SECTION I

INTRODUCTION

✓ Proper computer program documentation is essential to the effective use, maintenance, and modification of computer software. The documentation should be comprised of both user and programmer information and be designed to fill the informational needs of the personnel ultimately responsible for using, maintaining or updating the software. The amount and quality of the software documentation produced are usually dependent on two major factors in the program development cycle-- the length of time allotted for development and the number of people assigned to the development effort. Normally, the longer the duration of a project and the larger the software development team, the greater the need for software documentation. Proper documentation (1) provides a means to efficiently monitor and control long-term projects, (2) provides an understandable, transferrable method of communication between the project team members and future users or program modifiers, and (3) reduces the time consuming, labor intensive process of duplicating the development effort if key project members leave or the program is moved to another site and/or the programs require modification or updating. If the software documentation is adequate, only minimal problems arise when it is modified or transferred to new locations. If the formal documentation is inadequate, or nonexistent, the new user is faced with the formidable and tedious process of manually flow charting the program to determine program logic and defining the program variables prior to proceeding with any modifications. One solution to this approach is to develop a computer aid with the capability to accurately and expeditiously decipher the program logic and automatically provide a flow chart.

BACKGROUND

The Chief of Naval Education and Training (CNET) tasked the Training Analysis and Evaluation Group (TAEG) to document selected software components of the ADP portion of the Foreign Military Sales (FMS) financial management system. The specific objectives of the tasking were to:

- describe the structure of the FMS system and its elements, along with the logic for completing summary billing
- provide an operator's guide that would improve understanding of the program logic and procedures necessary to use the system
- document the specific system programming details of the FMS FY 80 costing/billing programs.

At the outset of this effort, little formal documentation was available other than comments contained in the program software concerning program structure and use. In order to understand how the programs worked, it was necessary to determine program logic and define software variables and their interrelationships. The need to accomplish this formidable labor intensive effort as the necessary prelude to achieving the FMS study objectives served as the impetus for automating this process.

PURPOSE

This document describes a computer aid designed to decipher and automatically flow chart computer program logic and provides the computer code necessary for this process. This computer aid reduces the labor intensive manual process of producing a flow chart for an undocumented or inadequately documented program. This TAEG developed program (hereafter called BASCHART) automatically produces an annotated flow chart for any program that uses WANG (MVP) BASIC-2 programming language.

ORGANIZATION OF THIS REPORT

In addition to this introduction, one other section and three appendices are provided. Section II describes the BASCHART flow charting program and its development and provides a detailed user's guide. Appendix A provides a system diagram of the BASCHART program showing the interrelationships between the subsystems contained in the program. It also contains a listing of the subroutines with brief descriptions of their purpose. Appendix B contains definitions of the BASCHART alphanumeric variables. Appendix C provides the WANG BASIC-2 computer code for the flow charting program.

SECTION II

SYSTEM DESCRIPTION AND USER'S GUIDE

This section briefly summarizes the development of the BASCHART program, describes the hardware requirements, and contains a user's guide for the BASCHART.

DEVELOPMENT HISTORY

The WANG MVP flow charting program is an extensive modification of an existing program developed at the University of Central Florida, Orlando. In the conversion, many of the unique WANG functions were implemented to provide as complete a documentation system as possible. The original program, operated in a batch environment, was designed to work in Harris BASIC on relatively short and noncomplex programs. BASCHART is an online interactive program that can be used on any WANG BASIC-2 program regardless of program length or programmers' writing technique. The program can also isolate a given segment of a program and flow chart only that portion. The user is provided substantial flexibility because BASCHART has been modified to interact with the WANG operating system and disk catalog structure.

HARDWARE REQUIREMENTS

BASCHART is written using WANG BASIC-2 and can be operated on a WANG 2200 MVP within a 56K partition. The user should have a line printer available and must supply the BASCHART program with the program to be flow charted from either a floppy disk or a fixed disk storage medium.

BASCHART OPERATING PROCEDURES

It is assumed that the required computer hardware (CRT, DISK DRIVE, and LINE PRINTER) is available to the user intending to use the BASCHART program. Initializing the equipment is an extremely easy task. However, because of the many possible equipment configurations, it is desirable that personnel knowledgeable in WANG equipment set up the system for subsequent use. After loading and starting the execution of program BASCHART, the following screen will appear.

```

BBBBBB      A      SSSSSS  CCCCCC  H      H      A      RRRKKR  TTTTTT
B  B      A  A      S      C      H      H      A  A      R      K      T
BBBBBB      A  A      SSSSSS  C      HHHHHH      A  A      RRRKKR  T
B  B      AAAAAA      S      C      H      H      AAAAAA  R  R      T
B  B      A      A      S      C      H      H      A      A      R  R      T
BBBBBB      A      A      SSSSSS  CCCCCC  H      H      A      A      R      R      T
    
```

This program is designed to create a logic flow chart of any active program on disk in the BASIC-2 language.
Is it your intention to run the program 'BASCHART'? (Y/N)

Technical Note 3-82

Entering an N will return the user to the WANG operating system. If the user enters a Y, the following screen will be displayed:

***** DISK ADDRESS YOUR PROGRAM *****

DISK ADDRESSES AVAILABLE: 325 825 365 D10 D11 D13

ENTER DISK ADDRESS _ _ _

The user must now enter the disk address where the program to be flow-charted is located. Entering a valid disk address will enable the program to scan the specified disk directory and automatically present the following display:

DISK D11 CATALOG OF PROGRAMS

1.	10.	20.	30.	40.
2.	11.	21.	31.	41.
3.	12.	22.	32.	42.
4.	13.	23.	33.	43.
5.	14.	24.	34.	44.
6.	15.	25.	35.	45.
7.	16.	26.	36.	46.
8.	17.	27.	37.	47. BASCHART
9.	18.	28.	38.	48. BASICout
	19.	29.	39.	49. BASchart

FN '4 = END PROGRAM / FN '5 = SEARCH / FN '6 = BASCHART PROGRAM

510 TOTAL PROGRAMS PRESS RTN/FN?

This display lists the programs contained at the disk address previously specified. This initial display contains the first 49 programs, after that the programs are presented in groups of 50. Pressing RETURN will cause the next group of 50 programs to appear. Repeating this process will present succeeding groups of programs until all the programs available at that disk address have been displayed. The total number of programs available on the disk is continuously displayed at the bottom of the screen.

Technical Note 3-82

Selecting FN '4 = END PROGRAM will return the user to the WANG operating system.

If the user does not know the entire name of the program or its correct spelling, use the search capability of BASCHART, special function Key '5. Selecting FN '5 = SEARCH will cause the screen to display the following:

***** DISK D11 CATALOG OF PROGRAMS *****				
	10.	20.	30.	40.
1.	11.	21.	31.	41.
2.	12.	22.	32.	42.
3.	13.	23.	33.	43.
4.	14.	24.	34.	44.
5.	15.	25.	35.	45.
6.	16.	26.	36.	46.
7.	17.	27.	37.	47. BASCHART
8.	18.	28.	38.	48. BASICout
9.	19.	29.	39.	49. BASchart
INPUT CHARACTER STRING: <u>B</u> <u>A</u> <u>S</u>				

The user is required to input a character string that approximates the program name. Using this character string, a search of the existing catalog index will be made and all the programs contained on the disk with that character string will be displayed as indicated below:

***** DISK D11 SEARCH *****				
47.	BASCHART			
48.	BASICout			
49.	BASchart			
Three files were searched out with string BAS.				
FN '4 = END PROGRAM / FN '5 = SEARCH / FN '6 = BASCHART PROGRAM				
510 TOTAL PROGRAMS PRESS RTN/FN?				

Technical Note 3-82

The user should now be able to identify the specific program to be flow charted.

Once the user has identified the desired program (either by entering program name or by using the search function, FN '5) and located the program number, special function key '6, FN '6 = BASCHART PROGRAM, is used to initiate the subroutine by which the number of the program (in this instance 47) to be flow charted is entered.

Pressing FN '6 will cause one of the following screens to be displayed. If the user has previously employed the search function (FN '5), the following will appear:

```
*****  DISK  D11  SEARCH  *****

47.  BASCHART
48.  BASICout
49.  BASchart

      Three files were searched out with string BAS.

      WHAT IS THE NUMBER OF THE PROGRAM? _____
```

If the user knew the program name and consequently pressed FN '6, the following will be displayed:

```
*****  DISK  D11  CATALOG OF PROGRAMS  *****

1.      10.      20.      30.      40.
2.      11.      21.      31.      41.
3.      12.      22.      32.      42.
4.      13.      23.      33.      43.
5.      14.      24.      34.      44.
6.      15.      25.      35.      45.
7.      16.      26.      36.      46.
8.      17.      27.      37.      47. BASCHART
9.      18.      28.      38.      48. BASICout
          19.      29.      39.      49. BASchart

      WHAT IS THE NUMBER OF THE PROGRAM? _____
```

Technical Note 3-82

Once the user enters a valid program number by either alternative, he has identified the specific program to be flow charted utilizing the BASCHART program.

After entry of a valid program number, a sequence of questions is asked pertaining to printer address, program line number (starting and stopping for the flow chart), and program subroutine structure. The first screen requests a valid printer address.

PRINTER ADDRESSES AVAILABLE: 204, 215, 216, 211, 005

SELECT PRINTER ADDRESS: ____

Entering the desired printer address will cause the following screen to appear:

PRINTER ADDRESSES AVAILABLE: 204, 215, 216, 211, 005

SELECT PRINTER ADDRESS: 215

DO YOU WANT A HARD COPY PRINTOUT OF YOUR ENTIRE PROGRAM? (Y/N) ____

If a Y is entered, the entire program will be flow charted and printed. If an N is entered, which indicates a desire to print only a portion of the flow charted program, the following display will appear:

At what line No. do you want a hard copy print to start?

If first line No. of program, type in '0000'=> _ _ _ _

At what line No. do you want the hard copy print to end?

If last line No. of program, type in '9999'=>

(Processing is done from the start regardless of where your line No. begins)

Technical Note 3-82

The user must now enter the starting and stopping line numbers of the portion of the program to be flow charted.

NOTE: If printer address 005 (CRT) is selected, questions pertaining to starting and ending line numbers will not appear. The entire flow charted program will appear on the screen in a continuous rollup display.

Once the program line numbers are entered, the following display, requesting the inclusion of remarks and image statements, appears:

DO YOU WISH TO INCLUDE THE REMARKS AND IMAGE STATEMENTS IN THE FLOW CHART?
(Y/N)

A Y response will include all program remarks and image statements in the flow chart. An N response will exclude all statements of that type and results in a flow chart containing only program logic.

Regardless of which entry is made, the following screen will appear:

If your program has marked subroutines, are all of them after the main program?

Y = Will cause the oversized heading, 'SUBROUTINES', to be printed upon encountering the first marked subroutine. Everything after this is assumed by the program to be subroutine connected.

N = Will treat all subroutines as if they are found within the main program. No oversized 'SUBROUTINES' heading is printed.

SELECT OPTION (Y/N) ____

Technical Note 3-82

A Y response will cause the BASCHART program to print the heading "SUBROUTINES" when it encounters the first subroutine in the program being flow charted. This signifies that the main program is complete and everything that follows the SUBROUTINE heading is, in fact, a subroutine. If the user inserts an N, no heading will be printed and the BASCHART program will treat the subroutines as if they are contained in the main program.

Finally, a list of all the user's responses is presented providing the ability to re-input the data if erroneous results were entered.

```

.. .. .. .. ..
..
.. Your program name is ..... BASCHART
..
.. Your program is on disk address ..... D11
..
.. Your program will be flow charted on ..... 215
..
.. You want a printout of the entire program ..... NO
..
..     Starting at line number ..... 0
..     Ending at line number ..... 100
..
.. You want remarks & image statements included ..... YES
..
.. Your marked subroutines follow the main program... YES
.. .. .. .. ..
..
Key return to continue, any other key to re-input data ==> ?

```

After the user enters the desired response, BASCHART will proceed to flow chart the requested program. If a portion of a program is to be flow charted on a printer, and that portion does not begin at zero, the screen will display the flow chart of the program beginning at the first line number. The reason processing is done from the first Line Number, regardless of where the user would like the flow chart to begin, is simply to know if printing is started in a loop or branching sequence. When the starting Line Number to be printed is encountered, the screen displays the status, while flow charting is done at the printer.

Technical Note 5-12

During the flow charting process, the FLOWCHART program will keep the user informed as to status by displaying the following screen:

```
<<<<<<<<<<<<<<<<< 0190 IF D75="008" THEN PRINT HEX(03) >>>>>>>>>>>>>>>>>>
```

```
0190 IF D75="008" THEN PRINT HEX(03)
```

```
now at sector # 36086          Numbered statements in sector: 1  
Ending sector # 36219          Percentage of processing completed: 2%
```

```
.....  
.. NOW FORMING A FLOW CHART OF PASCAL ON PRINTER 215 ..  
.....
```

```
REMARKS ARE BEING INCLUDED
```

```
OPERATOR NOTE: PROCESSING TIME VARIES WITH EACH PROGRAM,  
THE AVERAGE IS 10 MINUTES FOR EVERY 30 SECTORS.
```

The status screen displays the line that is currently being flow charted, the ending sector, the sector being flow charted, and the percentage of processing completed. Once finished, the program returns to query the user as to any more flow chart requirements at this time.

BASCHART PROGRAM FLOW CHART

This subsection contains an example of the automated flow charting output produced by the BASCHART program. Program comments are supplied by BASCHART during the processing and at the end of an entire printout. The comments can range from remarks about the programming technique to remarks about a command or commands that could not be translated properly from hexadecimal or exceeded the parameters of the BASCHART program.

APPENDIX A
SYSTEM DIAGRAM OF BASCHART PROGRAM
AND
BASCHART SUBROUTINE LISTING

Figure A-1. Interrelationship of BASCHART Subroutines

BASCHART SUBROUTINE LISTING

<u>Subroutine</u>	<u>Line</u>	<u>Purpose</u>
'4	3680	Print direction lines branching horizontally in and out of the flow of logic
'8	3650	Print (down) direction lines with arrows, prior to printing a new sequence in the flow chart
* '10	1670	Search new command string for (ON..GOSUB, ON..GOTO, FOR..NEXT, REM, GOTO, GOSUB), <u>AND</u> send to appropriate subroutine
* '15	1480	Search command string for (REM, %), separate the line No. from the command, in modular phase check for (FOR..NEXT)
'19	3800	Modular print routine or comment on (IF..THEN) or (FOR..NEXT) statement
* '20	1830	Search new command string for (IF..THEN, PRINT, INPUT, STOP, END, LOAD, RETURN) <u>AND</u> send to appropriate subroutine
'30	2420	Print (FOR symbol) in a (FOR..NEXT) Loop, branch <u>out</u> for start of loop
'35	2520	Print (NEXT symbol) in a (FOR..NEXT) Loop, branch <u>in</u> for end of loop
'40	2620	Print routine for (ON..GOTO, ON..GOSUB)
'45	2850	Print (GOTO symbol)
'50	2920	Print (STOP, END, LOAD symbols)
'60	2120	Print routine for (IF..THEN) branching sequence and symbol
'65	2980	Print routine for ELSE, ERROR) Loop branching sequence, <u>begin</u> Loop
'66	3960	Print routine for (ELSE, ERROR) Loop branching sequence, <u>terminate</u> Loop

*One of three main directional subroutines that decide, based on the present command string, what print subroutine to call up and process.

Technical Note 3-82

BASCHART SUBROUTINE LISTING (continued)

<u>Subroutine</u>	<u>Line</u>	<u>Purpose</u>
'75	3040	Print <u>REMARKS</u> from program being flow charted
'80	3550	Print routine for (data process) symbol, unidentified commands default here
'81	3080	Print routine to <u>end</u> (data process) symbol
'82	3860	Print routine for (PRINT symbol)
'83	3940	Print routine to <u>end</u> (PRINT symbol)
'85	3120	Print (RETURN symbol) and/or comment on, no (STOP) or (END) encountered prior to this subroutine
'90	3180	Print flow chart (down) direction lines or straight or in branched, nested Loops
'91	3230	Print comment on Instruction number out of order
'92	3280	Print comment on Instruction number exceeding the program parameters
'93	3320	Print routine for Loop flow direction arrow ('↑' or '↓') up or down
'95	3370	Search the command string for the Operand, or a second <u>main</u> command statement
'96	3440	Print comment on illegal BASIC-2 Language statement encountered
'98	2020	Loop nest counter for the (FOR..NEXT) sequence, check count is within parameters
'99	3500	Print comment on unmatched Loop complement encountered
1100	1110	Search New command string for the First and Last statement of the program and the First and Last statement of a marked subroutine, print summation comments at end of program run

APPENDIX B
BASCHART ALPHANUMERIC VARIABLES

Technical Note 3-82

BASCHART ALPHANUMERIC VARIABLES

- A\$ holds the command string, after isolating from the disk sector and translating from hexcode to normal text
- A1\$ holds the current command string line number
- A2\$ holds the first word located in the current command string
- B2\$ holds the command string, other than the first isolated word of the string
- C\$ holds the operator input 'Y' or 'N' on the question of marked sub-routines following the main program body
- C2\$ holds the operand section of the current processed command string
- D2\$ holds the second command encountered in a large string command (double command string) (i.e., ELSE, ERROR, IF..THEN)
- D7\$ holds the printer address
- D8\$ holds the temporary printer address
- D9\$ holds the disk address
- E\$ holds the referenced line numbers in (ON..GOTO), (ON..GOSUB) statements
- F\$ holds temporary first word of the current command string
- F2\$ holds the variable and starting value in a (FOR..NEXT) statement, to use later in identifying the end of loop
- K2\$ holds the (FOR..) or (..NEXT) command in the modular phase of the flow chart being created
- L2\$ holds the (FOR..) or (..NEXT) command during a check routine to match each with its correct complement
- N\$ holds the present statement line number
- Q0\$ holds the locations of the starting line numbered statements, for each sector of the program being processed
- Q1\$ holds the location of the end of sector data marker (FD) or (FE) for each sector of the program being processed
- Q6\$ holds the first byte of each command string and, if needed, the translated ASCII of the hexcoded command byte
- S9\$ holds a blank field, used in translating statements during the flow charting sequence of the program

Technical Note 3-82

BASCHART ALPHANUMERIC VARIABLES (continued)

- T\$ holds the name of the program being flow charted
- T1\$ holds the temporary value of 'S9\$', used as a flag when encountered to indicate some operation was completed
- T2\$ holds the entire (intact) command string, while elsewhere it is being broken down and processed during the flow chart sequence
- U1\$ holds the location in a command string, while being read from the sector, of the actual end of the statement, not counting the ':' (colon), which can be a statement separator
- Z1\$ holds the operator input 'Y' or 'N' on the question of including remarks and image statements in the flow chart output

BASCHART ALPHANUMERIC ARRAY VARIABLES

<u>L\$()</u>	holds the sorted sector location of each beginning string command
<u>L1\$()</u>	holds the stored, nested (FOR..NEXT) statement, to match against each equal complement
<u>L2\$()</u>	holds the stored line number of each nested, starting (FOR..NEXT) statement
<u>Q2\$()</u>	holds locations of each start of numbered statements in each sector, read by the program
<u>Q3\$()</u>	holds locations of each start of nonnumbered statements in each sector, read by the program
<u>Q4\$()</u>	holds the ASCII equivalent of a hexcoded command
<u>Q5\$()</u>	holds the hexcoded commands used in the BASIC-2 Language
<u>Q7\$()</u>	holds the sector position of each ":" mark, and later each "%", in the sector currently being read
<u>W\$()</u>	holds the work array for the <u>MAT SORT</u> command
<u>X\$()</u>	holds the entire sector being read by the program
<u>Z\$()</u>	holds the temporary location of "%" statements in the process of isolating string commands, later it holds the sorted location, in the sector being read, of each string command prior to its being translated from hexcode into ASCII
