REFSIM HANDBOOK OF VARIABLE NAMES

1. INTRODUCTION

This handbook provides a combined glossary and composite cross-reference capability for the variable names used in the common areas of the reference engagement simulation (REFSIM) modeling facility and in two additional hybrid models which use REFSIM. These hybrid models are the ECM applications model (ECMAFF) and the SLQ-32 applications model (SLQAPP).

Three cross-reference/glossaries are included as APPENDICES A, B, and C, and are preceded by brief sections which describe their use and limitations. Appendix D lists additional definitions which were too long to be included in the glossary format.

2. BACKGROUND

In REFSIM, almost all of the program-to-program communication is by named common area, rather than by calling sequence. The new person becoming familiar with REFSIM needs to be able to "ferret out" and comprehend such interfaces between subroutines of interest to him. This handbook has been designed to assist him in this task.

3. EXAMPLE OF HANDBOOK USE WITH REFSIM

Consider the following typical situation: a new modeler has come "on board" and is in the process of familiarizing himself with the REFSIM programs. Suppose he is currently looking at subroutine AUTO2 at the "IF" statement below which computes DIPSID (if MODE is greater than 2):

```
SUBROUTINE AUTO2
.
.
C $INSERT REFCOM$COMMON$C.AIRSR(inserts following:)
COMMON /AIRSR/ ALPH,BETA,THTC,PSI,PERR,PSID,MODE,
1             IFFALT,IFFLCY,IFFECY,IFFECP,IFFTRM,IFFROT,
2             IFFDUP,IFFCHP,IFFAIR,IFFOLT,IFFATP,IFFPAT,
3             IFFANT,IFFERR
.
.
IF(MODE.GT.2) DIPSID=DV1 - 2.44*PSID
```

Perhaps he is interested in the variable named PSIB. What does it contain? What are its units? Where was it computed? In what other programs is it used?

These are the kinds of questions that the combination cross-reference/glossary can answer. The entry for PSIB appears as follows in the REFSDI cross-reference:

REFSDI Cross-Reference/Glossary				
Symbol	Description	T	Common	Routine L_File
PSIB	Dish yaw angle relative to missile body in degrees.	R	/AIRSIR/	AUTO2 L REPAIR
		R	/AIRSIR/	AUTO3 L REPAIR
		R	/AIRSIR/	INITS M L REFSEEX
		R	/AIRSIR/	INT2 M L REFSEEX

NOTES: "M" column indicates variable is modified.
 "T" column heading indicates type attribute.

The above excerpt reveals the following about PSIB:

- 1) It contains the "dish yaw angle relative to missile body in degrees."
- 2) Its type is REAL*4 (indicated by the R under column T.)
- 3) PSIB is contained in named common area /AIRSIR/.
- 4) PSIB appears only in four programs: AUTO2, AUTO3, INITS, and INT2. This is very important and illustrates the value of this cross-reference package. There are presently over 140 subroutines in REFSDI, but now the new person only has to look at four of them to investigate all uses of his current variable of interest, PSIB.
- 5) The "M" which appears between the "Routine" column and the "L File" column indicates the routines where variables are modified (i.e. computed or stored). Therefore PSIB is accessed in AUTO2 and AUTO3 and is modified in INITS and INT2.
- 6) The rightmost column of the cross-reference listing contains the "L File" in which the subroutine was contained and therefore is an indirect indicator of the REFSDI UPD where the subroutine resides. Thus, AUTO2 and AUTO3 came from within UPD REPAIR and INITS and INT2 came from within UPD REFSEEX.

4. EXAMPLE OF HANDBOOK USE WITH SCHAPP (OR SLAPP)

The entry for PSIB in the SCHAPP cross-reference appears as follows:

SCWAPP Cross-Reference/Glossary

Symbol	Description	T	Common	Routine	L_File
PSIB	Dish yaw angle relative to missile body in degrees.	R	/AIRSIR/	AUTO2	L_REPAIR
		R	/AIRSIR/	AUTO3	L_AIR
		R	/AIRSIR/	INITS	M L_COVID
		R	/AIRSIR/	INT2	M L_REFSEEK

NOTES: "M" column indicates variable is modified.
 "T" column heading indicates type attribute.

This entry shows that again PSIB happens to appear in four sub-routines. However, in this entry two of the "L File" (listing file) names, L_AIR and L_COVID, do not begin with "REF", hence the associated subroutines AUTO3 and INITS are obtained from SCWAPP, not from REFSM.

It may appear from the preceding example that the only difference between the REFSM cross-reference and the SCWAPP cross-reference are the "L-File" names. However, this is not the case. Consider the following excerpts for the variable "RF":

REFSM Cross-Reference/Glossary

Symbol	Description	T	Common	Routine	L_File
RF	Radar frequency in hertz.	R	/SCINT/	INITR	M L_REFSM
		R	/SCINT/	SWRCS	L_REFERANT
		R	/SCINT/	TCORSC	L_REFERANT
		R	/SCINT/	CRITRA	L_REFERANT
		R	/SCINT/	INITS	M L_REFSEEK

NOTES: "M" column indicates variable is modified.
 "T" column heading indicates type attribute.

SCWAPP Cross-Reference/Glossary

Symbol	Description	T	Common	Routine	L_File
RF	Radar frequency in hertz.	R	/SCINT/	INITS	M L_COVID
		R	/SCINT/	INITD	L_CORE
		R	/SCINT/	SWRCS	L_REFERANT
		R	/SCINT/	TCORSC	L_REFERANT

NOTES: "M" column indicates variable is modified.
 "T" column heading indicates type attribute.

Note that the REFSDM excerpt includes two routines, INTR and CRTRA, which are not in the SDAPP excerpt, and that the latter contains one routine, DITD, which is not in the REFSDM excerpt.

5. LIMITATIONS

The following limitations apply to the tables in this handbook:

1) Not all parameters are passed through common. Those which are passed through calling sequences do not appear.

2) Certain logical flags which are read from the input scenario file via an equivalenced block do not show the usual "N" after INIT2, the subroutine which reads them. However, the "Description" field is annotated accordingly as "Read in DIT2". These logical flags are: LCLUTR, LCONRT, LWRATH, LORSE, LPLOT, LPRINT, LREPT, LSCINT, LSTOP, and LTRER.

3) Certain variables appear in the cross-reference/glossaries which are not actually in common themselves, but which are equivalenced to common variables.

APPENDIX D - Additional Definitions

Name	Definition
AUTOGN	Gain for PSID feedback circuit; PSID late gain. AUTOGN(1) Gain for PSID feedback circuit. AUTOGN(2) PSID late gain.
AUTOL	Lower limits for PSID, THTD, DELP, or DELY in degrees. AUTOL(1) Lower PSID limit. AUTOL(2) Lower THTD limit. AUTOL(3) Lower DELP limit. AUTOL(4) Lower DELY limit.
AUTOU	Upper limits for PSID, THTD, DELP, or DELY in degrees. AUTOU(1) Upper PSID limit. AUTOU(2) Upper THTD limit. AUTOU(3) Upper DELP limit. AUTOU(4) Upper DELY limit.
G	G Array. Contains gain constants, etc. G(1) DC blocking filter gain. G(2) Pitch error filter gain. G(3) Dish servo filter gain. G(4) Search yaw beam rate in degrees/second. G(5) Track yaw beam rate in degrees/second. G(25) Loaded with 'AUX1' in subroutine DEMOD2. G(26) Loaded with 'AUX2' in subroutine DEMOD2. G(27) Loaded with 'AUX3' in subroutine DEMOD2.
IDPLOY	IDPLOY starts off at some initial value and is incremented as the associated platform goes through the various stages of its motion (i.e. launch, ballistic flight, level flight, etc). If IDPLOY is less than or equal to 0, the target does not respond to the seeker. If IDPLOY is greater than 0, the target does respond. IDPLOY is initialized to -10 and is re-initialized at decoy launch to the appropriate value in the appropriate platform routine. For a ship IDPLOY is initialized to 1.
ISCINT	Indicates probability density type: ISCINT(1,I) meanings: 1 = Chi square. 2 = Rayleigh. 3 = Rice power. ISCINT(2,I) meanings: 0 = One density type only. 1 = No change in density type at bow or stern. 2 = Change at bow/stern and port/starboard. ISCINT(3,I) meanings: 1 = Chi square. 2 = Rayleigh. 3 = Lognormal. 4 = Rice power. (Where I=target index)

APPENDIX D - Additional Definitions (Continued)

Name	Definition (Continued)
MODTYP	Modulation type flag. MODTYP meanings: 0 = No target (skipped). 1 = Passive target. 2 = Active repeater with constant delay. 3 = Active repeater with RGPO sweep. 4 = Active repeater with multiple pulse output. 5 = Active repeater with multiple pulses and RGPO. 6 = Noise jammer. 7 = Sea clutter return.
SCINT(1,I)	Current correlation time of RCS fluctuations computed in the program in milliseconds.
SCINT(2,I)	Current elevation angle between missile antenna and target ship I in radians.
SCINT(3,I)	Total (random plus deterministic) rate of change of elevation angle between missile and target ship I. (milliradians/second)
SCINT(4,I)	Current aspect angle between missile radar and target ship I in degrees.
SCINT(5,I)	Total (random plus deterministic) rate of change of aspect angle between missile and target ship I in milliradians/second.
SCINT(6,I)	Characteristic width of the ship (longest distance between major scatterers across the ship) in meters, usually equal to its width.
SCINT(7,I)	Length of major flat (dominant) reflector located alongside the ship in meters.
SCINT(8,I)	Length of major flat (dominant) reflector located across the ship in meters.
SCINT(9,I)	Real variable, dimensionless, between 0 and 1; percentage of probability densities that are of the same type as the one appearing at major aspect angles.
SCINT(10,I)	Characteristic length between major reflectors alongside the ship in meters. Used in correlation time calculation.
SCINT(11,I)	Replaced by ISCINT(1,I).
SCINT(12,I)	Random rate of change of aspect angle between missile and target ship I (1 - 100 milliradians/second).
SCINT(13,I)	Random rate of change of elevation angle between missile and target ship I (1 - 100 milliradians/second).
SCINT(14,I)	Dimensionless mean-to-median ratio for lognormal densities.
SCINT(15,I)	Switching angle for change in distribution type from major aspect types to mixture at stern and bow in degrees.
SCINT(16,I)	Switching angle for change in distribution type from major aspect type to mixture at port and starboard in degrees.
SCINT(17,I)	Replaced by ISCINT(2,I).
SCINT(18,I)	Initial value of deterministic rate of change of aspect angle in degrees/second.

APPENDIX D - Additional Definitions (Continued)

Name	Definition (Continued)
SCINT(19,I)	Dimensionless between 0 and 1. Percentage of probability densities that are of the same type as the one appearing at quarter aspect angles.
SCINT(20,I)	Angle sector over which probability density type is undetermined and use of mixed process model is required. (degrees)
SCINT(21,I)	Average random pitch rate for ship I in milliradians/second.
SCINT(22,I)	Average random roll rate for ship I in milliradians/second.
SCINT(23,I)	RMS value of pitch for ship I in radians.
SCINT(24,I)	RMS value of roll for ship I in radians.
SCINT(25,I)	Characteristic elevation angle indicating the beginning of increased values of median RCS. (radians)
SCINT(26,I)	Dimensionless ratio of steady power to average random power in case of Rice power statistics.
SCINT(28,I)	Dimensionless mean-to-median ratio of Rice power statistics.
SCINT(29,I)	Constant for elevation dependence of median RCS.
SCINT(30,I)	Ship's hull height above water line in meters. Where: I = target index.

T T Array. Contains time constants, time delays, etc.

Meanings:

- T(1) Low pass filter time constant.
- T(2) DC blocking filter time constant.
- T(3) Relay time delay in seconds.
- T(4) Pitch error filter time constant.
- T(5) Dish servo filter time constant.
- T(6) Dish servo filter time constant.
- T(7) Video threshold.
- T(8) Pulse counter threshold.
- T(9) Delay in acquisition mode to track in seconds.
- T(10) Delay from track to drop track in seconds.
- T(11) Delay in drop mode before search in seconds.
- T(13) Signal filter time constant.
- T(14) Yaw error filter time constant.
- T(15) Timing filter time constant.
- T(16) Threshold on timing filter.
- T(17) Lower range gate limit in microseconds.
- T(18) Upper range gate limit in microseconds.
- T(19) Seeker transmit pulse width in microseconds.
- T(20) Seeker turn-on range in meters.
- T(21) Initial dish offset in degrees.
- T(22) Dish position limit in track mode in degrees.

TDPLOY Target deployment time is the initial time (in seconds) that the target platform location or target response to missile seeker has to be considered, whichever comes first.
