20. ABSTRACT *(Continue on reverse side if necessary and identify by block number)*

Following the passage of the Defense Authorization Act (PL96-107) U.S. Army Mobility Equipment Research and Development Command (MERADCOM) was tasked by Department of Defense to evaluate gasohol in U.S. Army vehicles. A cooperative program between MERADCOM and the Department of Energy resulted in five vehicle fleet tests at four Army installations conducting an evaluation of gasohol in administrative and tactical vehicles. A test group (gasohol) and control group (gasoline) was established in each fleet except

20. ABSTRACT (Cont'd)

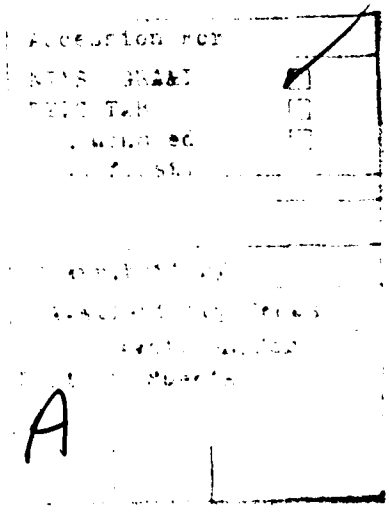
MERADCOM, which only used a test group. There was a grand total of 104 test vehicles and 69 control vehicles in the evaluation. The test groups accumulated 496,985 miles while the control groups accumulated 378,756 miles.

Two of the five installations reported no performance problems for either test or control groups. For the remaining three fleets, 17% (18 of 104) of the test vehicles and 9% (6 of 69) of the control vehicles experienced one or more performance problems. The 18 test vehicles reported 30% more problems than did the 6 control vehicles. This agrees with trends observed in the DOE Reliability Fleet Test in which gasohol-powered vehicles have a higher frequency of incidents in traffic.

Overall indication is that a 10/90 blend of ethanol/unleaded gasoline can provide a slight increase in total available fuel without serious drivability penalties.

FOREWORD

Work covered in this report was conducted during the period 1 April 1980 and 31 Dec. 1981 and was funded by the Department of Energy under Contract No. DE-AC03-79CS50004. Mobility Equipment Research and Development Command Technical Monitors were Mr. Jim Conoly and Dr. Herman Spitzer. The DOE Technical Monitor was Mr. E. Eugene Ecklund.



ACKNOWLEDGEMENTS

The authors wish to acknowledge the administrative assistance in data processing, etc., by Mrs. Sandra Gonzales and Mrs. Julia Madden of Southwest Research Institute and to Mr. John A. Russell for assistance in statistical data analysis.

Special acknowledgements are also given to the following Installation Monitors for their assistance throughout the program:

MERADCOM	Mr. Ed Johnson
Ft. Belvoir, VA	Mr. Amos Overton
Ft. Lewis, WA	Mr. Loren Jenkinson
Ft. McCoy, WI	Ms. Rose Acheson
Red River Army Depot, TX	Mr. Gary Schultz

I. INTRODUCTION

Recognizing a need for a capability to extend the availability of mobility fuels within Department of Defense (DOD), a program was initiated in 1979 to develop the technology required for using alternative fuels. With the passage of the Defense Authorization Act (PL96-107), DOD was directed to purchase alcohol fuels to the maximum extent possible. To implement the Act, the U.S. Army was assigned the lead role for alcohol fuels within DOD. Mobility Equipment Research and Development Command (MERADCOM) initiated a comprehensive program to determine the suitability for using gasohol in all gasoline-consuming military vehicles. Southwest Research Institute (SwRI) was already under contract to the U.S. Department of Energy (DOE) to conduct an Alcohol/Gasoline Reliability Fleet Test Program and a data base for that program had already been established. Therefore, the U.S. Army fleets became part of a cooperative effort in the DOE program to share that data base. MERADCOM selected the test sites and the installations made vehicle assignments to the program. Program management and responsibility remained under MERADCOM although DOE provided funds for SwRI to collect, process and analyze driver survey questionnaires, fuel economy data, and vehicle performance problems at each test site.

II. DATA COLLECTION AND ANALYSIS

Test records were maintained by each installation monitor and submitted to Southwest Research Institute biweekly for analysis. A daily log sheet was completed for each vehicle indicating mileage, fuel and oil added, and driveability performance. The driveability parameters checked by the drivers indicated the occurrence and severity of problems in the following categories:

a. Cranking required to start engine
b. Stalled after starting
c. Stalls in traffic
d. Idle roughness
e. Hesitation
f. Power loss
g. Pinging
h. Dieseling

to record and analyze this data the following two computer programs were utilized:

- Scientific Information Retrieval Program (SIR)
- Statistical Program for Social Sciences (SPSS)

When data sheets were received by SwRI, they were sorted by vehicle identification number, date and odometer reading. The data was then keypunched and added into the computer program, a computer listing was reviewed for errors in the data or gaps in data reporting. It should be noted that at times, erroneous odometer readings were received, and fuel additions were not recorded. Therefore, the test reporting was stopped at the last known fuel fill up and restarted when a new fuel fill up and odometer reading was reported. Following purification of the computer listing, the corrected data were then added to the data base. A flow diagram used for data processing is shown as Figure 1.

III. TEST SITES

For this program, five vehicle fleet locations were identified:

MERADCOM (Tenant at Ft. Belvoir, Va)
Ft. Belvoir, VA
Ft. Lewis, WA
Ft. McCoy, WI
Red River Army Depot, TX

A program monitor was appointed at each installation to collect data sheets for timely submission to SwRI and also to provide continuity between the installation, MERADCOM, and SwRI. Each installation identified vehicles for test (gasohol) and control (gasoline) groups except for MERADCOM, which only utilized test vehicles. Program initiation and completion dates are shown in Table 1.

TABLE 1. INCLUSIVE PROGRAM DATES

Installation	Initiation Date	Completion Date
MERADCOM	1 July 1980	30 Sept 1981
Ft. Belvoir, VA	1 Aug 1980	31 Aug 1981
Ft. Lewis, WA	1 April 1981	31 Dec 1981
Ft. McCoy, WI	1 Aug 1980	31 Aug 1981
Red River Army Depot, TX	1 Feb 1981	28 Feb 1982

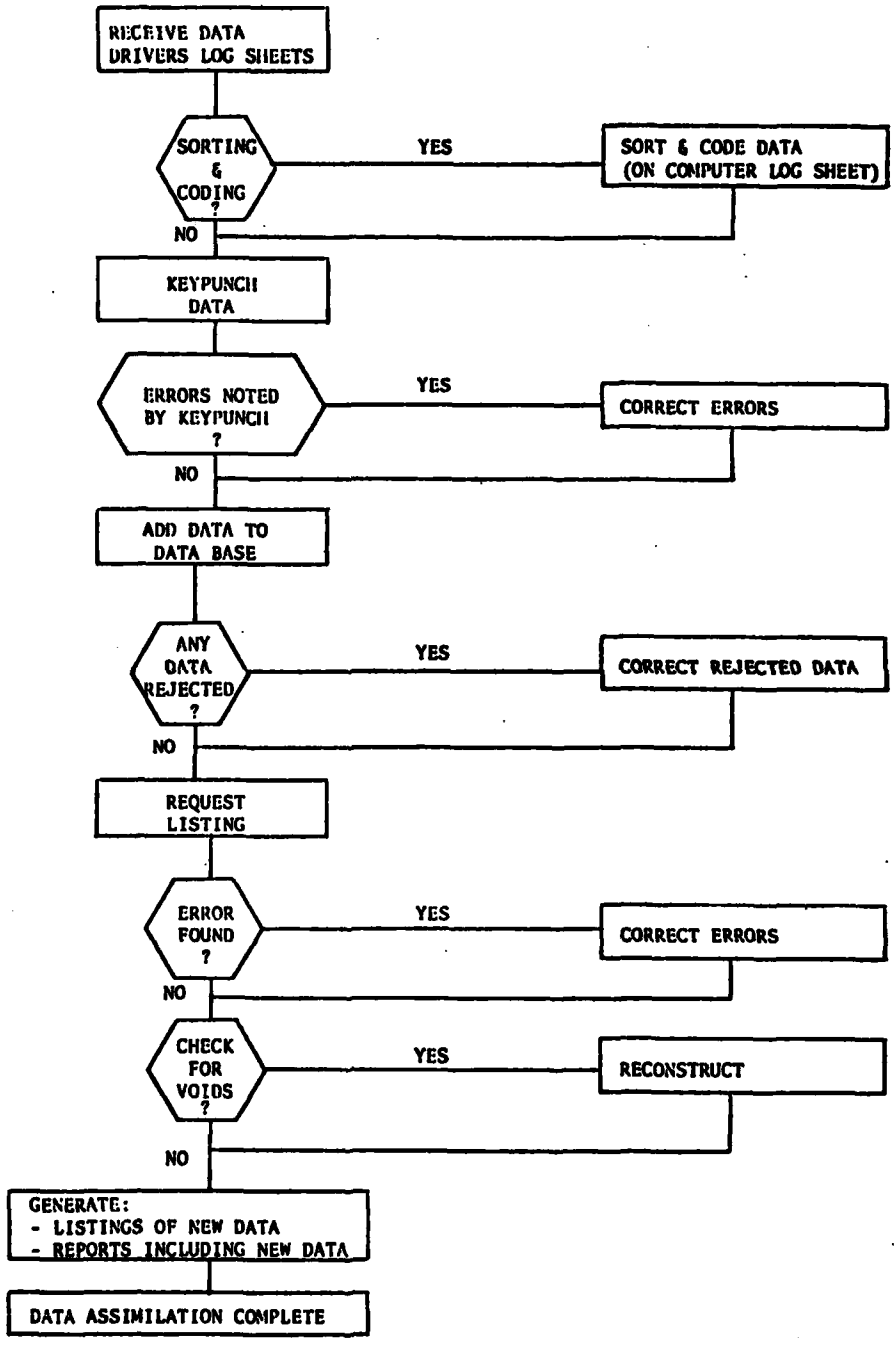

FIGURE 1. DATA PROCESSING PROCEDURES

IV. TEST EQUIPMENT

Each fleet except MERADCOM consisted of two groups; test and control. Table 2 provides test and control group makeup at each installation:

TABLE 2. TEST AND CONTROL VEHICLES

Installation	No. Test Vehicles	No. Control Vehicles
MERADCOM	22	0
Ft. Belvoir	20	20
Ft. Lewis	14	8
Ft. McCoy	28	21
Red River Army Depot	20	20

Both administrative and tactical vehicles were included in the evaluation and the test and control vehicles were selected as evenly as possible by year, make, model and mileage. However, these vehicle groups were not perfectly matched. Tactical vehicles included in this program consisted of M880 series vehicles and M151A2 jeeps. The M880 series are 5/4 ton Dodge pickup trucks in different configuration depending on their original mission, i.e., a 4 x 4 M886 is configured as an ambulance, the M880 is a 4 x 4 pickup and the M890 is a 2 x 2 pickup. The M151A2 is a 1/4 ton 4 x 4 vehicle referred to as a "jeep". More complete vehicle descriptions for each fleet are included as Appendix A.

V. FLEET OPERATIONS

The Energy and Water Resources Laboratory, U.S. Army Mobility Equipment Research and Development Command, Ft. Belvoir, VA selected five fleets at four U.S. Army Installations for this program. These sites were selected to provide a representative mix of commercial design administrative vehicles and tactical vehicles. Each site was to operate on gasohol for a minimum of one year to experience all seasonal climatic conditions. The test groups operated on commercially available gasohol or locally mixed 10 volume percent ethanol (197 minimum proof) and 90 volume percent unleaded gasoline. The control groups operated on commercially available unleaded gasoline. Individual fleet operations were as follows:

MERADCOM With the exception of one M151A2 vehicle, the test group of 22 vehicles were comprised entirely of commercial design administrative vehicles.

No control vehicles were utilized. The test group accumulated 23,174 test miles and utilized 2,402 gallons of gasohol.

Ft. Belvoir Twenty test and twenty control vehicles were identified for this fleet. Only tactical vehicles were utilized as follows:

	M880 Series	M151A2
Test	11	9
Control	13	7

Ft. Lewis There were 14 test (8 M886 and 6 M151A2) vehicles and 8 M886 control vehicles in the Ft. Lewis fleet. Ten M151A2 vehicles had been identified for the program, however, no useful data was ever received on these vehicles. Therefore, for the purpose of data reporting in this report it will be considered that no M151A2 control vehicles were run. Very low mileage was generated on this fleet. The test group accumulated 9,868 miles and used 1,139 gallons of gasohol, while the control vehicles accumulated 8,633 miles using 866 gallons of unleaded gasoline.

Ft. McCoy Only administrative vehicles were utilized in this fleet. There were 28 test vehicles and 21 control vehicles. Although both groups consisted only of administrative vehicles, a good mix of engine size was included. The test group accumulated 244,164 miles on 21,194 gallons of gasohol, while the control group accumulated 158,624 miles using 11,278 gallons of unleaded gasoline.

Red River Army Depot There were no tactical vehicles in the RRAD fleet. There were 20 test and 20 control vehicles, and the fleet make up consisted mostly of sedan and pickup trucks. However, several heavier duty trucks were involved. The test group of 20 vehicles accumulated 163,107 miles using 16,912 gallons of gasohol, while the control group of 20 vehicles accumulated 141,149 miles using 13,171 gallons of unleaded gasoline.

VI. FUEL ECONOMY

Throughout the test period, the 104 test vehicles at all sites accumulated 496,985 miles utilizing 47,700 gallons of gasohol. The 69 control vehicles accumulated 378,756 miles using 33,435 gallons of regular unleaded gasoline.

The overall comparison (all vehicles) indicates that the control vehicles got better fuel economy than test vehicles at a very modest level of significance (α =0.10). This is equally true for control-to-test comparisons at Ft. Lewis and Ft. McCoy (the inference at Ft. McCoy is even stronger, α =0.05). The single exception to this pattern is Ft. Belvoir, where test vehicle mpg exceeded control for α =0.10. Red River Army Depot showed no significant differences. Table 3 presents statistical fuel economy comparisons for all fleets.

Figure 2 presents graphically the average fuel economy by months of operation for all test and control vehicles in all fleets. There appears to be some seasonal effect, since lower fuel economy was obtained during the colder months. However, this effect may possibly be due to driver technique, i.e., leaving the vehicle running when the driver is out of the vehicle to maintain heat in the cab, etc. This would certainly account for higher fuel usage and lower mileage accumulation. An individual vehicle/group summary of miles traveled, fuel economy, and mpg is included as Appendix B.

VII. DRIVER-REPORTED PERFORMANCE PROBLEMS

Performance problems recorded from all sites are shown in Table 4. Approximately 17% of the test vehicles experienced one or more performance problems, while approximately 9% of the control vehicles experienced one or more performance problems. However, the total number of occurrences experienced by the 18 test vehicles which reported problems was 30% greater than the 6 control vehicles reporting problems. It is interesting to note that no performance problems in either the test or control groups were reported by Ft. Belvoir, VA or Red River Army Depot, TX. Each of these installations maintained that performance problems were not encountered with either group of vehicles.

These performance problem trends agree with results seen in the DOE Reliability Fleet Test at three test sites that operated on gasohol for over one year and showed test vehicles experienced 48% higher frequency of incidents than the control vehicles. This indicates that gasohol-powered vehicles operating in traffic situations have a significantly higher frequency of incidents than their gasoline-powered counterparts.

VIII. CONCLUSIONS

From the observation made in this program, it has been demonstrated that military vehicles (both administrative and light tactical) can operate satisfactorily on gasohol (a blend of 10% vol. ethanol and 90% vol. unleaded gasoline). Although the test vehicles experienced less fuel economy than the control vehicle fleets, this would still indicate that as a fuel extender, a 10/90 blend could provide a slight increase in total available petroleum fuel without serious driveability penalties to vehicle operations.
