19. KEY WORDS (Continue on reverse side if necessary and identify by block number) <b>Schistosoma mansoni; Biomphalaria glabrata; trematode; cercariae; eggs; worms; miracidia; snails; optimal maintenance conditions.</b>				
20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Parasite materials ( <i>S. mansoni</i> ) were supplied to investigators at the National Health Research Institute in Bethesda, Maryland for immunoparasitological research.				

This contract is funded to provide schistosomes (*Schistosoma mansoni*) for research at the Naval Medical Research Institute (NMRI). To meet the needs of the NMRI investigators, the life cycle of this parasite is maintained at the Biomedical Research Institute (BRI) and research material provided as requested.

*Biomphalaria glabrata* snails (Nimri substrain) were reared in 20 gallon aquaria. Eggs collected from these snails were hatched and the young snails reared in shallow pans to infection size of 5 to 7 mm diameter. Each week, the following schedule was maintained. (1) 250 to 300 snails were exposed to 5 to 7 or to 1 newly-hatched miracidia each. Exposed snails were kept in a 27 to 28°C warm room. (2) Snails exposed 4 week previously were checked individually for cercarial production and thereafter patent snails were held in a warm dark room in dark covered pans. Rotifers were washed off all shedding snails. (3) 8 to 10 mice were exposed to 250 to 270 cercariae for use as the source of miracidia 7 weeks later. (4) Cercariae were harvested 4 days a week and delivered to investigators as requested.

Schistosome research materials were provided on request as follows: cercariae as a mix of both sexes; cercariae of known sex, that is, from 1 miracidium snails with a known male or female infection; snails shedding cercariae; infected mice.
