COMPUTATION METHODS BASIC FUNCTIONS

INTRODUCTION

The computation methods described in this section are for use in fatigue analyses. The functions to be computed are the Gamma Function, the two Incomplete Gamma Functions, an Error Function and its Inverse, a Probability of Failure Function, and a transcendental accelerated test level function.

These methods are intended to be user oriented. The user is given a choice of methods. Tables and interpolation methods are included for those who prefer to use tables. Techniques are also included for use with calculators, with the modern TI-59, HP-67, HP-34C and HP-41C Programmable Calculators and with large computers (i.e. Basic Language). Both numerical integration and closed form equation methods are given. Examples using each method are worked out. Computer program listings are also shown.

It should be noted that the same programs can be used for both the HP-67 and HP-41C programmable calculators. Only the HP-67 is referred to in the listings for simplicity.

A. GAMMA FUNCTION COMPUTATION

Definition:

The Gamma Function is defined as follows:

$$\Gamma(\alpha) = \int_0^{\infty} x^{\alpha-1} e^{-x} dx$$

$\Gamma(\alpha)$ is undefined for $\alpha = 0$ and for negative integer values of α .

For fatigue analyses $\alpha > 1$. Figure 1 shows $\Gamma(\alpha)$ versus α for

$0 < \alpha < 4$. The curve increases monotonically for $\alpha > 4$.

Figure 1 Plot of Gamma Function Versus α

TABULAR METHOD

Table I (Table 6.1 pages 267-270 of Abramowitz [1]) gives values to ten places of $\Gamma(\alpha)$ versus α for $1 \leq \alpha \leq 2$. Table II (Table 6.3 pages 272, 273 of Abramowitz [1]) gives values to eleven places of $\Gamma(\alpha)$ for integer and half-integer values of α for $1 \leq \alpha \leq 101$.

EXAMPLE

FIND: $\Gamma(1.225)$

SOLUTION: In Table I (Table 6.1 page 267 [1])

$$\Gamma(1.225) = 0.9119156071$$

EXAMPLE:

FIND: $\Gamma(8.5)$

SOLUTION: In Table II (Table 6.3 page 272 [1])

$$\Gamma(8.5) = 1.4034407 \times 10^4$$

The following expression can be used recursively:

$$\Gamma(\alpha) = (\alpha-1) \Gamma(\alpha-1)$$

EXAMPLE:

FIND: $\Gamma(5.64)$

SOLUTION: $\Gamma(5.64) = 4.64 \times 3.64 \times 2.64 \times 1.64 \times \Gamma(1.64)$

In Table 6.1 page 269 [1]

$$\Gamma(1.64) = 0.8986420302$$

$$\therefore \Gamma(5.64) = 65.71338911$$

Table I GAMMA FUNCTION ($1 \leq \alpha \leq 2$)

CALCULATOR METHOD

The expression $\Gamma(\alpha + 1) = \alpha \Gamma(\alpha)$ is applied repeatedly to increase the value of the argument until it is greater than 9, when Stirling's formula can be applied. If the argument is initially greater than 9, Stirling's formula is used at once.

Stirling's formula is given in Abramowitz [1]

For $\alpha > 9$:

$$\begin{aligned} \text{Define } Y &= \alpha + 1 \\ X &= (\alpha + 1)\alpha \end{aligned}$$

$$\begin{aligned} S &= 0.9189385332 - Y + (Y + 0.5) \ln Y \\ &+ \frac{1}{(12 Y)} \left[\frac{1}{Y} - \frac{1}{30 Y^2} + \frac{1}{420 Y^4} \right] \end{aligned}$$

$$\Gamma(\alpha) = \frac{e^S}{X}$$

EXAMPLE

FIND: $\Gamma(10.4)$

SOLUTION: $Y = 11.4$; $X = (11.4)(10.4)$

$$S = 0.9189385332 - 11.4 + (11.9) \ln 11.4$$

$$+ \frac{1}{(12)(11.4)} \left[1 - \frac{1}{30(11.4)^2} + \frac{1}{105(11.4)^4} \right]$$

$$S = 18.48624553$$

$$e^S = 1.067761911 \times 10^8$$

$$X = 118.56$$

$$\Gamma(10.4) = \frac{e^S}{X} = 900608.9$$

For $\alpha < 9$:

DEFINE $Y = 9 + \text{fractional part of } \alpha$

$$X = \alpha(\alpha+1)(\alpha+2) \times \dots Y$$

$$S = 0.9189385332 - Y + (Y+0.5) \ln Y$$

$$+ \frac{1}{(12 Y)} \left[1 - \frac{1}{30 Y^2} + \frac{1}{150 Y^4} \right]$$

$$\Gamma(\alpha) = \frac{e^S}{X}$$

EXAMPLE

FIND: $\Gamma(2.4)$

SOLUTION:

$$Y = 9.4$$

$$X = 9.4 \times 8.4 \times 7.4 \times 6.4 \times 5.4 \times 4.4 \times 3.4 \times 2.4$$

$$X = 725029.0842$$

$$S = 0.9189385332 - 9.4 + 9.9 \ln 9.4$$

$$+ \frac{1}{(12)(9.4)} \left[1 - \frac{1}{30(9.4)^2} + \frac{1}{150(9.4)^4} \right]$$

$$S = 13.71082637$$

$$\Gamma(2.4) = \frac{e^S}{X} = \frac{9.006089021 \times 10^5}{7.250290842 \times 10^5}$$

$$\Gamma(2.4) = 1.242169346$$

AS A CHECK

$$\Gamma(2.4) = 1.4 \Gamma(1.4) = 1.4 \times 0.8872638175$$

See TABLE I

$$\Gamma(2.4) = 1.242169345$$

BASIC LANGUAGE PROGRAM

The previous calculator method is shown as a program listing in
Basic Language, PL-1.

```

TI-59 Methods

A. USER ENTERED PROGRAM

The following program PL-2 is for use with the TI-59 Programmable Calculator and is part of Texas Instrument's Math 39 program exchange. It calculates the Gamma Function $\Gamma(x)$ for integer and non-integer values of the argument x .

An internal accuracy check using a fractional argument can be made by calculating $\Gamma(0.5)$, then squaring the answer. The result should be π . Subtracting the stored value of π from the previously calculated value gives 4×10^{-10} . Thus, the error is 4 in the 11th digit. Other non-integer values have been compared with the National Bureau of Standards Tables [1] and almost all agree within $\pm$ one unit in the 10th digit. PL-2 accuracy is considered accurate for all practical purposes.

To use enter the value of x ; then press D. The computed value of $\Gamma(x)$ will ultimately be displayed.

$$x < 69.5$$

Calculation time is 5 to 15 seconds, depending on x .

EXAMPLE: Compute $\Gamma(6.5)$

Enter 6.5. PRESS D.

The displayed output is 287.8852778

Thus, $\Gamma(6.5) = 287.8852778$

TI-59 Methods (Cont'd)

B. MATH UTILITY MODULE PROGRAM MU-11

The new math utility module can be used for computing $\Gamma(x)$ directly.

EXAMPLE: Compute $\Gamma(6.3)$

<u>ENTER</u>	<u>PRESS</u>	<u>DISPLAY</u>
	[2nd] [Pgm] 11	
6.3	[A]	201.8132752

Thus, $\Gamma(6.3) = 201.8132752$

HP-34C METHOD

The key $x!$ can be used directly to calculate $\Gamma(x)$ using the following relationship:

$$\Gamma(x) = (x - 1) !$$

EXAMPLE: Calculate $\Gamma(6.3)$

<u>KEYSTROKES</u>	<u>DISPLAY</u>	<u>COMMENT</u>
6.3	6.3	x
ENTER $\uparrow$ 1[-]	5.3	x-1
[h] [x!]	201.8132	$\Gamma(6.3)$

B. INCOMPLETE GAMMA FUNCTIONS COMPUTATION

Definition:

The two Incomplete Gamma Functions $\gamma(\alpha, \tau)$ and $Q(\alpha, \tau)$ are defined as follows:

$$\gamma(\alpha, \tau) = \int_0^{\tau} x^{\alpha-1} e^{-x} dx$$

$$Q(\alpha, \tau) = \int_{\tau}^{\infty} x^{\alpha-1} e^{-x} dx$$

The Incomplete Gamma Functions are related to the Complete Gamma Function $\Gamma(\alpha)$ as follows:

$$\Gamma(\alpha) = \gamma(\alpha, \tau) + Q(\alpha, \tau)$$

That is

$$\int_0^{\infty} y dx = \int_0^{\tau} y dx + \int_{\tau}^{\infty} y dx$$

$$\text{where } y = x^{\alpha-1} e^{-x}$$

TABULAR METHOD

On page 941 of Abramowitz [1]

$$\gamma(\alpha, \tau) = \Gamma(\alpha) P(\chi^2 | \nu)$$

$$\text{where } \chi^2 = 2\tau ; \nu = 2\alpha$$

$$Q(\alpha, \tau) = \Gamma(\alpha) - \gamma(\alpha, \tau)$$

$$\text{Also } Q(\alpha, \tau) = \Gamma(\alpha) Q(\chi^2 | \nu)$$

$$\text{NOTE: } Q(\alpha, \tau) \neq Q(\chi^2 | \nu)$$

$$P(\chi^2 | \nu) = 1 - Q(\chi^2 | \nu)$$

Values of $Q(\chi^2 | \nu)$ are tabulated in Table III, on pages 978-983 [1]

$$\text{where } y = x^{\alpha-1} e^{-x}$$

A pictorial representation is shown in figure 2. Note that $y_{\max}$ occurs at $x = \alpha-1$.

FIGURE 2 PICTORIAL REPRESENTATION
OF THE INCOMPLETE
GAMMA FUNCTIONS

EXAMPLE

FIND: $\gamma(1.5, 0.9)$, $Q(1.5, 0.9)$

SOLUTION: $\alpha = 1.5$; $\tau = 0.9$

$\Gamma(1.5) = 0.8862269255$ from Table I (Table 6.1 page
268 [1])

$$\chi^2 = 2\tau = 1.8; \quad \nu = 2\alpha = 3$$

In Table 26.7 page 978 [1]

$$Q(\chi^2 | \nu) = 0.61493$$

$$P(\chi^2 | \nu) = 1 - Q(\chi^2 | \nu) = 0.38507$$

$$\gamma(1.5, 0.9) = \Gamma(1.5) P(\chi^2 | \nu) = 0.34126$$

$$Q(1.5, 0.9) = \Gamma(1.5) Q(\chi^2 | \nu) = 0.54497$$

As a check

$$\gamma(1.5, 0.9) + Q(1.5, 0.9) = 0.88623 \text{ to five places} = \Gamma(1.5)$$

Interpolation formulas are shown on the bottom of p. 981 [1] (Table III).

One formula is for interpolation on χ^2 alone. The Double Entry Interpolation formula is for interpolation on both χ^2 and ν .

$$\text{where } \phi = \frac{1}{2} (\chi^2 - \chi_0^2)$$

$$w = \nu - \nu_0 > 0$$

For interpolation on ν alone, the Double Entry formula can be modified by letting $\phi = 0$ (i.e. $\chi^2 = \chi_0^2$) as follows:

$$\begin{aligned} Q(\chi^2 | \nu) &= Q(\chi_0^2 | \nu_0 - 1) \left[\frac{1}{2} w^2 - \frac{w}{2} \right] \\ &\quad + Q(\chi_0^2 | \nu_0) \left[1 - w^2 \right] \\ &\quad + Q(\chi_0^2 | \nu_0 + 1) \left[\frac{1}{2} w^2 + \frac{w}{2} \right] \end{aligned}$$

EXAMPLE:

FIND: $\gamma(5.64, 8)$, $Q(5.64, 8)$

SOLUTION:

$$\alpha = 5.64 \quad ; \quad \tau = 8$$

$$\Gamma(5.64) = 4.64 \times 3.64 \times 2.64 \times 1.64 \times \Gamma(1.64)$$

$$\Gamma(1.64) = 0.8986420302 \text{ from Table I (Table 6.1 page 269 [1])}$$

$$\Gamma(5.64) = 65.71338911$$

$$\chi_0^2 = \chi^2 = 2\tau = 16 \quad ; \quad \nu = 2\alpha = 11.28$$

In this example

$$\nu_0 = 11 \quad ; \quad \nu_0 - 1 = 10 \quad ; \quad \nu_0 + 1 = 12$$

$$w = \nu - \nu_0 = 11.28 - 11 = 0.28$$

Thus

$$\begin{aligned}
 Q(\chi^2 | v) &= (0.09963) \left[\frac{.28}{2} - \frac{.28}{2} \right] \\
 &+ (0.14113) \left[1 - .28^2 \right] \\
 &+ (0.19124) \left[\frac{.28^2}{2} + \frac{.28}{2} \right] \\
 &= -0.01004 + 0.13006 + 0.03427
 \end{aligned}$$

$$Q(\chi^2 | v) = 0.15429$$

$$P(\chi^2 | v) = 1 - Q(\chi^2 | v) = 0.84571$$

$$\gamma(5.64, 8) = \Gamma(5.64) P(\chi^2 | v) = 55.574$$

$$Q(5.64, 8) = (5.64) Q(\chi^2 | v) = 10.139$$

As a check

$$\gamma(5.64, 8) + Q(5.64, 8) = 65.713 \text{ to five places} = \Gamma(5.64)$$

EXAMPLE

FIND: $\gamma(4.3, 3.77)$, $Q(4.3, 3.77)$

SOLUTION:

$$\alpha = 4.3 \quad ; \quad \tau = 3.77$$

$$\Gamma(4.3) = 3.3 \times 2.3 \times 1.3 \times \Gamma(1.3)$$

$$\Gamma(4.3) = 8.855343359$$

$$\chi^2 = 2\tau = 7.54 \quad ; \quad v = 2\alpha = 8.6$$

For this example

$$\chi^2 = 7.54 \quad ; \quad \chi_o^2 = 7.4$$

$$\phi = \frac{1}{2} (7.54 - 7.4) = 0.07$$

$$v = 8.6 \quad ; \quad v_o = 8 \quad ; \quad v_o + 1 = 9$$

$$v_o - 4 = 4$$

$$v_o - 2 = 6$$

$$v_o - 1 = 7$$

EXAMPLE (Cont'd)

$$w = 8.6 - 8 = 0.6$$

The Double Entry Interpolation expression on page 981 [1] (Table III) will be used.

$$\begin{aligned} Q(x_0^2 | v) &= Q(x_0^2 | v_0 - 4) \left[\frac{1}{2} \phi^2 \right] \\ &+ Q(x_0^2 | v_0 - 2) \left[\phi - \phi^2 - w \phi \right] \\ &+ Q(x_0^2 | v_0 - 1) \left[\frac{1}{2} w^2 - \frac{1}{2} w + w \phi \right] \\ &+ Q(x_0^2 | v_0) \left[1 - w^2 - \phi + \frac{1}{2} \phi^2 + w \phi \right] \\ &+ Q(x_0^2 | v_0 + 1) \left[\frac{1}{2} w^2 + \frac{1}{2} w - w \phi \right] \end{aligned}$$

$$\begin{aligned} Q(x^2 | v) &= (0.11620) \left[\frac{1}{2} (.07)^2 \right] \\ &+ (0.28543) \left[.07 - .07^2 - (.6)(.07) \right] \\ &+ (0.38845) \left[\frac{1}{2} (.6)^2 - \frac{1}{2} (.6) + (.6)(.07) \right] \\ &+ (0.49415) \left[1 - .6^2 - .07 + \frac{1}{2} (.07)^2 + (.6)(.07) \right] \\ &+ (0.59555) \left[\frac{1}{2} (.6)^2 + \frac{1}{2} (.6) - (.6)(.07) \right] \end{aligned}$$

$$\begin{aligned} Q(x^2 | v) &= 0.00028469 + 0.006593433 \\ &- 0.0302991 + 0.30363046 + 0.2608509 \\ &= 0.5410603905 \end{aligned}$$

$$Q(4.3, 3.77) = \Gamma(4.3) Q(x^2 | v)$$

$$= 4.7913 \text{ to five places}$$

$$4.791276 \text{ to seven places}$$

$$\gamma(4.3, 3.77) = \Gamma(4.3) \left[1 - Q(x^2 | v) \right]$$

$$= 4.0641 \text{ to five places}$$

$$4.064068 \text{ to seven places}$$

$$8.85534 \text{ to six places}$$

$$\phi \left(\frac{1}{2} (\chi^2 - \chi_0^2) \right) \quad w = \nu - \chi_0 - 0$$

Interpolation on χ^2

$$Q(\chi^2, \nu) = Q(\chi_0^2, \nu_0 - 4) \left[\frac{1}{2} \phi^2 \right] + Q(\chi_0^2, \nu_0 - 2) \left[\phi \phi^2 \right] + Q(\chi_0^2, \nu_0) \left[1 - \frac{1}{2} \phi^2 \right]$$

Double Entry Interpolation

$$Q(\chi^2, \nu) = Q(\chi_0^2, \nu_0 - 4) \left[\frac{1}{2} \phi^2 \right] + Q(\chi_0^2, \nu_0 - 2) \left[\phi \phi^2 + w \phi \right] + Q(\chi_0^2, \nu_0 - 1) \left[\frac{1}{2} w^2 - \frac{1}{2} w \phi \right]$$

$$+ Q(\chi_0^2, \nu_0) \left[1 - w^2 - \phi^2 - w \phi \right] + Q(\chi_0^2, \nu_0 + 1) \left[\frac{1}{2} w^2 - \frac{1}{2} w \phi \right]$$

$$Q(\chi^2|\nu) = 1 - P(\chi^2|\nu) = \left[2^{\frac{\nu}{2}} \Gamma\left(\frac{\nu}{2}\right) \right]^{-1} \int_{\chi^2}^{\infty} x^{\frac{\nu}{2}-1} e^{-\frac{x}{2}} dx = \left[\Gamma\left(\frac{\nu}{2}\right) \right]^{-1} \int_{\chi^2/2}^{\infty} e^{-t} t^{\frac{\nu}{2}-1} dt = \sum_{j=0}^{\infty} \frac{e^{-\chi^2/2} (\chi^2/2)^j}{j!} \quad (\nu \text{ even, } \nu = 2m, m = \frac{\nu}{2})$$

$$\phi\left(\frac{1}{2}(\chi^2 - \chi_0^2)\right) \quad w = \nu - \nu_0 > 0$$

Interpolation on χ^2

$$Q(\chi^2|\nu) = Q(\chi_0^2|\nu_0 - 4) \left[\frac{1}{2} \phi^2 \right] + Q(\chi_0^2|\nu_0 - 2) [\phi - \phi^2] + Q(\chi_0^2|\nu_0) \left[1 - \phi + \frac{1}{2} \phi^2 \right]$$

Double Entry Interpolation

$$Q(\chi^2|\nu) = Q(\chi_0^2|\nu_0 - 4) \left[\frac{1}{2} \phi^2 \right] + Q(\chi_0^2|\nu_0 - 2) [\phi - \phi^2 - w\phi] + Q(\chi_0^2|\nu_0 - 1) \left[\frac{1}{2} w^2 - \frac{1}{2} w + w\phi \right] \\ + Q(\chi_0^2|\nu_0) \left[1 - w^2 - \phi + \frac{1}{2} \phi^2 + w\phi \right] + Q(\chi_0^2|\nu_0 + 1) \left[\frac{1}{2} w^2 + \frac{1}{2} w - w\phi \right]$$

TI-59 METHOD (ML-09)

The TI-59 Programmable Calculator has a numerical integration program in its Master Library, ML-09. Included in PL-4 are pages 29-31 of the TI-59 User's Manual. The method uses Simpson's Rule. $\gamma(\alpha, \tau)$ and $Q(\alpha, \tau)$ can be computed using ML-09. The integration limits will be different for the two Incomplete Gamma Functions.

	<u>$\gamma(\alpha, \tau)$</u>	<u>$Q(\alpha, \tau)$</u>
Lower Limit X_0	0	τ
Upper Limit X_n	τ	∞^*

*A suitably large real number must be found to represent ∞ .

This would be a value such that a large value would result in a negligible increase in the value of the integral. A value of $X_n > 227$ will cause underflow.

A sufficiently large value for n must be established. The larger the value of n used, the better the accuracy of the integral. The computation time also increases.

A listing for $f(x)$ is also included.

SIMPSON'S APPROXIMATION (CONTINUOUS)

This program may be used to approximate the integral, I , of a function defined by the user, over an interval x_0 to x_n , using Simpson's Rule.

$$I = \int_{x_0}^{x_n} f(x) dx$$

The function $f(x)$ must be expressed as a sequence of keystrokes in the user program memory.

USER INSTRUCTIONS

STEP	PROCEDURE	ENTER	PRESS	DISPLAY
1	Initialize		[RST]	0.
2	Select learn mode		[LRN]	000 00
3	Use A as label		[2nd] [17]	001 00
			[2nd] [18]	002 00
4	Enter $f(x)$ as a series of keystrokes. Do not use $\equiv$ or [C/R]. Do not use registers 0-5.			
5	End $f(x)$ with [INV] [SRP]		[INV] [SRP]	xxx 00
6	Leave learn mode		[LRN]	0.
7	Select program		[2nd] [19]	009
8	Enter lower limit	x_0	[A]	x_0
9	Enter upper limit	x_n	[B]	x_n
10	Enter n ($n = 2, 4, 6, \dots$, display flashes if not legal entry)	n	[C]	h
11	Compute integral		[D]	I
12	For a new interval or a new n , repeat Steps 7-11.			

- NOTE:
1. Evaluate expressions using parentheses only.
 2. Running time is dependent on input data.

PL-4

Example:

Evaluate $\int_0^{\pi/2} \frac{1}{\cos x + 2} dx$ using two subintervals.

Method Used

Calculations are based on Simpson's rule:

$$\int_{x_0}^{x_n} f(x) dx \approx \frac{h}{3} (f_0 + 4f_1 + 2f_2 + 4f_3 + 2f_4 + \cdots + 2f_{n-2} + 4f_{n-1} + f_n)$$

where:

$$h = \frac{x_n - x_0}{n}, \quad x_n > x_0$$

n = number of subintervals = 2, 4, 6, 8, ...

x_0 : lower limit

A

x_n : upper limit

B

$n(n = 2, 4, 6 \dots)$

C

Compute Integral

D

EXAMPLE

FIND: $\gamma(1.5, 0.9)$ and $Q(1.5, 0.9)$

$$\alpha = 1.5$$

$$x_0 = 0 ; x_n = 0.9$$

<u>n</u>	<u>$\gamma(1.5, 0.9)$</u>
16	0.3401
32	0.34087
64	0.3411193
128	0.341207
512	0.341249

$$\therefore \gamma(1.5, 0.9) \approx 0.341249$$

Accuracy could be improved by increasing n still further or by breaking the integral into two integrals with limits from $0 - 0.5$ and $0.5 - 0.9$ respectively.

$$n = 512$$

$$\gamma_{0-0.5} = 0.1761333892$$

$$\gamma_{0.5-0.9} = 0.1651191608$$

$$\gamma(1.5, 0.9) \approx 0.34125255$$

$n = 128$ for each of the following integrals:

$$Q_{0.9-4} = \int_{0.9}^4 y \, dx = 0.504195085$$

$$Q_{4-8} = 0.0397718$$

$$Q_{8-20} = 0.001005$$

$$Q_{20-40} = 0.0000000094$$

$$\therefore Q(1.5, 0.9) \approx 0.54497189$$

$$\gamma(1.5, 0.9) + Q(1.5, 0.9) = 0.88622444$$

FIGURE 3 GAMMA FUNCTIONS FOR $\alpha=1.5$; $\tau=0.9$

EXAMPLE

FIND: $\gamma(5.64, 8)$

$$x_0 = 0; x_n = 8; n = 128$$

$$\gamma(5.64, 8) = 55.57279 \text{ (55.5728 to six places)}$$

FIND: $Q(5.64, 8)$

$$x_0 = 8; x_n = \infty \text{ (say, } x_n = 64)$$

$$n = 128$$

$$Q(5.64, 8) = 10.14056 \text{ (10.1406 to six places)}$$

$$\gamma(5.64, 8) + Q(5.64, 8) = 65.7134$$

FIND: $\Gamma(5.64)$

$$x_0 = 0; x_n = 64; n = 256$$

$$\Gamma(5.64) \approx 65.7134$$

FIGURE 4 GAMMA FUNCTIONS FOR $\alpha=5.64$; $\tau=8$

B. TI-59 METHOD (MU-17)

The new Math Utility module can also be used for computing the Gamma Functions. The numerical integration program, MU-17, is much faster in execution time than ML-09 (i.e. PL-4) and simpler to use. This method uses the systematic procedure called Romberg Integration. The subroutine for $f(x)$ must be entered (see PL-5) along with the integration limits and expected accuracy of the result. The program then quickly computes the integral.

HP-34C METHOD

The program for computing the Incomplete Gamma Functions on the HP-34C is listed in PL-15 which also computes other functions. The following listing for $\gamma(\alpha, \tau)$ and $Q(\alpha, \tau)$ are included for information only. This computer has a very fast and accurate numerical integration scheme built into it.

HP34C
INCOMPLETE GAMMA FUNCTIONS
 $\gamma(\alpha, \tau)$, $Q(\alpha, \tau)$

$\gamma(\alpha, \tau)$:

Put value of α in X-register

Press ENTER $\uparrow$

Put value of τ in X-register *

Press GTO 4

Press R/S

Display will be $\gamma(\alpha, \tau)$

$Q(\alpha, \tau)$:

Put value of α in X-register

Press ENTER $\uparrow$

Put value of τ in X-register *

Press GTO 3

Press R/S

Display will be $Q(\alpha, \tau)$

NOTE: The upper integration limit that represents ∞ is stored in $R_{.1}$.

For example: upper limit = 50. Put 50 in the X-register. Press
STO .1 . The upper limit should be less than 227; otherwise under-
flow will occur in computing $f(x)$. An upper limit of 50 has proven
to give accurate results. See page 44.

* Press f SCI 7 (for accuracy of 7 significant figures)

EXAMPLES

Program Description

Program Title Incomplete Gamma Functions By HP-67

Name

Date

Address

City

State New York

Zip Code

Program Description, Equations, Variables, etc.

Program to evaluate the following two functions:

$$\gamma(\alpha, \tau) = \int_0^{\tau} x^{\alpha-1} e^{-x} dx$$

$$Q(\alpha, \tau) = \int_{\tau}^{\infty} x^{\alpha-1} e^{-x} dx$$

Comments: Running time for $\gamma < 3$ min, $Q < 4$ min

Operating Limits and Warnings Generally accurate to at least three significant figures.

To increase accuracy for γ increase number in program lines 7 and 8 to a greater even number. To increase accuracy for calculating Q increase number on lines 65 and 66 (upper limit) and increase number on lines 69 and 70 to a greater even number.

DO NOT USE THIS SPACE

C. GAMMA FUNCTIONS COMPUTATION PROGRAM (BASIC LANGUAGE)

Included in PL-8 is a computer program written in Basic Language which quickly, conveniently and accurately computes the three Gamma Functions: $\Gamma(\alpha)$, $\gamma(\alpha, \tau)$, $Q(\alpha, \tau)$.

The method for computing $\Gamma(\alpha)$ is as previously described. The method for computing the two Incomplete Gamma Functions has not been previously described. This method uses an approximation formula as described in Abramowitz [1] to calculate a "Normalized Incomplete Gamma Function: $Q_0(\alpha, \tau)$. $Q_0(\alpha, \tau)$ is extremely accurate for $\alpha = \text{integer}$. τ may be either an integer or non-integer.

$$Q_0(\alpha, \tau) = \frac{Q(\alpha, \tau)}{(\alpha-1)!}$$

$$(\alpha-1)! = \Gamma(\alpha) \text{ for } \alpha = \text{integer}$$

The approximation formula is as follows:

$$Q_0(\alpha, \tau) = \frac{\tau^{\alpha-1} e^{-\tau}}{(\alpha-1)!} \left[1 + \sum_{n=2}^{\infty} \frac{(-1)^{n+1}}{\tau^{n-1}} \prod_{k=1}^{(n-1)} (k - \alpha) \right]$$

$$1 \leq \alpha \leq 350$$

NOTE: For most fatigue analysis applications $5 < \alpha < 15$.

C. GAMMA FUNCTIONS COMPUTATION PROGRAM (Cont'd)

For α = non-integer the interpolation method in Abramowitz [1] is used.

Define:

$$\alpha_0 = \text{integer part of } \alpha$$

$$w = \alpha - \alpha_0$$

$$\begin{aligned} Q_0(\alpha, \tau) = & Q_0(\alpha_0 - 1, \tau) \left[\frac{1}{2} w^2 - \frac{1}{2} w \right] \\ & + Q_0(\alpha_0, \tau) \left[1 - w^2 \right] \\ & + Q_0(\alpha_0 + 1, \tau) \left[\frac{1}{2} w^2 + \frac{1}{2} w \right] \end{aligned}$$

Then

$$Q(\alpha, \tau) = \Gamma(\alpha) Q_0(\alpha, \tau)$$

$$\gamma(\alpha, \tau) = \Gamma(\alpha) \left[1 - Q(\alpha, \tau) \right]$$

Several computation runs are included. It can be seen that the accuracy is sufficient for practical applications. Refer to Tables IV and V.

In PL-8

$$N = \alpha$$

$$Z = \tau$$

$$G0 = Q_0(\alpha, \tau)$$

$$G1 = \gamma(\alpha, \tau)$$

$$G2 = Q(\alpha, \tau)$$

$$G5 = \Gamma(\alpha)$$

D. ERROR FUNCTION COMPUTATION

Definition

The Error Function used is that of Papoulis [2] :

$$\text{erf}_p(\alpha) = \frac{1}{\sqrt{2\pi}} \int_0^{\alpha} e^{-x^2/2} dx$$

$$\text{erf}_p(0) = 0 \quad ; \quad \text{erf}_p(\infty) = 0.5$$

$$\text{erf}_p(-\alpha) = -\text{erf}_p(\alpha)$$

Hereafter the above subscript p will be dropped for convenience.

It will be understood that $\text{erf}(\alpha) = \text{erf}_p(\alpha)$.

Figure 5 shows a graph of $\text{erf}(\alpha)$ versus α .

FIGURE 5 ERROR FUNCTION VERSUS α

TI-59 METHOD

The TI-59 Programmable Calculator can be used as the program listing PL-9 to calculate $\text{erf}(\alpha)$.

EXAMPLE:

FIND: $\text{erf}(1.5)$

SOLUTION: Use PL-9

Enter 1.5

Display

1.5

Press A

0.4331927713

$\text{erf}(1.5) = 0.4331927713$

EXAMPLE:

Find: $\text{erf}(-0.125)$

Enter .125

Display

.125

Press +/-

-.125

Press A

-.0497382658

$\text{erf}(-0.125) = -0.0497382658$

HP-34C METHOD

The program listing for $\text{erf}(\alpha)$ is given in PL-15 and will not be shown here. The program is used as follows to calculate $\text{erf}(\alpha)$:

HP-34C

ERF(α)

GIVEN: Positive or negative value of α

FIND: ERF(α)

Put the value of α into X-register (i.e. Display register)

Key in desired accuracy *

Press B

Final display will be the value of erf(α)

*Accuracy: In scientific notation set the display for the value of α to the desired number of significant digits desired for the final value of erf(α).

EXAMPLE:

GIVEN: $\alpha = 1.$

FIND: ERF(α)

Put "1" in X-register

Press f SCI 7 (for accuracy of 7 significant figures)

Press B

ERF(α) = 0.3413447 will be displayed

HP-67 METHOD

A. MATH PAC 1

An Error Function Program is most conveniently obtained as program 18-02 of Hewlett-Packard's Math Pac 1 package. The Error Function of program 18-02 is defined slightly different than Papoulis' Error Function.

Program 18-02 can still be used to calculate $\text{erf}_p(\alpha)$ as follows:

- a) Use α divided by $\sqrt{2}$ instead of α as the argument value.
- b) Divide the final answer by 2.

B. PL-10

Program listing PL-10 computes both $\text{erf}(\alpha)$ and its inverse.

TABULAR METHODS

Table VI tabulates values of $\text{erf}(\alpha)$ versus α for values of α from zero to 4.0. These values were computed using the BASIC LANGUAGE Program as listed in PL-11.

EXAMPLE:

FIND $\text{erf}(2.05)$

$$\text{erf}(2.05) = 0.4798178$$

FIND $\text{erf}(-1.72)$

$$\text{erf}(1.72) = 0.4572838$$

$$\text{erf}(-1.72) = -0.4572838$$

FIND $\text{erf}(2.044)$

$$\text{erf}(2.045) = 0.4795726$$

$$\text{erf}(2.040) = 0.4793249$$

Using linear interpolation:

$$\text{erf}(2.044) = 0.4795230$$

$$\text{erf}(2.044)_{\text{actual}} = 0.4795232$$

TABULAR METHOD (Cont'd)

FIND: erf (0.068)

$$\text{erf}(0.065) = 0.0259131$$

$$\text{erf}(0.070) = 0.0279032$$

Using linear interpolation

$$\text{erf}(0.068) = 0.0271071$$

$$\text{erf}(0.068)_{\text{actual}} = 0.0271072$$

PL-10

PAPOULIS ERROR FUNCTION AND INVERSE HP-67

$\alpha, A \rightarrow \text{erf}(\alpha)$ $\text{erf}(\alpha) +, \epsilon, D \rightarrow \alpha$

Program Description

Program Title	Papoulis Error Function and Its Inverse - HP-67		
Name			Date
Address			
City	State	Zip Code	
Program Description, Equations, Variables, etc. Evaluates $\text{erf}(\alpha) = \frac{1}{\sqrt{2\pi}} \int_0^\alpha e^{-\frac{x^2}{2}} dx$ As well as the inverse function.			
Operating Limits and Warnings The computing time for the inverse error function is long. It is a function of the maximum error ϵ desired. For an error $<.0005$ the running time is about 10 minutes. Range of α for inverse error function $-5 \rightarrow +5$.			

DO NOT USE THIS SPACE

PL-11

E. INVERSE ERROR FUNCTION COMPUTATION

Definition

The Inverse Error Function is that value of α that yields a specified value of $\text{erf}(\alpha)$. That is, given the value of $\text{erf}(\alpha)$, find α .

TI-59 METHOD:

The following computation method applies to positive values of α .

For negative values of α use the relationship

$$\text{erf}(-\alpha) = -\text{erf}(\alpha)$$

That is, calculate $\text{erf}(\alpha)$ and change the sign of $\text{erf}(\alpha)$ for negative α values.

Define

$$K = \text{erf}(\alpha) \quad ; \quad 0 < K < 0.5$$

$$z = \sqrt{-2 \ln(2K)}$$
$$\alpha = g_0 + g_1 z + g_2 z^2 + \dots + g_{10} z^{10}$$

Where:

$$g_0 = 6.55864 \times 10^{-4}$$

$$g_1 = -0.02069$$

$$g_2 = 0.737563$$

$$g_3 = -0.207071$$

$$g_4 = -2.06851 \times 10^{-2}$$

$$g_5 = 0.03444$$

$$g_6 = -1.17213 \times 10^{-2}$$

$$g_7 = 2.10941 \times 10^{-3}$$

$$g_8 = -2.18541 \times 10^{-4}$$

$$g_9 = 1.23163 \times 10^{-5}$$

$$g_{10} = -2.93138 \times 10^{-7}$$

TI-59 METHOD (Cont'd)

The following listing PL-12 is for the TI-59 Programmable Calculator.

It utilizes the equations previously described. To use: enter the value of $\text{erf } (\alpha)$; then press $\boxed{A}$. The computed value of α will ultimately be displayed. Table VI can be used as a check on the reasonableness of the answer. Computation time is approximately 10 seconds.

$$0 < \text{erf } (\alpha) < 0.5$$

For negative values of $\text{erf } (\alpha)$, calculate α for the positive value of $\text{erf } (\alpha)$. Then change the sign of α .

Example:

Find α for $\text{erf } (\alpha) = 0.4995$

Enter 0.4995; Press $\boxed{A}$

Display: 3.29049

Thus $\alpha = 3.29049$

Example:

Find α for $\text{erf } (\alpha) = - 0.4975$

Enter 0.4975 ; Press $\boxed{A}$

Display: 2.8066

Thus $\alpha = - 2.8066$

INVERSE ERROR FUNCTION

GIVEN: $\text{ERF}(\alpha)$; positive or negative value

FIND: α

Put the value of $\text{erf}(\alpha)$ into the X-register

Key in desired accuracy *

Store the value of $\text{erf}(\alpha)$ into register 6

Put initial estimate on bounds of α . Upper and lower bounds must bracket true value of α . Lower bound is put into X-register. Then press ENTER $\uparrow$. Then put upper bound in X-register. Press f SOLVE 1.

Execution time is approximately as follows:

<u>Accuracy</u>	<u>Time</u>
f SCI 3	7 minutes
f SCI 5	14 minutes
f SCI 7	24 minutes

EXAMPLE:

GIVEN: $\text{ERF}(\alpha) = -.4331927$

FIND: α

Put $-.4331927$ in X-register

* Press f SCI 7 (for accuracy of 7 significant figures)

Press STO 6

Press 2 CHS (i.e. -2)

Press ENTER $\uparrow$

Press .1 CHS (i.e. -.1)

Press f SOLVE 1

bounds on answer

Final Display = -1.500

F. PROBABILITY OF FAILURE COMPUTATION

TI-59 METHOD

Many probability of failure $F(\alpha)$ expressions are of the form

$$F(\alpha) = 0.5 + \text{erf}(\alpha)$$

This expression can be conveniently computed using PL-13. To use enter the value of α and press A. The value for $F(\alpha)$ will ultimately be displayed.

EXAMPLE:

FIND: $F(\alpha)$ for $\alpha = -2.305, -1.365, -0.68, -0.365, -0.125, 0.125, 0.365, 0.68, 1.365, 2.305$

<u>α</u>	<u>$F(\alpha)$</u>
-2.305	0.0105832588
-1.365	0.0861265831
-0.68	0.24825221581
-0.365	0.3575557601
-0.125	0.4502617342
0.125	0.5497382658
0.365	0.6424442399
0.68	0.7517478419
1.365	0.9138734169
2.305	0.9894167412

BASIC LANGUAGE METHOD

PL-14 is a modification of PL-11 to calculate $F(\alpha)$.

$$F(\alpha) = 0.5 + \operatorname{erf}(\alpha)$$

TABULAR METHOD

Table VII tabulates $F(\alpha)$ versus α .

EXAMPLE:

FIND: $F(-2.305)$ using Table VII

$$F(-2.3) = 0.0107241$$

$$F(-2.31) = 0.010444$$

Using linear interpolation

$$F(-2.305) = 0.010584$$

$$F(-2.305)_{\text{ACTUAL}} = 0.010583$$

EXAMPLE:

FIND: $F(.368)$ using Table VII

$$F(.36) = 0.6405764 ; F(.37) = 0.6443087$$

Using linear interpolation: $F(.368) = 0.6435622$

$$F(.368)_{\text{ACTUAL}} = 0.6435633$$

H. ACCELERATED RANDOM TEST LEVEL COMPUTATION

The computation methods in this section calculate the accelerated random input vibration level $\ddot{x}_2$ that will cumulate the same fatigue damage to a structural element being stressed for T2 hours as a random input vibration level $\ddot{x}_1$ for T1 hours. Fracture Mechanics effects causes the relationship between parameters to be a transcendental function as follows:

$$\ddot{x}_2 - b_4 [1 - b_2 \ddot{x}_2^{n(\theta-2)}]^{1/n\theta} = 0$$

$\ddot{x}_2$ is computed by solving the above function. These programs use the half-interval technique.

INPUT PARAMETERS:

- a_i = initial crack half-length (inches); NOTE: a_i must be >0.004 inches
- $\ddot{x}_1$ = input acceleration rms level at the service environment (g rms)
- $\ddot{x}_2$ = input acceleration rms level at the accelerated test environment (g rms)
- C_4 = rms stress per g rms constant (ksi/g rms)
- T_1 = service environment duration (time units)
- T_2 = accelerated test duration (same time units as T_1).
- n = damping linearity constant
- θ = material crack growth rate constant
- Y = geometrical parameter
- $\bar{A}$ = material sinusoidal fatigue curve constant (ksi)
- $\bar{C}$ = material random fatigue curve constant (ksi)
- ΔK_c = material fracture toughness (ksi $\sqrt{\text{in}}$)

The constant C4 is the ratio of the rms stress in the structural element that is cumulating fatigue damage to the "black box" rms vibration input acceleration level. These programs assume that the power spectral density of the input acceleration retains the same shape at both $\ddot{x}_1$ and $\ddot{x}_2$ levels, especially in the vicinity of structural resonant frequencies. Otherwise C4 will take on a different value at each input acceleration level. This is because the rms stress level in the structural element (hence, fatigue) is related to the square root of the power spectral density of the acceleration input in the regions of the resonant frequencies.

The constant η denotes the linearity of the structural assembly in relating the rms stress level σ of the structural element to the input acceleration level as follows:

$$\sigma_1 = C4 \ddot{x}_1^\eta \quad ; \quad \sigma_2 = C4 \ddot{x}_2^\eta$$

$\eta = 1$ represents the damping linearity system. $\eta = 0.833$ represents a system whose damping is controlled by internal stress-strain hysteresis damping. $\eta = 1.5$ represents a system controlled by Coulomb friction damping.

Define

CONSTANTS:

$$b_1 = \frac{1}{a_1} \left[\frac{\Delta K_c}{C_5 Y} \right]^2$$

$$c_5 = \left(\frac{2\bar{A}}{\bar{C}} \right) c_4$$

$$b_2 = \left(\frac{1}{b_1} \right)^{\frac{\theta - 2}{2}}$$

$$b_3 = 1 - b_2 \ddot{x}_1^{n(\theta - 2)}$$

$$b_4 = \ddot{x}_1 \left(\frac{T_1}{T_2} \right)^{1/n\theta} \left(\frac{1}{b_3} \right)^{1/n\theta}$$

$$\ddot{x}_{2\max} = b_1^{1/2n}$$

For convenience let $\ddot{x}_2$ be also referred to as x . The value of x (i.e. $\ddot{x}_2$) to be solved for is that value that sets the following function equal to zero:

$$f(x) = x - b_4 [1 - b_2 x^{n(\theta - 2)}]^{1/n\theta}$$

$\ddot{x}_{2\max}$ is the largest value of x that will not cause computational problems (e.g. $\ln$ of a negative number). It represents the largest value of x that has practical use. If $\ddot{x}_2 > \ddot{x}_{2\max}$, fatigue failure will occur during the application of the first vibration cycle. A similar practical limit is imposed on the selection of the value for a_i . If a_i is chosen larger than a_{c2} (see below), $\ddot{x}_2$ will be less than $\ddot{x}_1$, which is meaningless for an "accelerated" test.

a_{c2} = critical crack size at $\ddot{x}_2$

$$a_{c2} = \left[\frac{\Delta K_c}{Y C_5 \ddot{x}_2^\eta} \right]^2 \quad \text{inches}$$

1. BASIC LANGUAGE (PL-16)

PL-16 solves for $\ddot{x}_2$.

INPUT DATA:

A1, C4, N, O, K, Y, C, A, T2, T1, X1

represents

$a_1, C_4, \eta, \theta, \Delta K_c, Y, \bar{C}, \bar{A}, T_2, T_1, \ddot{x}_1$

OUTPUT DATA:

X2 = $\ddot{x}_2$

EXAMPLES:

RUN

WHAT ARE A1,C4,N,O,K,Y,C,A,T2,T1,X1

ACCELERATED $\ddot{x}_2$ (HP-34C)

The following program listing solves for the accelerated random input vibration level $\ddot{x}_2$ to accomplish the same goal as PL-16. PL-16 is written in BASIC language. PL-15 is written for the HP-34C programmable Calculator. The constants C_5 , $\ddot{x}_{2\max}$, b_1 thru b_4 must be calculated separately as shown below. Then their values are entered into PL-15.

INPUT PARAMETERS:

a_1 (inches)	θ
$\ddot{x}_1$ (g rms)	Y
C_4 (ksi/g rms)	$\bar{A}$ (ksi)
T_1/T_2	$\bar{C}$ (ksi)
n	ΔK_c (ksi $\sqrt{\text{in}}$)

CONSTANTS:

$$b_1 = \frac{1}{a_1} \left[\frac{\Delta K_c}{C_5 Y} \right]^2$$

$$C_5 = \left(\frac{2\bar{A}}{\bar{C}} \right) C_4$$

$$b_2 = \left(\frac{1}{b_1} \right)^{\frac{\theta - 2}{2}}$$

$$b_3 = 1 - b_2 \ddot{x}_1^{n(\theta - 2)}$$

$$b_4 = \ddot{x}_1 \left(\frac{T_1}{T_2} \right)^{1/n\theta} \left(\frac{1}{b_3} \right)^{1/n\theta}$$

$$\ddot{x}_{2\max} = b_1^{1/2n}$$

HP-34C

$$f(x) = x - b_4 \left[1 - b_2 x^{\eta(\theta - 2)} \right]^{1/\eta\theta}$$

EXAMPLE:

HP-34C

$$b_2 = 1.1102214 \times 10^{-3} *$$

R₀

$$b_3 = 9.9888978 \times 10^{-1}$$

R₁

$$b_4 = 7.952523$$

R₂

$$\eta(\theta - 2) = 1.666$$

R₃

$$1/\eta\theta = 3.0012005 \times 10^{-1}$$

R₄

$$\ddot{x}_{2_{\max}} \approx 59.35586$$

$$\ddot{x}_2 \equiv x$$

x

R₅

$$f(x) = R_5 - R_2 \left[1 - R_0 x R_5^{R_3} \right]^{R_4}$$

Two initial guesses: $\ddot{x}_1$; $\ddot{x}_{2_{\max}}$ (i.e. 1; 59.35)

Program uses 17 lines. Refer to the following page for execution instructions. The solution $\ddot{x}_2$ for the above example is:

$$\ddot{x}_2 = 7.8691 \quad \triangleleft$$

* $a_1 = .007$ inches for all of the above parameter values.

$a_1 > .004$ inches for these equations to apply.

Turn On

Enter values of desired $f(x)$
coefficients into $R_0 \rightarrow R_4$

Enter two initial guesses for x :

$\ddot{x}_1$

ENTER $\uparrow$

$\ddot{x}_{2_{\max}}$ *

f SOLVE A

*The value for $\ddot{x}_{2_{\max}}$ entered should be slightly less than the actual value of $\ddot{x}_{2_{\max}}$. Otherwise the program will take the $\ln$ of a negative number (which is illegal) and "ERROR 0" will appear. EXAMPLE: $\ddot{x}_{2_{\max}} = 3.0199$. For $\ddot{x}_{2_{\max}}$ enter the value of 3.01.

I. SYMBOLS

$\Gamma(\alpha)$	Gamma Function with argument α
α	variable
x	dummy variable, variable
S	variable
Y	variable
$\gamma(\alpha, \tau)$	Incomplete Gamma Function with argument parameters α and τ .
$Q(\alpha, \tau)$	Incomplete Gamma Function with argument parameters α and τ .
y	variable
τ	variable
x^2	variable
ν, ν_0	variable
$Q(x^2 \nu)$	Incomplete Gamma Function Parameters
$P(x^2 \nu)$	
$Q_0(\alpha, \tau)$	Normalized Incomplete Gamma Function with argument parameters α and τ .
ϕ	interpolation variable
w	interpolation variable
$\text{erf}_p(\alpha)$ $\text{erf}(\alpha)$	error function defined by Papoulis [2]
$\text{erf}^{-1}(\alpha)$	inverse error function
$F(N)$	probability of failure in N stress cycles
z	variable
$g_1, \dots, g_{10}$	constants
K	variable
