I. Introduction

This report contains a target position estimation program for each of the following calculators: The Hewlett-Packard HP-41CV, the Sharp PC-1500 (or Radio Shack TRS-80 PC-2), the Sharp PC-1211 (or Radio Shack TRS-80 PC-1), the Casio FX-702P and the Texas Instruments TI-59.

The programs provide a means of implementing a position estimation procedure that is described in Appendix 1. The procedure is based on the following assumptions: Bearings taken on or from a target are available from two or more stations of known position. The positions of the stations and the target are such that they can be considered to be on the surface of a plane (a flat earth model). The error in a bearing taken on or from a station is a normal random variable. Its standard deviation (bearing error) is known and its mean (bias) is zero (if there is bias in a bearing, it is known and it is removed). The errors in bearing measurements are independent.

The position estimation procedure requires an initial estimate of the target's position. In the programs that are given here, the initial estimate is at the intersection of the bearing lines determined by the first two target bearings that are input to the program. Because of the use of this method to choose an initial estimate, the first two stations, with respect to the order of data input, should be chosen so that the intersection of their bearing lines is likely to be closer to the target's position than the intersection of the bearing lines from any other pair of stations.

The target ranges and errors of the bearings of the first two stations determine the distance between the intersection of their bearing lines and the target's position. In particular, if the angular separation between two stations as seen from the target is small relative to the bearing error of one or both of the stations, the bearing lines from the two stations may not intersect. If they do not intersect and they are not parallel, their reciprocal bearing lines will. In this case, if the observed bearings from the two stations were the first two bearing inputs to the program, the initial estimate of the target's position would be at the intersection of the two reciprocal bearing lines, and a gross error in the final position estimate could result.

II. Program User Instructions

Before using a program for the first time, refer to the notes that follow the user's instructions. Also, note the comments in Section I regarding the relationship between the accuracy of the computed estimates and the order of data entry.

For a PC-1211, use the PC-1500 User Instructions. Use the DEF mode and substitute SHFT for DEF wherever DEF appears in the instructions.

Station positions are determined with respect to a known reference point. The reference point can be a station position, in this case the station bearing and range from the reference point are both zero.

Program listings are given in Section IV and two example applications are discussed in Section III.

Position Estimation Program

HP-41CV User Instructions

Step	Instruction	Prompt	Press
1	Select USER mode and enter the program (see Note 1). Press $\Sigma+$ to run the program.		$\Sigma+$
2	Key in, in decimal degrees, the observed bearing of the target from a station or the reciprocal of the observed bearing of the station from the target (see Note 2).	OBS BRG?	R/S
3	Key in the station bearing in decimal degrees from the reference point. Use zero if the station is the reference point.	STA BRG?	R/S
4	Key in the station range (in any units) from the reference point. Use zero if the station is the reference point.	STA RNG?	R/S
5	Key in the bearing error (standard deviation) in decimal degrees.		R/S
6	Repeat Steps 2, 3, 4 & 5 for one or more additional stations.		
7	Compute bearing & range estimates.		1/x
8	A computed target bearing estimate in decimal degrees is displayed.	BRG=est.	R/S
9	A computed target range estimate in meters. For an elliptical containment region, go to Step 10 or Step 17. To enter additional data from new or old stations, go to Step 24.	RNG=est.	
10	For a containment ellipse of a given containment probability, press LN.		LN
11	Key in the desired containment probability.	PRB?	R/S
12	Computed value of the ellipse size: (See Note 3.)	SIZE=val.	R/S

Step	Instruction	Prompt	Press
13	Computed semi-major axis length:	SMJ=val.	R/S
14	Computed major axis direction:	DRC=val.	R/S
15	Computed semi-minor axis length:	SMI=val.	R/S
16	Computed containment ellipse area: (See Note 4.)	A = val.	
17	For a containment ellipse of a given size, press LOG.		LOG
18	Key in the desired containment ellipse size (see Note 3).	SIZE?	R/S
19	Computed value of the containment probability:	PRB=val.	R/S
20	Computed semi-major axis length:	SMJ=val.	R/S
21	Computed major axis direction:	DRC=val.	R/S
22	Computed semi-minor axis length:	SMI=val.	R/S
23	Computed containment ellipse area: (See Note 4.)	A = val.	
24	To enter additional data from new or old stations, press $\sqrt{x}$ and then repeat Steps 2, 3, 4 & 5		$\sqrt{x}$

Notes:

1. The program size is 35. The key assignments are: $TPE \rightarrow \Sigma+$, $CON \rightarrow \sqrt{x}$, $EST \rightarrow 1/x$, $SIZ \rightarrow LOG$ and $PRB \rightarrow LN$. If they are not present, they must be made in order to follow the user instructions. For an alternative, see Appendix 2.
2. Reciprocal bearings are used when bearings are taken on known positions from the unknown position (target).
3. In the model that is the basis for the program, for a given probability of containment, the minimum area containment region is an ellipse centered on the position estimate. The semi-major axis = $k\sigma_{MJ}$ and semi-minor axis = $k\sigma_{MI}$ where k is the size of the ellipse and σ_{MJ} and σ_{MI} are the standard deviations (uncertainty measure) of the position estimate in the major axis and minor axis directions.
4. The area units are the range units squared.

Position Estimation Program
PC-1500 User Instructions

Step	Instruction	Prompt	Press
1	Enter the program. To run the program, press DEF, A. For a PC-1211, see Note 5.		DEF A
2	Key in, in decimal degrees, the observed bearing of the target from a station or the reciprocal of the observed bearing of the station from the target (see Note 1).	OBS BRG?	ENTER
3	Key in the station bearing in decimal degrees from the reference point. Use zero if the station is the reference point.	STA BRG?	ENTER
4	Key in the station range (in any units) from the reference point. Use zero if the station is the reference point.	STA RNG?	ENTER
5	Key in the bearing error (standard deviation) in decimal degrees.	BRG ERR?	ENTER
6	Repeat Steps 2, 3, 4 & 5 for one or more additional stations.		
7	Compute bearing & range estimates.		DEF Z
8	A computed target bearing estimate in decimal degrees is displayed.	BRG=est.	ENTER
9	A computed target range estimate is displayed. For an elliptical containment region, go to Step 10 or Step 17. To enter additional data from new or old stations, go to Step 24.	RNG=est.	
10	For a containment ellipse of a given containment probability, press DEF, X.		DEF X
11	Key in the desired containment probability.	PRB?	ENTER
12	Computed value of the ellipse size: See Note 2.	SIZE=val.	ENTER

Step	Instruction	Prompt	Press
13	Computed semi-major axis length:	SMJ=val.	ENTER
14	Computed major axis direction:	DRC=val.	ENTER
15	Computed semi-minor axis length:	SMI=val.	ENTER
16	Computed containment ellipse area: (See Note 3.)	A = val.	
17	For a containment ellipse of a given size, press DEF, S.		DEF S
18	Key in the desired containment ellipse size (see Note 2).	SIZE?	ENTER
19	Computed value of the containment probability:	PRB=val.	ENTER
20	Computed semi-major axis length:	SMJ=val.	ENTER
21	Computed major axis direction:	DRC=val.	ENTER
22	Computed semi-minor axis length:	SMI=val.	ENTER
23	Computed containment ellipse area: (See Note 3.)	A = val.	
24	To enter additional data from new or old stations, press DEF, C and then repeat Steps 2, 3, 4 & 5.		DEF C

Notes:

1. Reciprocal bearings are used when bearings are taken on known positions from the unknown position (target).
2. In the model that is the basis for the program, for a given probability of containment, the minimum area containment region is an ellipse centered on the position estimate. The semi-major axis = $k\sigma_{MJ}$ and semi-minor axis = $k\sigma_{MI}$ where k is the size of the ellipse and σ_{MJ} and σ_{MI} are the standard deviations (uncertainty measure) of the position estimate in the major axis and minor axis directions.
3. The area units are the range units squared.
4. For a definition of the program initiating keys and their function, press DEF, H. The display will show:
TPE = A EST = Z SIZ = S PRB = X. Next press ENTER. The display will show: CON = C. To repeat the display, press ENTER.
5. For a PC-1211, use the DEF mode and substitute SHFT for DEF wherever DEF appears in the instructions.

Position Estimation Program

FX-702P User Instructions

Step	Instruction	Prompt	Press
1	Enter the program (see Note 1). To run the program, first press F1, Ø.		F1 Ø
2	Next, key in 1 and press EXE.	OPTION?	1 EXE
3	Key in, in decimal degrees, the observed bearing of the target from a station or the reciprocal of the observed bearing of the station from the target (see Note 2).	OBS BRG?	EXE
4	Key in the station bearing in decimal degrees from the reference point. Use zero if the station is the reference point.	STA BRG?	EXE
5	Key in the station range (in any units) from the reference point. Use zero if the station is the reference point.	STA RNG?	EXE
6	Key in the bearing error (standard deviation) in decimal degrees.	BRG ERR?	EXE
7	Repeat Steps 3, 4, 5 & 6 for one or more additional stations.		
8	To compute bearing & range estimates, first press F1, Ø.		F1 Ø
9	Next, key in 2 and press EXE.	OPTION?	2 EXE
10	A computed target bearing estimate in decimal degrees is displayed.	BRG=est.	CONT
11	A computed target range estimate is displayed. For an elliptical containment region, go to Step 12 or Step 20. To enter additional data from new or old stations, go to Step 28.	RNG=est.	
12	For a containment ellipse of a given containment probability, first press F1, Ø.		F1 Ø
13	Next, key in 3 and press EXE.	OPTION?	3 EXE

Step	Instruction	Prompt	Press
14	Key in the desired probability.	PRB?	EXE
15	Computed value of the ellipse size: See Note 3.	SIZE=val.	CONT
16	Computed semi-major axis length:	SMJ=val.	CONT
17	Computed major axis direction:	DRC=val.	CONT
18	Computed semi-minor axis length:	SMI=val.	CONT
19	Computed containment ellipse area: See Note 4.	A = val.	
20	For a containment ellipse of a given size, first press F1, Ø.		F1 Ø
21	Next, key in 4 and press EXE.	OPTION?	4 EXE
22	Key in the desired containment ellipse size (see Note 3).	SIZE?	EXE
23	Computed value of the containment probability:	PRB=val.	CONT
24	Computed semi-major axis length:	SMJ=val.	CONT
25	Computed major axis direction:	DRC=val.	CONT
26	Computed semi-minor axis length:	SMI=val.	CONT
27	Computed containment ellipse area: See Note 4.	A = val.	
28	To enter additional data from new or old stations, first press F1, Ø.		F1 Ø
29	Next, key in 5, press EXE and then repeat Steps 3, 4, 5 & 6.	OPTION?	5 EXE

Notes:

1. Enter the program in PØ for F1 Ø activation. Before running the program, first press F2 then DEFM then 1 and then EXE. This is required in order to use the array variables in the program.
2. Reciprocal bearings are used when bearings are taken on known positions from the unknown position (target).
3. In the model that is the basis for the program, for a given probability of containment, the minimum area containment region is an ellipse centered on the position estimate. The semi-major axis = $k\sigma_{MJ}$ and semi-minor axis = $k\sigma_{MI}$ where k is the size of the ellipse and σ_{MJ} and σ_{MI} are the standard deviations (uncertainty measure) of the position estimate in the major axis and minor axis directions.
4. The area units are the range units squared.
5. For a definition of the program options and their function, press F1, Ø. Then after OPTION? is displayed, enter Ø and press EXE. The display will show: TPE = 1 EST = 2 SIZ = 3. Next, press CONT. The display will show: PRB = 4 CON = 5. To repeat the displays, press CONT.

POSITION ESTIMATION PROGRAM

TI-59 USER INSTRUCTIONS

Step	Instruction	Enter	Press	Display
1	Enter the program (see Note 1).			
2	To run the program, press A.		A	9
3	Enter, in decimal degrees, the observed bearing of the target from a station or the reciprocal of the observed bearing of the station from the target (see Note 2).	θ	B	θ
4	Enter the station bearing in decimal degrees from the reference point. Use zero if the station is the reference point.	α	R/S	α
5	Enter the station range from the reference point. Use zero if the station is the reference point. Use any units.	ρ	R/S	ρ
6	Enter the bearing error (standard deviation) in decimal degrees. After pressing R/S, the display indicates the order number of the data entry.	e	R/S	n
7	Repeat Steps 3, 4, 5 & 6 for at least one more station.			
8	Display a bearing estimate $\hat{\phi}$ with respect to the reference station.		C	$\hat{\phi}$
9	Display a range estimate $\hat{r}$ with respect to the reference station. For an elliptical containment region, go to Step 10 or Step 15. To enter additional data from new or old stations, repeat Steps 3, 4, 5 & 6.		R/S	$\hat{r}$
10	For a containment ellipse of a given containment probability, enter the containment probability. Next, press E and display the ellipse size (see Note 3).	p	E	k
11	Display the semi-major axis length.		R/S	$k\sigma_{MJ}$
12	Display the major axis direction.		R/S	γ
13	Display the semi-minor axis length.		R/S	$k\sigma_{MI}$

Step	Instruction	Enter	Press	Display
14	Display the containment ellipse area. (See Note 4.)		R/S	area
15	For a containment ellipse of a given size, enter the containment ellipse size (See Note 3). Next, press D and display the containment probability.	k	D	p
16	Display the semi-major axis length.		R/S	$k\sigma_{MJ}$
17	Display the major axis direction.		R/S	γ
18	Display the semi-minor axis length.		R/S	$k\sigma_{MI}$
19	Display the containment ellipse area. (See Note 4.)		R/S	area
20	To enter additional data from new or old stations, repeat Steps 3, 4, 5 & 6.			

Notes:

1. The program requires the normal partition. If the calculator has been in use, this can be assured by turning the calculator off and then on before loading the program.
2. Reciprocal bearings are used when bearings are taken on known positions from the unknown position (target).
3. In the model that is the basis for the program, for a given probability of containment, the minimum area containment region is an ellipse centered on the position estimate. The semi-major axis = $k\sigma_{MJ}$ and semi-minor axis = $k\sigma_{MI}$ where k is the size of the ellipse and σ_{MJ} and σ_{MI} are the standard deviations (uncertainty measure) of the position estimate in the major axis and minor axis directions.
4. The area units are the range units squared.
5. Negative bearing estimates and negative major axis directions can result. To convert a negative bearing estimate to the value that would be output by the other programs, add 360° to the estimate. For example, -5° becomes 355° . To convert a negative direction, add 180° . For example, -5° becomes 175° .

III. Two Examples

In Scenario 1, the scenario for the first example, bearings are taken on a target from three separate stations. Figure 1 on Page 18 shows Scenario 1 and Table 1 below gives the station data. The stations are numbered according to the order of station data input to the program.

TABLE 1

	OBS BRG	STA BRG	STA RNG	BRG ERR
Station 1	038°	334°	13500	4°
Station 2	324°	050°	11350	3°
Station 3	003°	000°	0	4°

Note from Table 1 that the reference point is at Station 3.

Program outputs for Scenario 1 are given in List 1 on Page 19. List 1 and List 2 which gives program outputs for Scenario 2, are copies of printer tapes that were generated with a Casio FP-10 printer and a Casio FX-702P using the Casio FX-702P program. With allowance for differences in user instructions, display formats and round-off errors, the tapes indicate the output that should be obtained using any of the other calculator programs except for the TI-59 program where equivalent negative angles occur.

In Scenario 2, the scenario for the second example, bearings are taken from a target on three separate stations. Figure 2 on Page 20 shows Scenario 2 and Table 2 below gives the station data. As in Scenario 1, the stations are numbered according to the order of station data input to the program. In this scenario the reciprocal of the observed bearings are used in order to provide an equivalent scenario that is appropriate for the program.

TABLE 2

	OBS BRG	RCP BRG	STA BRG	STA RNG	BRG ERR
Station 1	211°	031°	000°	0	3°
Station 2	172°	352°	115°	11100	3°
Station 3	146°	326°	082°	13800	3°

Note from Table 2 that the reference point is at Station 1.

Program outputs for Scenario 2 are given in List 2 on Page 21. The two bearing estimates in the list are the reciprocal of the target's estimate of the bearing of Station 1.

Figure 1. A position estimate and a .83 confidence region.

Table 1 gives the bearings of the indicated bearing lines and List 1 gives the bearing and the range of the position estimate from Station 3.

Appendix 1. The Estimation Procedure

In this development the assumptions stated in Section I are required conditions. A rectangular coordinate system is used with the positive y-axis directed north, the positive x-axis directed east and the origin at the reference point and all angles are in radians. Figure 3 shows a station located with respect to the coordinate system. The bearing line of length r goes to the object's unknown position, the bearing line of length r goes to an initial estimate of the object's position and the third bearing line corresponds to an observed bearing.

To determine the coordinates for a final estimate, consider the arc segments $u = r(\theta - \phi)$ where $\theta - \phi$ is the bearing error and $v = r(\phi - \beta)$ and $w = r(\theta - \beta)$ that are defined by the three bearing lines and the circle of radius r that is centered on the station and goes through the initial estimate. The geometry is shown in Figure 3. Note that u can be defined by $u = w - v$. In this expression, $w = r(\theta - \beta)$ is known, and v can be determined in terms of x and y the unknown coordinates of the target. With the reference point at the initial estimate, to first order, $v = x \cos \beta - y \sin \beta$ and $u = w - x \cos \beta + y \sin \beta$. Since this approximation applies to all stations, its use suggests that, for each station, $r \approx r$ which is equivalent to having the initial estimate relatively close to the target's position.

Since, for each station i , an observed bearing θ_i is the value of a normal random variable θ_i with mean ϕ_i , the coordinate $u_i = r_i(\theta_i - \phi_i)$ is the value of a normal random variable U_i with mean zero. In addition, since the θ_i are independent, the U_i are

Figure 3. The coordinate geometry. The coordinates of the initial estimate are (x^*, y^*) . In the development, the reference point is at the initial estimate.

also independent. And, consequently, the joint distribution of the U_i is determined.

To estimate x and y , maximum likelihood estimates are used here. The likelihood for a sample $\theta_1, \theta_2, \dots, \theta_n$ from n stations is

$$L(\theta_1, \theta_2, \dots, \theta_n) = \prod_{i=1}^n \frac{1}{\sqrt{2\pi} e_i} \exp - \frac{1}{2} \sum_{i=1}^n (\theta_i - \phi_i)^2 / e_i^2$$

and the likelihood for a cooresponding sample $u_1, u_2, \dots, u_n$ is

$$L(u_1, u_2, \dots, u_n) = \prod_{i=1}^n \frac{1}{\sqrt{2\pi} \sigma_i} \exp - \frac{1}{2} \sum_{i=1}^n u_i^2 / \sigma_i^2$$

with $\sigma_i = r_i e_i$ where e_i is the standard deviation of θ_i .

By definition, the maximum likelihood estimates for x and y are the estimates which make $L(u_1, u_2, \dots, u_n)$ a maximum. In this case, making $L(u_1, u_2, \dots, u_n)$ a maximum is equivalent to making $\sum_{i=1}^n (u_i^2 / \sigma_i^2)$ a minimum. So, to find the maximum likelihood estimates $\hat{x}$ and $\hat{y}$, solve the following two equations for $\hat{x}$ and $\hat{y}$:

$$\left. \frac{\partial (\ln L)}{\partial x} \right| = 0 \quad \text{and} \quad \left. \frac{\partial (\ln L)}{\partial y} \right| = 0$$

$$x = \hat{x} \qquad y = \hat{y}$$

With $u_i = w_i - x \cos \beta_i + y \sin \beta_i$, the equations can be written as follows:

$$\sum_{i=1}^n (w_i - \hat{x} \cos \beta_i + \hat{y} \sin \beta_i) (\cos \beta_i) / \sigma_i^2 = 0$$

and

$$\sum_{i=1}^n (w_i - \hat{x} \cos \beta_i + \hat{y} \sin \beta_i) (\sin \beta_i) / \sigma_i^2 = 0 .$$

In terms of the following quantities:

$$A = \Sigma(\cos^2 \beta_i) / \sigma_i^2 ,$$

$$B = \Sigma(\sin \beta_i \cos \beta_i) / \sigma_i^2 ,$$

$$C = \Sigma(\sin^2 \beta_i) / \sigma_i^2 ,$$

$$D = \Sigma(w_i \cos \beta_i) / \sigma_i^2 ,$$

$$E = \Sigma(w_i \sin \beta_i) / \sigma_i^2 ,$$

the equations become:

$$A\hat{x} - B\hat{y} = D$$

$$B\hat{x} - C\hat{y} = E$$

The solutions are:

$$(1) \quad \hat{x} = (BE - CD) / (B^2 - AC)$$

and

$$(2) \quad \hat{y} = (AE - BD) / (B^2 - AC)$$

A confidence region can be constructed about an estimated position. In order to indicate how this can be done, a probability region about the true position will be considered first.

Both $\hat{x}$ and $\hat{y}$ are values of random variables. If a new set of bearings $\theta_1, \theta_2, \dots, \theta_n$ is observed (for the same initial estimate and a fixed target), in general, a new pair of values $\hat{x}$ and $\hat{y}$ will be obtained.

If $\hat{X}$ and $\hat{Y}$ represent these random variables,

$$\hat{X} = \frac{1}{(B^2 - AC)} \sum_{i=1}^n (W_i / \sigma_i^2) (B \sin \beta_i - C \cos \beta_i)$$

$$\hat{Y} = \frac{1}{(B^2 - AC)} \sum_{i=1}^n (W_i / \sigma_i^2) (A \sin \beta_i - B \cos \beta_i)$$

where $W_i = r_i (\theta_i - \beta_i)$.

Since $\hat{X}$ and $\hat{Y}$ are a linear combination of the n normal random variables $W_1, W_2, \dots, W_n$, or equivalently of the n normal random variables $\theta_1, \theta_2, \dots, \theta_n$, they have a joint normal distribution. Since $E(W_i) = r_i (\phi_i - \beta_i)$, if $\beta_i = \phi_i$ for $i = 1, 2, \dots, n$, that is, if the initial estimate of the target's position is at the target's position, $E(W_i) = 0$ for $i = 1, 2, \dots, n$. In this case $E(\hat{X}) = 0$ and $E(\hat{Y}) = 0$ and the joint normal distribution is centered on the object's position. To the degree of the approximations that have been made, this is also true if the initial estimate is not at the target's position.

A region of minimum area for a given probability of containment of an estimated position can be determined. The region is bounded by an ellipse which is centered on the object's position and whose axes lie along the axes of an $x'y'$ -coordinate system that is obtained by rotating the xy -coordinate system that is centered on the object's position through an angle γ . In this system, $\sigma_{\hat{x}, \hat{y}}$ is 0, that is $\hat{x}'$ and $\hat{y}'$ are independent normal random variables. The two coordinate systems are illustrated in

Figure 4. The coordinates of a point in the two systems are related by

$$x' = x \cos \gamma - y \sin \gamma$$

$$y' = x \sin \gamma + y \cos \gamma$$

These relations imply:

$$(3) \quad \sigma_{x'}^2 = \sigma_x^2 \cos^2 \gamma - 2\sigma_{\hat{x}\hat{y}} \cos \gamma \sin \gamma + \sigma_y^2 \sin^2 \gamma,$$

$$(4) \quad \sigma_{y'}^2 = \sigma_x^2 \sin^2 \gamma + 2\sigma_{\hat{x}\hat{y}} \cos \gamma \sin \gamma + \sigma_y^2 \cos^2 \gamma$$

and

$$(5) \quad \sigma_{\hat{x}'\hat{y}'}^2 = (\sigma_{\hat{x}}^2 - \sigma_{\hat{y}}^2) \sin \gamma \cos \gamma + \sigma_{\hat{x}\hat{y}} (\cos^2 \gamma - \sin^2 \gamma)$$

where γ , the angle of rotation of the coordinate axes, is positive in the clockwise direction. And $\sigma_{\hat{x}'\hat{y}'}^2 = 0$ implies

$$\tan 2\gamma = \frac{2\sigma_{\hat{x}\hat{y}}}{\sigma_{\hat{y}}^2 - \sigma_{\hat{x}}^2}$$

With the initial estimate of the target's position at the target's position $E(W_i) = 0$ and therefore, $\text{Var}(W_i) = \sigma_i^2$ for $i = 1, 2, \dots, n$. In this case

$$\sigma_{\hat{x}}^2 = \frac{1}{(B^2 - AC)^2} \sum_{i=1}^n (1/\sigma_i^2) (B \sin \beta_i - C \cos \beta_i)^2,$$

Figure 4. An elliptical confidence region and the primed coordinate system in which the covariance $\sigma_{\hat{x}', \hat{y}'}$ is zero. The center of the ellipse and the origin of the coordinate systems are at the target's estimated position. The estimated bearing $\hat{\alpha}$ and estimated range $\hat{\rho}$ are indicated for a reference position.

$$\sigma_{\hat{y}}^2 = \frac{1}{(B^2 - AC)^2} \sum_{i=1}^n (1/\sigma_i^2) (A \sin \beta_i - B \cos \beta_i)^2$$

and

$$\sigma_{\hat{x}\hat{y}} = \frac{1}{(B^2 - AC)} \sum_{i=1}^n (1/\sigma_i^2) (B \sin \beta_i - C \cos \beta_i) (A \sin \beta_i - B \cos \beta_i).$$

Using the definition for A, B and C, the above become

$$(6) \quad \sigma_{\hat{x}}^2 = \frac{C}{(AC - B^2)},$$

$$(7) \quad \sigma_{\hat{y}}^2 = \frac{A}{(AC - B^2)},$$

and

$$(8) \quad \sigma_{\hat{x}\hat{y}} = \frac{B}{(AC - B^2)}.$$

So $\tan 2\gamma = 2B/(A - C)$ for $\beta_i = \phi_i$, $i = 1, 2, \dots, n$.

With the target's position known and, consequently, ϕ_i known for $i = 1, 2, \dots, n$, the above expressions for $\sigma_{\hat{x}}^2$, $\sigma_{\hat{y}}^2$, $\sigma_{\hat{x}\hat{y}}$ and γ can be used, since the initial estimate of the target's position can be taken as the target's position.

With values for $\sigma_{\hat{x}}$, $\sigma_{\hat{y}}$, $\sigma_{\hat{x}\hat{y}}$ and γ , values for $\sigma_{\hat{x}}$, and $\sigma_{\hat{y}}$, can be found by using equations (3) and (4). The probability that an estimated position will be within an ellipse of semiaxes $k\sigma_{\hat{x}}$, and $k\sigma_{\hat{y}}$, which is centered on the target's position is

$1 - \exp(-k^2/2)$. This result can be found by integrating the bivariate normal density over the ellipse. And the area of the ellipse is $k^2 \sigma_{\hat{x}}^2 \sigma_{\hat{y}}^2$.

Given estimates $\hat{x}$ and $\hat{y}$ found by using Equations (1) and (2), the ellipse with semi-axes $k\sigma_{\hat{x}}$ and $k\sigma_{\hat{y}}$, in a coordinate system that is centered on the point $(\hat{x}, \hat{y})$ and has been rotated through an angle γ is a $1 - \exp(-k^2/2)$ confidence region. This follows, since, to the degree of the approximations involved, the bivariate normal distribution of X and Y is centered on the target's position. The confidence ellipse is defined if $\sigma_{\hat{x}}^2$, $\sigma_{\hat{y}}^2$ and $\sigma_{\hat{x}\hat{y}}$ can be found, that is if the elements of the covariance matrix can be found. To the degree of the approximations involved, this can be done as follows: First, assume the initial estimate of the target's position is at the target's position. Then, values for $\sigma_{\hat{x}}^2$, $\sigma_{\hat{y}}^2$, $\sigma_{\hat{x}\hat{y}}$ and γ can be determined by using Equations (6), (7) and (8). These values can then be used to determine $\sigma_{\hat{x}}^2$, $\sigma_{\hat{y}}^2$, and $\sigma_{\hat{x}\hat{y}}$, by using Equations (3), (4) and (5). Now, with a value for k , a confidence region can be constructed. To the degree of the approximations involved, the shape of the confidence region is independent of both the target's position and of the initial estimate of the target's position.

For the case where bearings are taken from the target on two or more stations, θ_1 is the reciprocal of the bearing taken from the target.

A discussion of the theory of bearings only position estimation procedures for situations similar to the one considered here is given in Reference 1. Reference 2 gives an essentially

equivalent bearings only procedure. It also gives a range only procedure, a range and bearing procedure and HP-9830A programs with which to implement the procedures. Using the fix determined by two lines of bearing as the initial estimate was suggested by this reference.

The following equations are evaluated in the program to determine the coordinates of the initial estimate:

$$\begin{aligned} x^* \sin (\theta_2 - \theta_1) &= [\rho_1 \sin (\alpha_1 - \theta_1)] \sin \theta_2 \\ &- [\rho_2 \sin (\alpha_2 - \theta_2)] \sin \theta_1 \end{aligned}$$

and

$$\begin{aligned} y^* \sin (\theta_2 - \theta_1) &= [\rho_1 \sin (\alpha_1 - \theta_1)] \cos \theta_2 \\ &- [\rho_2 \sin (\alpha_2 - \theta_2)] \cos \theta_1 . \end{aligned}$$

Reference 3 describes a TI-59 program that is based on an equivalent procedure. The program allows a user to either input the coordinates of the initial estimate or determine them in the manner described here.

Appendix 2. HP-41CV Program Labels

The global labels in the HP-41CV program that are assigned to the keys $\Sigma+$, $1/x$, $\sqrt{x}$, LOG and LN give these keys a mnemonic character. For example, with the calculator in USER mode, if LOG is pressed and held, SIZ will be displayed and then after a delay, NULL.

If a global label is replaced by a local label, this mnemonic character will be lost. However, automatic key assignment will be gained if the key corresponding to the local label has not been previously assigned. If this is the case and if there is a second program in program memory that uses the same local label, then it will be automatically assigned when the calculator is positioned in program memory at that program.

Global labels in the HP-41CV program can be replaced with local labels. If this is done as described below, the user instructions will still be applicable. First, make the following replacements:

Line 329: LBL "PRB" $\rightarrow$ LBL E. Line 311: LBL "SIZ" $\rightarrow$ LBL D.
Line 186: LBL "EST" $\rightarrow$ LBL B. Line 008: LBL "CON" $\rightarrow$ LBL C.
Line 047: GTO "CON" $\rightarrow$ GTO C.

Next, after line 001: LBL "TPE", insert LBL A so that it becomes line 002. Finally, if there is a key assignment for a key in the following list: $\Sigma+$, $1/x$, $\sqrt{x}$, LOG and LN, remove it. Now, with the calculator in USER mode, if LOG is pressed and held, XEQ D will be displayed and then, after a delay, NULL. The key's mnemonic character has been lost, but if there is a second program in program memory with the local label D, LOG will be automatically assigned to D when the calculator is positioned in program memory at that program.
