NOTICE

When Government drawings, specifications, or other data are used for any purpose other than in connection with a definitely related Government procurement operation, the United States Government thereby incurs no responsibility nor any obligation whatsoever; and the fact that the government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

This technical report has been reviewed and is approved for publication.

VIPPERLA B. VENKAYYA
Project Engineer
Design & Analysis Methods Group

FREDERICK A. PICCHIONI, Lt Col, USAF
Chf, Analysis & Optimization Branch

FOR THE COMMANDER:

RALPH L. KUSTER, JR., Col, USAF
Chief, Structures & Dynamics Div.

"If your address has changed, if you wish to be removed from our mailing list, or if the addressee is no longer employed by your organization please notify AFWAL/FIBRA, W-P AFB, OH 45433 to help us maintain a current mailing list."

Copies of this report should not be returned unless return is required by security considerations, contractual obligations, or notice on a specific document.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report documents an effort to develop an optimality criterion approach to the design of damage tolerant structures subject to stress, deflection, and frequency requirements. Damage conditions are treated in an integral manner in the resizing algorithm. An iterative reanalysis procedure is used to improve the efficiency of the static analyses that are needed as the optimization proceeds. In this volume of the report,

(Block 20 Continued)

input instructions to the computer code ADDRESS (Automated Design of Damage Resistant Structures) are detailed. Further information is included which shows the required control card sequence, the program structures, and subroutine descriptions. The program is operational on the CDC CYBER system at Wright-Patterson Air Force Base.

FOREWORD

This final report documents work performed by the Aerospace Mechanics Division of the University of Dayton Research Institute (UDRI) for the Structures and Dynamics Division of the Flight Dynamics Laboratory, Air Force Wright Aeronautical Laboratories (AFWAL), Wright-Patterson Air Force Base, Ohio. The work was performed under contract F33615-79-C-3209. Dr. V. B. Venkayya was the AFWAL Project Engineer.

This report consists of two volumes. Volume I, entitled, "Theory and Application," describes the theory behind the design optimization method and gives design results. In Volume II, Program User's Manual," detailed instruction are given for use of the ADDRESS (Automated Design of Damage Resistant Structures) computer code on the Wright-Patterson Air Force Base CDC computing system. The report covers work conducted between 1 June 1979 and 30 April 1982.

Dr. Ronald F. Taylor was the Principal Investigator and Dr. Fred K. Bogner was the Project Manager. The author acknowledges the important contributions of Dr. Bogner and Dr. Robert A. Brockman during the formative stages of the program. Acknowledgement is also made of the programming assistance of Mr. Keith Miller and Mr. Jerry Jensen.

SECTION I

INTRODUCTION

In this report user's information for the ADDRESS program (Automated Design of Damage Resistant Structures) is presented. The first volume of this report discusses the theory behind the ADDRESS program and presents representative applications. In this introductory section an overview of the user's instruction manual is given. Also included is a discussion of the supplemental data found in the appendices.

1.1 OVERVIEW

Section 2 of this report details the data input requirements. Particular attention should be paid to the user notes at the end of that section.

Program output is discussed in Section 3. This includes printed output as well as informaton to local files for further processing. Formats for these files are specified in the code.

Control cards and program updates are given in Section 4. Several distinct versions of ADDRESS can be easily obtained to handle vibration problems and models which use beam finite elements. Segmentation directives are also given which help to reduce the core requirements for analysis problems.

The organization of the subroutines is detailed in Section 5. This information is helpful in adding new features to the program.

1.2 ORGANIZATION OF THE SUPPLEMENTAL DATA

In the appendices other useful programing information are presented. Appendices A and B were generated using the UDRI cross-reference program XREF². The first two pages of Appendix A contain a brief explanation of the use of XREF.

The variable name - subroutine name cross-reference table of Appendix A gives an alphabetical listing of all the program variables. After the colon following the variable name is a listing

of all the subroutines where this variable is used. An asterisk before the subroutine name indicates that the variable is defined or redefined in that routine. Appendix B is a list of the common blocks and the routines in which they appear.

The subroutine descriptions of Appendix C provide the following information:

- subroutine name (the descriptions are in alphabetical order by name);
- a short statement of the purpose of the routine;
- the call sequence with the arguments as they appear in the subroutine;
- a description of the arguments;
- a list of the subroutines which call the given subroutine;
- a list of the externals, including any intrinsic functions;
- the files used by this routine;
- special notes or user information.

The updates in Appendix D show the changes that are needed to put the mass and stiffness matrices out of core. The PUTSK, PRNTSK, and SK function routines are listed with extensive user comments.

Appendix E is a listing of the TRUSS program discussed in Reference 1 which compares various iterative reanalysis techniques for the calculation of stresses and deflections in a damaged truss structure. The program is written for the CDC Fortran V compiler.

SECTION 2

INPUT INSTRUCTIONS FOR THE ADDRESS PROGRAM

In this section the data requirements of the ADDRESS program are discussed. The input consists of the following blocks of data:

- A. General Input
- B. Coordinate Data
- C. General Element Data
- D. Materials Data
- E. Connectivity Data
- F. Fiber Orientation Data (optional)
- G. Boundary Conditions
- H. Loads Data
- I. Displacement Data (optional)
- J. Damage Data (optional)
- K. Lumped Mass Data (optional)

The following pages describe each of these data blocks in detail. Each data block consists of one or more card sets, and each card set consists of one or more cards. The notes inform the user as to the number of cards in each set as well as explanatory information.

A. GENERAL INPUT-READ IN SUBROUTINE INITIAL (CARD SET 1) AND
INGNRL (CARD SETS 2-5)

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
1 (1I5)	NSTR	Number of problems to be solved	-
2 (8A10)	TITLE	Any alphanumeric description of the problem	-
3 (16I5)	MM	=2 for a two-dimensional problem =3 for a three-dimensional problem	-
	LMTDSP	=0 if there is no displacement constraint =1 if displacement constraint is the same for all nodes =2 if displacement constraint is not the same for all nodes	-
	LMTSTR	=0 if no stress constraints exist =1 if stress constraints exist	-
	NDMGCAS	Number of damage cases	-
	NLMPMSS	Number of lumped masses	-
	MAXDCCL	Number of cycles of iteration using the recursion relation based on displacement gradients	-
	MAXECCL	Number of cycles of iteration using the recursion relation based on energy gradients	-
	IAREAS	=0 if the initial design variables of the elements are set to 1.0 inches =1 if you wish to input the initial design variables for each element	-
	INDMIN	=0 if the minimum allowable size is the same for all elements =1 if the minimum sizes of the elements are to be input directly	-

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
	KANLYZE	=0 if you wish to use the program for structural optimization =1 if you wish to use the program for structural analysis only (no resizing)	-
	MAXSIZE	=0 if no maximum size is to be specified for the elements =1 if the maximum allowable sizes of the elements are to be input directly	-
	LAYERD	=0 if problem contains no layered composite elements =1 if problem contains layered composite elements	-
	INDANG	=0 if no composite elements or 0° fibers are defined per elements with respect to the global coordinate system =1 if the 0° fibers are defined per element with respect to the local coordinate system =2 if 0° fiber orientation is the same for all composite elements with respect to the global coordinate system	-
	MNLAYR	=0 if same for composite elements =1 if the minimum proportions of 0°, 90° ±45° layers will be input for each member	-
	IPP	=0 if no postprocessor file present =1 if postprocessor file on DPOST created	-
4 (8F10.3)	AEMNMM	Minimum allowable design value	-
	DINCR	A parameter to determine the active set of displacement constraints	-
	THKLAM	Minimum composite layer thickness	-
	SPRDF	Shear panel reduction factor	-

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
5 (2I5, F10.0)	MODES	Number of eigenvalues to compute	-
	NOI	Maximum number of iterations	-
	TOLVEC	Eigenvector tolerance	-

B. COORDINATE DATA - READ IN SUBROUTINE INXYZ

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
6 (15X,2I5)	NODES	Total number of nodes in the finite element model. Limit is 90.	-
	MGEN	Mesh generator flag =0 if you wish to read in the coordinates =1 if the coordinates are to be read or generated in the user subroutine MESH	-
7 (I5,A1,I4 3E10.0)	N	Node Number	(1)
	ISYS	Reference coordinate system =: Cartesian system x,y,z, =A: Cylindrical R, θ ,Z =B: Spherical R, θ , ϕ =C: (user defined) =D: (user defined) =E: (user defined)	-
	NINCR	Increment for node point generation	(2)
	X1	X-node coordinate	-
	X2	Y-node coordinate	-
	X3	Z-node coordinate	(3)

C. GENERAL ELEMENT DATA - READ IN SUBROUTINE ELEMEN

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
8 (4I5)	ITYPE	Always=3 (fixed variable)	(4)
	NMT	Total number of material property sets. Limit is 20.	-
	NELEM	Total number of elements	-
	NCØMP	Number of composite material property sets. Must always be less than or equal to NMT	-

D. MATERIALS DATA - READ IN SUBROUTINE INPO3

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
9 (5E10.0)	YØUNGM(I)	If material is isotropic (same elasticity in all directions) then it is the Young's modulus for the I-th material (psi) If material is composite then it is the elastic modulus in the 0° fiber direction for the I-th material	(5)
	PØISØN(I)	If the material is isotropic then it is Poisson's ratio for the I-th material If the material is composite then it is Poisson's ratio for the transverse strain due to stress along the 0° fiber direction for the I-th composite material	-
	RHØ1(I)	Density of the I-th material	-
	ELASM(I)	If the material isotropic then =0 If material is composite then it is the elastic modulus transverse to the 0° fiber direction of the I-th composite material (psi)	-
	SHEARM(I)	If material is isotropic then =0 If material is composite then it is the shear modulus for the I-th composite material	-
10 (5E10.0)	ALSTRS(1)	Tension stress allowable in psi in the 0° fiber direction	(5)
	ALSTRS(2)	Compression stress allowable in psi in the 0° fiber direction	
	ALSTRS(3)	Tension stress allowable in psi transverse to the 0° fiber direction	

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
	ALSTRS(4)	Compression stress allowable in psi transverse to the 0° fiber direction	-
	ALSTRS(5)	Shear stress allowable in psi transverse to the 0° fiber direction	-

If LAYERED (see Card Set 2) = 0, go to Card Set 18

If INDANG (see Card Set 2) = 1, go to Card Set 13

If INDANG (see Card Set 2) = 2, go to Card Set 14

If ITYPE $\neq$ 1, omit Card Sets 11A and 11B.

E. CONNECTIVITY DATA - READ IN SUBROUTINE INCØNN

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
11 (9I5, 3E10.0)	IELNO	Element number	(6)
	ITYPE	Element type =1 for beam element =2 for axial bar =3 for triangular membrane =4 for quadrilateral membrane =5 for shear panel	-
	IPR	Material property set for this element	(7)
	LAMFØ	Fiber orientation parameter =0 for isotropic element =1 for fiber orientations 0°, 90°, ±45° in the proportions .25, .25, .50 respectively. =2 for fiber orientations 0°, 90° in the proportions .50, .50 respectively. =3 for fiber orientations ±45° in the proportion 1.00 =4 for fiber orientations 0°, ±45° in the proportions 1/3, 2/3 respectively. =5 for fiber orientations 90°, ±45° in the proportions 1/3, 2/3 respectively.	-
	KGEN	Node increment for element generation	(8)
	NØD(1)	Local node number 1	(9)
	NØD(2)	Local node number 2	
	NØD(3)	Local node number 3	
	NØD(4)	Local node number 4	
	THICK	Member size	(10)
	THICKMN	Minimum element thickness	(10)
	THICKMX	Maximum element thickness	(10)

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
11A (5X, 7E10.0)	YI1	Moment of inertia about the y-axis at node 1	-
	YI2	Moment of inertia about the y-axis at node 2	-
	ZI1	Moment of inertia about the z-axis at node 1	-
	ZI2	Moment of inertia about the z-axis at node 2	-
	XJ1	Polar moment of inertia at node 1	-
	XJ2	Polar moment of inertia at node 2	-
	YK1	y-component of the mass moment of inertia at node 1	-
11B (5X, 7E10.0)	YK2	y-component of the mass moment of inertia at node 2	-
	ZK1	z-component of the mass moment of inertia at node 1	-
	ZK2	z-component of the mass moment of inertia at node 2	-
	YM	Mass centroid offsets	
	ZM		
	YG	Geometric centroid offsets	
	ZG		

F. FIBER ORIENTATION DATA - READ IN SUBROUTINE INLAYR

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
12 (3F10.3)	XANG(I)	The angle in degrees that the 0° fibers of the I-th element makes with the global x-axis	(11)
	YANG(I)	The angle in degrees that the 0° fibers of the I-th element makes with the global y-axis	-
	ZANG(I)	The angle in degrees that the 0° fibers of the I-th element makes with the global z-axis	-
GO TO CARD SET 16			
13 (6F10.3)	XANG(I)	The angle in degrees that the 0° fibers of the I-th element makes with the local element coordinate system	(12)
GO TO CARD SET 16			
14 (3F10.3)	XA	The angle the 0° fibers make with the global x-axis	(13)
	YA	The angle the 0° fibers make with the global y-axis	-
	ZA	The angle the 0° fibers make with the global z-axis	-
IF IAREAS = 0 SKIP CARD SETS 15 and 16			
15 (3F10.3)	AEX(I)	Proportion of fibers in the 0° direction for the I-th element	-
16 (3F10.3)	AEY(I)	Proportion of fibers in the 90° direction for the I-th element	-

IF MNLAYR = 0 SKIP CARD SET 17

17 (3F10.3)	AEXMIN(I)	Minimum proportion of 0° layers for the I-th element	-
	AEYMIN(I)	Minimum proportion of 90° layers for the I-th element	-
	AEXYMIN(I)	Minimum proportion of ±45° layers for the I-th element	-

G. BOUNDARY CONDITIONS - READ IN SUBROUTINE GETBC

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
18 (2I5)	NBC1	Number of type 1 constraints	(14)
	NBC2	Number of type 2 constraints	(15)
IF NBC1 = 0 GO TO CARD SET 21			
19 (3I5)	N1	Beginning node number to be constrained	(16)
	N2	Ending node number to be constrained	
	INCR	Node number increment	
20 (3I5)	JD(I)	Nodal components constrained (type 1)	(16)-(17)
IF NBC2 = 0 SKIP CARD SETS 21 and 22			
21 (3I5)	JD(I)	Nodal components constrained (type 2)	(17)-(18)
22 (10I5)	ND(I)	Nodes constrained	(18)-(19)

H. LOADS DATA - READ IN SUBROUTINE INLOADS

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
23 (16I5)	LOADS	Number of load conditions	-
	NJLOADS	Number of load components in the Ith loading condition	(20)
24 (3(F10.0, 2I5))	TEMP(I)	Magnitude of the Ith load	(21)
	IM(I)	Direction of the load =1 if in x direction =2 if in y direction =3 if in z direction	-
	JM(I)	Node number where load is applied	-

IF LMTDSP = 0 SKIP CARD SETS 25, 26, and 27

IF LMTDSP = 2 GOT TO CARD SET 26

I. DISPLACEMENT CONSTRAINT DATA - READ IN SUBROUTINE INDSPL

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
25 (3F10.3)	DEFMAX(I)	Absolute value of the displacement constraint in the Ith direction for all nodes =1 for x direction =2 for y direction =3 for z direction	(22)
IF LMTDSP = 1 SKIP CARD SETS 26 and 27			
26 (I5)	KH	Number of displacement constraints	-
27 (3(F10.0, 2I5))	TEMP(I)	Magnitude of the displacement constraint	(23)
	IM(I)	Direction in which the constraint is applied =1 if in x direction =2 if in y direction =3 if in z direction	-
	JM(I)	Number of the node where constraint is applied	-

IF NDMGCAS = 0 SKIP CARD SETS 28, 29, and 30

J. DAMAGE DATA - READ IN SUBROUTINE INDMGE

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
28 (2(F10.0, I5))	TOLDMGD	Damage displacement iteration tolerance	-
	MAXDDIT	Maximum number of damage displacement iteration	-
	TOLDMGF	Damage mode shape iteration tolerance	-
	MAXDFIT	Maximum number of damage mode shape iteration	-
29 (I5)	NDMG(J)	Number of damage elements in damage case J	(24)
30 (I5, 2F10.0)	IDNG(J,I)	Ith element in damage case J	-
	DKF	Stiff damage factor	-
	DMF (TR(J,I))	Mass damage factor in the Ith element and in the Ith damage case	-

IF NLMPMSS = 0 THEN STOP

K. LUMPED MASS DATA - READ IN SUBROUTINE INPMSS

CARD SET (FORMAT)	VARIABLE NAME	DESCRIPTION	NOTES
31	LMNØDE(I)	Node location of Ith lumped mass	(25)
(I5, F10.0)	WLMPMSS(I)	Value of Ith lumped mass in lbf.	-

NOTES:

- (1) Repeat Card Set 5 NØDES times, then add one blank card.
- (2) A nonzero value of NINCR causes nodes to be equally spaced between the last and current nodes, with numbering increment NICR. As an example, the data

10		0.	0.	0.
20	2	10.	-10.	0.

is equivalent to

10	0.	0.	0.
12	2.	-2.	0.
14	4.	-4.	0.
16	6.	-6.	0.
18	8.	-8.	0.
20	10.	-10.	0.

- (3) If MM = 2 (i.e., two-dimensional problem) then X3 is zero.
- (4) ITYPE in ELEMIN is not the same as ITYPE in INPO3. In subroutine ELEMIN the following variable assignments are made:

```

NMAT = NMT
MEMBS = NELEM
ISØTRN = NMAT - NCØMP = Number of isotropic
                        material property sets

```

- (5) Repeat Card Sets 9 and 10 NMT times. The isotropic material properties are ordered before the composite properties.
- (6) Repeat Card Set 11 NELEM times if KGEN = 0 (see Note 8 below). Add two blank cards at the end.
- (7) This is determined by the ordering established in Card Sets 9 and 10.
- (8) A nonzero value of KGEN on the second card of a pair causes elements between the last and current elements to be automatically generated. With the exception of node numbers, all elements generated are assigned the same data as the current element. Local node numbers for the previous element are incremented by KGEN to generate each succeeding element. More than one element must be generated to use this feature; node numbers for the current element need not be given. As an example, the data

85	5	1	0	0	49	50	52	51	.0190
88				2					

is equivalent to

85	5	1	0	0	49	50	52	51	.0190
86	5	1	0	0	51	52	54	53	.0190
87	5	1	0	0	53	54	56	55	.0190
88	5	1	0	0	55	56	58	57	.0190

- (9) For beams, leave NØD(4) blank. Beam NØD(3) determines principal axes of bending.
For bars, leave NØD(3) and NØD(4) blank.
For triangular membrane, leave NØD(4) blank.
For each element, let NØD(1) be the lowest node number and NØD(2) the next lowest.
For quadrilaterals and shear panels, NØD(3) and NØD(4) are determined by continuing in the direction defined by NØD(1), NØD(2).
- (10) For bars, THICK is the cross-sectional area. For all others, except beams, THICK is the element thickness.
For beam analysis, set THICK = 0; THICKMN = area at end A of beam; THICKMX = area at end B of beam.
- (11) Include only if LAYERD = 1 and INDANG = 0 (see Card Set 3).
Read continuously for I = 1 to I = NELEM. If an element is not composite, set XAND(I) = YANG(I) = ZANG(I) = 0.0 for that element.
- (12) Include only if LAYERD = 1 and INDANG = 1 (see Card Set 3).
Read continuously for I = 1 to I = NELEM. If an element is not composite set XANG(I) = 0.0 for that element.
- (13) Include only if LAYERD = 1 and INDANG = 2 (see Card Set 3).
- (14) A type 1 constraint is used to fix selected degrees of freedom over a specified range of nodes with specified increment in node numbers.
- (15) A type 2 constraint is used to fix selected degrees of freedom over a list of nodes.
- (16) Type 1 constraint data to be entered NBC1 times. Omit if NBC1 = 0.

- (17) Values of 1, 2, and 3 can be used. To fix u at a node (x component of deflection) include a 1 value. To fix v at a node (y component of deflection) include a 2 value. To fix w at a node (z component of deflection) include a 3 value. For example, make Card Set 13

1	2	3
---	---	---

to fix all degrees of freedom. To fix only u use

1	0	0
---	---	---

- (18) Type 2 constraint data to be entered NBC2 times. Omit if NBC2 = 0.
- (19) Each of the nodes ND(I) are constrained in the components specified by Card Set 13; some of the ND(I) may be zero.
- (20) Repeat LOADS times.
- (21) Repeat for I = 1 to NJLØADS(I) for a total of (NJLØADS(I)/3 + 1) cards.
- (22) Repeat MM times (see Card Set 3).
- (23) Repeat for I = 1 to KH for a total of (KH/3 + 1) cards.
- (24) Repeat NDMGCAS times (see Card Set 3).
- (25) Repeat NLMPMSS times.

SECTION 3

PROGRAM OUTPUT

Output of the ADDRESS program is very similar in nature to the OPSTAT³ program. Formats have been changed to some extent and additional information on damage cases is printed. Output for a typical static optimization run is as follows:

1. Input Data Echo. Fifty lines of data are printed per page with header and trailer numbers to help check the column locations of the data. The title card information is printed on all pages of the output, together with a page number.

2. General Data. Card Set 3 information is presented with explanations of the numerical values.

3. Nodal Coordinates. Data is always printed in Cartesian coordinates even though another system may be used for input.

4. Materials Data. Properties from Card Set 9 and the allowables from Card Set 10 are printed for each material.

5. Element Connectivity. Element number (ELEM), type (ITYPE), material code (MATL), fiber orientation parameter (LAM), local nude number, and member sizes are printed, based on the Card Set 11 data.

6. Composite Element Data. If the model contains composite elements the fiber orientation data from Card Sets 12, 15, 16, and 17 are printed.

7. Boundary Conditions. A summary of the type 1 and type 2 boundary conditions (see Notes 14 and 15 of Part G of Section 2) is printed. For the current library of elements, components 4 through 10 will always be printed as zeroes.

8. Load Summary. For each load case the net loads (FX, FY, FZ) in the coordinate directions are printed, together with their respective moments (MX, MY, MZ).

9. Damage Data. Data from Card Sets 28, 29, and 30 are printed for each damage case.

10. Population Information.³ Output from Subroutine PØP concerning the distribution of elements in the stiffness matrix. This information is generated before the stiffness matrix of the structure is assembled.

- (a) Gross Population = total number of elements in the upper triangle of the matrix.

Apparent Population = actual number of elements considered as non-zero by a given solution scheme. Thus the apparent population represents the number of storage locations required for the stiffness matrix.

- (b) Starting Row Numbers for each column - the number of the row where the first non-zero element occurs in each column.

- (c) Numbers of Diagonal Elements in Single Array Stiffness Matrix. For each Column I the actual number of elements, ID(I), in the upper triangular matrix up to and including that column, i.e.,

$$ID(I) = \frac{I(I+3)}{2} - \sum_{j=1}^I b_j$$

where b_j is the row number given for Column I in (b). Thus for the last column, ILAST,

$$ID(ILAST) = \text{Apparent Population}$$

11. Relative Design Data. After the static analysis is performed, the relative sizes of the elements are printed. The maximum relative size is 1.0 and all other sizes are given relative to this largest size. Next, a summary of the time for the analysis is printed. This is broken down into time for the matrix assembly, decomposition, and forward and backward substitution.

12. Damage Reanalysis Error Summary. If damage cases are included, then the analysis iteration error summary is printed for each case. The norm of the vector error is printed with the load case index in parentheses. Error information on the extrapolation process is also printed. Total time required to analyze each damage case is indicated. This should be less than the time for the analysis of Item 11 above for the reanalysis to be cost-effective.

13. Initial Scale Factor (BASEA). This is defined in subroutine SCALE to be .01 times the square root of the quotient of STRMAX and ENGCAP. The variable STRMAX is the maximum over all load vectors of the inner product of the load and displacement vectors. In STIFFK, ENGCAP is defined as the sum over all elements of AE times ELENGTH where AE is the member size and ELENGTH is length (for bars) or area (for membranes and shear panels). The initial BASEA is used in PREPAR to scale the stress allowables. These scaled allowables, ALS, are used in STRCON to compute the element stress ratios, ESRTIO.

14. Scaling Factors. If a stress ratio for an element in some load/damage case combination exceeds 1.0, its maximum value is printed. The listing of corresponding element numbers that is printed beside these exceedance values tells the user which elements are overstressed for the design whose relative member sizes are scaled by the initial scaling factor of Item 13. The product of the initial scaling factor and the critical element scaling factors gives the new BASEA which is printed next with the header, "Scaling factor to satisfy stress constr."

15. Summary of Current Cycle. Current cycle number of this resizing is printed, together with a weights summary.

16. Resizing Continues. Items 11 through 15 are repeated until one of the following happens:

- (a) All energy and displacement cycles have been completed as specified in Card Set 3;

(b) The weight goes up in an energy cycle;

(c) The weight doubles in a displacement cycle.

17. Final Design Stress Summary. Stresses, member sizes, element numbers, and ESRATIO's are printed. The column of ESRATIO's are the last set of ESRATIO's computed (see Item 13). They are ordered so that the undamaged load cases come first, followed by the damage case information by load case. Example: 2 load cases, 2 damages,

	ELMT	ESRATIO	
element no.	5	.91162E-01	LC1, no damage
		.74404E-01	LC2, no damage
		.12544E+00	LC1, DC1
		.10595E+00	LC2, DC1
		.91743E-01	LC1, DC2
		.75008E-01	LC2, DC2

LC = load case, DC = damage case.

18. Final Design Deflection Summary. Deflections are printed by node in the three coordinate directions. Applied loads are also printed in the same format as the ESRATIO's above in Item 17.

Additional output is written to local files 8 and 99. The subroutines beginning with "PP" write information to one or both of these files for post-processing. See the subroutine descriptions in Appendix C for further information.

SECTION 4
CONTROL CARDS AND PROGRAM UPDATES

Table 1 lists the control cards needed to run the version of ADDRESS which is dimensioned for 453 elements (design variables) and 339 degrees of freedom. The central memory requirement of 255K octal can be reduced to 155K octal through the use of the control cards and segmentation shown in Table 2. When segmentation is used, the program capacity is doubled; however, the I/O requirement also doubles.

SECTION 5

PROGRAM ORGANIZATION

The ADDRESS program contains 101 routines, counting the main program. Figures 1 through 6 show their interrelationship. In this section the overall organization of this calling sequence will be outlined. For details of the individual subroutines, see Appendix C.

The main program first calls INITIAL which sets certain variables and reads NSTR which is the number of problems to be solved in this run. The input data is echoed and mass storage is set up for the global mass and stiffness matrices. All of the analysis and optimization functions are controlled by DØPRØB, which is called within a loop whose index ranges from 1 to NSTR.

The DØPRØB routine shown in Figure 1 contains the program logic for performing all the aspects of the optimization. Its functions are as follows:

- (1) Read the input data (call to INITP)
- (2) Analyze the current design (call to CURRENT)
- (3) Perform resizing for strength requirements (call to EMØDE)
- (4) Perform resizing to meet displacement constraints (call to DMØDE)
- (5) Perform bookkeeping functions such as getting the best design, averaging with a previous design, and saving the results (calls to GETBEST, AVERAGE, and SAVE)
- (6) Print the results (call to PRINT)

During the input phase the routines of Figure 2 are called. In addition to input, a preliminary estimate of the storage space required for the mass and stiffness matrices is made by subroutine PØP. The input routines read the following types of data:

- (1) General data such as analysis and optimization options to be performed (call to INGNRL);
- (2) Coordinate data for the nodes in the finite element model (call to INXYZ);
- (3) Element data including material properties, stress allowables, and connectivity (call to ELEMEN);
- (4) Layer data for any composite elements (call to INLAYR);
- (5) Boundary condition information (call to GETBC);
- (6) Lumped mass data (call to INLPMSS);
- (7) Applied load conditions (call to INLOADS);
- (8) Information defining the damage conditions (call to INDMGE) and the displacement constraints (call to INDSPL).

All of the input data are also printed by these routines, and the model data is also put on the local file NFIL=99 for optional post-processing of the model.

Figure 3 shows the relationship of the various routines which perform the analysis of the current design. The functions performed by CURRENT are as follows:

- (1) Set up the global mass and stiffness matrices and perform a static analysis (call to ANALYZ);
- (2) Perform a vibration analysis (call to SIVIB2);
- (3) For the damage conditions, compute the static (call to DAMAGE) and vibration (call to DMGFREQ) response by reanalysis methods;
- (4) Scale the design to meet stress requirements (call to SCALE) and compute the weight (call to WEIGHT).

The routines shown in Figure 4 are called when resizing for displacement constraints takes place. Virtual displacements due to the dummy loads are determined by calls to REDUCE, FØRSUB, and BACKSUB. Calls to RESTØR and UNTFRC determine response to the

loads. Damage cases are handled by the call to DAMAGE. After resizing, LMSIZE is called to determine the thickness distributions for any composite elements that have been resized.

Figures 5 and 6 show the relationship of various utility routines. The print routines of Figure 5 involve calls to analysis routines to obtain results for the final design. The utility routines of Figure 6 set up the element mass and stiffnesses for both damaged and undamaged elements.

Note: See Figures 2, 3, 4, and 5 for details of A, B, C, and D, respectively.

Figure 1. ADDRESS Program Routines: MAIN, DØPRØB, and INITIAL Call Sequence.

Figure 2. Input Routines: INITP Call Sequence.

NOTE: For details of E, F, and H, see Figure 6.

Figure 3. Analysis Routines: CURRENT Call Sequence (Overall).

NOTE: For details of E and F, see Figure 6.

Figure 6. Analysis Routine Segments E, F, G, and H.

APPENDIX A
VARIABLE NAME / SUBROUTINE NAME
CROSS-REFERENCE TABLE

UDRI - Cross reference program: XREF

This program was written using FORTRAN V on the ASD CDC Cyber 750. It is designed to read a compiler listing of a FORTRAN IV program and generate a complete list of variable and labeled common names. It also provides a set of tables which identify which variables are used and defined in which routines as well as labeled commons.

Program access:

ATTACH,XREF,XREFPLUS,ID=KLØØS,SN=ASDAD	(source code)
ATTACH,XX,XXPLUS,ID=KLØØS,SN=ASDAD	(object code)

Compilation of source code:

FTN5,I=XREF,B=XX,LØ=0,ANSI=0,ØPT=2	
FTN5,I=XREF,B=0,LØ=M/A/R,L=LIST,ANSI=0,ØPT=2	(for listing)

Preparations for execution:

TAPE1 must contain the program listing which XREF is to read. XREF considers TAPE1 to be multiple routines; all of the same executable program. This does not have to be a complete program nor arranged in any particular order. To develop a TAPE1:

FTN,I=1fn,L-TAPE1,R=3,...

TAPE1 can be edited prior to execution of XREF.

Execution:

XREF can be run at the terminal or in batch in the same manner as any other LGO file. (The presence of TAPE1 is the only requirement.) As XREF reads the symbolic reference map, it will display various error messages related to the routine it is currently processing. This is useful in finding FTN error messages in large listings. For very large listings, the OUTPUT file can be disconnected from the terminal and PAGED after termination.

Results:

XREF will display a summary of the number of routines in TAPE1, the number of variable names in the cross-reference table, and the number of labeled commons found. It will then list all of the routine, variable, and common names in alphabetical order (listing is in 132 columns). Then XREF will report the number of 'garbage' variables and list their names. A 'garbage' variable name is one which was found to be unused in one of the routines. Some of these may occur in the variable cross-reference table, others may not. XREF stores the cross reference tables on TAPE2. This file is rewound at the end of the program and can be printed by: COPY,TAPE2,OUTPUT. TAPE2 is constructed in two parts; variables and commons. The names are listed in alphabetical order (by internal CDC display code) with the routines they are found in listed beside them. For variable names, an asterisk will appear with the routines that were found to define the variable in the R=3 map. The tables are designed to be reproduced onto a 8 1/2 X 11 inch paper with regular typing margins (and no reduction).

APPENDIX C
SUBROUTINE DESCRIPTIONS

ROUTINE NAME - Main Program
PURPOSE - Initiate Calculations
CALL SEQUENCE - N/A
ARGUMENTS - N/A

CALLED BY - N/A
EXTERNALS - INITIAL, DØPRØB
COMMON BLOCKS - NPRØB
FILE NAMES - DPØST, ØUTPUT, TAPE5, TAPE6, TAPE8, TAPE99

NOTES - The call to INITIAL sets certain constants.
The DØPRØB call is in a loop which allows several problems to be run at once. It is usually more convenient to keep the data sets separate and run only one problem at a time.

ROUTINE NAME - ANALYZ
PURPOSE - Perform Static Analysis of Undamaged Design
CALL SEQUENCE - CALL ANALYZ
ARGUMENTS - None

CALLED BY - CURRENT
EXTERNALS - BACKSUB, BOUND2, FORSUB, LLT, REDUCE, SECOND,
STIFFK
COMMON BLOCKS - FRDR
FILE NAMES - TAPE6

NOTES - Calls all the routines which form the mass and
stiffness matrices, imposes the boundary
conditions, decomposes the stiffness matrix,
and solves for the displacements.

ROUTINE NAME - ASEMBL
PURPOSE - Assemble the Global Mass and Stiffness Matrices
CALL SEQUENCE - CALL ASEMBL(L)
ARGUMENTS - L = Element Number

CALLED BY - STIFFK
EXTERNALS - PUTSK, SK
COMMON BLOCKS - CØNN, EIGN, ELEM, GM, MASS, N, SKGM, STIFF
FILE NAMES - None

NOTES - None

ROUTINE NAME - ASEMDK
PURPOSE - Assemble the Damaged Mass and Stiffness Matrices
CALL SEQUENCE - CALL ASEMDK(L,M,KDMG)
ARGUMENTS - L = Damaged Element Number
M = Damage Case
KDMG = Index of Damaged Element in DMFCTR Array

CALLED BY - GETDK
EXTERNALS - None
COMMON BLOCKS - CØNN, DK, DMG, EIGN, ELEM, MASS, N, STIFF
FILE NAMES - None

NOTES - None

ROUTINE NAME - AVERAGE
PURPOSE - Average Current Design with Least Weight Design
CALL SEQUENCE - CALL AVERAGE
ARGUMENTS - None

CALLED BY - DØPRØB
EXTERNALS - None
COMMON BLOCKS - AMAXMIN, BASEA, ELEM, LAYERD, SAVE, TITLE
FILE NAMES - TAPE6

NOTES - None

ROUTINE NAME - BACKSUB
 PURPOSE - Backsubstitution
 CALL SEQUENCE - CALL BACKSUB(W,U,I0,I1)
 ARGUMENTS - W = Solution Vector
 U = Right Hand Side
 I0 = First Vector to be Used
 I1 = Last Vector to be Used

CALLED BY - ANALYZ, DMGITER, DMØDE, FRQITER, SIVIB2
 EXTERNALS - None
 COMMON BLOCKS - N, SKBM
 FILE NAMES - none

NOTES - $L^T W = U$ is solved. The W and U need not be
 in separate locations.

ROUTINE NAME	-	BEAMKM
PURPOSE	-	Compute Three-dimensional Beam Element Mass and Stiffness
CALL SEQUENCE	-	CALL BEAMKM(ITYPE,ITRAN,EM,CC,XL)
ARGUMENTS	-	ITYPE = 0 For Stiffness Calculations > 0 For Mass Calculations ITRAN = 0 For 3-D Beam = 1 For Plane Beam EM = Element Matrix CC = Axial Strains XL = Length of Beam
CALLED BY	-	GETDK, STIFFK
EXTERNALS	-	BMSYMM, BMX
COMMON BLOCKS	-	BMPRØB, TEMP
FILE NAMES	-	None
NOTES	-	See Vol. I for discussion of beam element.

ROUTINE NAME - BMGEØM
PURPOSE - Geometry Calculation for Beam
CALL SEQUENCE - CALL BMGEØM(TR)
ARGUMENTS - TR = Geometry Matrix

CALLED BY - BMX
EXTERNALS - None
COMMON BLOCKS - NV
FILE NAMES - None

NOTES - None

ROUTINE NAME - BMSYMM
PURPOSE - Make the Beam Element Matrices Symmetric
CALL SEQUENCE - CALL BMSYMM(EM,IØORDER)
ARGUMENTS - EM = Mass or Stiffness Matrix
IØORDER = Array Containing DOF Ordering

CALLED BY - BEAMKM
EXTERNALS - None
COMMON BLOCKS - None
FILE NAMES - None

NOTES - None

ROUTINE NAME - BMX
PURPOSE - Sort the Beam DOF's
CALL SEQUENCE - CALL BMX(EM,IØRDER)
ARGUMENTS - EM = Mass or Stiffness Matrix
IØRDER = Array Containing DOF Ordering

CALLED BY - BEAMKM
EXTERNALS - BMGEØM
COMMON BLOCKS - None

NOTES - None

ROUTINE NAME - BMXTRS
PURPOSE - Compute Beam Stresses
CALL SEQUENCE - CALL BMXTRS(II,XL)
ARGUMENTS - II = Element Number
 XL = Length

CALLED BY - PRNTEL
EXTERNALS - BMGEØM
COMMON BLOCKS - CØNN, ELEM, FRDR, MAT, N, NØDES, TTBME,
 AMAXMIN, BASEA, AFK
FILE NAMES - None

NOTES - None

ROUTINE NAME - BØUND2
PURPOSE - Apply Boundary Conditions to the Mass and Stiffness
CALL SEQUENCE - CALL BOUND2
ARGUMENTS - None

CALLED BY - ANALYZ
EXTERNALS - PUTSK, SK
COMMON BLOCKS - BND, EIGN, GM, N, SKGM
FILE NAMES - None

NOTES - The rows and columns in the mass and stiffness matrices which correspond to the boundary degrees of freedom are eliminated.

ROUTINE NAME - CHANGE
PURPOSE - Perform Row and Column Interchanges for
Quadrilateral Elements
CALL SEQUENCE - CALL CHANGE(EKM,IX,IY)
ARGUMENTS - EKM = Element Mass or Stiffness Matrix
IX, IY = Row and Column Numbers to be Interchanged

CALLED BY - CØNDNS
EXTERNALS - None
COMMON BLOCKS - None
FILE NAMES - None

NOTES - The rows and columns of a quadrilateral element
mass or stiffness matrix must be interchanged
so that the degrees of freedom are in ascending
order as required by ASEMBL.

ROUTINE NAME - CØNDNS
 PURPOSE - Condense the Quad. Mass and Stiffness Matrices
 CALL SEQUENCE - CALL CØNDNS (MB,MC,MD,NØ)
 ARGUMENTS - MB, MC, MD = Node Numbers
 NØ = Control Parameter

CALLED BY - QDRLTL
 EXTERNALS - CHANGE
 COMMON BLOCKS - EIGN, MASS, STIFF
 FILE NAMES - None

NOTES - Since the quadrilateral elements are formed by assembly of four triangles, the center node degrees of freedom must be reduced. The 10 x 10 mass and stiffness matrices are reduced to 8 x 8 by static condensation.

ROUTINE NAME - CØØRD
PURPOSE - Determine Direction Cosines for Element Transformation
CALL SEQUENCE - CALL COORD(L)
ARGUMENTS - L = Element Number

CALLED BY - GETDK, PRNTEL, STIFFK, STRCØN, UNTFRC
EXTERNALS - SQRT
COMMON BLOCKS - AREA, CØNN, ELEM, LØCAL, NODES
FILE NAMES - None

NOTES - None

ROUTINE NAME - CRAMER
PURPOSE - Cramer's Rule for Inversion of Triangle
Coordinate Matrix
CALL SEQUENCE - CALL CRAMER(A,TRIANG,MA,MB,MC)
ARGUMENTS - A = 3 x 3 Matrix which Contains the Inverse
TRIANG = Area
MA, MB, MC = Node Numbers

CALLED BY - PLSTIF, STRESS
EXTERNALS - None
COMMON BLOCKS - LOCAL
FILE NAMES - None

NOTES - None

ROUTINE NAME - CTYPE
 PURPOSE - Transformations to Cartesian Coordinates
 CALL SEQUENCE - CALL CTYPE(ITYPE,X1,X2,X3)
 ARGUMENTS - ITYPE=1 Cylindrical coordinates given
 =2 Spherical coordinates given
 X1,X2,X3 = r, θ, z for ITYPE=1
 = r, θ, ϕ for ITYPE=2

CALLED BY - INXYZ
 EXTERNALS - None
 COMMON BLOCKS - None
 FILE NAME - None

NOTES - Other transformations can be supplied by the user. On return, X1,X2,X3 are the x,y,z cartesian coordinates.

ROUTINE NAME - CURRENT
PURPOSE - Evaluate Current Design and Call Related Routines
CALL SEQUENCE - CALL CURRENT
ARGUMENTS - None

CALLED BY - DØPRØB, LAYPR
EXTERNALS - ANALYZ, DAMAGE, DMGFREQ, SCALE, SIVIB2, WEIGHTS
COMMON BLOCKS - BASEA, DMG, EIGN, ELEM, FRDR
FILE NAMES - TAPE6

NOTES - The current design is evaluated from a stress and deflection standpoint. If required, the natural frequencies and modes will be calculated. The structural weight is also computed.

ROUTINE NAME - DAMAGE
PURPOSE - Perform Static Reanalysis for Damage Cases
CALL SEQUENCE - CALL DAMAGE(L,D)
ARGUMENTS L = Load Case Counter
D = Array of Deflections for Each of the
Damage Cases

CALLED BY - CURRENT, DMØDE
EXTERNALS - DMGITER, ERR, GETDK, SECØND
COMMON BLOCKS - DMG, DMGERR, EIGVEC, N, TITLE
FILE NAMES - TAPE6

NOTES - Main iteration loop contains the Aitken's
extrapolation procedure. Time and error
summary printed at the end of the loop.

ROUTINE NAME - DECØUP
PURPOSE - Decouple the Eigenvector Matrix
CALL SEQUENCE - CALL DECØUP
ARGUMENTS - None

CALLED BY - SIVIB2
EXTERNALS - SQRT
COMMON BLOCKS- EIGN, EIGVEC, N
FILE NAMES - None

NOTES - The eigenvalues are also sorted in descending order of magnitude. The two most recent eigenvectors are decoupled.

ROUTINE NAME - DMGFREQ
PURPOSE - Frequency Reanalysis for Damage Cases
CALL SEQUENCE - CALL DMGFREQ
ARGUMENTS - None

CALLED BY - CURRENT
EXTERNALS - DMGØRTH, ERR, FRQITER, GETDK, SECØND
COMMON BLOCKS - DMG, DMGERR, EIGN, EIGVEC, N, NØDES, TITLE
FILE NAMES - TAPE6

NOTES - The damaged stiffness and mass matrices are obtained and the vector estimate is orthogonalized with respect to the modified stiffness matrix. Procedure is repeated until the vector error in the norm is small.

ROUTINE NAME - DMGITER
 PURPOSE - Damage Reanalysis Iteration
 CALL SEQUENCE - CALL DMGITER(X,Y,D,L)
 ARGUMENTS - X = Old Iterate
 Y = New Iterate
 D = Original Displacement Vectors
 L = Load Case Counter

CALLED BY - DAMAGE
 EXTERNALS - BACKSUB, DX, FØRSUB
 COMMON BLOCKS - DK, N
 FILE NAMES - None

NOTES - Iteration formula is

$$K \, dx_{\text{new}} = dK \, \bar{x}_{\text{old}}$$

$$\bar{x}_{\text{new}} = x + d\bar{x}_{\text{new}} = \text{response in damage condition}$$

where x is the solution of the undamaged problem $Kx = f$. If loads change in damage condition $\bar{f} = f - f_1$, then modify the Y vectors output just after call to DX. Set $Y = Y - f_1$ before call to FØRSUB.

ROUTINE NAME - DMGØRTH
 PURPOSE - Orthogonalize Current Eigenvector Estimates
 CALL SEQUENCE - CALL DMGØRTH(T)
 ARGUMENTS - T = Array of Vectors to be Orthogonalized

CALLED BY - DMGFREQ, FRQITER
 EXTERNALS - DX, PRELT, SQRT
 COMMON BLOCKS - DK, EIGN, EIGVEC, N
 FILE NAMES - None

NOTES - The current eigenvector estimates for the damage cases are orthogonalized with respect to $K-dK$ where $K = LL^T$.

ROUTINE NAME - DMØDE
PURPOSE - Resize in the Displacement Mode
CALL SEQUENCE - CALL DMØDE
ARGUMENTS - None

CALLED BY - DØPRØB
EXTERNALS - BACKSUB, DAMAGE, FØRSUB, LMSIZE, REDUCE, RESTØR,
SQRT, UN
COMMON BLOCKS - AMAXMIN, BASEA, DEFLMT, DMG, DUMMY, ELEM, FRDR,
LAYERD, LM
FILE NAMES - TAPE6

NOTES - A check is first made to see if there are any
active displacements (i.e. ones sufficiently
close to their limits). Next a dummy loads
vector is formed for each active displacement.
The virtual displacements due to these dummy
loads are then computed. Static reanalyses
for the damage cases are then performed.

ROUTINE NAME - DØPRØB
 PURPOSE - Overall Sequence Control
 CALL SEQUENCE - CALL DØPRØB
 ARGUMENTS - None

CALLED BY - Main Program
 EXTERNALS - INITP, CURRENT, EMØDE, SAVE, GETBEST, DMØDE,
 AVERAGE, PRINT
 COMMON BLOCKS - LMTEXCD, ØPT, TITLE, WEIGHT

NOTES - Routines are called which read and check the input data. The current design is then analyzed. Resizing is performed in the energy mode and then in the displacement mode. If the weight increases during the next energy mode resizing the best design is returned and the program proceeds with the next step in the optimization. If the weight increases during the displacement mode resizing, this design is either averaged with the current least weight design or resizing is terminated if the weight has more than doubled.

ROUTINE NAME - DX
 PURPOSE - Premultiplication by Damaged Mass or Stiffness Matrix
 CALL SEQUENCE - CALL DX(Y,D,Z,N)
 ARGUMENTS - Y = Vectors Resulting from Premultiplication
 D = Damaged Mass or Stiffness Matrix
 Z = Vector Premultiplied by D
 N = Number of Vectors

CALLED BY - DMGITER, DMGØRTH, FRQITER, GENMSS
 EXTERNALS - REDUCE, RESTØR
 COMMON BLOCKS - DK, N
 FILE NAMES - None

NOTES - None

ROUTINE NAME - ECHØ
PURPOSE - Echo the Input Data
CALL SEQUENCE - CALL ECHØ
ARGUMENTS - None

CALLED BY - INITIAL
EXTERNALS - EOF
COMMON BLOCKS - None
FILE NAMES - TAPE5, TAPE6

NOTES - The input data is printed at the beginning of each run from TAPE5. Fifty lines are printed per page with column and line numbers.

ROUTINE NAME	-	ELEMIN
PURPOSE	-	Read Element Data
CALL SEQUENCE	-	CALL ELEMIN
ARGUMENTS	-	None

CALLED BY	-	INPT
EXTERNALS	-	INP03,PPHDR
COMMON BLOCKS	-	BASEA, NMAT
FILE NAMES	-	TAPE5

NOTES - Read element control data and call INP03 which reads connectivity and materials data. Several key variables are defined:

NMAT = NMT = total number of materials
 ISØTRN = NMAT-NCØMP = number of isotropic materials
 MEMBS = NELEM = number of elements

ROUTINE NAME	-	ELFØRC
PURPOSE	-	Get Element Displacements and Transform to Local System
CALL SEQUENCE	-	CALL ELFØRC(DR,EDR,L,LDS)
ARGUMENTS	-	DR = Global Displacement Array
		EDR = Local Displacement Array
		L = Element Number
		LDS = Number of Load Cases

CALLED BY	-	PRNTEL, STRCØN, UNTFRC
EXTERNALS	-	None
COMMON BLOCKS	-	CØNN, ELEM, LØCAL, N
FILE NAMES	-	None

NOTES	-	None
-------	---	------

ROUTINE NAME - ELSTIC
PURPOSE - Generate Elastic Constant Matrix
CALL SEQUENCE - CALL ELSTIC
ARGUMENTS - None

CALLED BY - GETDK, STIFFK, TRQDSTR, UNTFRC
EXTERNALS - None
COMMON BLOCKS - MATAXIS, TEMP
FILE NAMES - None

NOTES - None

ROUTINE NAME - ELSTIF
PURPOSE - Generate Element Mass and Stiffness for Bars
CALL SEQUENCE - CALL ELSTIF(AE)
ARGUMENTS - AE = AE for Bars

CALLED BY - GETDK, STIFFK
EXTERNALS - LMPRØD
COMMON BLOCKS - AREA, EIGN, LØCAL, MASS, N, STIFF, TEMP
FILE NAMES - None

NOTES - The mass terms are divided by 386 for dimensional consistency with the units of the material density that are input.

ROUTINE NAME - EMØDE
 PURPOSE - Resize in the Energy Mode
 CALL SEQUENCE - CALL EMØDE
 ARGUMENTS - None

CALLED BY - DØPRØB
 EXTERNALS - LMSIZE, SQRT
 COMMON BLOCKS - AMAXMIN, BASEA, ELEM, LAYERD, MAT, STRNENG,
 TITLE
 FILE NAMES - TAPE6

NOTES - Resize according to

$$AE_{\text{new}} = AE_{\text{old}} \sqrt{U / (RHO * AE_{\text{old}} * L)}$$

U = Strain Energy

RHO = Density

L = Length

ROUTINE NAME - ERR
 PURPOSE - Compute an Error Estimate Between S and T
 CALL SEQUENCE - CALL ERR(S,T,ERRMAX,L,IMAX)
 ARGUMENTS - S,T = Vectors to be Tested
 ERRMAX = Norm of Error Vector
 L = Number of Vectors to be Tested
 IMAX = Index of the L Vectors which has
 the Largest Error

CALLED BY - DAMAGE, DMGFREQ
 EXTERNALS - SQRT
 COMMON BLOCKS - N
 FILE NAMES - None

NOTES - None

ROUTINE NAME - ERRØR
PURPOSE - Lock Eigenvectors that have Converged within
Tolerance
CALL SEQUENCE - CALL ERRØR
ARGUMENTS - None

CALLED BY - SIVIB2
EXTERNALS - SQRT
COMMON BLOCKS - EIGN, EIGVEC, N
FILE NAMES - None

NOTES - Eigenvector predictions are locked when the
corresponding error is less than TOLVEC (see
input instructions) and higher eigenvector
have also been locked.

ROUTINE NAME	-	FØRSUB
PURPOSE	-	Forward Substitution Routine
CALL SEQUENCE	-	CALL FØRSUB(V,X,I0,I1)
ARGUMENTS	-	V = Solution Vector
		X = Right Hand Side
		I0 = First Vector in X to Use
		I1 = Last Vector in X to Use
CALLED BY	-	ANALYZ, DMGITER, DMØDE, FRQITER, SIVIB2
EXTERNALS	-	SK
COMMON BLOCKS	-	N, SKGM
FILE NAMES	-	None
NOTES	-	None

ROUTINE NAME - FRQITER
PURPOSE - Dynamic Reanalysis Iteration
CALL SEQUENCE - CALL FRQITER(IP1)
ARGUMENTS - IP1 = Damage Case Counter

CALLED BY - DMGFREQ
EXTERNALS - BACKSUB, DMGØRTH, DX, FØRSUB, PREMULT
COMMON BLOCKS - DK, EIGN, EIGVEC, N
FILE NAMES - None

NOTES - See Vol. I for a discussion of the dynamic
reanalysis iteration.

ROUTINE NAME - GETBC
PURPOSE - Input Boundary Conditions
CALL SEQUENCE - CALL GETBC
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - BND, N, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - See input instructions for a discussion of
boundary conditions.

ROUTINE NAME - GETBEST
PURPOSE - Returns to Previous Best Design
CALL SEQUENCE - CALL GETBEST
ARGUMENTS - None

CALLED BY - DØPRØB
EXTERNALS - None
COMMON BLOCKS - BASEA, ELEM, LAYERD, SAVE, TITLE
FILE NAMES - TAPE6

NOTES - In the energy mode, a weight increase results in the lower weight design returned. If there are displacement constraints, GETBEST returns the lower weight design if weight has more than doubled.

ROUTINE NAME - GENMSS
PURPOSE - Compute Generalized Masses
CALL SEQUENCE - CALL GENMSS
ARGUMENTS - None

CALLED BY - PRNTMDS
EXTERNALS - DX, GETDK, PREMULT
COMMON BLOCKS - DK, DMG, EIGN, EIGVEC, GENM, N
FILE NAMES - None

NOTES - The generalized masses are computed in both the damaged and undamaged conditions. The units are converted to pound-force.

ROUTINE NAME - GETDK
PURPOSE - Set Up the Damaged Stiffness and Mass Matrices
CALL SEQUENCE - CALL GETDK(M)
ARGUMENTS - M = Damage Case Counter

CALLED BY - DAMAGE, DMGFREQ, GENMSS
EXTERNALS - ASEMDK, CØØRD, ELSTIC, ELSTIF, LMPMAS, PLMASS,
PLSTIF, PREPAR, QDRLTL, TRECØN, TRNSFM
COMMON BLOCKS - AREA, DK, DMG, EIGN, ELEM, FRDR, MASS, STIFF
FILE NAMES - None

NOTES - None

ROUTINE NAME	-	INCØNN
PURPOSE	-	Read Connectivity Data
CALL SEQUENCE	-	CALL INCØNN
ARGUMENTS	-	None

CALLED BY	-	INP03
EXTERNALS	-	NØDCHCK, PPELEM
COMMON BLOCKS	-	AMAXMIN, BASEA, CØNN, ELEM, TITLE
FILE NAMES	-	TAPE5, TAPE6

NOTES	-	Read connectivity data and generate element connectivity under certain circumstances (see input instructions). The node sequence is checked by calling NØDCHCK and the element connectivity is printed.
-------	---	---

ROUTINE NAME - INDMGE
PURPOSE - Read Damage Input
CALL SEQUENCE - CALL INDMGE
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - BASEA, DMG, DMGERR, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - Mass and stiffness damage factors are read
for each element in each damage case.

ROUTINE NAME - INDSPL
PURPOSE - Read Displacement Constraint Data
CALL SEQUENCE - CALL INDSPL
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - DEFLMT, N, NØDES, ØPT, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - Deflection limits for all nodes or selected
nodes are input and printed.

ROUTINE NAME - INLAYR
PURPOSE - Read Composite Layer Data
CALL SEQUENCE CALL INLAYR
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - AMAXMIN, ANG, BASEA, ELEM, LAYERD, LAYMIN, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - The fiber directions are read, initial layer proportions are computed, and data is printed.

ROUTINE NAME - INLØADS
PURPOSE - Read Loads Data
CALL SEQUENCE - CALL INLØADS
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - DMG, DRDR, N. NØDES, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - Applied loads are input and printed. Total forces and moments are computed for each load condition.

ROUTINE NAME - INITIAL
PURPOSE - Sets Constants
CALL SEQUENCE - CALL INITIAL
ARGUMENTS - None

CALLED BY - Main Program
EXTERNALS - ECHO, ØPENSK
COMMON BLOCKS - LMTEXCD, NPRØB, QUAD, PØSTPR
FILE NAMES - TAPE5

NOTES - The number of problems is read, a call to ECHØ
prints the data listing, and the constants
NFIL, MAXSK, NACTIVE, MAA, MBB, MCC are set.

ROUTINE NAME	-	INITP
PURPOSE	-	Problem Initialization
CALL SEQUENCE	-	CALL INITP
ARGUMENTS	-	None

CALLED BY	-	DØPRØB
EXTERNALS	-	INPT, PØP
COMMON BLOCKS	-	NPROB, ØPT, SKGM, TITLE, WEIGHT
FILE NAMES	-	TAPE6

NOTES	-	This input initialization routine is called at the beginning of each problem. Calls are made to the routine which reads the input and to the routine which maps the stiffness matrix. Variables NPAGE, NECYCL, NDCYCL, and WTLAST are set.
-------	---	--

ROUTINE NAME	-	INGNRL
PURPOSE	-	Read General Analysis and Optimization Data
CALL SEQUENCE	-	CALL INGNRL
ARGUMENTS	-	None

CALLED BY	-	INPT
EXTERNALS	-	None
COMMON BLOCKS	-	AMAXMIN, ANG, DEFLMT, DMG, EIGN, LAYERD, LAYMIN, LMASS, N, ØPT, PØSTPR, STRNENG, TITLE
FILE NAMES	-	TAPE5, TAPE6

NOTES	-	The general input is read which controls the program options. This information is also printed with explanatory headings.
-------	---	---

ROUTINE NAME - INLPMSS
PURPOSE - Read Lumped Mass Data
CALL SEQUENCE - CALL INLPMSS
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - None
COMMON BLOCKS - LMASS, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - None

ROUTINE NAME - INP03
PURPOSE - Read Element Data
CALL SEQUENCE - CALL INP03
ARGUMENTS - None

CALLED BY - ELEMEN
EXTERNALS - PPHDR, INCØNN
COMMON BLOCKS - BASEA, MAT, NMAT, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - Read materials properties and allowables.
Call INCØNN to read the connectivity.
Materials properties and allowables are
printed.

ROUTINE NAME	-	INPT
PURPOSE	-	Calls all the Input Routines
CALL SEQUENCE	-	CALL INPT
ARGUMENTS	-	None

CALLED BY	-	INIPT
EXTERNALS	-	INGNRL, INXYZ, ELEMIN, INLAYR, GETBC, INLØADS, INDSPL, INDMGE, INLPMSS
COMMON BLOCKS	-	BND, DMG, FRDR, LAYERD, LMASS, N, NØDES, ØPT
FILE NAMES	-	None

NOTES	-	Various input routines are called, depending on the input read in the general input routine INGNRL.
-------	---	---

ROUTINE NAME - INXYZ
PURPOSE - Read Nodal Data
CALL SEQUENCE - CALL INXYZ
ARGUMENTS - None

CALLED BY - INPT
EXTERNALS - MESHG, CTYPE, PPHDR, PPNODE
COMMON BLOCKS - NØDES, TITLE
FILE NAMES - TAPE5, TAPE6

NOTES - Nodal data is read, optional mesh generator called, coordinates transformed to cartesian form from cylindrical or spherical if necessary (call to CTYPE), and call routines to write header and nodal data to the optional post-processor file.

ROUTINE NAME	-	LAYCALC
PURPOSE	-	Calculate No. of Layers in Each Fiber Direction
CALL SEQUENCE	-	CALL LAYCALC(L)
ARGUMENTS	-	L = Element Number
CALLED BY	-	LAYPR
EXTERNALS	-	None
COMMON BLOCKS	-	AREA, BASEA, ELEM, LAYERD, LAYMIN, LAYPRNT, SAVE
FILE NAMES	-	None
NOTES	-	None

ROUTINE NAME - LAYPR
PURPOSE - Print # Layers Each Direction, Integerize Design
CALL SEQUENCE - CALL LAYPR
ARGUMENTS - None

CALLED BY - PRINT
EXTERNALS - CURRENT, LAYCALC
COMMON BLOCKS - BASEA, ELEM, LAYERD, LAYMIN, LAYPRNT, OPT, SAVE,
TITLE
FILE NAMES - TAPE6

NOTES - None

ROUTINE NAME - LLT
PURPOSE - LLT Decomposition of Stiffness Matrix
CALL SEQUENCE - CALL LLT
ARGUMENTS - None

CALLED BY - ANALYZ
EXTERNALS - PRNTSK, PUTSK, SK, SQRT
COMMON BLOCKS - N, SKGM
FILE NAMES - TAPE6

NOTES - The stiffness matrix is decomposed by the Choleski method into the form $K=LL^T$. The skyline storage space for K is replaced with L^T .

ROUTINE NAME - LMPMAS
PURPOSE - Compute Local Mass Matrix for Triangles
and Quads
CALL SEQUENCE - CALL LMPMAS(L)
ARGUMENTS - L = Element Number

CALLED BY - GETDK, STIFFK
EXTERNALS - None
COMMON BLOCKS - AREA, CØNN, ELEM, LØCAL, MASS, TEMP
FILE NAMES - None

NOTES - None

ROUTINE NAME - LMPRØD
PURPOSE - Compute Mass Matrix for Bar
CALL SEQUENCE - CALL LMPRØD(AE)
ARGUMENTS - AE = AE for Bar

CALLED BY - ELSTIF
EXTERNALS - SQRT
COMMON BLOCKS - AREA, LØCAL, MASS, N, TEMP
FILE NAMES - None

NOTES - None

ROUTINE NAME - LMSIZE
PURPOSE - Compute Proportions of Fiber Directions
CALL SEQUENCE - CALL LMSIZE
ARGUMENTS - None

CALLED BY - DMØDE, EMØDE
EXTERNALS - SQRT
COMMON BLOCKS - BASEA, ELEM, LAYENG, LAYERD, LAYMIN
FILE NAMES - None

NOTES - The proportions are also adjusted to satisfy
minimum size constraints.

ROUTINE NAME - ØPENSK
PURPOSE - Sets Up Mass Storage for Stiffness Array
CALL SEQUENCE - CALL ØPENSK
ARGUMENTS - NONE

CALLED BY - INITIAL
EXTERNALS - ØPENMS, WRITMS
COMMON BLOCKS - SKBUF
FILE NAMES - None

NOTES - A mass storage file is set up to be used as a pseudo array for the stiffness array SK. This array is divided into MAXREC records of 1000 words per record. Five records are in core at any one time. A list of the record numbers for these five records is contained in the INDXSK array. The SK buffer SKBUF contains the last five SK records. This is done to minimize the MS reads and writes.

ROUTINE NAME - ØRTHØG
 PURPOSE - Orthonormalize W
 CALL SEQUENCE - CALL ØRTHØG(W,LØCK,L1,NTRIAL)
 ARGUMENTS - W = Vectors to be Orthonormalized
 LØCK = Number of Vectors Locked
 L1 = Total Number of Vectors Less LØCK
 NTRIAL = Number of Trial Vectors

CALLED BY - SIVIB2
 EXTERNALS - SQRT
 COMMON BLOCKS - N
 FILE NAMES - None

NOTES - The "unlocked" trial vectors are orthonormalized
 by the standard Gram-Schmidt process.

ROUTINE NAME	-	MESHG
PURPOSE	-	Generate Nodal Data
CALL SEQUENCE	-	CALL MESHG(NWORK,MGEN)
ARGUMENTS	-	NWORK, work space dimension MGEN, generator option (positive number)

CALLED BY	-	INXYZ
EXTERNALS	-	See notes
COMMON BLOCKS	-	NODES, see notes
FILE NAME	-	See notes

NOTES	-	This is a user written subroutine. In the current version of ADDRESS, no mesh generator is supplied. The routine may contain additional common blocks, externals, and references to files.
-------	---	--

ROUTINE NAME	-	NØDCHCK
PURPOSE	-	Check Connectivity Data
CALL SEQUENCE	-	CALL NØDCHCK(IELNØ, ITYPE, NØD, DØNE, ERR)
ARGUMENTS	-	IELNØ = element number
		ITYPE = element type
		NØD(4) = element nodes for this element
		DØNE = logical error flag (warning)
		ERR = logical error flag (fatal)

CALLED BY	-	INCØNN
EXTERNALS	-	None
FILE NAMES	-	TAPE6

NOTES	-	Connectivity data checked to make sure
		MA<MB (bars)
		MA<MB<MC (triangle)
		MA<min(MB,MC,MD) (quadrilaterals)
		Data is corrected for the bars and triangles.
		Error flag ERR is set to true and the program
		stops if there is an error in the quadrilateral
		data.

ROUTINE NAME - PLMASS
PURPOSE - Determine Mass Matrix for Triangular Elements
in the Local Coordinates
CALL SEQUENCE - CALL PLMASS(EEMM,AREA)
ARGUMENTS - EEMM = Mass Matrix Array
AREA = Area of Element

CALLED BY - GETDK, QDRLTL, STIFFK
EXTERNALS - None
COMMON BLOCKS - AREA, TEMP
FILE NAMES - None

NOTES - None

ROUTINE NAME	-	PLSTIF
PURPOSE	-	Determine Stiffness Matrix for Triangular Elements in the Local Coordinates
CALL SEQUENCE	-	CALL PLSTIF (EEKK, AREA, MA, MB, MC, NØNØRM)
ARGUMENTS	-	EEKK = Stiffness Matrix Array AREA = Area of Element MA, MB, MC = Node Numbers for Elements NØNØRM = 0 for membrane elements = 1 for shear panel calculations
CALLED BY	-	GETDK, QDRLTL, STIFFK, UNTFRC
EXTERNALS	-	CRAMER
COMMON BLOCKS	-	AREA, MATAXIS
FILE NAMES	-	None
NOTES	-	None

ROUTINE NAME - PPDISP
PURPOSE - Write Displacements to Post-processor File 99
CALL SEQUENCE - CALL PPDISP(IL)
ARGUMENTS - IL = Load Case Index

CALLED BY - PRNTDR
EXTERNALS - None
COMMON BLOCKS - FRDR, N, NØDES, PØSTPR
FILE NAMES - NFIL

NOTES - None

ROUTINE NAME - PPELEM
PURPOSE - Write Element Connectivity to Post-processor File
CALL SEQUENCE - CALL PPELEM
ARGUMENTS - NONE

CALLED BY - INCØNN
EXTERNALS - None
FILE NAMES - NFIL

NOTES - None

ROUTINE NAME	-	PPHDR
PURPOSE	-	Write Header to Post-processor File
CALL SEQUENCE	-	CALL PPHDR(ITYPE,I1,I2,I3,I4,R1)
ARGUMENTS	-	ITYPE=1 geometry =2 connectivity =3 end of data =4 nodal displacements =5 element stress =6 element type =7 element data =8 end of problem trailer I1= number of nodes, ITYPE=1 = element type, ITYPE=2,6 = load case, ITYPE=4 = number of element types, ITYPE=5 = element number, ITYPE=7 I2= max. no. of nodes/element, ITYPE=2 = number of nodes, ITYPE=4 = load case number, ITYPE=5 = dimensionality, ITYPE=6 = max. number of nodes/element, ITYPE=7 I3= number of nodes, ITYPE=2 = interpolation code, ITYPE=6 = integration order, ITYPE=7 I4= number of element, ITYPE=6 R1= load parameter, ITYPE=4,5
CALLED BY	-	ELEMIN, INPO3, INXYZ, PRINT, PRNTDR
EXTERNALS	-	None
COMMON BLOCKS	-	PØSTPR
FILE NAMES	-	NFIL
NOTES	-	None

ROUTINE NAME - PPMØDE
PURPOSE - Write Mode Shapes to Post-processor File 8
CALL SEQUENCE - CALL PPMØDE
ARGUMENTS - None

CALLED BY - PRNTMDS
EXTERNALS - None
COMMON BLOCKS - DMG, EIGN, EIGVEC, GENM, N, NØDES, TITLE
FILE NAMES - TAPE8

NOTES - Mode shapes are written to TAPE8. It is assumed that only the Z component of the vector is of interest and that the nodes are numbered in accordance with the standard conventions for a wing structure. Generalized masses, frequencies, and (x,y) locations of the grid points are also output to TAPE8.

ROUTINE NAME - PPNØDE
PURPOSE - Write Node Coodinates to Post-processor
File 99
CALL SEQUENCE - CALL PPNØDE
ARGUMENTS - None

CALLED BY - INXYZ
EXTERNALS - None
COMMON BLOCKS - NØDE, PØSTPR
FILE NAMES - NFIL

NOTES - All three components of the coordinates are
written to NFIL.

ROUTINE NAME - PPTTL
PURPOSE - Write Title to Post-processor File
CALL SEQUENCE - CALL PPTTL
ARGUMENTS - None

CALLED BY - INGNRL
EXTERNALS - None
COMMON BLOCKS - POSTPR, TITLE
FILE NAME - NFIL

NOTES - The title that is read as input is written
to a post-processor file NFIL (set to 99 in
INITIAL) for possible later use.

ROUTINE NAME - PØP
PURPOSE - Map the Stiffness Matrix
CALL SEQUENCE - CALL PØP
ARGUMENTS - None

CALLED BY - INITP
EXTERNALS - None
COMMON BLOCKS - BASEA, CØNN, ELEM, N, SKGM, TITLE
FILE NAMES - TAPE6

NOTES - The gross population (total number of elements in the upper triangle) and the apparent population (total number of elements in the skyline) of the stiffness matrix are computed for the unrestrained structure. The apparent population must be not greater than MAXSK which is defined in INITIAL.

ROUTINE NAME - PRELT
PURPOSE - Compute $X = LT*Y$
CALL SEQUENCE - CALL PRELT(X,Y,N)
ARGUMENTS - X = Vectors to be Computed
Y = Given Vectors
N = Number of Vectors to be Computed

CALLED BY - DMGØRTH
EXTERNALS - SK
COMMON BLOCKS - N, SKGM
FILE NAMES - None

NOTES - The L matrix is stored in skyline form.

ROUTINE NAME - PREMULT
 PURPOSE - Matrix Vector Multiplication: $Y = GM*Z$
 CALL SEQUENCE - CALL PREMULT(Y,Z,N,L)
 ARGUMENTS - Y = Vectors to be Computed
 Z = Given Vectors
 N = Number of Vectors to be Computed
 L = Shift Factor for Y

CALLED BY - FRQITER, GENMSS, SIVIB2
 EXTERNALS - None
 COMMON BLOCKS - GM, N, SKGM
 FILE NAMES - None

NOTES - The mass matrix is stored in skyline form.

ROUTINE NAME	-	PREPAR
PURPOSE	-	Compute Moduli and Allowable Stresses
CALL SEQUENCE	-	CALL PREPAR(L,BA,BAE,INDEX,LDS)
ARGUMENTS	-	L = Element Number BA = Reference Thickness Used to Establish Triangle and Quadrilateral Element Thicknesses and Moduli BAE = Reference Thickness Used to Compute Allowable Stresses INDEX = 0, Compute Element Thicknesses = 1, Compute Allowable Stresses LDS = # of Load Cases
CALLED BY	-	GETDK, PRNTEL, STIFFK, STRCØN, UNTFRC
EXTERNALS	-	None
COMMON BLOCKS	-	ALSTRS, AREA, EIGN, ELEM, ENERGY, ESTRESS, LAYERD, MASS, MAT, MATAxis, NMAT, STIFF, TEMP
FILE NAMES	-	None
NOTES	-	BA = 1.0 when PREPAR is called by STIFFK, GETDK, STRCØN, and UNTFRC = BASEA when PREPAR is called by PRNTEL BAE = 1.0 when PREPAR is called by STIFFK, GETDK, PRNTEL, AND UNTFRC = BASEA when PREPAR is called by STRCØN INDEX = 0 when PREPAR is called by STIFFK, GETDK, and UNTFRC = 1 when PREPAR is called by PRNTEL, STRCØN, and UNTFRC

ROUTINE NAME - PRINT
PURPOSE - Scale Thicknesses, Call Various Print Routines
CALL SEQUENCE - CALL PRINT
ARGUMENTS - None

CALLED BY - DØPRØB
EXTERNALS - LAYPR, PPHDR, PRNTDR, PRNTEL, PRNTMDS
COMMON BLOCKS - BASEA, EIGN, ELEM, LAYERD, SAVE
FILE NAMES - None

NOTES - None

ROUTINE NAME - PRNTDR
PURPOSE - Print Table of Node Information
CALL SEQUENCE - CALL PRNTDR
ARGUMENTS - None

CALLED BY - PRINT
EXTERNALS - PPDISP, PPHDR
COMMON BLOCKS - BND, FRDR, N, NØDES, TITLE
FILE NAMES - TAPE6

NOTES - Coordinates, applied loads, and displacements
are printed.

ROUTINE NAME - PRNTEL
PURPOSE - Print Element Information
CALL SEQUENCE - CALL PRNTEL
ARGUMENTS - None

CALLED BY - PRINT
EXTERNALS - CØØRD, ELFØRC, PREPAR, SK, TRQDØUT, TRQDSTR
COMMON BLOCKS - ALSTRS, AREA, BASEA, CØNN, DMG, ELEM, ENERGY,
ESTRESS, FRDR, LAYERD, SAVE, STRESS, TEMP, TITLE
FILE NAMES - TAPE6

NOTES - Element thicknesses, connectivity, stresses, and
strain energies are printed.

ROUTINE NAME - PRNTSK
PURPOSE - Print the Structural Stiffness or Mass Matrix
by Rows
CALL SEQUENCE - CALL PRNTSK(SK)
ARGUMENTS - SK = Pseudo Stiffness Matrix

CALLED BY - LLT
EXTERNALS - SK
COMMON BLOCKS - N, SKGM, TITLE
FILE NAMES - TAPE6

NOTES - This replaces the routine PRINTK in previous
versions of this program.

ROUTIN NAME - PRNTMDS
PURPOSE - Print Out Frequencies and Modeshapes
CALL SEQUENCE - CALL PRNTMDS
ARGUMENTS - None

CALLED BY - PRINT
EXTERNALS - ATAN, GENMSS, PPMØDE, RESTØR, SQRT
COMMON BLOCKS - DMG, EIGN, EIGVEC, GENM, N, NØDES, PØSTPR, TITLE
FILE NAMES - TAPE6

NOTES - Before mode shapes are printed they are
normalized so that the maximum component is
 ± 1.0 .

ROUTINE NAME - PUTSK
PURPOSE - Buffer Bookkeeping
CALL SEQUENCE - CALL PUTSK(IWØRD,VALUE)
ARGUMENTS - See Notes

CALLED BY - ASEMBL, BØUNDS, LLT, STIFFK
EXTERNALS - SK
COMMON BLOCKS - SKBUF
FILE NAMES - None

NOTES - This routine loads the value "VALUE" into the pseudo array SK; i.e. this routine replaces the statement SK(IWØRD) = VALUE.

ROUTINE NAME - QDRLTL

PURPOSE - Compute Stiffness and Mass Matrices for the
Quadrilateral and Shear Panel Elements

CALL SEQUENCE - CALL QDRLTL(AREA,L,NØ)

ARGUMENTS - AREA = Element Area
L = Element Number
NØ = Control Parameter (See CØNDNS Arguments)

CALLED BY - GETDK, STIFFK, TRQDSTR, UNTFRC

EXTERNALS - CØNDNS, PLMASS, PLSTIF, SUM

COMMON BLOCKS - AREA, CØNN, EIGN, ELEM, MASS, QUAD, STIFF

FILE NAMES - None

NOTES - This routine calls the triangular element
routines for each of the four elements making
up the quadrilateral and makes sure that the
results are properly combined into one mass
and one stiffness matrix.

ROUTINE NAME	-	QLSTRS
PURPOSE	-	Compute Stresses for 4 Triangles of the Quadrilateral
CALL SEQUENCE	-	CALL QLSTRS(L)
ARGUMENTS	-	L = Element Number
CALLED BY	-	TRQDSTR
EXTERNALS	-	STRESS
COMMON BLOCKS	-	ALSTRS, ELEM, ENERGY, ESTRESS, FRDR, QUAD, STIFF, STRESS
FILE NAMES	-	None
NOTES	-	None

ROUTINE NAME - RANDØM
 PURPOSE - Enter Random Vectors into Certain Columns of W
 CALL SEQUENCE - CALL RANDØM(W,IFLAG)
 ARGUMENTS - W = Initial Array of Eigenvectors
 IFLAG = See Notes

CALLED BY - SIVIB2
 EXTERNALS - None
 COMMON BLOCKS - EIGN, N
 FILE NAMES - None

NOTES - If IFLAG=10, random numbers are entered in just the last column of W. When IFLAG=0, random members are generated for all columns of W.

ROUTINE NAME - REDUCE
PURPOSE - Eliminate Rows from Vector for Boundary DØF
CALL SEQUENCE - CALL REDUCE(F,L)
ARGUMENTS - F = Vector to be Reduced
 L = Number of Vectors

CALLED BY - ANALYZ, DMØDE, DX
EXTERNALS - None
COMMON BLOCKS - BND, N
FILE NAMES - None

NOTES - None

ROUTINE NAME - RESTØR
PURPOSE - Restore the Displacement or Force Matrix to Full
Size
CALL SEQUENCE - CALL RESTØR(D,L)
ARGUMENTS - D = Vector to be Restored
L = Number of Vectors

CALLED BY - DMIDE, DX, PRNTMDS, SCALE
EXTERNALS - None
COMMON BLOCKS - BND, N
FILE NAMES - None

NOTES - None

ROUTINE NAME - SAVE
PURPOSE - Save Current Least-weight Design
CALL SEQUENCE - CALL SAVE
ARGUMENTS - None

CALLED BY - DØPRØB
EXTERNALS - None
COMMON BLOCKS - BASEA, ELEM, LAYERD, SAVE, WEIGHT
FILE NAMES - None

NOTES - The design is saved if the weight decreased
from the previous cycle.

ROUTINE NAME - SCALE
PURPOSE - Adjust Scaling Factor to Satisfy Constraints
CALL SEQUENCE - CALL SCALE
ARGUMENTS - None

CALLED BY - CURRENT
EXTERNALS - None
COMMON BLOCKS - AMAXMIN, BASEA, DEFLMT, ELEM, FRDR, LMTEXCD,N,
ØPT, STRNE
FILE NAMES - None

NOTES - Maximum-size constraints are also impaired by
this subroutine.

ROUTINE NAME - SIVIB2
 PURPOSE - Compute Eigenvalues and Eigenvectors
 CALL SEQUENCE - CALL SIVIB2
 ARGUMENTS - None

CALLED BY - CURRENT
 EXTERNALS - BACKSUB, DECØUP, ERRØR, FØRSUB, ØRTHØG, PREMULT,
 RANDØM, SECØND
 COMMON BLOCKS - EIGN, EIGVEC, N
 FILE NAMES - TAPE6

NOTES - This is the main calling routine for the
 eigensolution. See Vol. I for a discussion
 of the simultaneous iteration techniques used
 in this routine.

ROUTINE NAME	-	SK
PURPOSE	-	Bookkeeping for Stiffness Matrix, SK
CALL SEQUENCE	-	FUNCTION SK(IWØRD)
ARGUMENTS	-	IWØRD = See Notes

CALLED BY	-	ASEMBL, BACKSUB, BØUNDS, FØRSUB, LLT, PRELT, PRNTEL, STRCØN, PUTSK, PRNTSK
EXTERNALS	-	READMS, WRITMS
COMMON BLOCKS	-	SKBUF
FILE NAMES	-	TAPE6

NOTES	-	This function returns the value of SK(IWØRD) from the pseudo array SK. Since SK has been replaced by a MS file, this routine performs all the bookkeeping required to access the correct word on the correct record.
-------	---	--

ROUTINE NAME - STIFFK
PURPOSE - Set Up Total Stiffness and Mas Matrices for
Structure
CALL SEQUENCE - CALL STIFFK
ARGUMENTS - None

CALLED BY - ANALYZ
EXTERNALS - ASEMBL, CØØRD, ELSTIC, ELSTIF, LMPMAS, PLMASS,
PLSTIF, PREPAR, PUTSK, QDRLTL, TRECØN, TRNSFM
COMMON BLOCKS - AREA, BASEA, EIGN, ELEM, FRDR, GM, LMASS, MASS,
N, SKGM, STIFF, STRNENG
FILE NAMES - None

NOTES - This is the main calling routine which sets
up the global mass and stiffness matrices.

ROUTINE NAME - STRCØN
PURPOSE - Determine Scale Factor Needed to Satisfy Constraints
CALL SEQUENCE - CALL STRCØN
ARGUMENTS - None

CALLED BY - SCALE
EXTERNALS - CØØRD, ELFØRC, PREPAR, SK, TRQDSTR
COMMON BLOCKS - ALSTRS, AREA, BASEA, DMG, ELEM, ENERGY, ESTRESS,
FRDR, STRESS, STRNENG, TEMP
FILE NAMES - TAPE6

NOTES - None

ROUTINE NAME - STRESS
 PURPOSE - Compute Strains and Stresses for Triangular Element
 CALL SEQUENCE - CALL STRESS(UV,MA,MB,MC,ENG,NND)
 ARGUMENTS - UV = Local Strains
 MA,MB,MC = Node Numbers
 ENG = Element Strain Energy
 NND = 5 If Triangular Element is Part of a
 Shear Panel

CALLED BY - QLSTRS, TRQDSTR
 EXTERNALS - CRAMER, SQRT
 COMMON BLOCKS - ALSTRS, AREA, ESTRESS, FRDR, MATAXIS, STRESS
 FILE NAMES - None

NOTES - None

ROUTINE NAME - SUM
 PURPOSE - Assemble a Single Matrix from 4 Triangular
 Matrices
 CALL SEQUENCE - CALL SUM(EKM,EEKM,MA,MB,MC)
 ARGUMENTS - EKM = Mass or Stiffness Matrix to be Computed
 EEKM = Mass or Stiffness Matrices for the
 Individual Triangular Elements
 MA,MB,MC = Node Numbers for the Triangular
 Element

CALLED BY - QDRLTL
 EXTERNALS - None
 COMMON BLOCKS - None
 FILE NAMES - None

NOTES - None

ROUTINE NAME - TRECØN
PURPOSE - Coordinate Transformations: Orthotropic
Materials
CALL SEQUENCE - CALL TRECØN(L,IND)
ARGUMENTS - L = Element Number
IND = 1 for 0° calculations
2 for 90° calculations
3 for +45° calculations
4 for -45° calculations

CALLED BY - GETDK, STIFFK, TRQDSTR, UNTFRC
EXTERNALS - CØS, SIN, SQRT
COMMONG BLOCKS - ANG, LØCAL, MATAXIS
FILE NAMES - None

Notes - None

ROUTINE NAME - TRNSFM
 PURPOSE - Transform a Matrix From Local to Global
 Coordinates
 CALL SEQUENCE - CALL TRNSFM(EKM,CCC,NNØDES)
 ARGUMENTS - EKM = Element Matrix in Local Coordinate
 CCC = Global Matrix
 NNØDES = 3 For Triangular Element
 = 4 For Quad Element

CALLED BY - GETDK, STIFFK
 EXTERNALS - None
 COMMON BLOCKS - LØCAL, N
 FILE NAMES - None

NOTES - None

ROUTINE NAME - TRQDØUT
PURPOSE - Output--Triangles and Quadrilaterals
CALL SEQUENCE - CALL TRQDOUT(L)
ARGUMENTS - L = Element Number

CALLED BY - PRNTEL
EXTERNALS - None
COMMON BLOCKS - ALSTRS, AREA, CØNN, ELEM, ENERGY, ESTRESS,
FRDR, LAYERD, S
FILE NAMES - None

NOTES - Print element thickness, stresses, and energy.

ROUTINE NAME - TRQDSTR
 PURPOSE - Compute Triangle and Quadrilateral Stress, Energy
 CALL SEQUENCE - CALL TRQDSTR(L,BA)
 ARGUMENTS - L = Element Number
 BA = 1.0 for stresses in element of unit
 thickness
 = BASEA for stresses in current design

CALLED BY - PRNTEL, STRCØN
 EXTERNALS - ELSTIC, QDRLTL, QLSTRS, STRESS, TRECØN
 COMMON BLOCKS - AREA, DMG, ELEM, ENERGY, ESTRESS, FRDR, LAYENG,
 LAYMIN, ST
 FILE NAMES - None

NOTES - Stresses and engergy for both isotropic and
 composite elements are computed.

ROUTINE NAME	-	UNITEG
PURPOSE	-	Determine Energy Due to Dummy Unit Loads
CALL SEQUENCE	-	CALL UNITEG(L,II,INDX)
ARGUMENTS	-	L = Element Number
		II = 1, 0° composite larger calculation
		2, 90° composite larger calculation
		3, +45° composite larger calculation
		4, -45° composite larger calculation
		INDX = 0 if this is not a composite element
CALLED BY	-	UNTFRC
EXTERNALS	-	None
COMMON BLOCKS	-	AREA, DMG, DUMMY, ELEM, FRDR, LAYENG, LMTEXCD, STIFF, STRNENG
FILE NAMES	-	None
NOTES	-	None

ROUTINE NAME - UNTFRC
 PURPOSE - Determine Stress Due to Dummy Unit Loads
 CALL SEQUENCE - CALL UNTFRC
 ARGUMENTS - None

CALLED BY - DMØDE
 EXTERNALS - CØØRD, ELFØRC, ELSTIC, PLSTIF, PREPAR, QDRLTL,
 TRECØN, UNITEG
 COMMON BLOCKS - ANG, AREA, BASEA, DUMMY, ELEM, FRDR, LMTEXCD,
 STIFF
 FILE NAMES - None

NOTES - None

ROUTINE NAME - WEIGHTS
PURPOSE - Determine Weights for Structure, Scale Displacements
CALL SEQUENCE - CALL WEIGHTS
ARGUMENTS - None

CALLED BY - CURRENT
EXTERNALS - None
COMMON BLOCKS - BASEA, EMG, ELEM, FRDR, LMASS, MAT, N, NPRØB,
ØPT, WEIGHT
FILE NAMES - TAPE6

NOTES - Total structural weight as well as weights
of all the elements by type are computed and
printed.

  SUBROUTINE OPENSF
C
C THIS ROUTINE SETS UP A MASS STORAGE FILE TO BE USED AS A PSEUDO ARRAY
C FOR THE STIFFNESS ARRAY SK. SK WILL BE DIVIDED INTO MAXREC RECORDS
C OF 1000 WORDS PER RECORD. 5 RECORDS WILL BE IN CORE AT ANY ONE TIME.
C A LIST OF THE RECORD NUMBERS FOR THESE 5 RECORDS IS CONTAINED IN
C THE ARRAY INDXSK. THE MAPPING OF SK ONTO THE MASS STORAGE FILE IS
C AS FOLLOWS
C
C
C      SK(1) THROUGH   SK(1000)      RESIDES ON MS RECORD 1
C      SK(1001)  -    SK(2000)      RESIDES ON MS RECORD 2
C
C      AND SO ON
C
C THE SK BUFFER SKBUF CONTAINS THE LAST 5 SK RECORDS THAT HAVE BEEN
C ACCESSED. THIS IS DONE SO THAT, HOPEFULLY, THE NUMBER OF MS READS
C AND WRITES WILL BE MINIMIZED.
C
C
C                                     J. JENSEN  11/1/81
C
C      COMMON /SKBUF/ SKBUF(1000,5),INDXSK(5),MAXREC,DIRSK(101),NXTREC
