR FORCE

3 --- MOMENT

4 --- ALL PLOTS

04 --- RETURN

- a. A response of 1 gives the user a plot of axial force versus elevation for the member selected. An example of this is as follows:

- b. A response of 2 gives the user a plot of shear force versus elevation for the member selected. An example of this plot is below:

- c. A response of 3 allows the user to display moment versus elevation for the member selected. An example of this is as follows:

13-5-5 If the user responds with any number greater than 3, the member selection portion of the output graphics routine is again invoked:

ENTER 1 TO PLOT ANOTHER MEMBER
0 TO CONTINUE

?

A response of 1 allows the user to select another member for plotting (paragraph 13-5-2). A response of 0 returns the user to the load case level of section.

ACTIVE LOAD CASES

=====

1

ENTER DESIRED ACTIVE LOAD CASE
OR AN * TO RETURN

?

A response of 1 allows the user to select another load case to be displayed (paragraph 13-5-1). A response of 0 returns the user to input-output selection (paragraph 13-3).

13-6 TERMINATION. Referring to the question in paragraph 13-3, a response of an * terminates the graphics portion of TWDA.

CHAPTER 14: EXAMPLES

14-1 EXAMPLE 1: ANALYSIS OF A BASIC RETAINING WALL

WALL CROSS SECTION

DATA PREPARATION

Starting responses (paragraphs 7.1, 7.2a)

INIT (because this is a new problem)

I (how many load cases)

R (for retaining wall)

IV (for non-hydraulic)

NAME EXAMPLE 1 -- BASIC RET WALL ANALYSIS

Selection of data lists needed (see paragraphs 3.2, 8.1-8.1.3)

Use Modules FA for foundation analysis

and WA for (working) stress analysis, therefore

data lists SSHC, SST, SPE3, WLA, WLAB, WLAM,

WLAS, WLAT, STLB, and STLS will be needed

and the other lists mentioned in paragraph 8.1.3

may be used. A data list is one line of data,

consisting of the list name followed by the

desired values of the data items in that list.

The lists may be entered in any order provided

that the values in a list are in the proper order

within the list. See also paragraph 5 for

list preparation general rules.

Preparation of Data Lists (See paragraphs 8.3-8.12)

Soil Surfaces (data lists beginning with letters "SS"):

* Over heel (for Coulomb K_1), paragraph 8.3.12

Data list name = SSHC

Use Load case number LC=0 in case additional load cases are added later.

list name	LC	ESHW	H53
SSHC	0	87.29	6

- * Over Toe, paragraph 8.3.1 b
- | list name | LC | ESTW | SST | level grade, at elev. 74.0 |
|-----------|----|------|-----|----------------------------|
|-----------|----|------|-----|----------------------------|

SST	0	74.0	100.0	
-----	---	------	-------	--

- * Existing grade (list SSEE), paragraph 8.3.2
This list is not applicable to analysis, so is omitted.

Soils Properties (data list beginning with the letters "SP"):

- * Subgrade data list SPE3, paragraph 8.4.1

data list name	ϕ	C, pcf	γ_s , pcf	ϕ sliding adhesion, pcf	sliding adhesion, pcf
	PHI3	CON3	GAMAS3	OHIS3	ADHS3
SPE3	18	0	120	18	0

Allowable Bearing Pressures, pcf				
Top surface	@ ELBS3	Top surface	@ ELBS3	Elev. of bottom ELBS3
BW=BW1	BW=BW1	BW=BW2	BW=BW2	
ABP3TN	ABP3BN	ABP3TW	ABP3BW	
3000	4600	3000	4600	60.00

- * Heel backfill (because ϕ , C, or γ_s is different from the subgrade), paragraph 8.4.2 a:

list name	LC	ϕ	C, pcf	γ_s , pcf	K_3	δ	K_{oe}	min heel backfill feet
		PHI1	CON1	GAMAS1	RKA1	DELTA1	RKOE1	HCMIN1
SPH1	0	30	0	120	C	0	C	C

C because it is not applicable

- * Toe backfill (because ϕ , C, or γ_s is different from the subgrade), paragraph 8.4.2 b:

list name	LC	ϕ	C, pcf	γ_s , pcf
		PHI7	CON7	GAMAS7
SPT7	0	30	0	120

Soils Foundation Design Parameters (data list SOLP),
paragraph 8.5.1:

RKH and RKV are not needed because no earthquake effects are included in the problem.

CFMA is not needed because the default value of 1 is acceptable with no arching active situation.

∴ the list is not needed.

Data list RRD is not applicable to investigation, so is not needed, paragraph 8.5.2

Water :- With no water, lists SEEP (para. 8.6.1) and BOIL (para 8.6.2) may be omitted.

Surcharges :- With no surcharges, the lists described in paragraph 8.7 may all be omitted.

Cost data are optional for investigation, so may be omitted (paragraph 5.).

Wall Geometry, paragraph 5.8

Use data lists with names beginning with WLA, standing for "Wall Analysis": Omit list WLAK as being optional when there is no key. See paragraphs 8.8.3 and 8.8.4 for definitions:

list name	ETS feet	TW2 feet	STR	HEELW feet	(can be calculated from data items BW, TW2, TSTB)
* WLA	87.5	2.0	C	C	
list name	BW feet	BW1 for ABP3IN	BW2 for ABP3TW	BS 0=level	
* WLAB	11.0	11.0	12.0	0	

list name	HEELT2 inches	HEELW feet	HEELT1 inches
* WLAH	18.0	S	18.0

already established in list WLA, so "same"

list name	TSTT inches	TSB in/ft.	TSTB inches	HSTPH feet	HSTPB in/ft	HSTPB in/ft
* WLAS	12.0	0.0	18.0	0.0	0.0	

no separate top panel

list name	BTE1 feet	TOENT inches	TSZ	TW1 feet	TS1
* WLAT	72.5	18.0	100	0.0	100

always use TW1=0 when there is no break in slope on the toe top.

already defined by other stem data

Now see if data list WLDS is needed for 12" TSTT value:

1. $ETS - BTE1 = 87.5 - 72.5 = 15.0$ feet clear
2. Paragraph 8.9.2 b (2) says that the default for TMIN is 12 inches for heights up to 15 feet, so OK without needing list WLDS.
3. Note: If this list had been needed, it would have been entered thus:

list name	TMIN inches	TSB in/ft.	HSTPH feet	HSTPB in/ft	HSTPB in/ft
WLDS	12.0	S	S	S	S

already established in data list WLAS

(The data are now complete for Module 1FA)--add Module WA
Reinforcing Steel

- ★ Bar Cover & Spacing, paragraph 8.9.1:
Default values are all acceptable, so none of these data lists need to be used.

- ★ Stem, paragraph 8.9.2:

list name	LOC	ASTLST(LOC) ④/1	LN	ASTLSH(LOC, LN) ④/1
STLS	1	0.79	1	0.79

↑
(end of stem)

Only one use of this list is needed because there is only one layer of steel in the heel-side face and because there are no bar cutoff points.

- ★ Key, paragraph 8.9.3: This list is not needed because there is no key.

- ★ Toe, paragraph 8.9.4 (a):

Location code LOC = 1 at end of toe. Only one layer of steel in each face, no cutoff points;

list name	LOC	LNA	ASTLBT(LOC, LNA) ④/1	LNB	ASTLBB(LOC, LNB) ④/1
STLB	1	1	0.79	1	0.79

- ★ Heel, paragraph 8.9.4 (b):

Location code for "first" location at end of base
= $BLW + 1.9999$, discard decimal
= $11.5 + 1.999 = 13.4999 \rightarrow 13$

list name	LOC	LNA	ASTLBT(LOC, LNA) ④/1	LNB	ASTLBB(LOC, LNB) ④/1
STLB	13	1	0.79	1	0.79

(Note paragraph 8.9.5 a.)

Concrete Analysis Parameters, paragraph 8.10:

The default values are all acceptable, so these lists (CND, CNWD, STLD) are not needed.

Automatic Alternate Load Cases, paragraph 9.1:

"Do not use this" = zero for IFEM in data list CND;
may be put in with list

list name	RATION Es/Ec	FPCON f'c, psi	ESTL psi	IFEM 0 or 1
CND	D	D	D	0

or interactively in Module WA -- do this way.

Data Finished -- Put into data file form:

* Heel Backfill, paragraph 8.4.2 a:

This list is needed because ϕ , c , and γ are different from SPE3

list name	LC	PHI1	COH1 psf	GAMASI pcf	RAI count	DELTA1 s	RADE1 count- gamma	HCMIN
SPH1	0	30.0	0.0	125.0	C	0.0	C	D

Toe Backfill, paragraph 8.4.2 b:

This list is not needed because the properties are the same as in list SPE3.

Foundation Design Parameters

With no earthquake and not-arching active, data list SOLP is not needed.

Data list RRD is not needed because the default value of $1/3$ ($ETS-ELWH > 1.05'$) is acceptable for retaining wall.

Water, paragraph 8.6

* Seepage, paragraph 8.6.1:

data list name	LC	ELWT over toe feet	ELWH over heel feet	HBSW, ISLC, ISFT, KRACK are to be the default values, so stop list here
SEEP	0	142.0	142.0	

* Boil control is not applicable with $ELWT = ELWH$ so do not use list BOIL.

Surcharges, paragraph 8.7

Distributed surcharge over heel, so use list SCWV in paragraph 8.7.2: See also Figure 4.

list name	LC	WT psf	WWT feet	OWT feet	WH psf	WWH feet	OWWH feet
SCWV	0	0.0	0.0	0.0	200.0	100.0	2.0

Wall Geometry Data, paragraph 8.8:

1. Use data lists with names beginning with WLD, standing for "Wall Design"; WLD, WLDB, WLDT are required.
2. Omit list WLOH because TMINS is acceptable for H00672
3. Omit list WLCK because there is no key
4. Use list WLDS because TMINS is to be held at 12" when (ETS - BT&1) goes over 15' as BT&1 goes from BT&11 to BT&12.

list name	ETS feet	TW2 feet	STR	HEELW feet	TSTD inches	TMINS inches
WLD	152.5	C	0.333	C	C	18.0

list name	BW1 feet	BW2 feet	BS1	BS2
WLDB	5.0	15.0	0.0	0.0

to be calculated for strength

list name	TMINS inches	TSD in/ft	HSTPH feet	HSTPB in/ft	HSBPB in/ft
WLDS	12.0	0.0	0.0	0.0	C

list name	BT&11 feet	BT&12 feet	TOLNT inches	TWI feet
WLDT	133.5	138.5	D	0.0

3-E12 will probably control, with the level base and no key.

default to TMINS

142.0 - 2 min. cover - 1.5' to center

Selected to be below lowest probable most economical embedment

Reinforcing Steel Design, paragraphs 8.9, 8.9.1

Data list COVR is not needed because all of the default values are acceptable. Note paragraph 8.9.5 b.

Concrete Design Parameters, paragraph 8.10

- * Data list CND is needed, to set IFEM to 0 to get design for exact load case only:

list name	RATION Es/Ec	FPCON psi	ESTL psi	IFEM
CND	C	D	D	0

- * Use data list CNWD to use IFDR=0 to get design for exact loadings only:

list name	RATIO fc/fk	FYSTL psi	FSTLMX psi	IBSANE	IFDR
CNWD	D	D	D	0	0

- * Data list STLD is not needed, since the default values are all acceptable.

Cost Data, paragraph 8.11:

- * Backfill @ \$6.00 / CY = \$0.22222 / CF

list name	Unit costs \$ / CF				
	Filter zone	layer 1	layer 2	layer 6	layer 7
CSTB	0.0	0.22222	0.0	0.0	0.22222

- * Concrete @ \$120 / CY in stem and \$90 / CY in slab

list name	Unit costs \$ / CF		
	Base slab	Stem	Key
CSTC	3.33333	4.44444	0.0

- * Structural Excavation @ \$3.50 / CY

list name	Unit costs \$ / CF		
	layer 3	layer 4	layer 5
CSTE	0.12963	0.0	0.0

*f i' v f v h o t t e

1. *When is the best time to visit?*

1. The first part of the paper is devoted to the study of the asymptotic behavior of the solutions of the system (1) for large values of the parameter ϵ . It is shown that the solutions of the system (1) are bounded and converge to the solutions of the system (2) as $\epsilon \rightarrow \infty$.

1. $\frac{1}{2} \log \frac{1}{2}$ 2. $\frac{1}{2} \log \frac{1}{2}$ 3. $\frac{1}{2} \log \frac{1}{2}$ 4. $\frac{1}{2} \log \frac{1}{2}$

DATA LIST FOR REINFORCED CONCRETE WALL:

$$f_c = 3000 \text{ PSI}$$

$$f'_c = 0.35 f_c = 1050 \text{ PSI (FOR HYDRAULIC STRUCTURES)}$$

$$f_y = 40,000 \text{ PSI}$$

$$f = 20,000 \text{ PSI (FOR HYDRAULIC STRUCTURES)}$$

WALL REINFORCEMENT

DATA PREPARATIONStarting Resumes paragraphs 7.1 and 7.2 a

INIT (new problem)

2 (2 load cases)

F (floodwall default values selected)

H (hydraulic structure default values selected)

NAME EXAMPLE 3 -- BASIC FLOOD WALL ANALYSIS

Selection of Data Lists, paragraphs 3.2 and 8.1 thru 8.1.3

Module FA for foundation analysis

Module WA for stress analysis

Preparation of Data Lists, paragraphs 8.3 - 8.12:Soil Surfaces (data lists beginning with the letters "SS"):

★ Finished grade over the heel, paragraph 8.3.1 a

<u>list name</u>	<u>LC</u>	<u>ESTW feet</u>	<u>SST</u>
SSH	0	50.0	100.0

level ground

0 = "all load cases"

★ Finished grade over the toe, paragraph 8.3.1 b

<u>list name</u>	<u>LC</u>	<u>ESTW</u>	<u>SST</u>
SST	0	50.0	100.0

Finished grade of existing soil is not applicable to analysis,
so data list SST is not needed.

Soil Properties (data lists beginning with the letters "SP"):

★ Subgrade data list SPE3, paragraph 8.4.1:

list name	PHI3 ϕ	COH3 C, psc	GAMAS3 γ_s , pcf	PHIS3 $\phi_{sh, lim}$	ADMS3 allowable bearing pressure, psc
SPE3	15.0	400.0	125.0	15.0	400.0

truncate
the list
here
since
allowable
bearing
pressure
is not
stated

Data lists SPH1 and SPT7 are not needed
because the backfill soils data are the same
as for the subgrade soil and the following
default values are valid (paragraph 8.4.2.2):

RKA1 is to be calculated

DELTA1 is zero

RKA2 is zero

HCMIN is immaterial for analysis.

Foundation Design parameters

Data list SOLP, paragraph 8.5.1, is not needed
because all of the default values are acceptable.

Data list RRD, paragraph 8.5.2, is not needed
for analysis.

Water

★ Data list SEEP, paragraph 8.6.1:

list name	LC	ELWT feet	ELWH feet
SEEP 1	1	50.0	65.0
SEEP 2	2	50.0	62.0

truncate the
list here since
"C" is valid
for the rest
of the values
in the list.

Data list BOIL is not needed because there are
no data for sheet pile cutoff criteria.

Surcharge data lists are not needed (paragraph 8.7.1)

Wall geometry data for analysis, paragraph 8.9.4
(Data lists beginning with the letters "WLA"):

<u>list name</u>	<u>ETS feet</u>	<u>TW2 feet</u>	<u>STR</u>	<u>HEELW feet</u>
★ WLA	65.0	8.25	C	C
<u>list name</u>	<u>BW feet</u>	<u>BW1 for ABP3_{BN}</u>	<u>BW2 for ABP3_{BN}</u>	<u>BS</u>
★ WLAB	25.0	24.0	26.0	0.0
<u>list name</u>	<u>HEELT2 inches</u>	<u>HEELW feet</u>	<u>HEELT1 inches</u>	
★ WLAH	18.0	C	21.0	

WLAK is not needed because there is no key

<u>list name</u>	<u>TSTT inches</u>	<u>TSD in/ft</u>	<u>TSTB inches</u>	<u>HSTPH feet</u>	<u>HSTPB in/ft</u>	<u>HSPB in/ft</u>
★ WLAS	18.0	0.0	30.0	0.0	0.0	C

<u>list name</u>	<u>BTE1 feet</u>	<u>TOEHT inches</u>	<u>TS2</u>	<u>TW1 feet</u>	<u>TS1</u>
★ WLAT	43.0	18.0	24.0	0.0	100.0

WLBR is not needed since the wall alignment is straight

-- data complete for module FA --

Reinforcing Steel data, paragraph 8.9:

Data list COVR is not needed because the default values in paragraph 8.9.1 are acceptable.

* Stem, paragraph 8.9.2

$$\text{at top (LOC=1): } ASTLST(1) = \#5@12 = 0.31 \text{ in}^2/\text{ft}$$

$$ASTLSH(1,1) = \#6@12 = 0.44 \text{ in}^2/\text{ft}$$

$$\text{at El. 55 (LOC=11): } ASTLST(11) = \#6@12 = 0.44 \text{ in}^2/\text{ft}$$

$$ASTLSH(11,1) = \#9@12 = 1.00 \text{ in}^2/\text{ft}$$

$$\text{at El. 51 (LOC=15): } ASTLST(15) = \text{same as above}$$

$$ASTLSH(15,1) = \#9@6 = 2.00 \text{ in}^2/\text{ft}$$

at El. 46 = top of base, steel is same as above

list name	LOC	ASTLST(LOC) in ² /ft	LN	ASTLSH(LOC, LN) in ² /ft
STLS	1	0.31	1	0.44
STLS	11	0.44	1	1.00
STLS	15	(5 or 0.44)	1	2.00

* Toe, paragraph 8.9.4 (2)

$$\text{at outer end (LOC=1): } ASTLBT(1,1) = \#6@12 = 0.44 \text{ in}^2/\text{ft}$$

$$ASTLBB(1,1) = \#9@12 = 1.00 \text{ in}^2/\text{ft}$$

$$5' \text{ from outer end (LOC=6): } ASTLBT(6,1) = \text{same}$$

$$ASTLBB(6,1) = \#9@6 = 2.00 \text{ in}^2/\text{ft}$$

@ 8' from outer end, steel is same as at 5' from outer end.

list name	LOC	LNA	ASTLBT(LOC, LNA) sq in / ft	LNB	ASTLBB(LOC, LNB) sq in / ft
STLB	1	1	0.44	1	1.00
STLB	6	1	(5 or 0.44)	1	2.00

★ Heel, paragraph 8.9.4 (6)

LOC value at outer end:

$$BW + 1.9999 = 25.0 + 1.9999 = 26.9999$$

4 decimals

LOC = 26 @ end

@ outer end (LOC = 26): $ASTLBT(1,1) = *7 @ 12 = 0.6 \text{ @ } 1$

$ASTLBB(1,1) = *6 @ 12 = 0.44 \text{ @ } 1$

10' from outer end (LOC = 16): $ASTLBT(1,1) = *7 @ 6 = 1.20 \text{ @ } 1$

$ASTLBB(1,1) = \text{same as at end}$

Steel at stem is same as at LOC = 16

list name	LOC	LNA	ASTLBT(LOC, LNA) sq in / ft	LNB	ASTLBB(LOC, LNB) sq in / ft
STLB	26	1	0.60	1	0.44
STLB	16	1	1.20	1	(5 or 0.44)

Concrete analysis parameters, paragraph 8.10

Data lists CND and CNWD are not needed because all of the default values are acceptable.

Data list STLD is not applicable to analysis.

Cost data, paragraph 8.11

Not needed because there is no boundary defined between existing and backfill soil systems and because no cost data are given.

DATA READY -- BUILD DATA FILE

```

The report file for Example 3 is similar in form and messages to that for Example 1 and is not shown in this user's guide. It is shown in the program validation report.

4-1

The objective of this example is to determine stability and member design of a basic floodwall. Wall layout and the same as were used in floodwall analysis example 1. Data will be in a Command-Data file named FWLX2. Program control will be interactive at the time-share terminal.

Allowable bearing pressures:

	<u>BW1 = 15.0</u>	<u>BW2 = 30.0</u>
E1. 50.0	1500.0 pf	2500.0
E1. 38.0	1820.0	2820.0

DATA PREPARATION

Convert the analysis problem in example 3 into design

Starting response, paragraph 4.2.1

TEST EX3.D

NAME EXAMPLE 4 -- BRICK FLOOR WALL DESIGN

PREPARATION OF DATA LISTS, paragraph 8.1

Soil Surfaces (data lists beginning with the letters "S")

F = no grade, bed and toe = same as Example 3, no change

Existing grade, paragraph 8.3.2 = no change

Soil Properties (data lists beginning with letters "SP")

SP1 = as analyzed example 3 = no change for backfill

2nd list SP2 will be used again to identify
all other soil properties that were omitted in Example 3

★ Existing soil, paragraph 8.4.1

LIST	PHI3	GM3	GM3	PHI3	ADPH3
NAME	φ	ρ _u	ρ _u	φ _u	ρ _u
SP2	S	S	S	S	S
→ AR4STN AR4SR AR4STN AR4SR AR4SR 2nd list 2nd list 2nd list 2nd list 2nd list for 2nd for 2nd for 2nd for 2nd list list list list list					
1500.0	1520.0	1520.0	2820.0	2820.0	38.0

+ base used to test
change to the
identify S's
listings (see
paragraph 8.3.3)

Foundation Design Parameters, paragraph 8.5

With no earthquake and no arching active earth, data list SOLP (paragraph 8.5.1) is not needed.

Data list RRO (paragraph 8.5.2) is not needed because the default values of $1/4$ for load case 1 (water within 1.05 ft. of top of wall) and $1/3$ for load case 2 (water more than 1.05 ft. below top of wall) are acceptable.

Water, paragraph 8.6

No change, so data list SEEP is not needed.

Surcharges, paragraph 8.7

none, so omit these lists

Wall geometry, paragraph 8.8:

The data for analysis must be converted to data for design. The main concern in doing this is to make sure the dimensions desired to vary during the design are so specified. The fastest way for the beginning user is to cancel all geometry data not used. Study of paragraph 8.8.3 shows that these data lists are needed to cancel all analysis geometry data not to be entered for design: WLAB, WLAH, WLAK (if there is a key), WLAS, and WLAT

★ WLAB C C C C
 ★ WLAH C C C
 ★ WLAS C C C C C C
 ★ WLAT C C C C C

Note that only one "C" is actually needed because of the action described in paragraph 5.7.

11th add lists beginning with "WLD" to define design geometry:

1. Data list WLDH may be omitted because TRAINB is acceptable for HEIGHT (see paragraph 8.8.2 b)
2. With no key, data list WLDR may be omitted.
3. Data list WLBS may be omitted because TRAINS is acceptable for TSTT with height over 15'.

List name	ETS feet	TW2 feet	STR	HEIGHT feet	TSTB inches	TRAINB inches
*WLD	65.0	C	0.333	C	C	D

to be calculated for TRAINB
the list may be terminated here because the remaining values are identifiers "C" or "D"

List name	BW1 feet	BW2 feet	BS1	BS2
*WLDB	15.0	30.0	0.0	0.0

List name	BTE11 feet	BTE12 feet	TOENT inches	TW1 feet
*WLDT	39.0	43.0	D	0.0

default = TRAINB, when itself defaults to 18" with data list WLDH omitted.

Reinforcing Steel data - read the first sentence in paragraph 8.9

Concrete Design Parameters paragraph 8.10

Data list CND will be used to keep the design to the data as inputted only (I_{FR}CND = 0).

Data list CNVD will be used to keep the design based on full dead + live loads only (I_{FR}DR = 0)

All other values in data lists CND and CNWD may use their default values.

Data list STLO is not needed because its default values are acceptable.

list name	RATION $\lambda = E_s/E_c$	I-PCON f'_c, psi	ESTL E_s, psi	I/2CM	
*CND	D	D	D	O	
list name	RATIOF F_c/f'_c	FYSTL F_y, psi	FSTLMX $F_{s \text{ max}}, \text{psi}$	I/OANE	I/PDR
*CNWD	D	D	D	D	O

Cost Data, paragraph 8.11 (data lists beginning "CST...")

Excavation and backfill costs are not given, so data lists CSTB and CSTE are not applicable and should be omitted.

Data list CSTC is needed, to enter values for

Stem concrete @ \$120/cy = 84.444 /CF

Slab concrete @ \$90/cy = 33.333 /CF

list name	base slab \$/cy	stem \$/CF	key
*CSTC	3.3333	4.4444	0.0

ENTER DATA INTERACTIVELY

Note that the data could have been put in a data file, as described in paragraphs 6.1.1 b and 7.2.2.

15 April 1981

SUBJECT: Replacement Sheets for WES Instruction Report K-80-6, The Basic User's Guide for Computer Program TWDA

TO: All Recipients of Subject Report

Those sheets containing pages 10-1, 10-2, 12-3, 12-4, 13-1, 13-2, 13-7, 13-8, 13-11, 13-12, 14-1 through 14-10, 14-27 through 14-32, 14-49 through 14-54, 14-59 through 14-62, 14-65, and 14-66 should be replaced with the attached sheets containing identically numbered revised pages.

CHAPTER 10: SLIDING COMPUTATIONS

- 10-1 Sliding control is based on the values of KFLAG and DKEY in data lists WLAK and WLDK.
- 10-2 Sliding calculations use the method of wedges: active wedge beyond the heel, neutral block between the ends of the heel and the key, and a passive wedge beyond the toe.
- 10-3 Walls with no key and a level base use neutral block base sliding resistance calculated from the sliding friction angle and adhesion soils data values from the subgrade soil (data list SPE3 in paragraph 8-4-1).
- 10-4 Walls with no key and a sloping base use a variable angle OMEGA to define the bottom of the neutral block:

- 10-4-1 With maximum OMEGA, base sliding resistance includes the use of sliding friction and adhesion strength from the soils layers under the base, as well as the parallel component of the weight of the neutral block.
- 10-4-2 With OMEGA less than the maximum, base sliding resistance includes the use of soil internal friction and cohesion instead of sliding friction and adhesion.
- 10-5 Nomenclature for sliding (see sketches in following paragraphs):
N = normal force across bottom of neutral block
 ϕ = angle of sliding friction between base slab and subgrade, data variable PHIS3 in data list SPE3 (paragraph 8-4-1)
c = adhesive strength along interface between base slab and subgrade, data variable ADHS3 in data list SPE3
A = width of bottom of neutral block in contact with the subsoil
- 10-6 Walls with a key not less than 0.01 ft long (DKEY in data list WLAK or the result of module FD) will use a neutral block base

that depends on the value of KFLAG (data list WLAK or WLDK).

10-6-1 With $KFLAG = 0$ (key at end of heel), the computation will be as described in LMVD's documentation of the program specifications. The bottom of the neutral block will be like the sketch below for a level base:

And like this for a sloping base:

10-6-2 With $KFLAG = 1$ (key under stem), the computations will be similar to the $KFLAG = 0$ situation, but will be based on the descriptions given in LMVD's documentation of the program specifications and diagrammed below. Surfaces 1 and 2 are always both considered:

Data List	Data Item	Units	Definition
PPI			Passive pressure diagram ordinates
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	YITOP	FOOT	ELEV. OF TOP OF PASSIVE PRESSURE DIAGRAM
	WPE	PSF	MAX. PASSIVE PRESSURE FROM WIND LOAD
	EHPE	PSF	MAX. PASSIVE PRESSURE FROM EQ. HORIZ. ADDITIONAL
	HPE	PSF	MAX. PASSIVE PRESSURE FROM HORIZ. EARTH + SURCHARGE
	FHPE	PSF	MAX. PASSIVE PRESSURE FROM HORIZ. SEEPAGE
RRD			Minimum allowable resultant ratio
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	RRMIN	RATIO	MIN. ALLOWABLE OVERTURNING RESULTANT RATIO
SCFD			Direct vertical line loads on stem and base
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	PVS	LB/FT	LINE LOAD DOWN ON CENTER OF TOP OF STEM
	PVB	LB/FT	LINE LOAD DOWN ON BASE SLAB CONCRETE
	DVB	FOOT	HORIZONTAL DISTANCE, WORKING PT. TO PUB. + TO HEEL
SCFH			Direct horizontal line loads on stem
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	PH1	LB/FT	LINE LOAD HORIZ. ON STEM OR END OF TOE, + FROM HEEL
	ELPH1	FOOT	ELEV. OF PH1 (ON TOE OR STEM)
	PH2	LB/FT	LINE LOAD HORIZ. ON STEM ONLY, + FROM HEEL
	ELPH2	FOOT	ELEV. OF PH2 (ON STEM ONLY)
SCFV			Surcharge line loads on backfill
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	PV1	LB/FT	LINE SURCHARGE VERTICAL, NO. 1
	DV1	FOOT	HORIZ. DIST., BASIC WORK. PT. TO PV1, + OVER HEEL
	PV2	LB/FT	LINE SURCHARGE VERTICAL, NO. 2
	DV2	FOOT	HORIZ. DIST., BASIC WORK. PT. TO PV2, + OVER HEEL
	PV3	LB/FT	LINE SURCHARGE VERTICAL, NO. 3
	DV3	FOOT	HORIZ. DIST., BASIC WORK. PT. TO PV3, + OVER HEEL
	PV4	LB/FT	LINE SURCHARGE VERTICAL, NO. 4
	DV4	FOOT	HORIZ. DIST., BASIC WORK. PT. TO PV4, + OVER HEEL
	PV5	LB/FT	LINE SURCHARGE VERTICAL, NO. 5
	DV5	FOOT	HORIZ. DIST., BASIC WORK. PT. TO PV5, + OVER HEEL
SCWH			Direct horiz. pressures on stem & neutral block
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	W1	PSF	HORIZ. PRESSURE LOAD ON STEM, + FROM HEEL
	ELW1T	FOOT	ELEV. OF TOP OF LOAD W1 (MUST BE ON STEM)
	ELW1B	FOOT	ELEV. OF BOTTOM OF LOAD W1 (MUST BE ABOVE GRADE)
	W3	PSF	EXTERNAL HORIZ. PRESSURE AT HEEL, VALUE AT GRADE
	W4	PSF	EXTERNAL HORIZ. PRESSURE AT HEEL, VALUE AT BOTTOM
SCWV			Surcharge area loads on backfill
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	WT	PSF	VERT. DISTRIBUTED SURCHARGE OVER TOE ONLY
	WWT	FOOT	WIDTH OF STRIP LOADED BY SURCHARGE WT
	DWT	FOOT	HORIZ. DISTANCE, BASIC WORK. POINT TO SURCHARGE WT
	WH	PSF	VERT. DISTRIBUTED SURCHARGE OVER HEEL ONLY
	WWH	FOOT	WIDTH OF STRIP LOADED BY SURCHARGE WH
	DWH	FOOT	HORIZ. DISTANCE, BASIC WORK. POINT TO SURCHARGE WH

(Continued)

Data List	Data Item	Units	Definition
SEEP			Water elevations and seepage options
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	ELWT	FOOT	ELEV. OF WATER LEVEL OVER TOE
	ELWH	FOOT	ELEV. OF WATER LEVEL OVER HEEL (WAVE STILL WATER)
	HGSW		SOILS WEIGHT CHANGE DUE TO HYDRAULIC GRADIENT, 0.00RX
	ISLC	1-2	1 = EACH LOAD CASE SEPARATE CREEP, 2 = ALL AS NO 1
	ISFT	1234	1, 2, 3, OR 4 FOR TYPE OF SEEPAGE FLOW, 1=CREEP
SLID	KRACK	1-2	1 FOR CRACK (+ W3, W4) OVER HEEL, 2 FOR ACTIVE SOIL
			Sliding control data - see also ONEA
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	NSLIDE	1234	1, 2, 3, OR 4 FOR SLIDING CALCULATION TYPE OPTION
SOLP	FSMIN	RATIO	MINIMUM FACTOR OF SAFETY AGAINST SLIDING
			Soils design parameters
	LC	EACH	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	IFWOC	10R2	1 FOR INCREMENTAL WEDGE METHOD OR 2 FOR COULOMB
	NODE	EACH	NUMBER OF NODES TO USE WHEN IFWOC = 1 & IFSOM = 2
	IFSOM	10R2	1 FOR SINGLE WEDGE IN AL SURFACE, 2 FOR MULTIPLE
	NPPD	1-5	OVERTURNING PASSIVE PRESSURE SHAPE CODE, 5 = STRUT
	RKH	RATIO	HORIZ. EARTHQUAKE ACCELERATION FACTOR
	RKV	RATIO	VERT. EARTHQUAKE ACCELERATION FACTOR
SPE3	CFMA	RATIO	ACTIVE PRESSURE MOMENT ARM FACTOR FOR ARCHING CASE
			Soil properties, exist. soil layer 3 (basic)
	PHI3	DEG.	ANGLE OF INTERNAL FRICTION, SOIL LAYER 3
	COH3	PSF	COHESIVE STRENGTH OF SOIL LAYER 3
	GAMAS3	LB/CF	UNIT WEIGHT OF SOIL LAYER 3, SATURATED IF BELOW WT
	PHIS3	DEG.	MAX ANGLE OF SLIDING FRICTION ON SOIL LAYER 3
	ADHS3	PSF	SLIDING ADHESIVE STRENGTH FOR SOIL LAYER 3
	ABP3TN	PSF	ALLOW. BRNG. PRESSURE, TOP OF LAYER 3, NARROW BASE
	ABP3BN	PSF	ALLOW. BRNG. PRESSURE, BOTT OF LAYER 3, NARROW BASE
	ABP3TW	PSF	ALLOW. BRNG. PRESSURE, TOP OF LAYER 3, WIDE BASE
	ABP3BW	PSF	ALLOW. BRNG. PRESSURE, BOTT OF LAYER 3, WIDE BASE
	ELBS3	FOOT	ELEVATION CORRESPONDING TO ABP3BN AND ABP3BW
SPE4			Soil properties, existing soil layer 4
	ELTS3	FOOT	ELEV OF TOP OF SOIL LAYER 3
	PHI4	DEG.	ANGLE OF INTERNAL FRICTION, SOIL LAYER 4
	COH4	PSF	COHESIVE STRENGTH OF SOIL LAYER 4
	GAMAS4	LB/CF	UNIT WEIGHT OF SOIL LAYER 4, SATURATED IF BELOW WT
	PHIS4	DEG.	MAX ANGLE OF SLIDING FRICTION ON SOIL LAYER 4
	ADHS4	PSF	SLIDING ADHESIVE STRENGTH FOR SOIL LAYER 4
	ABP4TN	PSF	ALLOW. BRNG. PRESSURE TOP OF LAYER 4, NARROW BASE
	ABP4BN	PSF	ALLOW. BRNG. PRESSURE BOTT OF LAYER 4, NARROW BASE
	ABP4TW	PSF	ALLOW. BRNG. PRESSURE TOP OF LAYER 4, WIDE BASE
	ABP4BW	PSF	ALLOW. BRNG. PRESSURE BOTT. OF LAYER 4, WIDE BASE
SPE5			Soil properties, existing soil layer 5
	ELTS4	FOOT	ELEV. OF TOP OF SOIL LAYER 4
	PHI5	DEG.	ANGLE OF INTERNAL FRICTION, SOIL LAYER 5
	COH5	PSF	COHESIVE STRENGTH OF SOIL LAYER 5
	GAMAS5	LB/CF	UNIT WEIGHT OF SOIL LAYER 5, SATURATED IF BELOW WT
	PHIS5	DEG.	MAX ANGLE OF SLIDING FRICTION ON SOIL LAYER 5
	ADHS5	PSF	SLIDING ADHESIVE STRENGTH FOR SOIL LAYER 5
	ABP5TN	PSF	ALLOW. BRNG. PRESSURE TOP OF LAYER 5, NARROW BASE
	ABP5BN	PSF	ALLOW. BRNG. PRESSURE BOTT OF LAYER 5, NARROW BASE
	ABP5TW	PSF	ALLOW. BRNG. PRESSURE TOP OF LAYER 5, WIDE BASE
	ABP5BW	PSF	ALLOW. BRNG. PRESSURE BOTT OF LAYER 5, WIDE BASE

CHAPTER 13: GRAPHICS DISPLAY OF DATA AND RESULTS

13-1 GENERAL. Module FA has the capability of displaying the input data and computed applied and reactive pressures in graphical form on a Tektronix 4014 graphics display terminal. Output examples are shown later in this Chapter. The program may be run without graphics, on any kind of terminal.

13-2 EQUIPMENT VARIATION EFFECTS. The nongraphics portion of the time-sharing terminal printout from the program does not keep track of how much has been printed on a page. It keeps on printing line after line in typical paper copy fashion. Allowing for this makes the following alternate procedure necessary, depending on which type of Tektronix terminal is available.

13-2-1 Tektronix 4014 terminal with option 40-41 installed. Use these switch settings:

- a. OFF key to setting 1.
- b. AUTO PRINT key to the left, for automatic printing of each page.

The screen will automatically be printed, then cleared for the next page as the printout continues with nothing lost. Use the program in the usual way, getting a stack of paper copies in the hard copy unit hopper. Answer the question at the end of module FA

ENTER 1 TO SEE PLOTS OF THE DATA AND ANALYSES
(NOTE: DO NOT ENTER 1 IF YOU ARE GOING TO RUN MODULE WD.)
OR 0 TO OMIT THE PLOTS
?

with a 1. A hard copy will automatically be taken. The screen will be erased and execution will proceed as described in paragraph 13-3.

13-2-2 Tektronix 4014 terminal without the 40-41 option installed. Use a regular paper copy printing terminal such as Teletype, Texas Instruments Silent 700, DECWRITER, etc., and answer the question at the end of module FA with a zero. When module FA is complete, either stop the program run with the END command or let the terminal sit waiting for the next command while you move to a Tektronix 4014 terminal. Start the program running on the 4014 and restore (REST command in the program starting sequence) from the UPDATE file from the printing terminal program run. Note that this will not interfere with the program still running on the printing terminal provided that it is waiting for a command. Then RUN module GA, ignoring the printout until the question appears. Answer it with a 1 and proceed to paragraph 13-3. This process may be repeated each time the UPDATE file is reset in the run in the printing terminal using the REST command as described above.

13-2-3 No Tektronix 4014 terminal available. Plots are not possible.

13-3 DISPLAY OPTIONS. After the user responds to the first question with a 1, the screen is erased and the following is written:

NOTE --- A BELL WILL RING AT SELECTED TIMES
TO ALLOW YOU TO MAKE A HARDCOPY IF
YOU SO DESIRE. TO RESUME EXECUTION
SIMPLY ENTER A CARRIAGE RETURN

ENTER 1 TO PLOT INPUT DATA
1 TO PLOT FORCES AND MOMENTS
* TO TERMINATE GRAPHICS
?

13-4 INPUT DATA. Responding to the above question with a 1 starts the input plotting portion of the code. The active load cases will be printed. The user must then enter the number of the load case he wants plotted:*

ACTIVE LOAD CASES

1

2

ENTER DESIRED ACTIVE LOAD CASE
OR AN * TO RETURN
?

13-4-1 If the user responds with a load case not available, the following message is written:

LOAD CASE SELECTION NOT ACTIVE

The load case question is then repeated. If the user enters an *, the input graphics portion of the code is terminated.

13-4-2 If the user responds with a load case number that has been processed, the screen is erased and the following pictures are output:

* NOTE: If there is only one load case, the question will be skipped.

13-4-3 The user is then given the opportunity to plot the input for another load case:

ENTER 1 TO PLOT ANOTHER LOAD CASE
0 TO CONTINUE
?

Responding with a 1 returns the user to the question in paragraph 13-4. A response of 0 terminates the input plotting section of the code and returns the user to the question in paragraph 13-3.

13-5 COMPUTED MEMBER FORCES AND MOMENTS

13-5-1 If the user responds with a 2 to the question in paragraph 13-3, the output portion of TWDA is invoked. The available load case numbers are output and the user is given the opportunity to select a load case to be processed:*

ACTIVE LOAD CASES

1

2

ENTER DESIRED ACTIVE LOAD CASE
OR AN * TO RETURN

?

If the user selects a load case other than the ones output, the following is output:

LOAD CASE SELECTION NOT ACTIVE

The load case question is then repeated. If the user enters an *, the output graphics portion of the code is terminated.

13-5-2 Once a correct load case has been selected, the user must then choose which member of the wall he wants output displayed for:

ENTER MEMBER NUMBER

STEM --- 1

TOE --- 2

KEY --- 3

HEEL --- 4

* --- RETURN

?

* NOTE: If there is only one load case, the question will be skipped.

If the user responds with any number other than $1 \leq n \leq 4$, the following is output and the user is given another chance to input a member number:

THE 'TOE' IS NOT DEFINED FOR THIS GEOMETRY

The user is then given the opportunity to select another member or return:

ENTER 1 TO PLOT ANOTHER MEMBER
0 TO CONTINUE
?

A response of 1 returns the user to the question in paragraph 13-5-2. A response of 0 returns the user to the load case selection question in paragraph 13-5-1. Any other response repeats the question. The user must enter either 0 or 1.

13-5-3 If the selection of a member (paragraph 13-5-2) is successful, the screen is erased and the plot selection is displayed to the user:

ENTER PLOT SELECTION
TYPE 1 --- AXIAL FORCE
2 --- SHEAR FORCE
3 --- MOMENT
4 --- ALL PLOTS
* --- RETURN
?

- c. A response of 3 allows the user to display moment versus elevation for the member selected. An example of this is as follows:

If the user responds with 4, all of the preceding plots will be displayed sequentially with a pause between each one.

13-5-4 If the user responds with an *, the member selection portion of the output graphics routine is again invoked:

ENTER 1 TO PLOT ANOTHER MEMBER
0 TO CONTINUE
?

A response of 1 allows the user to select another member for plotting (paragraph 13-5-2). A response of 0 returns the user to the load case level of selection.

ENTER 1 TO PLOT ANOTHER LOAD CASE
0 TO CONTINUE
?

A response of 1 allows the user to select another load case to be displayed (paragraph 13-5-1). A response of 0 returns the user to input-output selection (paragraph 13-3).

13-6 TERMINATION. Referring to the question in paragraph 13-3, a response of an * terminates the graphics portion of TWDA.

CHAPTER 14: EXAMPLES

14-1 EXAMPLE 1: ANALYSIS OF A BASIC RETAINING WALL.

1-1

DATA PREPARATION

Starting responses (paragraphs 7-2, 7-3a)

INIT (because this is a new problem)

I (how many load cases)

R (for retaining wall)

N (for non-hydraulic)

NAME EXAMPLE 1 -- BASIC RET WALL ANALYSIS

Selection of data lists needed (see paragraphs 3-2 & 8-1)

Use Modules F-A for foundation analysis

and WA for (working) stress analysis, therefore

data lists SSHC, SST, SPE3, WLA, WLAB, WLAH,

WLAS, WLAT, STLB, and STLS will be needed

and the other lists mentioned in paragraph 8-1-3

may be used. A data list is one line of data,

consisting of the list name followed by the

desired values of the data items in that list.

The lists may be entered in any order provided

that the values in a list are in the proper order

within the list. See also Chapter 5 for

list preparation general rules.

Preparation of Data Lists (See paragraphs 8-3-8-11)

Soil Surfaces (data lists beginning with letters "SS"):

* Over heel (for Coulomb & K.), paragraph 8-3-1a

Data list name = SSHC

Use Load Case Number LC=0 in case additional load cases are added later.

list name	LC	ESHW	H53
SSHC	0	87.29	6

- * Over Toe, paragraph 8-3-1 b level grade, at elev. 74.0

list name	LC	ESTW	SST
SST	0	74.0	100.0

- * Existing grade (list SSEE), paragraph 8-3-2

This list is not applicable to analysis, so is omitted.

Soils Properties (data lists beginning with the letters "SP"):

- * Subgrade data list SPE3, paragraph 8-4-1

data list name	ϕ	C, psf	γ_s , pcf	ϕ sliding, psf	sliding adhesion, psf
	PHI3	CON3	γ_s pcf	PHI3S	ADHS3
SPE3	18	0	120	18	0

Allowable Bearing Pressures, psf				
Top surface	@ ELB53	Top surface	@ ELB53	Elev. of bottom ELB53
BW = BW1	BW = BW1	BW = BW2	BW = BW2	
ABP3TN	ABP3BN	ABP3TW	ABP3BW	
3000	4600	3000	4600	60.00

- * Heel backfill (because ϕ , C, or γ_s is different from the subgrade), paragraph 8-4-2 a:

list name	LC	ϕ	C, psf	γ_s , pcf	K_2	δ	K_{ae}	min heel cover, ft
		PHI1	CON1	γ_s pcf	RAI	DELTA1	RAEI	NCMIN
SPH1	0	30	0	120	C	0	C	C

C because it is not applicable

- * Toe backfill (because ϕ , C, or γ_s is different from the subgrade), paragraph 8-4-2 b:

list name	LC	ϕ	C, psf	γ_s , pcf
		PHI7	CON7	γ_s pcf
SPT7	0	30	0	120

Soils Foundation Design Parameters (data list SOLP),
paragraph 8-5-1:

RKH and RKV are not needed because no earthquake effects are included in the problem.

CI=MA is not needed because the default value of 1 is acceptable with no arching active situation.

∴ the list is not needed.

Data list RRD is not applicable to investigation, so is not needed, paragraph 8-5-2

Water.- With no water, lists SEEP (para. 8-6-1) and BOIL (para 8-6-2) may be omitted.

Surcharges.- With no surcharges, the lists described in paragraph 8-7 may all be omitted.

Cost data are optional for investigation, so may be omitted (paragraph 8-11).

Wall Geometry, paragraph 8-8

Use data lists with names beginning with WLA, standing for "Wall Analysis"; Omit list WLAK as being optional when there is no key. See paragraphs 8-8-3 and 8-8-4 for definitions:

List name	ETS feet	TW2 feet	STR	HEELW feet	can be calculated from data items BW, TW2, TSTR
* WLA	87.5	2.0	C	C	
List name	BW feet	BW1 for ABP3 TN	BW2 for ABP3 TW	BS Oz level	
* WLAB	11.0	11.0	12.0	0	

list name	HEELT2 inches	HEELW feet	HEELT1 inches
* WLAH	18.0	S	18.0

already established in list WLA, so "same"

list name	TSTT inches	TSB in/ft.	TSTB inches	HSTPH feet	HSTPB in/ft.	HSPDB in/ft.
* WLAS	12.0	0.0	18.0	0.0	0.0	

no separate top panel

list name	BTE1 feet	TOENT inches	TSZ	TW1 feet	TS1
* WLAT	72.5	18.0	100	0.0	100

*always use TW=0
when there is no break
in slope on the toe top.*

Now see if data list WLDS is needed for 12" TSTT value:

1. $ETS - BTE1 = 87.5 - 72.5 = 15.0$ feet b/a
2. Paragraph 8-8-2 b (2) says that the default for TMIN is 12 inches for height up to 15 feet, so OK without needing list WLDS.
3. Note: If this list had been needed, it would have been entered thus:

list name	TMIN inches	TSO inches/ft.	HSTPH feet	HSTPB in/ft.	HSPDB in/ft.
WLDS	12.0	S	S	S	S

already established in data list WLAS

(The data is now complete for Module FA)--add Module WA
Reinforcing Steel

★ Bar Cover & Spacing, paragraph 8-9-2:

Default values are all acceptable, so none of these data lists need to be used.

★ Stem, paragraph 8-9-3:

list name	LOC	ASTLST(LOC) 1	LN	ASTLSH(LOC, LN) 1
STLS	1	0.79	1	0.79

(end of stem)

Only one use of this list is needed because there is only one layer of steel in the heel-side face and because there are no bar cutoff points.

★ Key, paragraph 8-9-4: This list is not needed because there is no key.

★ Toe, paragraph 8-9-5 (2):

Location code LOC = 1 at end of toe. Only one layer of steel in each face, no cutoff points.

list name	LOC	LNA	ASTLBT(LOC, LNA) 1	LN	ASTLBB(LOC, LNB) 1
STLB	1	1	0.79	1	0.79

★ Heel, paragraph 8-9-5 (6):

Location code for "first" location at end of base
 $= BL + 1.9999$, discard decimal
 $= 11.5 + 1.999 = 13.499 \rightarrow 13$

list name	LOC	LNA	ASTLBT(LOC, LNA) 1	LN	ASTLBB(LOC, LNB) 1
STLB	13	1	0.79	1	0.79

(Note paragraph 8-9-6 a.)

Concrete Analysis Parameters, paragraph 8-10:

The default values are all acceptable, so these lists (CND, CNWD, STL0) are not needed.

Automatic Alternate Load Cases, paragraph 9-1:

"Do not use this" = zero for IFEM in data list CND; may be put in with list

list name	RATION E_s/E_c	FPCON $f'_{c,psi}$	ESTL psi	IFEM 0 or 1
CND	D	D	D	0

or interactively in Module WA -- do this way.

Data Finished -- Put into data file form:

INIT (new problem)
1 (1 load case)
R (retaining wall)
H (hydraulic structure)

NAME EXAMPLE 2 -- BASIC RET WALL DESIGN

Selection of data lists, paragraphs 3-2 and 8-1 through 8-1-3

Module FD for foundation design:

1. SSNC SST SPE3 WLD WLUB WLUT required
2. NAME SSEE... WLDK optional.

Preparation of Data Lists, paragraphs 8-3-8-11Soil Surfaces (data lists beginning with letter "SS")* Finished Grade over Heel, paragraph 8-3-1 a

list name	LC	ESHW feet	HSS
SSHC	0	150.0	100.0

* Finished Grade over Toe, paragraph 8-3-1 b

list name	LC	ESTW	SST
SST	0	142.0	100.0

* Existing Grade, paragraph 8-3-2 (list SSEE)

$$EXW = 2.0 \text{ ft.}$$

$$ESS = 0.5 \text{ ft horizontal per foot vertical (1H=2V)}$$

$$HSSST = 100.0 \text{ (level) on toe-side (D ok)}$$

$$ELTSSST = 142.0 \text{ 'elev. on toe-side (D ok)}$$

$$DTSSST = 10' = \text{immaterial on level surface}$$

$$ELTSSW = 142.0 \text{ under basic working point}$$

$$ELTSSH = 150.0 \text{ elev at DTSSH from basic working point}$$

$$DTSSH = 10.0 \text{ feet from basic working point to ELTSSH}$$

$$HSSSH = 100.0 = \text{level beyond DTSSH}$$

$$SSEE \quad 2.0 \quad 0.5 \quad 100.0 \quad 142.0 \quad 10.0 \quad 142.0 \quad 150.0 \quad 10.0 \quad 100.0$$

Soil Properties (data lists beginning with the letters "SP"):* Existing soil, paragraph 8-4-1:

list name	PHI3 °	COH3 psf	GAMASS pcf	PHI53 ° sliding	ADH53 adhesion psf
SPE3	20.0	0	120.0	20.0	0

ABP3TN @ surface BW = BW1	ABP3BN @ el. 130 BW = BW1	ABP3TW @ surface BW = BW2	ABP3BW @ el. 130 - BW = BW2	ELBS3
2500.0	4000.0	2500.0	4000.0	130.0

* Heel Backfill, paragraph 8-4-2 a:

This list is needed because ϕ , c , and γ are different from SPE3

list name	LC	PHI	COH1 psf	GAMASI pcf	RRAI coulomb	DELTA1 S	RRAE1 coulomb gamma	HCMIN
SPH1	0	30.0	0.0	125.0	C	0.0	C	D

Toe Backfill, paragraph 8-4-2 b:

This list is not needed because the properties are the same as in list SPE3.

Foundation Design Parameters

With no earthquake and not-arching active, data list SOLP is not needed.

Data list RRD is not needed because the default value of $1/3$ ($ETS-ELWN > 1.05'$) is acceptable for retaining wall.

Water, paragraph 8-6

* Seepage, paragraph 8-6-1:

data list name	LC	ELWT over toe feet	ELWN over heel feet	HGSW, ISLC, ISFT, KRACK are to be the default values, so stop list here
SEEP	0	142.0	142.0	

* Boil control is not applicable with $ELWT = ELWN$ so do not use list BOIL.

Surcharges, paragraph 8-7

Distributed surcharge over heel, so use list SCWV in paragraph 8-7-2: See also Figure 8-3.

list name	LC	WT psf	WWT feet	DLWT feet	WH psf	WWH feet	DLWH feet
SCWV	0	0.0	0.0	0.0	200.0	100.0	2.0

Wall Geometry Data, paragraph 8-8:

1. Use data lists with names beginning with WLD, standing for "Wall Design"; WLD, WLDB, WLDT are required.
2. Omit list WLCH because TMINB is acceptable for NOCUT2.
3. Omit list WLCK because there is no key.
4. Use list WLDS because TMINB is to be held at 12" when (ETS - BTET) goes over 15' as BTET goes from BTET11 to BTET12.

list name	ETS feet	TW2 feet	STR	HGELW feet	TSTD inches	TMINB inches
WLD	152.5	C	0.333	C	C	18.0

list name	BW1 feet	BW2 feet	BS1	BSE
WLDB	5.0	15.0	0.0	0.0

to be calculated for strength

list name	TMINB inches	TSB in/ft	HSTPN feet	HSTPB in/ft	HSPB in/ft
WLDS	12.0	0.0	0.0	0.0	C

list name	BTET11 feet	BTET12 feet	TOCHT inches	TWI feet
WLDT	133.5	138.5	D	0.0

BTET12 will probably control, with the level base and no key.

default to TMINB

(142.0 - 2 min. cover - 1.5' rebar)

Selected to be below lowest probable most economical embedment

Reinforcing Steel Design, paragraphs 8-9, 8-9-1, 8-10

Data list COVR is not needed because all of the default values are acceptable. Note paragraph 8-9-5b.

Concrete Design Parameters, paragraph 8-10

- * Data list CND is needed, to set IFBM to 0 to get design for exact load case only:

list name	RATION E_s/E_c	FPCON psi	CSTL psi	IFBM
CND	C	D	D	0

- * Use data list CNWD to use IFDR=0 to get design for exact loadings only:

list name	RATIO F_c/F_k	FYSTL psi	FSTLMX psi	IBSAME	IFDR
CNWD	D	D	D	0	0

- * Data list STLD is not needed, since the default values are all acceptable.

Cost Data, paragraph 8-11:

- * Backfill @ \$6.00 / CY = \$0.22222 / CF

list name	unit costs, \$ / CF				
	filter zone	layer 1	layer 2	layer 6	layer 7
CSTB	0.0	0.22222	0.0	0.0	0.22222

- * Concrete @ \$120 / CY in stem and \$90 / CY in slab

list name	unit costs, \$ / CF		
	base slab	stem	key
CSTC	3.33333	4.44444	0.0

- * Structural Excavation @ \$3.50 / CY

list name	unit costs, \$ / CF		
	layer 3	layer 4	layer 5
CSTE	0.12963	0.0	0.0

DATA PREPARATIONStarting Resumes, paragraphs 7-2 and 7-3 a

INIT (new problem)

2 (2 load cases)

F (Floodwall default values selected)

H (hydraulic structure default values selected)

NAME EXAMPLE 3 -- BASIC FLOOD WALL ANALYSIS

Selection of Data Lists, paragraphs 3-2 and 8-1 thru 8-1-3

Module FA for foundation analysis

Module WA for stress analysis

Preparation of Data Lists, paragraphs 8-3 - 8-11 =Soil Surfaces (data lists beginning with the letters "SS"):

★ Finished grade over the heel, paragraph 8-3-1 a

list name	LC	ESTW Feet	SST
SSHG	0	50.0	100.0

level ground

0 = "all load cases"

★ Finished grade over the toe, paragraph 8-3-1 b

list name	LC	ESTW	SST
SST	0	50.0	100.0

Finished grade of existing soil is not applicable to analysis,
so data list SSG is not needed.

Soil Properties (data lists beginning with the letters "SP"):

★ Subgrade data list SPE3, paragraph 8-4-1:

list name	PHI3 ϕ	CON3 C, psi	SAMAS3 γ_s , pcf	PHIS3 $\phi_{s, lim}$	ADMS3 settling adhesion, psi
SPE3	15.0	400.0	125.0	15.0	400.0

truncate
the list
here
since
allowable
bearing
pressures
are not
shown

Data lists SPH1 and SPT7 are not needed
because the backfill soils data are the same
as for the subgrade soil and the following
default values are valid (paragraph 8-4-2 a):

RKA1 is to be calculated

DELTA1 is zero

RKAE1 is zero

HCMIN is immaterial for analysis.

Foundation Design parameters

Data list SOLP paragraph 8-5-1, is not needed
because all of the default values are acceptable.

Data list RRD, paragraph 8-5-2, is not needed
for analysis.

Water

★ Data list SEEP, paragraph 8-6-1:

list name	LC	ELWT feet	ELWH feet
SEEP	1	50.0	65.0
SEEP	2	50.0	62.0

truncate the
list here since
"C" is valid
for the rest
of the values
in the list.

Data list BOIL is not needed because there are
no data for shear pile cutoff criteria.

Surcharge data lists are not needed (paragraph 8-7-1)

Wall geometry data for analysis, paragraph 8-8-3a
(Data lists beginning with the letters "WLA"):

<u>list name</u>	<u>ETS feet</u>	<u>TW2 feet</u>	<u>STR</u>	<u>HEELW feet</u>
★ WLA	65.0	8.25	C	C
<u>list name</u>	<u>BUV feet</u>	<u>BUV1 for ABP3TN</u>	<u>BUV2 for ABP3TW</u>	<u>BS</u>
★ WLAB	25.0	24.0	26.0	0.0
<u>list name</u>	<u>HEELT2 inches</u>	<u>HEELW feet</u>	<u>HEELT1 inches</u>	
★ WLAH	18.0	C	21.0	

WLAK is not needed because there is no key

<u>list name</u>	<u>TSTT inches</u>	<u>TSD in/ft</u>	<u>TSTB inches</u>	<u>HSTPN feet</u>	<u>HSTPB in/A</u>	<u>HSBPB in/S</u>
★ WLAS	18.0	0.0	30.0	0.0	0.0	C

<u>list name</u>	<u>BTE1 feet</u>	<u>TOENT inches</u>	<u>TS2</u>	<u>TW1 feet</u>	<u>TS1</u>
★ WLAT	43.0	18.0	24.0	0.0	100.0

WLBR is not needed since the wall alignment is straight

-- data complete for module FA --

Reinforcing Steel data, paragraph 8-9:

Data list COVR is not needed because the default values in paragraph 8-9-1 are acceptable.

* Stem, paragraph 8-9-3

$$\text{at top (LOC=1): } ASTLST(1) = 5@12 = 0.31 \text{ in./ft.}$$

$$ASTLSH(1,1) = 6@12 = 0.44 \text{ in./ft.}$$

$$\text{at El. 55 (LOC=11): } ASTLST(11) = 6@12 = 0.44 \text{ in./ft.}$$

$$ASTLSH(11,1) = 9@12 = 1.00 \text{ in./ft.}$$

$$\text{at El. 51 (LOC=15): } ASTLST(15) = \text{same as above}$$

$$ASTLSH(15,1) = 9@6 = 2.00 \text{ in./ft.}$$

at El. 46 = top of base, steel is same as above

list name	LOC	ASTLST(LOC) in./ft.	LN	ASTLSH(LOC, LN) in./ft.
STLS	1	0.31	1	0.44
STLS	11	0.44	1	1.00
STLS	15	(5 or 0.44)	1	2.00

* Toe, paragraph 8-9-5 (2)

$$\text{at outer end (LOC=1): } ASTLBT(1,1) = 6@12 = 0.44 \text{ in./ft.}$$

$$ASTLBB(1,1) = 9@12 = 1.00 \text{ in./ft.}$$

$$5' \text{ from outer end (LOC=6): } ASTLBT(6,1) = \text{same}$$

$$ASTLBB(6,1) = 9@6 = 2.00 \text{ in./ft.}$$

@ 8' from outer end, steel is same as at 5' from outer end.

list name	LOC	LNA	ASTLBT(LOC, LNA) sq in./ft.	LNB	ASTLBB(LOC, LNB) sq in./ft.
STLB	1	1	0.44	1	1.00
STLB	6	1	(5 or 0.44)	1	2.00

★ Heel, paragraph 8-9-5 (6)

LOC value at outer end:

$$BW + 1.9999 = 25.0 + 1.9999 = 26.9999$$

4 decimals

LOC = 26 @ end

@ outer end (LOC = 26): $ASTLBT(1,1) = *7@12 = 0.6 \text{ @ } 1$

$ASTLBB(1,1) = *6@12 = 0.44 \text{ @ } 1$

10' from outer end (LOC = 16): $ASTLBT(1,1) = *7@6 = 1.20 \text{ @ } 1$

$ASTLBB(1,1) = \text{same as at end}$

Steel at stem is same as at LOC = 16

list name	LOC	LNA	ASTLBT(LOC,LNA) sq in / ft	LNB	ASTLBB(LOC,LNB) sq in / ft
STLB	26	1	0.60	1	0.44
STLB	16	1	1.20	1	(5 or 0.44)

Concrete analysis parameters, paragraph 8-10

Data lists CND and CNWD are not needed because all of the default values are acceptable.

Data list STLO is not applicable to analysis.

Cost data, paragraph 8-11

Not needed because there is no boundary defined between existing and backfill soil systems and because no cost data are given.

DATA READY -- BUILD DATA FILE

DATA PREPARATION

Convert the analysis problem in example 3 into design

Starting response, paragraph 7-3c

REST EX3UPD

NAME EXAMPLE 4 -- BASIC FLOOD WALL DESIGN

PREPARATION OF DATA LISTS, paragraph 8-1

Soil Surfaces (data lists beginning with the letters "SS")

Finished grade, heel and toe = same as Example 3, no change

Existing grade, paragraph 8-3-2 = no change

Soil Properties (data lists beginning with letters "SP")

Same as analysis example 3 = no changes for backfill

Data list SPE3 must be used again, to enter the allowable bearing pressures that were omitted in Example 3

★ Existing soil, paragraph 8-4-1

list name	PHI3 φ	CON3 pcf	GAMAS3 γ _s , pcf	PHES3 φ _{shling}	ADHS3 adhesion pcf
SPE3	S	S	S	S	S

these items do not change, so the identifier "S" is illustrated (see paragraph 5-3-2)

ABP3TN	ABP3BN	ABP3TW	ABP3BW	BLBS3
@ surface for BW1	@ BLBS3 for BW1	@ surface for BW2	@ BLBS3 for BW2	feet
pcf	pcf	pcf	pcf	
1500.0	1820.0	2500.0	2820.0	38.0

Foundation Design Parameters, paragraph 8-5

With no earthquake and no arching active earth, data list SOCP (paragraph 8-5-1) is not needed.

Data list RKD (paragraph 8-5-2) is not needed because the default values of $1/4$ for load case 1 (water within 1.05 ft. of top of wall) and $1/3$ for load case 2 (water more than 1.05 ft. below top of wall) are acceptable.

Water, paragraph 8-6

no change, so data list WEF is not needed.

Surcharge, paragraph 8-7

none, so omit this list.

Wall geometry, paragraph 8-8:

The data for analysis must be converted to data for design. The main concern in doing this is to make that one dimension desired to vary determine the data format is so specified. The fastest way for the beginning user is to cancel all geometry data not used. Study of paragraph 8-8-3 shows that these data lists are needed to cancel all analysis geometry data not to be entered for design: WLAB, WLAM, WLAK (if there is a key), WLAS, and WLAT.

★ WLAB C C C C
 ★ WLAM C C C
 ★ WLAS C C C C C C
 ★ WLAT C C C C C

Note that only one "C" is actually needed because of the reason described in paragraph 5-7.

New add lists beginning with "WLD" to define design geometry:

1. Data list WLDH may be omitted because TMENB is acceptable for HEELW (see paragraph 8-8-2 b)
2. With no key, data list WLOR may be omitted.
3. Data list WLDS may be omitted because TRINS is acceptable for TSTT with beam over 15'.

list name	ETS feet	TWZ feet	STR	HEELW feet	TSTB inches	TMENB inches
*WLD	65.0	C	0.333	C	C	D

to be calculated for strength

the list may be truncated here because the remaining values are identifiers "C" or "D"

list name	BW1 feet	BW2 feet	BS1	BS2
*WLDB	15.0	30.0	0.0	0.0

list name	BTE11 feet	BTE12 feet	TOLNT inches	TW1 feet
*WLDT	39.0	43.0	D	0.0

default = TMENB, which itself defaults to 18" with data list WLDH omitted.

Reinforcing Steel data - read the first sentence in paragraph 8-9

Concrete Design Parameters paragraph 8-10

Data list CND will be used to keep the design to the data as inputted only (I_{PC}M = 0).

Data list CNWD will be used to keep the design based on full dead + live loads only (I_{PC}DR = 0)

All other values in data lists CND and CNWD may use their default values.

Data list STLD is not needed because its default values are acceptable.

list name	RATIO $\alpha E_s/E_c$	I-PCON f'_c, psi	ESTL E_s, psi	I/2CM	
* CND	D	D	D	D	

list name	RATIO F_c/f'_c	FYSTL F_y, psi	FSTLMX $F_{s, \text{max}}, \text{psi}$	I/2SANE	I/2DR
* CNWD	D	D	D	D	D

Cost Data, paragraph 8-11 (data lists beginning "CST...")

Excavation and backfill costs are not given, so data lists CSTB and CSTE are not applicable and should be omitted.

Data list CSTC is needed, to enter values for

Stem concrete @ \$120/cy = 84.444 /CF

Slab concrete @ \$90/cy = 33.333 /CF

list name	base slab \$/CF	stem \$/CF	key \$/CF
* CSTC	3.3333	4.4444	0.0

ENTER DATA INTERACTIVELY

Note that the data could have been put in a data file, as described in paragraphs 6-11 b and 7-3 a.

BASIC USER'S GUIDE: COMPUTER PROGRAM FOR DESIGN
AND ANALYSIS OF INVERTED-T RETAINING
WALLS AND FLOODWALLS (CTWDA)

CHAPTER 1: INTRODUCTION

1-1 PURPOSE OF PROGRAM CTWDA AND THIS BASIC USER'S GUIDE

1-1-1 CTWDA is a computer-aided structural design system for analysis and/or design of inverted-T cantilever walls founded on earth or rock. Multiple load cases allow the wall to act as a floodwall or a retaining wall.

1-1-2 This user's guide describes basic capabilities of CTWDA. Users are referred to the User's Reference Manual* for a complete description of capabilities and interpretation of the output.

1-2 SCOPE. Chapters 2 through 6, 10 and 11, constitute the basic instructions. Once the user has become familiar with these chapters, Chapters 7 through 9 serve as a step-by-step data preparation checklist. Chapter 12 is furnished as a data reminder list that can be used as a quick reference for coding. Chapter 13 describes the use of the graphics display capabilities. Chapter 14 presents examples of how the program can be used.

1-3 ACCESSING THE PROGRAM

1-3-1 On the computers at WES or Macon, use the command

*FRN WESLIB/CORPS/X0053

1-3-2 For use on the Boeing EKS1 system, see Appendix A.

* Price, W. A. et al. 1980. "User's Reference Manual: Computer Program for Design and Analysis of Inverted-T Retaining Walls and Floodwalls (TWDA)" Instruction Report K-80-7, U. S. Army Engineer Waterways Experiment Station, Vicksburg, Miss.

CHAPTER 2: DESCRIPTION OF BASIC PROGRAM CAPABILITIES

2-1 GENERAL. CTWDA uses a problem-oriented command language with data grouped into named lists that may be entered in any order convenient to the user. Data and most commands may be entered interactively or via data file. Program output includes graphic display of data and results. See the documentation of the program criteria specifications* for details on structural criteria used in CTWDA.

2-1-1 Unit Slice. Stability and stress analysis and design are for a unit slice of straight wall 1 ft long.**

2-1-2 Basic Command Language. The basic command language enables the user to control:

- a. Type of program start: INIT or RESTore. INIT = fresh start with all new data. REST = restart from old update file.
- b. Starting a computation procedure ("module") after the required data have been entered.
- c. Review and editing of data already entered using the LOOK command.
- d. Resetting (updating) the update file for future use of the REST command.
- e. End of a program run.
- f. Requests for information about a data item or what data items are required for a given computation module.

2-1-3 Load Cases. Up to 10 load cases may be entered in each program run. Data may be designated to be for all load cases or for any 1 load case.

2-2 ACTIVE EARTH PRESSURES. The active earth pressures for basic use of the program are calculated according to Coulomb's equation for active earth pressure, as described in Engineer Manual 1110-2-2502.†

2-2-1 Basic use of CTWDA to determine floodwall stability assumes a vertical crack in the earth cover at the end of the heel, precluding use of active pressures but allowing the consideration of additional,

* Copies of the documentation are available from the U. S. Army Engineer Division, Lower Mississippi Valley, Vicksburg, Miss.

** A table of factors for converting inch-pound units of measurement to metric (SI) units is presented on page vii.

† Headquarters, Department of the Army. 1961. "Retaining Walls," with Change 3, 25 Jan 1965, Washington, D. C.

optional external applied water pressure in the vertical crack due to wave force base pressures.

2-2-2 Basic use of CTWDA to determine retaining wall stability assumes active earth pressures at the end of the heel with no crack in the earth cover.

2-2-3 TWDA calculates active earth pressures on the stem for use in stress analysis/design.

2-3 PASSIVE EARTH PRESSURES FOR SLIDING. Passive earth pressures for sliding calculations are from Coulomb's equation, as described in EM 1110-2-2502.

2-4 HORIZONTAL EARTH RESISTANCE FOR OVERTURNING. Horizontal earth resistance for overturning calculations depends on several factors:

2-4-1 With a key, the net horizontal unbalanced force is resisted by passive pressure distributed as shown below:

Because the wall is independently checked against sliding, there is no arbitrary limit applied to the passive pressure calculated in the overturning calculations. See the User's Reference Manual for more detailed information.

2-4-2 Without a key, the net horizontal unbalanced force is resisted by friction on the base, up to a value of

$$N \tan \phi + cA$$

where

- N = resultant force normal to the base slab
- ϕ = angle of sliding friction between the slab and the subgrade
- c = adhesion between the slab and the subgrade, psi
- A = base area in contact with the subgrade

Above this limit, the excess force is resisted by passive pressure as for a key.

2-5 SLIDING CALCULATIONS. Sliding calculations in the basic use of the program depend on the status of the key. Three conditions can be handled:

- a. No key.
- b. Key under the stem.
- c. Key under the end of the heel.

See Chapter 10 of this user's guide and Chapter 4 of LMVD's documentation of the program specifications for more information on sliding computations.

2-5-1 Sliding for retaining walls is calculated according to Engineer Technical Letter 1110-2-184* using the shear-friction concept of the safety factor being the ratio of resisting capability to driving forces. All seepage pressures are considered as a driving force. The minimum allowable safety factor in design (module FD) is 2.0, which can be changed (see the User's Reference Manual).

2-5-2 Sliding for floodwalls is calculated according to the allowable soil strength procedures described in EM 1110-2-2501** using the multiple-plane failure surface shown in the diagram in Chapter 10. The allowable strengths are calculated according to

$$\tan \phi' = \frac{\tan \phi}{FS}$$

and

$$c' = \frac{c}{FS + 2c'}$$

where

- ϕ = angle of internal friction in soil from tests
- ϕ' = allowable angle of internal friction at equilibrium
- c = test cohesive strength, tsf
- c' = allowable cohesive strength, tsf
- FS = trial factor of safety

FS is varied until a value is found to make the driving and resisting forces equal. The minimum allowable safety factor in design (Module FD)

* Headquarters, Department of the Army. "Gravity Dam Design--Stability," Washington, D. C.

** . 1948. "Flood Walls," with Change 3, 25 Jan 1965, Washington, D. C.

is 1.5, which can be changed (see the User's Reference Manual).

2-6 UPLIFT. Uplift is calculated by the line of creep method described in EM 1110-2-2501. Different creep path descriptions are used for the three purposes described below. Other methods are available (see the User's Reference Manual).

2-6-1 Overturning calculations are exactly as shown in EM 1110-2-2501. When the vertical resultant force lies outside the kern (resultant ratio less than one third or more than two thirds), only the effective portion of the base width (the portion in bearing contact) is included in the creep path and in sliding adhesion strength. The toe-side face of the key is always included in the creep path unless ISFT = -1 in data list SEEP, in which case the toe-side face of the key is not included in the creep path when the bottom of the key is not in earth bearing contact. Basic use of the program assumes that floodwalls have a vertical crack in the earth cover at the end of the heel and that retaining walls do not. See LMVD's documentation of the program specifications for illustration.

2-6-2 Sliding calculations of creep pressures are similar to those for overturning except that the creep path follows the failure surface under the neutral block. This is along the concrete-subgrade interface only when there is no key and the maximum possible angle OMEGA is being considered (see the sliding discussion in Chapter 10).

2-6-3 Boil control creep ratio calculations in the basic use of the program use a creep path similar to that used for overturning. See paragraph 3-3-3 of the User's Reference Manual for more information on boil control capabilities. Basic use of the program reports the actual creep ratio but does not control it. For additional information, see the User's Reference Manual.

2-7 LOCATION OF VERTICAL RESULTANT FORCE. The vertical resultant force location is controlled during overturning stability design so that it is kept within the middle third (minimum resultant ratio = $1/3$) for load cases when the water level over the heel is more than 1.05 ft below the toe of stem and within the middle half (minimum resultant ratio = $1/4$) for load cases where the water level over the heel is within 1.0 ft of the top of the stem.

2-8 GRAPHICS OUTPUT. Graphics output includes input data, resulting pressures, and member forces and moments. See Chapter 13 for details.

2-9 EARTHQUAKE EFFECTS. Earthquake effects are included in the calculations in CTWDA but are beyond the scope of this user's manual. See the User's Reference Manual and LMVD's documentation of the program specifications for more information.

CHAPTER 3: PROGRAM ORIENTATION

3-1 GENERAL. When the user starts program CTWDA running, it is in the command-data entry phase. After an initialization sequence of questions and answers, the program will accept either commands or data lists when the prompting message

COMMAND
?

is printed at the time-sharing terminal. When enough data lists have been entered to define the data required for a particular computation module, the command

RUN Module-Name

may be entered, to start the named module running. The data lists may be entered in any order so long as the items in each list are in the order prescribed for that list.

3-2 OPTIONS. There are four computation modules available in the basic use of the program:

<u>Group</u>	<u>Module-Name</u>	<u>Action</u>
Stability	FA	Foundation investigation
	FD	Foundation design
Stress	WA	Stress analysis
	WD	Stress design

In the basic use of the program, either module FA or module FD must have been completed with the message

UPDATE FILE RESET
#

before modules WA or WD will run.

3-3 PROGRAM FILES. Basic use of the program includes the three different types of computer files defined below:

3-3-1 Update File. The update file must be new for each new program run. The name entered for this file must not already be in use. This file contains the execution status (data and intermediate information) of the program as of the last time the message

UPDATE FILE RESET

was printed at the user's time-sharing terminal. The file may be used only for future use with the REST command to restart after a program termination. It cannot be listed in time-sharing and can be created only by CTWDA.

3-3-2 Data File. A data file contains data lists and commands that were typed and saved into a file instead of being entered interactively. It is created by the user before starting TWDA. This file is used as input only and is not updated or changed by the program. Its use is described in detail in Chapter 6.

3-3-3 Report File. The program creates a temporary report file that the complete output is written to (only a summary output is printed to the time-sharing terminal). When the user uses the END command to stop the program, he is given the options of directing the report file to a high-speed batch terminal, saving the file as a permanent file, or destroying the file. The user must be ready with a station code if he is running on the U. S. Army Engineer Waterways Experiment Station (WES) or Office of Personnel Management, Macon, Ga., (Macon), computers. The station code is obtained from the user's ADP Center. A saved permanent report file may not be used with the REST command or as a data file. All the user can do with it is list it at a terminal. See paragraph 4-7 for instructions on how to control the amount of information written to the report file.

ELTS5W = elevation of existing ground under basic working point

ELTS5H = elevation of existing surface at a distance DTS5H on the heel side from the BWP, feet. Default = same as ELTS5W

DTS5H = horizontal distance from the BWP to ELTS5H, feet.
Default = 0.0

HSS5H = existing surface slope beyond distance DTS5H, heel side, feet horizontal per foot vertical, 100.0 = level. Positive upward leaving the stem. Default = 100.0

8-4 SOIL PROPERTIES. Data Lists beginning with SP:

8-4-1 Required Data List SPE3 (Soil Properties of Existing Soil). This data list is not load case dependent. It defines the subgrade soil plus backfill earth if not separately defined and modules FA and FD have not been run.

SPE3 PHI3 COH3 GAMAS3 PHIS3 ADHS3 ABP3TN ABP3BN ABP3TW ABP3BW ELBS3

SPE3 = name of list

PHI3 = angle of internal friction, degrees. No default value.

COH3 = cohesive strength, psf. No default value.

GAMAS3 = unit weight, including weight of water if submerged, pcf.
No default value

PHIS3 = maximum angle of friction along soil-concrete interface for sliding on subgrade, degrees

ADHS3 = adhesive strength along soil-concrete interface for sliding, psf

(NOTE: The rest of this list may be omitted if bearing pressure is not to be checked.)

ABP3TN = allowable bearing pressure under a wall with base width = BW1 (narrow base) as defined in paragraph 8-8-4, psf, at the top of this soil (no overburden). No default value

ABP3BN = allowable bearing pressure under a wall with base width = BW1 (narrow base), psf, at the bottom of existing soil, including weight of overburden. (At elevation ELBS3.)
No default value

ABP3TW = allowable bearing pressure under a wall with base width = BW2 (wide base), psf, at the top of this soil. No default value

ABP3BW = allowable bearing pressure under a wall with base width = BW2 (wide base), psf, at the bottom of existing soil, including weight of overburden. (At elevation ELBS3.)
No default value

ELBS3 = elevation of bottom of soil layer 3, feet. Basis for ABP3BN and ABP3BW. Default = 10 ft below the lowest concrete elevation

8-4-2 Optional Data Lists:

a. Data list SPH1 (soil properties of heel backfill, layer number 1). This list is not needed for a particular load case if the following conditions are true for that load case:

- (1) The basic properties of internal friction angle, cohesion, and saturated earth unit weight are the same for the heel backfill as for the subgrade data list SPE3.
- (2) The user is willing to use the default values shown below for data variables RKAL, DELTA1, PKAE1, and HCMIN:

<u>Data Variable</u>	<u>Units</u>	<u>Default Value</u>
RKAL	ratio	C (see paragraph 8-3-3)
DELTA1	degrees	0.0
PKAE1	ratio	C
HCMIN	feet	$3 + 0.1[(TS - ESHW LC)] \leq 5.0$

- (3) Modules FA and FD have not yet been run.

The default values listed below are applicable when SPH1 is used for a particular load case or all load cases:

SPH1 LC PH11 COH1 GAMAS1 RKAL DELTA1 PKAE1 HCMIN

SPH1 = name of list

LC = load case number for this set of values

PH11 = angle of internal friction, degrees. Default = 0.0

COH1 = cohesive strength, psf. Default = 0.0

GAMAS1 = unit weight, including weight of water if submerged, pcf. No default value

(NOTE: The list may be truncated here.)

RKAL = horizontal active earth pressure coefficient. Will be used instead of Coulomb calculations based on PH11, DELTA1, and stem face batter, if defined. Use of the letter C as the value will cause it to be calculated. Default = C

DELTA1 = wall friction angle for Coulomb's equation for active earth pressure coefficient, degrees. See RKAL above. Default = 0.0.

RKAE1 = Mononobe-Okabe earthquake active earth added pressure coefficient. Will be calculated from RKH and RKV in data list SOLP if the letter C is used as a value for RKAE1

HCMIN = minimum earth backfill cover over the end of the heel, feet. Used only by module FD. Default = $3 + 0.1[ETS - ESHW(LC)] \geq 5.0$. This is the only data variable in this list that is not load case dependent.

- b. Data list SPT7 (soil properties of toe backfill, layer number 7). This list is not needed for a particular load case if the data for internal friction angle (PHI3), cohesion (COH3), and saturated unit weight (GAMAS3) of data list SPE3 are also valid for the toe earth backfill, for that load case, and if modules FA and FD have not yet been run. The default values listed below are applicable when SPT7 is used for a particular load case or all load cases:

SPT7 LC PHI7 COH7 GAMAS7

SPT7 = name of list

LC = load case number for this set of values

PHI7 = angle of internal friction, degrees. Default = 0.0

COH7 = cohesive strength, psf. Default = 0.0

GAMAS7 = unit weight, including weight of water if submerged, pcf. No default value

8-5 FOUNDATION DESIGN PARAMETERS

8-5-1 Optional Data List SOLP (Soils Design Parameters). This list contains the major stability design/analysis control parameters. It is described in detail in the User's Reference Manual and is not needed for basic use of the program. The summary definitions in this user's manual are included only to show the possible versatility of the program. Chapter 2 describes the programmed action when data list SOLP is not used:

SOLP LC IFWOC NODE IFSOM NPPD RKH RKV CFMA

SOLP = name of list: soil design parameters

LC = load case number for this set of values

IFWOC = wedge method or Coulomb's method for active earth pressures

NODE = how many nodes are used to specify active earth pressures

IFSOM = wedge method control parameter

NPPD = passive pressure diagram shape control for overturning calculations

RKH = earthquake horizontal acceleration factor

RKV = earthquake vertical acceleration factor

CFMA = correction factor for active earth pressure moment arm,
to include arching active

8-5-2 Optional Data List RRD (Used in Module FD Only). This list controls the limits placed on resultant vertical reaction force location in the foundation stability design calculations. It is described in detail in the User's Reference Manual and is not needed for basic use of the program. The summary definitions shown in this user's manual are included only to show the possible versatility of the program. Paragraph 2-7 describes the programmed action when data list RRD is not used:

RRD LC RRMIN

RRD = list name: resultant ratio for design

LC = load case number for this value of RRMIN

RRMIN = minimum allowable resultant ratio for stability design

8-6 WATER. Both of these lists are optional, so go on to paragraph 8-7 if there is no groundwater or pool.

8-6-1 Required Data List SEEP. The first three variables in data list SEEP define water elevations; most of the other data variables in this list are beyond the scope of this basic user's guide. Only the names of the variables are shown herein. See the User's Reference Manual for information on these variables concerning alternate methods for determining seepage pressures:

SEEP LC ELWT ELWH HGSW ISLC ISFT KRACK

SEEP = list name

LC = load case number for this set of values

ELWT = elevation of water on the toe side of the stem, feet.
Default = C for "no water"

ELWH = elevation of water on the heel side of the stem, feet.
Default = C for "no water"

(NOTE: The list may be truncated here.)

HGSW = use a value of C

ISLC = use a value of C

ISFT = use a value of C (for line of creep method). See para. 2-6-1.

KRACK = use a value of C. The programmed action is described in Chapter 2

8-6-2 Optional Data List BOIL. This controls calculation of the boil control creep ratio. The list is described in detail in the

8-8-4 Data Item Descriptions. (See Figure 8-4.) Wall parts are listed in the approximate order that they are used in the program:

Variable Name	Units	Default Value	Definition
<u>Stem Description</u>			
TSTT	in.	TMINS	Stem thickness at top. See note 11
ETS	ft	(1)	Elevation of top of stem
TSB	in./ft	0.0	Toe-side batter, inches horizontal per foot vertical
TSTB	in.	(10)	Stem thickness at base. See note 11
TMINS	in.	(3)	Minimum allowable stem thickness. See paragraph 8-8-2b(2)
HSTPH	ft	(2)	Heel-side top panel height. Should be 0.0 if no top panel. See note 13
HSTPB	in./ft	0.0	Heel-side top panel batter, inches horizontal per foot vertical. See note 13
HSBPB	in./ft	(3)	Heel-side bottom panel batter, inches horizontal per foot vertical. There must be a bottom stem thickness at base (horizontal projection). See notes 10 and 13
<u>Toe Description</u>			
TW1	ft	0.0	Width of part 1 of toe (at stem)
TS1	ratio	100.0	Slope of top of part 1 of toe, 1.0 vertical to TS1 horizontal, 100.0 = level. Must always be positive
TW2	ft	(4)	Width of entire toe. See note 10
TS2	ratio	100.0	Slope of top of part 2 of toe (at end), 1.0 vertical to TS2 horizontal, 100.0 = horizontal. Must always be positive
TOEHT	in.	TMINB	Toe thickness at end. Always vertical. See note 12
BTE1	ft	(1)	Elevation of bottom of toe at end
BTE11	ft	(1)	Lowest value of BTE1 in module FD
BTE12	ft	(5)	Highest value of BTE1 in module FD
STR	ratio	None	Stem ratio (Design value for TW2/BW)

(Continued)

8-8-4 Data Item Descriptions (Continued):

Variable Name	Units	Default Value	Definition
Base Bottom Description (The values of TW2 (or STR) and BW must be such that at least one point at the toe-side face of the stem or inside the stem is an integer number of feet from the end of the toe.)			
BW	ft	(6)	Base width (horizontal projection). See note 10
BW1	ft	(1)	Minimum value for BW in module FD. Also needed for allowable bearing pressure interpolation in modules FA and FD
BW2	ft	(1)	Maximum value for BW in module FD. Also needed for allowable bearing pressure interpolation in modules FA and FD. Must be larger than BW1
BS	ratio	0.0	Base bottom side slope, BS vertical to 1.0 horizontal, 0.0 = level
BS1	ratio	0.0	Minimum value for BS in module FD
BS2	ratio	0.3333	Maximum value for BS in module FD
BASER	ft	0.0	Base horizontal radius defining trapezoidal plan, measured from basic working point, positive over heel. Base is always 1.0 foot wide under the basic working point. 0.0 = rectangular (infinite radius)
TMINB	in.	(3)	Minimum allowable base slab thickness. See paragraph 8-8-2b(2)
<u>Key Description</u>			
KFLAG	0 or 1	1	0 if key is at end of heel; 1 if key is under stem
DKEY	ft	0.0	Key length, measured vertically along heel side
DKEY1	ft	0.0	Minimum value for DKEY in module FD
DKEY2	ft	(7)	Maximum value for DKEY in module FD
BKTF	ratio	3.0	Toe-side face batter, 1.0 horizontal to B'TF vertical
WKEY	in.	TMINB	Width (thickness) at bottom of key. See note 12

(Continued)

8-8-4 Data Item Descriptions (Concluded):

Variable Name	Units	Default Value	Definition
<u>Heel Description</u>			
HEELT1	in.	(8)	Thickness at stem. See note 12
HEELT2	in.	TMINB	Thickness at end, not including any key. May not be greater than HEELT1
HEELW	ft	(9)	Width (horizontal projection). See note 10

- NOTES:
- (1) Required data item with no default value or default calculation procedure.
 - (2) Will be calculated to be as large as possible. See Figures 8-4 and 8-5.
 - (3) Calculated by program.
 - (4) See paragraph 3-6-2a(1) of the User's Reference Manual.
 - (5) Note (1); must be below top of soil layer 7 as defined by data list SST.
 - (6) Three fifths of ETS-BTF1 or, as determined by module FD, between BW1 and BW2.
 - (7) Default value for floodwall is 0.8 of ETS-BTF1 if KFLAG is defined or 0.0 if KFLAG is not defined; default value for retaining walls is zero.
 - (8) Default values
 - a. TMINB
 - b. Top of heel must not slope down toward the stem.
 - c. Set at top of toe at stem if IBSAME = 1 and if it is strong enough.
 - (9) See paragraph 3-5-2a(3) of the User's Reference Manual.
 - (10) Program verifies consistency of following equation, within 0.01 ft, or calculates values to complete the equation:

$$BW = TW2/STR + TW2 + TSTB/12.0 + HEELW$$
 - (11) May not be less than TMINB.
 - (12) May not be less than TMINB.
 - (13) When a single batter is desired on the heel-side face of the stem, use HSTPH = 0, HSTPB = anything, and use HSBPB for the single batter.

Figure 8-4. Wall cross-sectional data variables

10-7 All situations with OMEGA greater than zero also include the resisting force of the parallel component of the weight of the neutral block, along the inclined failure surface.

10-8 Uplift calculations for sliding include a line of creep that goes along the bottom of the neutral block and up vertically at each end of the base. Known earth weights are used in the active and passive wedge calculations.

10-9 Users should consider the impact of ETL 1110-2-256, 24 June 1981, "Sliding Stability for Concrete Structures", when selecting their values of NSLIDE in optional data list SLID.

10-9-1 NSLIDE = 1 is the default action for retaining walls. Its action is described in para 2-5-1 of the Basic User's Guide, page 3-10 of the User's Reference Manual, and Exhibit H of the Program Criteria Specifications Document. It is based on ETL 1110-2-184 and uses a limit state force ratio.

10-9-2 NSLIDE = 2 is the default action for flood walls. Its action is described in para 2-5-2 of the Basic User's Guide, page 3-10 of the User's Reference Manual, and Exhibit I of the Program Criteria Specifications Document. It is based on EM 1110-2-2501 and uses allowable soil strengths in force equilibrium.

10-9-3 NSLIDE = 3 is available in the program through use of data list SLID, to conform to the sense of ETL 1110-2-256. See Exhibit J of the Program Criteria Specifications Document for a description of the action when NSLIDE = 3. Data list SLID is described below:

SLID LC NSLIDE FSMIN

where

SLID = name of data list

LC = load case number (1-10, or 0 for all cases)

NSLIDE = 3

FSMIN = minimum factor of safety on material properties, for design, using:

$$C_{allow} = \frac{C_{ultimate}}{FS}$$

$$\tan(\phi_{allow}) = \frac{\tan(\phi_{test})}{FS}$$

See para 9, page 20, of ETL 1110-2-256 for suitable values for FSMIN when NSLIDE = 3.

Data List	Data Item	Units	Definition
LFD	LC	EACH	Passive pressure diagram ordinates.
	Y1101	FOOT	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)

	ITYPE	1-2	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
WEF	LC	EACH	1 FOR FLOOD WALL, 2 FOR RETAINING WALL
	LOC	EACH	Earth weight & surcharge pressures on base
	U	PSF	LOAD CASE NUMBER (1-10 OR 0 FOR ALL LOAD CASES)
	LV	PSF	LOCATION NUMBER (SEE USER GUIDE)
WEF	U	PSF	EARTH WEIGHT & VERTICAL SURCHARGE
	LV	PSF	DYNAMIC EARTH WT. & VERT SURCHARGE
WEF	GAMAC	LB/CF	Unit weights
	GAMAW	LB/CF	UNIT WEIGHT OF REINFORCED CONCRETE (DEFAULT = 150)
WEF			UNIT WEIGHT OF WATER (DEFAULT = 62.5)

(Continued)

Now add lists beginning with "WLD" to define design geometry:

1. Data list WLDB may be omitted because TMENB is acceptable for HEIGHT (see paragraph 8.8.2 b)
2. With no key, the data list WLDK must be used to cancel the KPLAB value of 0 set in Example 3. Use KPLAB = C.
3. Data list WLOS may be omitted because TMINS is acceptable for 7STT with height over 15'.

list name	ETS feet	TW2 feet	STR	HEELW feet	TSTB inches	TMENB inches
*WLD	65.0	C	0.333	C	C	D

to be cancelled for STRDATA

the list may be truncated here because the remaining values are identifiers "C" or "D"

list name	BW1 feet	BW2 feet	BS1	BS2
*WLDB	15.0	30.0	0.0	0.0

list name	BTE11 feet	BTE12 feet	TOENT inches	TW1 feet
*WLDT	39.0	43.0	D	0.0

default = TMENB, which itself defaults to 18" with data list WLDB omitted.

Reinforcing Steel data - read the first sentence in paragraph 8.9

Concrete Design Parameters paragraph 8.10

Data list CND will be used to keep the design to the data as inputted only (IIPCM = 0).

Data list CNWD will be used to keep the design based on full dead + live loads only (IIPDR = 0)

All other values in data lists CND and CNWD may use their default values.

Data list STLO is not needed because its default values are acceptable.

list name	RATION $\lambda = E_s/E_c$	I=PCON f'_c, psi	ESTL E_s, psi	I12CM	
* CND	D	D	D	D	

list name	RATIOF F_c/f'_c	FYSTL F_y, psi	FESTLMX $F_{s, \text{max}}, \text{psi}$	I0SANE	I12DR
* CNWD	D	D	D	D	D

Cost Data, paragraph 8.11 (data lists beginning "CST...")

Excavation and backfill costs are not given, so data lists CSTB and CSTC are not applicable and should be omitted.

Data list CSTC is needed, to enter values for

Stem concrete @ \$120/cy = 84.444/cy

Slab concrete @ \$90/cy = 33.333/cy

list name	base slab \$/cy	stem \$/cy	key \$/cy
* CSTC	3.3333	4.4444	0.0

ENTER DATA INTERACTIVELY

Note that the data could have been put in a data file, as described in paragraphs 6.1.1 b and 7.2.2.

APPENDIX A

Program CTWDA Available on Boeing

29 December 1982

Program CTWDA has been placed in the CORPS program library and is now available on the Boeing Computer Service system EKS1 (BCS) in Seattle. It may be used in either of two ways, interactive or low-priority batch.

a. To use interactively, at BCS priority P15, use these interactive commands:

```
C > OLD,CORPS/UN=CECELB  
C > CALL,CORPS,X0053
```

This program is then used exactly as shown in the user guide sample runs.

Note, however, that this is ten times as expensive as the batch run procedure described below.

b. To use in a non-interactive batch mode, at BCS priority P02, use the procedure described below:

- (1) Set up the command/data file as described in the user guides, except as follows:
 - (a) Place all RUN module-name and other commands in the command/data file. The END command must be in the file as the last line in the file. Exhibit A-1 is a sample run of Exhibit 1 in the Basic User Guide when used in the interactive mode. Exhibit A-2 shows the same example set to run in the batch mode. Note that none of the program modules can ask questions while the program is executing in batch. They must instead assume the default answers listed in Exhibit B.
 - (b) There will be no numerical answers printed to the output file shown in Exhibit C, only the skeleton output shown. All numbers will be printed in the report file shown in the user guides.

- (2) Execute the batch driver for program CTWDA, with the following time-sharing commands.

```
C > GET,CTWDAB/UN=CEROS2
C > CALL,CTWDAB
```

A sample execution of CTWDAB is shown in Exhibit D.

- (3) List your output file (you will have supplied a name for it when CTWDAB asked for it). To do this, use the commands

```
C > GET,filename
C > LIST,F=filename
```

If the program did not run right, you will not have a report file, and the output file will not look like the one shown in Exhibit C. You will, however, have output and report files if the program ran right.

- (4) Remember that your run will leave four files in your userid:

Data file (that you created in advance)
Update file (name given to CTWDAB)
Output file (described in (3) above)
Report file (if and as named to CTWDAB)

These should be purged as soon as they are no longer needed.
Use the time-sharing command

```
C > PURGE,filename
```

EXHIBIT A -- CTWDA EXAMPLE 1 DATA FILES

1. Data file EX1DATA as shown on page 14-8 of the Basic User's Guide:

```
0880 INIT
0990 1
1000 R
1010 N
1020 NAME EXAMPLE 1 -- BASIC RETAINING WALL ANALYSIS

1200 RUN FA
1300 CND C C C 0 } lines added for batch run
1310 RUN WA
1400 END
```

EXHIBIT B -- CTWDA BATCH DEFAULT ACTIONS

When the program command RUN module-name is placed in the command/data file, the following default actions are taken by the program instead of asking questions of the user.

Modules FA, FD. - Instead of asking the user if he wants graphics, the question and all graphics are omitted.

Modules WA and WD. -

1. Instead of asking the related questions, the following actions are taken:

- a. The table of coordinates is printed in the report file.
- b. Type "C" (critical section) analyses are performed for all members, in module WA.
- c. Full output is put in the report file.
- d. All load cases are analyzed.

2. Instead of asking the question

TO GET DEFAULT VALUE FOR "IFEM", ANSWER NEXT QUESTION WITH A CARRIAGE RETURN:

```
*** IFEM IS NOT DEFINED, SO YOU MUST
ENTER 0 TO USE LOAD CASES AS-IS
OR    1 TO ALSO USE EM ALTERNATE SPECIAL LOADINGS
      (A CARRIAGE RETURN WILL INSERT THIS DEFAULT
      VALUE OF 1)
OR    ? FOR MORE INFORMATION
OR    C TO CONTINUE DATA CHECK WITHOUT COMPUTATIONS
OR    * TO ABORT THE MODULE
```

I>

when data list CND has not been used to define the variable IFEM, modules WA and WD will omit the question and use the default value of 1. To avoid this action, use data list CND. If you accept all of the other default values in CND, use this form (line 1300 in data file EX1DATB in Exhibit A):

CND C C C 0

EXHIBIT C -- EXAMPLE 1 CTWDA BATCH RUN OUTPUT FILE

82/04/09. 14.53.38. FILE TAPE23 IS NOW JOB LE3ALVH.

C>

NOTES:

1. The output file will contain some of the output that would be at the terminal if the run were interactive.
2. The only file that may pre-exist is the command and data file, and it must exist before running CTWDAB.

3. The job identifier printed on the last line of the run of program CTWDAB is the batch system's identifier for the execution of program CTWDA. This identifier will not apply to the report file if option "5" is selected. (Option "5" will send the completed report file to a remote high speed terminal.) If option "5" is selected in answer to the question from program CTWDAB, the system's identifier for the report file can be found by entering the time-sharing command

C > FIND

after CTWDA execution is complete.
