DTIC FILE

TO THE REQUESTOR:

This Flood Plain Information (FPI) Report was prepared by the Philadelphia District office of the U.S. Army Corps of Engineers, under the continuing authority of the 1960 Flood Control Act, as amended. The report contains valuable background information, discussion of flood characteristics and historical flood data for the study area. The report also presents through tables, profiles, maps and text, the results of engineering studies to determine the possible magnitude and extent of future floods, because knowledge of flood potential and flood hazards is important in land use planning and for management decisions concerning floodplain utilization. These projections of possible flood events and their frequency of occurrence were based on conditions in the study area at the time the report was prepared.

Since the publication of this FPI Report, other engineering studies or reports may have been published for the area. Among these are Flood Insurance Studies prepared by the Federal Insurance Administration of the Federal Emergency Management Agency, Flood Insurance Studies generally provide different types of flood hazard data (including information pertinent to setting flood insurance rates) and different types of floodplain mapping for regulatory purposes and in some cases provide updated technical data based on recent flood events or changes in the study area that may have occurred since the publication of this report.

It is strongly suggested that, where available, Flood Insurance Studies and other sources of flood hazard data be sought out for the additional, and, in some cases, updated flood plain information which they might provide. Should you have any questions concerning the preparation of, or data contained in this FPI Report, please contact:

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This special flood hazard information report, was undertaken by the U.S. Army Corps of Engineers Philadelphia District at the request of the Bucks County Planning Commission. It covered the Unami Creek from its confluence with the Perkiomen Creek in Marlborough Township, Montgomery County to the study limit at Trolley Bridge Road, Milford Township, Bucks County, Pa. at a distance of 15.9 miles. Tributaries to the Unami Creek also studied in this report include Schmoutz Creek, →		

Molasses Creek and Licking Creek.

The hydrology, hydraulics and drainage areas of the creek, were described. The data included peak flows for the 10, 50, 100 year floods, rise and duration of flooding and flood profiles.

The information given within the scope of this report should be considered for its historical value. Since the publication of this report other flood insurance studies have been undertaken and should also be consulted for current information.

SPECIAL FLOOD HAZARD INFORMATION REPORT  
UNAMI CREEK AND TRIBUTARIES,  
BUCKS AND MONTGOMERY COUNTIES, PENNSYLVANIA

1.0 AUTHORITY FOR STUDY

This Special Flood Hazard Information Report was undertaken at the request of the Bucks County Planning Commission with the indorsement of the Pennsylvania Department of Environmental Resources. This report was prepared by the Philadelphia District, U. S. Army Corps of Engineers under continuing authority provided in Section 206 of the 1960 Flood Control Act as amended.

2.0 DESCRIPTION OF AREA AND LIMITS OF STUDY

This report covers the Unami Creek from its confluence with the Perkiomen Creek in Marlborough Township, Montgomery County, to the study limit at Trolley Bridge Road, Milford Township, Bucks County, Pennsylvania, a distance of 15.9 miles. The flood plain varies along the entire stream but is generally characterized by gently rolling hills occasionally giving way to areas where the side slopes are extremely steep. Due to the rural nature of the area, many of the overbanks are covered with brush and trees. Although the land adjacent to the stream is primarily undeveloped, there are some homes and a Boy Scout Camp along the stream. In addition to that portion of Unami Creek within Bucks County, this report also contains information on Unami Creek in Montgomery County.

Tributaries to the Unami Creek also studied in this report include Schmoutz Creek, Molasses Creek and Licking Creek. The study areas of Unami Creek and its Tributaries are shown on the General Map. A tabulation of stream mileages and respective drainage areas can be found in Table 1.

3.0 DESCRIPTION OF WORK

3.1 Surveys

Field surveys, including stream profiles, cross sections and bridge measurements were performed by the Philadelphia District, U. S. Army Corps of Engineers.

### 3.2 Hydrology

There are no stream gages located on Unami Creek to record historical flood events. The hydrologic analysis consisted of formulating a rainfall-runoff model for the entire Unami Creek Basin using the Corps of Engineers' HEC-I Computer Program, Flood Hydrograph Package. Using the model, hydrographs were computed and peak flows determined from frequency rainfall distributions for hypothetical storms having recurrence intervals of 10-, 50-, and 100-years. The 100-Year Flood is defined as the flood which occurs once in 100 years on the average and has a 1% chance of being equalled or exceeded in any year. Peak flows for the 500-Year Flood were obtained by extrapolating the discharge-frequency curve computed for flood events up to the 100-Year Flood and by comparison with Corps of Engineers' Standard Project Flood calculations. A tabulation of peak flows for Unami Creek and its Tributaries is given in Table 2.

### 3.3 Hydraulics

Water surface profiles for the 10-, 50-, 100-, and 500-Year Flood events for the Unami Creek and its Tributaries were computed using the Corps of Engineers' HEC-II Backwater Program. Starting water surface elevations for the Unami Creek were obtained through analysis of flooding conditions and backwater effects of the Perkiomen Creek. Similarly, starting water surface elevations for Unami Creek Tributaries were obtained from corresponding flood elevations on the Unami Creek. Water surface profiles shown in this report were developed based on existing conditions of the watershed at the time field surveys were performed. During an actual flood, debris collecting on bridges and culverts could decrease their water-carrying capacity and cause backwater effects upstream of these structures. However, since the location and extent of debris accumulation are impossible to predict, it was necessary, for the purposes of this report, to assume that bridge and culvert openings would remain unobstructed. In addition to bridges and culverts, there are 9 small dams located on Unami Creek within the study area. These dams have essentially no flood storage capacity, nor will they significantly alter the flow characteristics of floodwaters. Water surface profiles thus developed can be found on Plates 2 through 17. A tabulation of flood elevations at all bridges and culverts can be found in Table 3.

Typical stream cross sections on Unami Creek and its Tributaries and respective water surface elevations for the four frequency flood events are shown on Plates 18 and 19. Maximum

velocities of flow which are expected to occur at these selected cross sections are given in Table 4. Predicted rates of rise and duration of flooding for the 100-Year Flood on the Unami Creek is shown in Table 5.

#### 4.0 ACKNOWLEDGMENTS

The assistance and cooperation of the Bucks County Planning Commission and private citizens in supplying data for the preparation of this report are appreciated.

Additional copies of this report can be obtained from the Bucks County Planning Commission. The Philadelphia District Office of the Corps of Engineers, Department of the Army, will upon request provide technical assistance to planning agencies in the interpretation and use of the data presented as well as planning guidance and further assistance, including the development of additional technical information.
