ABSTRACT (Continued)

Species Index for Volumes I-V of the Compilation of Data Relevant to Gas Lasers," September 1979. These six volumes, authored by E.W. McDaniel and other personnel at Georgia Tech, Georgia State University, the Joint Institute of Laboratory Astrophysics (JILA), and the Army Missile Command (MICOM), were published as MICOM Technical Report H-78-1 at Redstone Arsenal, Alabama.

Volumes I and II were prepared in the context of the two most-used techniques for gas laser pumping: electrical discharges and high intensity, high energy electron and ion beams. Heavy emphasis was placed on the rare gases and halogens (atoms, molecules, and ions), and the rare gas-halides, although a significant amount of material on other species was included. Volumes III, IV, and V contain much information relevant to electrical discharges and high intensity, high energy electron and ion beams, but are oriented toward a third pumping technique: nuclear pumping. Since nuclear reactions may also become interesting in some form of hybrid laser where the excitation and ionization produced by the reaction products might be used to supply electrons for an electrical discharge laser or an initiator for a pulsed chemical laser, or as an initiator and sustainer for a continuous wave (CW) chemical laser; data relevant to these systems was also included.

The present volumes serve to update most of the areas covered in the previous documents. Those areas not treated here are considered to have been adequately dealt with earlier, as far as immediate data needs are concerned. However, even in those areas where new data are not presented here, references are given to past volumes in order to facilitate access to the previous data. Another function of the present work is to expand somewhat the scope of our data coverage, both with respect to atomic and molecular structural properties and with respect to atomic collisions. New species and sets of collision partners that have recently assumed importance are treated here, and other systems that may become important in the gas laser context are given attention. A significant amount of new material is also added to the chapter on surface impact phenomena, partly because of current interest in hollow-cathode lasers.

PREFACE

This volume and the succeeding volume are the seventh and the eighth in a series that presents data relevant to research and development in the field of gas lasers. Volumes I and II are entitled, "Compilation of Data Relevant to Rare Gas-Rare Gas and Rare Gas-Monohalide Excimer Lasers," December 1977. Volumes III, IV, and V comprise a "Compilation of Data Relevant to Nuclear-Pumped Lasers," December 1978. Volume VI provides a "Cumulative Reactant Species Index for Volumes I-V of the Compilation of Data Relevant to Gas Lasers," September 1979. These six volumes, authored by E.W. McDaniel and other personnel at Georgia Tech, Georgia State University, the Joint Institute of Laboratory Astrophysics (JILA), and the Army Missile Command (MICOM), were published as MICOM Technical Report H-78-1 at Redstone Arsenal, Alabama.

Volumes I and II were prepared in the context of the two most-used techniques for gas laser pumping: electrical discharges and high intensity, high energy electron and ion beams. Heavy emphasis was placed on the rare gases and halogens (atoms, molecules, and ions), and on the rare gas-halides, although a significant amount of material on other species was included. Volumes III, IV, and V contain much information relevant to electrical discharges and high intensity, high energy electron and ion beams, but are oriented toward a third pumping technique: nuclear pumping. Since nuclear reactions may also become interesting in some form of hybrid laser where the excitation and ionization produced by the reaction products might be used to supply electrons for an electrical discharge laser or an initiator for a pulsed chemical laser, or as an initiator and sustainer for a continuous wave (CW) chemical laser; data relevant to these systems was also included.

The present volumes serve to update most of the areas covered in the previous documents. Those areas not treated here are considered to have been adequately dealt with earlier, as far as immediate data needs are concerned. Such areas include all nuclear processes, and atomic collisions occurring at "high" energies, i.e., above about 100 eV impact energy. However, even in those areas where new data are not presented here, references are given to past volumes in order to facilitate access to the previous data. Attention should also be called to another document that may prove useful to those requiring data--"Bibliography: Sources of Information on Phenomena of Interest in Gas Laser Research and Development," Technical Report RH-77-1, by E.W. McDaniel, H.W. Ellis, F.L. Eisele, and M.G. Thackston, January 1977, US Army Missile Command, Redstone Arsenal, Alabama. A second, updated edition of this bibliography will be published early in 1981.

Another function of the present volume is to expand somewhat the scope of our data coverage. both with respect to atomic and molecular structural properties and with respect to atomic collisions (by the

latter term, we mean two- and three-body collisions between electrons, ions, atoms, molecules, and photons at impact energies sufficiently low that nuclear forces are unimportant). New species and sets of collision partners that have recently assumed importance are treated here, and other systems that may become important in the gas laser context are given attention. A significant amount of new material is also added to the chapter on surface impact phenomena, partly because of current interest in hollow-cathode lasers.

In conclusion, we wish to thank C.F. Barnett, former Director of the Controlled Fusion Atomic Data Center at the Oak Ridge National Laboratory, and E.C. Beaty, Chief of the Information Center at JILA, for their cooperation and the use of their facilities. In certain areas, our work would have been immensely more difficult without their assistance. Chapter D on photon collision processes in gases was put together with the aid of several scientists. Particularly significant were the contributions of Dr. Joseph Berkowitz, of Argonne National Laboratory, whose book Photoabsorption, Photoionization, and Photoelectron Spectroscopy (Academic Press, New York, 1979) provided us with a wealth of references and critically evaluated data on atoms and molecules. We gratefully acknowledge being allowed access to the manuscript prior to publication, as well as Dr. Berkowitz providing us with a number of large-size versions of figures from his book. In addition, we acknowledge the contributions of Professor C.E. Brion, of the University of British Columbia, for providing us with a complete set of reprints, spanning a decade, of his very extensive work on partial and total cross sections of atoms and molecules. Also, the expert help of Professor H.W. Ellis, of Eckerd College, St Petersburg, Florida, on the transport properties of electrons, ions, and neutrals in gases is gratefully acknowledged.

Graphical Data A-2.11. Potential energy curves for the ground electronic state and lowest ${}^1\Pi_u$ state of F_2 as calculated using the GVB-CI and POL-CI descriptions.

Graphical Data A-2.12. Potential energy curves, obtained using the POL-CI description, for the singlet valence states of F_2 dissociating into ground state F atoms.

Graphical Data A-2.13. Potential energy curves, obtained using the POL-CI description for the ground electronic states and those triplet electronic states dissociating into ground state F atoms.

F₂ VALENCE STATES

Graphical Data A-2.14. Orbital diagrams indicating how two ground state (²P) F atoms are combined to give the various valence electronic states. Only the atomic p-orbitals are shown and the electron occupancy is indicated by dots.

Graphical Data A-2.15. Potential energy curves for the ground state and the valence $^3\Pi_u$ and $^1\Pi_u$ electronic states of F_2 as calculated using the POL-CI description. Experimental ground state curve (Reference 12) and Rees (Reference 14) of A-2.1.

Graphical Data A-2.16. Comparison between the measured (Reference 14) and theoretical G_v'' values for the ground state of F_2 , as a function of the vibrational quantum number. Results obtained using both the POL-CI and GVB wavefunctions are shown for comparison.

Graphical Data A-2.17. Comparison between the measured and theoretical $B_{v''}$ values for the ground state of F_2 , as a function of the vibrational quantum number. Results obtained using both the POL-CI and GVB wavefunctions descriptions for the ground state are shown for comparison.

Graphical Data A-2.18. Quadrupole moment, as a function of internuclear distance, for ground state of F₂, as obtained using the POL-CI description. Wahl (Reference 3), Karplus and Kolker (Reference 15).

Graphical Data A-2.19. Electronic transition moment, as a function of internuclear distance, for the $^1\Pi_u \leftarrow X\ ^1\Sigma_g^+$ excitation in F_2 . Results obtained using the GVB-CI, POL-CI and POL-CI with Rydberg functions are compared to values in References 16 and 17.

Graphical Data A-2.20. Molar absorptancy, as a function of incident radiation wavelength λ , for F_2 in its lowest vibrational level (upper portion) and for F_2 initially in $v''=1$ and 2 (lower portion). Except (Reference 18).

Graphical Data A-2.21. Comparison of bound-continuum Franck-Condon factors for F_2 calculated using the complete vibrational wavefunction and using the delta-function-reflection method.

Graphical Data A-2.22. SCF potential curves for $I_2^+ ({}^2\Pi)$ showing, in the range 4.8–5.4 bohr, two stable solutions of the SCF equations, the higher with $D_{\infty h}$ symmetry, the lower with $C_{\infty v}$ symmetry. Also shown is the dipole moment curve (computed relative to the nuclear midpoint) of the $C_{\infty v}$ solution.

Tabular Data A-2.23. Spectroscopic analysis of potential curves.^a

^dJ. Jortner and W. Skolov, Nature (London) **190**, 1004 (1961).

^eK. Watanabe, J. Chem. Phys. **26**, 542 (1957) gives 74 850 ± 160 cm⁻¹, from which the table entry is computed.

A-3. TRANSITION MOMENTS AND ABSORPTION PROFILES FOR ELECTRONIC STATES OF Ne_2^+ , Ar_2^+ , Kr_2^+ , Xe_2^+ , POTENTIAL ENERGY CURVES, SPECTROSCOPIC CONSTANTS AND ABSORPTION CROSS SECTIONS FOR Hg_2^+ AND Ar_3^+ .

	<u>CONTENTS</u>	Page
A-3.1.	Transition moments (in a.u.) calculated for the $1(1/2)_u \rightarrow 1(3/2)_g$, $1(1/2)_u \rightarrow 1(1/2)_g$ and $1(1/2)_u \rightarrow 2(1/2)_g$ excitations in Ne_2^+	2578
A-3.2.	Transition moments (in a.u.) calculated for the $1(1/2)_u \rightarrow 1(3/2)_g$, $1(1/2)_u \rightarrow 1(1/2)_g$ and $1(1/2)_u \rightarrow 2(1/2)_g$ excitations in Ar_2^+	2579
A-3.3.	Transition moments (in a.u.) calculated for the $1(1/2)_u \rightarrow 1(3/2)_g$, $1(1/2)_u \rightarrow 1(1/2)_g$ and $1(1/2)_u \rightarrow 1(3/2)_g$ excitations in Kr_2^+	2580
A-3.4.	Transition moments (in a.u.) calculated for the $1(1/2)_u \rightarrow 1(3/2)_g$, $1(1/2)_u \rightarrow 1(1/2)_g$ and $1(1/2)_u \rightarrow 2(1/2)_g$ excitations in Xe_2^+	2581
A-3.5.	Calculated cross-sections (in cm^2) for $1(1/2)_u \rightarrow 2(1/2)_g$ in Ne_2^+ at 100K, 300K, 600K.	2582
A-3.6.	Calculated cross-sections (in cm^2) for $1(1/2)_u \rightarrow 2(1/2)_g$ in Ar_2^+ at 100K, 300K, 600K.	2583
A-3.7.	Calculated cross-sections (in cm^2) for $1(1/2)_u \rightarrow 2(1/2)_g$ in Kr_2^+ at 100K, 300K, 600K.	2585
A-3.8.	Calculated cross-sections (in cm^2) for $1(1/2)_u \rightarrow 2(1/2)_g$ in Xe_2^+ at 100K, 300K, 600K.	2587
A-3.9.	Comparison of theoretical and experimental cross-sections (in 10^{-18} cm^2) for Ne_2^+ at (350.7 and 356.7)nm and Ar_2^+ at 4.13.1nm.	2589
A-3.10.	Experimental and theoretical values for the wave-length (in nm) and magnitude (in 10^{-18} cm^2) of the maximal absorption cross-section for the $1(1/2)_u \rightarrow 2(1/2)_g$ transition in Ne_2^+ , Ar_2^+ , Kr_2^+ and Xe_2^+ at 300K	2590
A-3.11.	Transition moment functions for the $1(1/2)_u \rightarrow 1(3/2)_g$ transition	2591
A-3.12.	Transition moment functions for the $1(1/2)_u \rightarrow 1(3/2)_g$ transition	2592
A-3.13.	Transition moment functions for the $1(1/2)_u \rightarrow 2(1/2)_g$ transition	2593

ORBITAL DIAGRAMS FOR HgCl_2

Graphical Data A-4.11. Valence bond orbital diagrams for the ground $1^1\Sigma_g^+$ state of HgCl_2 .

Graphical Data A-4.12. Contour plots for the highest occupied orbitals of the $1^1\sigma_g^+$ state of HgCl_2 . Contours are spaced logarithmically starting at 0.02 and increasing by a factor of 1.58489 ($\approx 10^{.2}$).

Graphical Data A-4.13. Contour plots for the lowest virtual orbitals of the $1^1\Sigma_g^+$ state of HgCl_2 .

Graphical Data A-4.14. Orbital energy level diagram for HgCl_2 ($R = 2.275\text{\AA}$) for a bending angle of 180° , 140° and 100° .

HgCl_2 BENDING CURVES (C_{2v} , $R=2.27 \text{ \AA}$)

Graphical Data A-4.15. POL(1) CI potential curves for the states of HgCl_2 as a function of bending angle, θ .

CORRELATION DIAGRAM FOR HgCl + Cl → HgCl₂

Graphical Data A-4.16. Electronic state correlations diagrams for HgCl + Cl → HgCl₂.

Graphical Data A-4.17. Experimental energy level diagram for key excited states of HgCl_2 .

Graphical Data A-4.18. Schematic potential curves of ArBr, with the transitions observed in this study. See Fig. 5 for the ordering of the Br spin-orbit levels.

Graphical Data A-4.19. Energy level diagram, illustrating the electronic states of ArBr and Br accessible in the reactions studied.

Graphical Data A-4, 20. Representative set of ArBr potential curves giving good fits to the experimental ArBr(B-X) and [C-A($\frac{3}{2}$)] continua. Potentials: $V_{B1}^{\prime}, V_{X1}^{\prime} = 7.197 \times 10^6 \exp[-r(\text{nm})/0.03673] \text{ cm}^{-1}$; $V_{A1}^{\prime} = 1.6175 \times 10^6 \exp(-r/0.02798) \text{ cm}^{-1}$.

Graphical Data A-4.21. Theoretical potential energy curves for states of Zn_2 arising from $\text{Zn}(^1\text{S}, ^3\text{P}, \text{ and } ^1\text{P})$.

Graphical Data A-4.22. Theoretical potential energy curves for diatomic cadmium. All states of Cd_2 dissociating to $\text{Cd}(^1\text{S}) + \text{Cd}(^1\text{S}, ^3\text{P}, ^1\text{P})$ are included here.

Graphical Data A-4.23. Gerade states of Cd_2 including spin-orbit coupling.

Graphical Data A-4.24. Ungerade states of Cd_2 including spin-orbit coupling.

Graphical Data A-4.25. Computed $\text{Cd}_2^+ 1_u \rightarrow 0_g^+$ fluorescence band at 675°K, calibrated in relative units of quanta per unit wavelength per unit time.

Graphical Data A-4.26. Contributions of individual vibrational level to the Cd_2^* fluorescence rate at 675°K, in relative units of quanta per unit frequency per unit time.

Tabular Data A-4.27. Comparison between theory and experiment for the lowest atomic energy levels (in cm^{-1}) of zinc and cadmium. Note that for the 3P states the present nonrelativistic treatment does not distinguish fine structure components.

Electronic State	Zinc		Cadmium	
	Theory	Experiment	Theory	Experiment
$^1S_0 \text{ ns}^2$		0		0
$^3P_0 \text{ ns np}$	$\uparrow$	32,310	$\uparrow$	30,110
3P_1	28,170	32,500	23,570	30,660
3P_2	$\downarrow$	32,890	$\downarrow$	31,830
$^1P_1 \text{ ns np}$	47,960	46,750	41,790	43,690

Tabular Data A-4.28. Predicted spectroscopic constants for the bound states of Zn_2 and Cd_2 dissociating to $^1\text{S} + ^3\text{P}$ and to ^1S to ^1P separated atom limits. Excitation energies T_e are given relative to two ground state metal atoms.

	Electronic State	T_e (eV)	Adjusted T_e (eV)	r_e° (Å)	D_e (eV)	ω_e (cm ⁻¹)

^aThe first entry for each state corresponds to our MCSCF wave function described in part in Table II.

^bObtained from an extrapolation from $r'' = 45$ which lies at 5428 cm⁻¹.

^cValues estimated based on SHBW data.

^dThe energy listed under the D_e column is the hump height, the value listed in the R_e column is the position of the hump.

Valence Elec. Model: A. C. Roach, J. Mol. Spectrosc. 42, 27 (1972).

^aIn atomic units, $ea_0 = 1$ electron-bohr.

The transition operator is

$$\mu_0 = \sum_k e_k z_k$$

for parallel transitions and

$$\mu_{\pm 1} = \sum_k e_k \frac{\pm x_k - iy_k}{\sqrt{2}}$$

for perpendicular transitions.

Graphical Data A-5.9. Emission rate per cm^{-1} transition energy interval and gain cross sections (σ_e) for the $1^3\Sigma_u^+ - 1^3\Sigma_u^+$ emission in Li_2 . The arrows show the threshold between bound-free and bound-bound emission for each v .

Graphical Data A-5.10. Emission rate per cm^{-1} transition energy interval and gain cross sections (σ_e) for the $1^3\Sigma_u^+ - 1^3\Sigma_u^+$ emission in Na_2 .

Formulae A-5.13. Van der Waals formulae using Tabular Data A-5.14 and A-5.15.

The long range dispersion energy between two spherically symmetric atoms A and B at separation r is (Refs. a, b, c below).

$$u_{AB}(r) = - \sum_{\ell_1=1}^{\infty} \sum_{\ell_2=1}^{\infty} \frac{C_{AB}(\ell_1, \ell_2)}{2(\ell_1 + \ell_2 + 1)} \quad , \quad (1)$$

where $C_{AB}(\ell_1, \ell_2)$ is the dispersion force coefficient corresponding to the 2^{ℓ_1} -pole- 2^{ℓ_2} -pole interaction. $u_{AB}(r)$ can also be expressed as a power series of the inverse of r ,

$$u_{AB}(r) = c_6/r^6 - c_8/r^8 - c_{10}/r^{10} \dots , \quad (2)$$

where the van der Waals coefficients c_6 , c_8 , and c_{10} may be written

$$c_6 = C_{AB}(11), \quad (3)$$

$$c_8 = C_{AB}(12) + C_{AB}(21), \quad (4)$$

$$c_{10} = C_{AB}(13) + C_{AB}(22) + C_{AB}(31). \quad (5)$$

c_6 describes the dipole-dipole interaction, c_8 the quadrupole, and c_{10} the dipole-octupole interactions.

Introduction

The processes of interest here are the two- and three-body mechanisms which may respectively be written:

The square brackets indicate that the species may remain associated after recombination. They may also be excited. Data for the two-body case are presented as a two-body rate in units of $\text{cm}^3 \text{s}^{-1}$. Data for the three-body case are normally presented in the form of a two-body rate for recombination ($\text{cm}^3 \text{s}^{-1}$) as a function of the total gas density; density is often expressed as the ratio N/N_L where N is the density (cm^{-3}) and N_L is Loschmidt's number ($2.69 \times 10^{19} \text{ cm}^{-3}$, the number density at STP).

The data presented in Figs. 1-47 of this section are the results of computations by Hoffman and Moreno (see ref. 12 below). The computations involved the theoretical work of M. R. Flannery (see ref. 5 below). We are grateful to Drs. Hoffman and Moreno for permission to use their data.

Figs. 48 and 49 present theoretical data to be published by M. R. Flannery in 1981. The references in the figure legends refer to Flannery's 1981 paper.

Explanation of Tables

The following section contains information pertaining to ion-molecule reactions of the general form $A^+ + B \rightarrow C^+ + D$. Excluded from consideration for example are the following types of reactions:

If a certain reaction is not located in the ion-molecule section, check the charge transfer section also. Some overlap in the two categories is unavoidable and due to space limitations there is only one listing of each reaction.

The reaction $A^+ + B \xrightarrow{k} C^+ + D$ is described as a bimolecular reaction. The concentration of A^+ obeys the first order linear differential equation $d[A^+]/dt = -k[A^+][B]$.

The usual units for k are $\text{cm}^3/(\text{molecule} \cdot \text{sec})$ abbreviated as $\text{cm}^3 \text{ s}^{-1}$. The concentrations $[A^+]$ and $[B]$ are in units of $(\text{molecules} \cdot \text{cm}^{-3})$.

The reaction $A^+ + B + M \xrightarrow{k} C^+ + D + M$ is known as a termolecular reaction and obeys the equation $d[A^+]/dt = -k[A^+][B][M]$. The units of k are $\text{cm}^6/(\text{Molecule}^2 \cdot \text{sec})$ abbreviated as $\text{cm}^6 \text{ s}^{-1}$. Where several reaction channels are possible the probability of a certain reaction channel is described by the product ratio. If all the possible reaction channels are given by the following:

the product ratio, [i.e. probability of the reaction following channel (3)], is given by $k_3/(k_1+k_2+k_3)$.

Calculated Rate Coefficients

Langevin values for rate coefficients are calculated from the formula $k_L = 2\pi e \left(\frac{\alpha}{m_r} \right)^{1/2}$ where k_L is the Langevin rate coefficient, e is the electronic charge, α is the electric polarizability of the neutral molecule, and m_r is the reduced mass. The formula is derived assuming that the long range interaction potential is due to the ion-induced dipole force [M. McFarland, D. L. Albritton, F. C. Fehsenfeld, E. E. Ferguson, and A. L. Schmeltekopf, J. Chem. Phys. 59, 6620 (1973)]. ADO (Average Dipole Orientation) values are calculated for the case where a molecule has a dipole moment. This calculation takes into account both the dipole moment of the molecule and the ion-induced dipole moment, [see, for example, T. Su and T. Bowers, J. Chem. Phys. 58, 3027 (1973)].

Langevin and ADO values are considered accurate in the region where the ion energy approaches thermal energy. In this respect, they can be considered asymptotic values in the low energy region when the potential has certain long range features. k_L and k_{ADO} are the classical-model gas-kinetic upper limits that assume unity reaction probability for the collisions of ions with nonpolar and polar molecules, respectively. The designation k_L and k_{ADO} for Langevin and ADO values of the rate coefficient, respectively, are used throughout this section.

Tabular Data B-1.B-1. Individual reaction cross sections for the two spin orbit states $\text{Ar}^+ (2p_{1/2})$ and $\text{Ar}^+ (2p_{3/2})$. Ratios of the reaction cross sections are given as a function of relative collision energy.

$E_{\text{c.m.}}$ (eV)	0.048	0.095	0.238	0.476
$\sigma(1/2)/\sigma(3/2)^a$	1.56	1.47	1.59	1.44

Ratio of the reaction cross sections as a function of relative collision energy.

$E_{\text{c.m.}}$ (eV)	0.046	0.091	0.227	0.455
$\sigma(1/2)/\sigma(3/2)^a$	1.25	1.29	1.32	1.28

^aThe accuracy is estimated to be 15%.

^a Three-body reactions (in units of $\text{cm}^6 \text{s}^{-1}$) are distinguished from 2-body reactions (in units of $\text{cm}^3 \text{s}^{-1}$) by the association of the He atom with the 3-body product ion. The major products are underlined where there is more than one product channel. The square brackets contain the appropriate Langevin rate coefficient except in the case of H_2O where there is a significant additional contribution arising from its permanent dipole moment. Rate coefficients are as indicated, e.g. for $\text{CH}^+ + \text{H}_2$, $k = 1.2$ (-9) is equivalent to $1.2 \times 10^{-9} \text{ cm}^3 \text{s}^{-1}$. The "approximate" sign indicates that the rate coefficient is accurate to within a factor of two. "No reaction observed" implies an equivalent 2-body rate coefficient of less than 5 (-13) $\text{cm}^3 \text{s}^{-1}$.

^b Three-body reaction, unit of rate coefficient is $\text{cm}^6 \text{sec}^{-1}$.

Tabular Data B-1.B-13. Rate coefficients and product ion distributions for the reactions of N^+ , NH^+ , NH_2^+ , and NH_3^+ with a series of molecules at 300 K. The reactant ions and molecules are arranged in order of their recombination energies and ionization potentials, respectively, the magnitudes of which are indicated in eV below each reactant species. The proton detachment energies for the ions and proton affinities for the neutral molecules are indicated in eV above each reactant species. The binary rate coefficients are indicated as, for example, 1.0(-9) representing $1.0 \times 10^{-9} \text{ cm}^3 \text{ s}^{-1}$. The percentage of each ion product is given in round brackets after the product ion and the Langevin or ADO theoretical rate coefficient for each reaction is given in square brackets below the experimentally determined value. The ternary rate coefficient ($\text{cm}^6 \text{ s}^{-1}$) is quoted for the $N^+ + N_2$ reaction.

Tabular Data B-1.B-15. Rate coefficients and product ion distributions for the reactions of N^+ , N_2^+ , N_3^+ , N_4^+ , O^+ , O_2^+ , and NO^+ with a series of molecules. The binary rate coefficients are indicated as, for example, 1.0(-9), meaning $1.0 \times 10^{-9} \text{ cm}^3 \text{ s}^{-1}$. The percentage of each ion product is indicated in brackets after each ion. The ternary association reactions are indicated by the inclusion of either He, N_2 , or He/ N_2 after the product ion and have units of $\text{cm}^6 \text{ s}^{-1}$. The reactant ions and molecules are arranged in order of their recombination energies and ionization potentials (indicated in eV). The Langevin or ADO theoretical rate coefficient for each reaction is given in square brackets. $\sim$ implies a factor of 2 accuracy.

Tabular Data B-1.B-16. Reaction rate coefficients of the ground and metastable excited states of O_2^+ , NO^+ and O^+ with atmospheric gases at thermal energy. The type of reactions studied are the following:

where $k^* = k_1 + k_2$.

Reactions with $O_2^+(a^4\Pi_u)$ and $O_2^+(x^2\Pi_g)$

Reactant	Reaction	$k_1 [x]$	$k^* [a]$
CO_2	$O_2^+ + CO_2 \rightarrow CO_2^+ + O_2 + 2.1 \text{ eV}$	endo	$7.2(-10)$ $8.0(-10)^+$
N_2	$O_2^+ + N_2 \rightarrow N_2^+ + O_2 + 0.48 \text{ eV}$	endo	$6.0(-10)$
CO	$O_2^+ + CO \rightarrow CO^+ + O_2 + 2.07 \text{ eV} (83\%)$ $\rightarrow CO_2^+ + O + 2.68 \text{ eV} (17\%)$	endo	$1.8(-10)$
H_2	$O_2^+ + H_2 \rightarrow O_2H^+ + H + 2.33 \text{ eV} (85\%)$ $\rightarrow H_2^+ + O_2 + 0.65 \text{ eV} (15\%)$	endo	$1.0(-9)$ $0.9(-9)^+$
Ar	$O_2^+ + Ar \rightarrow Ar^+ + O_2 + 0.33 \text{ eV}$	endo	$4(-10)$
NO	$O_2^+(x) + NO \rightarrow NO^+ + O_2 + 2.81 \text{ eV}$ $O_2^+ + NO \rightarrow NO^+ + O_2 + 6.84 \text{ eV}$	$4.8(-10)$	$1.0(-9)$ $4.6(-10)^+$
O_2	$O_2^+ + O_2 \rightarrow O_2^+ + O_2 + 4.03 \text{ eV}$	endo	

Reactions with $NO^+(a^1\Sigma)$ and $NO^+(x^1\Sigma)$

Reactant	Reaction	$k^* = k_1 + k_2$	k_2
Ar	$NO^+ + Ar \rightarrow Ar^+ + NO - 0.1 \text{ eV}$	$3.5(-11)$	
CO	$NO^+ + CO \rightarrow CO^+ + NO + 1.63 \text{ eV}$	$7.2(-10)$ $6.4(-10)^+$	
CO_2	$NO^+ + CO_2 \rightarrow CO_2^+ + NO + 1.88 \text{ eV}$	$1.06(-9)$	
N_2	$NO^+ + N_2 \rightarrow N_2^+ + NO + 0.09 \text{ eV} (55\%)$ $\rightarrow NO^+(x) + N_2 + 6.4 \text{ eV} (45\%)$	$7.7(-10)$ $7.7(-10)^+$	$3.5(-10)$
O_2	$NO^+ + O_2 \rightarrow O_2^+ + NO + 3.6 \text{ eV} (30\%)$ $\rightarrow NO^+(x) + O_2 + 6.4 \text{ eV} (70\%)$	$3.3(-10)^+$	$2.3(-10)$
H_2	$NO^+ + H_2 \rightarrow H_2^+ + NO + 0.22 \text{ eV} (12\%)$ $\rightarrow NO^+(x) + H_2 + 6.4 \text{ eV} (88\%)$	$1.4(-9)^+$	$1.2(-9)$

Reactions with $O^+(^4S)$, $O^+(^2D,^2P)$ and $O_2^+(^4S)$

Reactant	Reaction	$k_1(^4S)$	$k^*(^2D,^2P)$
O_2	$O^+ + O_2 \rightarrow O_2^+ + O + 1.56 \text{ eV}$ $O^+ + O_2 \rightarrow O_2^+ + O + 4.85, 6.54 \text{ eV}$	$2.3(-11)$	$1.3(-10)$
N_2	$O^+ + N_2 \rightarrow NO^+ + N + 1.13 \text{ eV}$ $O^+ + N_2 \rightarrow N_2^+ + O + 1.34, 3.03 \text{ eV} (90\%)$ $\rightarrow NO^+ + N + 4.42, 6.11 \text{ eV} (10\%)$ $O_2^+ + N_2 \rightarrow O_2^+ + N_2^+$	$1.4(-12)$ $1.4(-12)$	$1.5(-10)$
NO	$O^+ + NO \rightarrow NO^+ + O + 4.37 \text{ eV}$ $O^+ + NO \rightarrow NO^+ + O + 7.66, 9.35 \text{ eV}$	$< 8(-12)$	$1.2(-9)$
CO	$O^+ + CO \rightarrow CO^+ + O + 2.89, 4.58 \text{ eV}$ $O_2^+ + CO \rightarrow O_2^+ + CO^+$		$1.3(-9)$

Rate coefficients listed as a(-b) represent $a \times 10^{-b}$. The accuracy is $\pm 30\%$. + rate constant obtained using monitor-ion method.

CH_4	$CH_4^+ + CO$ (61) $HCO^+ + CH_3$ (35) $CH_3CO^+ + H$ (4) 1.3 (-9)	— < 1 (-13)	$H_3CO^+ + CH_3$ (85) $C_2H_5O^+ + H$ (15) 1.1 (-10)	— < 4 (-14)

(1) Rate coefficients have units of $cm^3 s^{-1}$ except in the case of the 3-body association reaction (asterisked). Rate coefficients are as indicated: e.g., for $CO^+ + H_2$, $k = 2.0(-9)$ is equivalent to $2.0 \times 10^{-9} cm^3 s^{-1}$. The numbers in parentheses after each product channel represent the percentage product ion distribution. Where no significant reaction was observed an upper limit to the rate coefficient is quoted. In the reactions of H_nCO^+ with N_2 , the replacement of CO by N_2 to yield $H_nN_2^+$ could not be detected and thus is not subject to the upper limit quoted.

(2) For reactions of H_nCO^+ ions with N_2 and CO , $k < 4(-14)$.

Reference: N. G. Adams, D. Smith, and D. Grief, Int. J. Mass Spect. Ion Phys. 26, 405 (1978).

Tabular Data B-1.B-22. Rate constants for the reaction of $O_2^+(a^4\Pi_u)$ ions with CH_4 at relative kinetic energies 0.04 - 1.2 eV. Experiment was performed in a flow-drift tube with He buffer gas. The reactions studied are the following:

The rate constant k applies to the total loss of O_2 metastables where $k^* = k_1 + k_2 + k_3$.

The experimental uncertainty of the data is believed to be less than 40%. The relative magnitude for the first two processes was determined to be approximately $k_1/k_2 \approx 2$.

INTRODUCTION

This section represents an update of Section B-1.C of Technical Report H-78-1 "Compilation of Data Relevant to Nuclear Pumped Lasers" Volume IV, U.S. Army Missile Research and Development Command, Redstone Arsenal, December 1978. It includes the results of a literature search for the period August 1978 to August 1980. In order to limit transcription errors published data tables have been reproduced in their original form although this does result in the data presentation having a lack of logical order. Where possible the full reaction equation has been presented. Where the post collision states are not specified then it was not clear from the original publication what final states were involved.

To aid in location of reactions of interest we list below the excited species being quenched with the table or figure number where the data are located. Excited species are separated into mono-, di- and tri-atomic molecules and ordered by increasing molecular weight.

Graphical Data B-1. C-5. Branching Ratios for
reaction of $O(^1D_2)$ with
 N_2O .

Data represent the ratio of reaction rates k_a/k_b for reaction
1a and 1b of the following set, measured with an He buffer gas.

Ratio as a function of He to N_2O
molecular number density at 300°K

Ratio as a function of temperature at
a molecular number density ratio (He to
 N_2O) of 56.

Notes:

[†] Reaction rates at a specified temperature are given in units of $\text{cm}^3 \text{ s}^{-1}$ per molecule or in units of $\text{s}^{-1} \text{ torr}^{-1}$.
Reactions measured at a specified energy are shown as a cross section measured in Å².

Explanation of Coverage

The data presented here are for processes involving electron exchange between two colliding systems as represented by the following equations:

Reactions 1,2 and 3 are conventionally known as charge transfer or electron capture while reaction 4 is known as mutual neutralization. In some cases where molecular species are involved the post-collision system may dissociate; such reactions are included. We do not, however, consider here ion-molecule reactions where transfer of atoms between projectile and target molecules occurs; such reactions are considered in Section B-1.B. The energy range covered here is from thermal to approximately 100 eV, with a few exceptions where graphical data were available both below and above 100 eV and there was no reason not to present the entire graph. The reactions are listed in tabular form and where only a single datum point is available this is given in the table. Where the reaction has been studied over a range of energies the table refers to a figure which can be found immediately following the table. Data are presented in the form of cross sections (in cm^2 or $\text{\AA}^2$) or reaction rates (in cm^3/sec). In one case there is a 3-body reaction ($A^+ + B + C \rightarrow A + B^+ + C$) where the reaction rate is in cm^6/sec . In all cases the datum is a cross section or reaction rate per projectile (atom or molecule) incident.

This table represents an update and continuation of Section B-1 (Vol. I) of Technical Report H-78-1 ("Compilation of Data Relevant to Rare Gas - Rare Gas and Rare Gas - Monohalide Excimer Lasers") and Sections B-1 and B-2 (Volume IV) of Technical Report H-78-1 ("Compilation of Data Relevant to Nuclear Pumped Lasers") both volumes being published by the U.S. Army Missile Command, Redstone Arsenal, Alabama (in December 1977 and December 1978 respectively). The data are gleaned from a search of publications in the years 1978 through August 1980. In view of the continuing evolution of laser mechanisms we have not restricted the search to rare gas and rare gas-halide mechanisms but include also metallic and molecular species. A rather complete listing of thermal energy reaction rates published through 1977 can be found in the compendium by Albritton (Atomic and Nuclear Data Tables 22, 2 (1978)). The present listing should be regarded only as updating the work of Albritton for the limited area of charge transfer.

The table separates reactions of the types 1,2,3 and 4 defined above. Within each section the reactants are ordered first by increasing projectile mass and secondly by increasing target mass. In many cases the designation of a particle as projectile or target is arbitrary and irrelevant.
