20. ABSTRACT (Continue on reverse side if necessary and identify by block number) The studies carried out during the period of this grant have responded mainly to the query: How is the Raman or fluorescent scattering affected when the active molecules are embedded within dielectric particles or are adsorbed at the outer surface of either dielectric or metallic particles. There is a strong effect because the molecules are excited by the local electromagnetic fields which		

20. ABSTRACT CONTINUED

in turn depend upon the morphology and optical properties of the particles. In the case of certain metals, such as silver and gold, resonances may occur which give rise to the newly recognized phenomenon of surface enhanced Raman scattering (SERS). Theoretical studies have been carried out for spheres, concentric spheres, spheroids, and cylinders. Experimental studies have been carried out for fluorescent molecules embedded within polystyrene latex particles and for Raman scattering molecules adsorbed at the surface of colloidal silver particles.

Statement of Problem Studied:

The studies carried out during the period of this grant have responded mainly to the query: How is the Raman or fluorescent scattering affected when the active molecules are embedded within dielectric particles or are adsorbed at the outer surface of either dielectric or metallic particles.

Summary of Most Important Results:

There is a strong effect because the molecules are excited by the local electromagnetic fields which in turn depend upon the morphology and optical properties of the particles. In the case of certain metals, such as silver and gold, resonances may occur which give rise to the newly recognized phenomenon of surface enhanced Raman scattering (SERS). Theoretical studies have been carried out for spheres, concentric spheres, spheroids, and cylinders. Experimental studies have been carried out for fluorescent molecules embedded within polystyrene latex particles and for Raman scattering molecules adsorbed at the surface of colloidal silver particles. Detailed results may be found in the following publications.

Participating Scientific Personnel:

Milton Kerker, Principal Investigator
Stephen Druger, Research Associate
Dau-Sing Wang, Research Associate
Derry D. Cooke, Research Assistant Professor
Robert Callaghan, Graduate Research Assistant
Lloyd Bumm, Undergraduate student
