SUMMARY PAGE

PROBLEM:

Material safety data sheets are used by health professionals to determine possible health hazards posed by the use of various chemical compounds. The current methods of obtaining and sorting material safety data sheet (MSDS) information are cumbersome and time consuming.

FINDINGS:

Computer programs were specifically written to manipulate the voluminous data of MSDS's.

APPLICATION:

Our MSDS retrieval system was designed to improve the management of MSDS information primarily for DOD but may be applied to industry as well.

ADMINISTRATIVE INFORMATION

This work was carried out under the Naval Medical Research and Development Command Research Work Unit No. MF58.524.003-0002. The report was submitted for review on 11 July 1983, approved for publication on 20 July 1983. It has been designated as NSMRL Memorandum Report No. 83-4.

ABSTRACT

FORTTRAN computer programs were written in order to store and retrieve material safety data sheet (MSDS) information. The first program is used to add individual MSDS information to the master file whereas the second program allows the master file to be printed. The third and fourth programs allow for manipulation of the data in the master file such as searching and matching for specific information within the different information categories. Under development are programs used to extract certain data from the hazardous materials information system (HMIS) and incorporate them into our own MSDS system. When completed, our on-line hazardous compound records will number approximately 16,000.

INTRODUCTION

Part of a study for evaluating the limits of atmospheric contaminants in nuclear submarines work unit number MF58.524.003-0002 was to identify the chemical ingredients of substances used in the normal maintenance and operation of these vessels. Our method for completing this task was to obtain material safety data sheets (MSDS) for all 254 substances permitted aboard submarines. As we progressed in this endeavor, it became apparent that computerized storage and retrieval of MSDS information of some 30,000 different chemicals in more than 400,000 different products on the open market could vastly improve the ability of health professionals to help protect workers from chemical hazards in both the Department of Defense (DOD) and industry. For this reason we devised a computer program to manipulate MSDS data so it could be readily available to anyone who has a computer terminal and telephone link. The following is a description of how MSDS information can be of value and how our computer retrieval system works.

Federal law and regulations mandate that navy and maritime activities obtain MSDS's in order to have the necessary information so as to furnish safeguards to protect the life, health, and safety of their employees. MSDS's are available from most manufacturers on OSHA Form 20 "Material Safety Data Sheet" (appendix 1). The MSDS allows users of hazardous materials to ascertain the potential fire, toxic, or reactivity hazards which are likely to be encountered in their handling, application, or utilization and final disposal.

Because the information on these sheets may be complicated or involve trade secrets, the industrial hygienists at a local safety and health office will usually keep the sheets on file and interpret the product data in order to inform workers of potential hazards.

METHODOLOGY

Our MSDS data is managed by a group of FORTRAN programs specially designed for this application (Appendix 2, 2a, 3, 4, and 5). All the data is stored in five indexed sequentially organized files and maintained on-line on a computer disk normally available for access 24 hours per day. Individual MSDS's are added to the master file by running a program which prompts the user for the various pieces of information such as the trade name, hazard code, chemicals, etc. (information categories, Appendix 6c), arranges them in the appropriate format and appends the new MSDS to the files. The MSDS is assigned a unique number determined by its order of entry into the file.

The entire master file or portions thereof can be printed under the control of another FORTRAN program. Each MSDS is formatted with labels and arranged in the printout for easy identification (Appendix 7). The program prompts for a beginning MSDS number and an ending number thereby allowing any sequential subset of MSDS's to be printed.

A third program permits a search of the entire MSDS data base by presenting the user the menu of information categories. In order to retrieve specific data from an MSDS master file, the user specifies which category he would like searched and then enters a

string of characters spelling out the chemical, hazard code, trade name, etc. A search of the appropriate file is then done for the occurrence of the particular character string and the complete records of all MSDS's for which matches are found are automatically written into a separate disk file and printed (Appendix 8).

A fourth program reads the MSDS file and writes a user-selected specific information category file which is then sorted in alphabetical or numerical order (Appendix 9).

At present, correction to information in the data base can be made via a system text-editing utility program. A FORTRAN program is currently being written to provide this capability in a much simpler fashion. The new program will arrange information into the proper record locations under the design format and require the user only to verify the correction to the information in a given item of data.

These programs are now running on a VAX 11/750 central computer system (Digital Equipment Corporation). The processor is equipped with 1.5 megabytes of memory, 220 megabytes of on-line disk storage, and a dual density magnetic tape unit. The current MSDS master file consists of some 500 kilobytes of information and is resident on a 160 megabyte winchester-technology disk. There are currently 16 available ports to the VAX for user access, three of them being via phone lines. Authorized users need only dial into their accounts on the computer and issue run commands for the various programs of the VAX/MSDS system. The commands for operating the system are listed in Appendix 10.

FUTURE PLANS

DOD has instituted a hazardous material information system (HMIS) which provides reference data to assist in the management of hazardous materials so that the risks involved are minimized. The data provided on microfiche are compiled from MSDS sheets for approximately 15,000 chemical compounds listed in the Federal stock system and used by the armed forces. Although the HMIS is an excellent data base, the information is accessible only with a microfiche reader which we feel is a serious limitation. Another drawback of the HMIS system is that there is no effective method for locally surveying all the compounds for a particular chemical short of manually looking at all of the data sheets individually and noting those that have the chemical. When thousands of data sheets must be surveyed, the task becomes unmanageable. To solve this problem, we plan to extract certain data from the HMIS and incorporate them into our VAX/MSDS computer system. As previously explained, our computer system has the ability to rapidly search all the chemical files and list those MSDS's which have the chemical of interest. This feature will be especially valuable when conducting regional annual surveys of hazardous materials. In this respect, for example, plans call for the computer to be used to prepare lists of hazardous products used by various shops in the Naval Submarine Support Facility. A user code will be assigned to each shop or activity. Printouts of these lists will be sent to each shop periodically allowing them to compare the list with current stock and post hazard ratings where necessary.

A hazardous materials labelling program has recently been proposed at the Submarine Base by the Industrial Hygiene Branch of the Naval Submarine Medical Center in order to ensure that all workers are informed of the potential hazards of the products they use. The supply department will be responsible for labelling all incoming hazardous products with hazard warning decals. This hazard rating information will be supplied to them via the VAX/MSDS computer system which incorporates hazard ratings in the list of information. These ratings are assigned by the professional industrial hygienist and are not included in MSDS's from manufacturers on OSHA Form 20 or in the HMIS. A comparison of

information categories found on OSHA Form 20, the HMIS, and our VAX/MSDS system is listed in Appendix 6. Also, the user code breakdown for our system is in Appendix 6.

A field test of this system is currently in progress. We anticipate further minor changes in the programs as the system is developed and beneficial suggestions from users are received. Also, as data entry and file management utilities are added to the VAX system, the MSDS programs will be upgraded to take advantage of them. A field test report will be issued in about one year.

APPENDIX 6

COMPARISON OF INFORMATION CATEGORIES OF (A.) OSHA, (B.) HMIS, AND (C.) VAX/MSDS

The information on an MSDS OSHA form 20 is broken down into 9 separate sections:

- 1) manufacturer's name, address, phone number, chemical name, and trade name.
- 2) hazardous ingredients
- 3) physical data
- 4) fire and explosion hazard data
- 5) health hazard data
- 6) reactivity data
- 7) spill or leak procedures
- 8) special protection information
- 9) special precautions

The HMIS data sheet is broken down into 8 sections:

- 1) hazardous item indication which includes the federal stock number and trade name.
- 2) general information which includes manufacturer
- 3) hazardous components
- 4) transportation data
- 5) additional data
- 6) health and physical property data
- 7) safety storage and fire fighting procedures
- 8) spill and leak procedures

VAX/MSDS system uses a core of data which we feel is most germane for generating lists of information by the computer for the identification and protection from chemical hazards.

- 1) manufacturer
- 2) trade name
- 3) stock number
- 4) date MSDS was obtained
- 5) hazard code
- 6) user code (code is shown below)
- 7) ingredients
- 8) protective devices

THE VAX/MSDS USER CODE

SERIES	SUB SERIES	DESCRIPTION
0000		RESERVED
1000		NSSF
2000		SUBASE
3000		USS FULTON
4000		NUSC
5000		FORCES AFLOAT
6000		RESERVE CENTERS

APPENDIX 6
(continued)

7000		MISCELLANEOUS ACTIVITES, CT
	7100	SUBSCHOOL
	7200	SUPSHIP
	7300	NAVSUBMEDRSCHLAB
8000		MISCELLANEOUS ACTIVITIES, NY
	8100	BROOKLYN NAVAL STATION
9000		RESERVED

It should be noted that the user code as well as the other information categories of the VAX/MSDS system are still in the experimental testing stage of development.

MATERIAL SAFETY DATA

DATA SHEET NUMBER : 1
 MANUFACTURER : AMALIE REFINING CORPORATION
 TRADE NAME : BLACK VELVET GREASE
 STOCK/MANUF CODE : CA 1LG
 HAZARD CODES H : 4 F : 1 R : 0
 USER CODES : NK
 INGREDIENTS : CALCIUM STEARATE
 LEAD OXIDE
 GRAPHITE
 YEAR DATA SHEET OBTAINED : 1979
 SPECIAL HAZARD CODE :
 PR. DEVICES : NK

DATA SHEET NUMBER : 2
 MANUFACTURER : DEXTER CORPORATION
 TRADE NAME : AQUADUX TOUCH-UP
 STOCK/MANUF CODE : J2246
 HAZARD CODES H : N F : N R : N
 USER CODES : NK
 INGREDIENTS : LEAD SULPHATE
 LEAD
 YEAR DATA SHEET OBTAINED : 1975
 SPECIAL HAZARD CODE : NK
 PR. DEVICES : NK

DATA SHEET NUMBER : 3
 MANUFACTURER : AMALIE REFINING COMPANY
 TRADE NAME : AQUA-SONIC SHIELD
 STOCK/MANUF CODE : NK
 HAZARD CODES H : 2 F : 3 R : 0
 USER CODES : NK
 INGREDIENTS : STODDARD SOLVENT
 CALCIUM STEARATE
 YEAR DATA SHEET OBTAINED : 1979
 SPECIAL HAZARD CODE : NK
 PR. DEVICES : NK

DATA SHEET NUMBER : 4
 MANUFACTURER : AMALIE REFINING COMPANY
 TRADE NAME : FILMSPRAY RUSTOP
 STOCK/MANUF CODE : NK
 HAZARD CODES H : 2 F : 3 R : 0
 USER CODES : NK
 INGREDIENTS : STODDARD SOLVENT
 CALCIUM SULFONATE
 PETROLATUM
 YEAR DATA SHEET OBTAINED : 1979
 SPECIAL HAZARD CODE : NK

MATERIAL SAFETY DATA
WITH BENZENE IN THE INGREDIENT

DATA SHEET NUMBER : 116
MANUFACTURER : HUGHSON CHEMICALS
TRADE NAME : CHEMGLAZE BLUE ELASTOMERIC POLYURETHANE
STOCK/MANUF CODE : TS 3236-25A
HAZARD CODES H : 2 F : 4 R : 0
YEAR DATA SHEET OBTAINED : 1980
SPECIAL HAZARD CODE :
USER CODES : NK
INGREDIENTS : ETHYL BENZENE
N-BUTYL ACETATE
TOLUENE DIISOCYANATE
CELLOSOLVE ACETATE
2-ETHOXYETHYLACETATE

PR. DEVICES : NK

DATA SHEET NUMBER : 139
MANUFACTURER : THE CARTER'S INK COM
TRADE NAME : CARTER'S RUBBER CEMENT
STOCK/MANUF CODE : 8040-00-291-8625
HAZARD CODES H : 3 F : 3 R : 0
YEAR DATA SHEET OBTAINED : 1978
SPECIAL HAZARD CODE :
USER CODES : NK
INGREDIENTS : BENZENE

PR. DEVICES : NK

DATA SHEET NUMBER : 155
MANUFACTURER : HUGHSON CHEMICALS
TRADE NAME : CHEMGLAZE GREEN ELASTOMERIC POLYURETHANE
STOCK/MANUF CODE : TS 3236-23A
HAZARD CODES H : 3 F : 2 R : 1
YEAR DATA SHEET OBTAINED : 1980
SPECIAL HAZARD CODE :
USER CODES : NK
INGREDIENTS : ETHYL BENZENE
N-BUTYL ACETATE
CELLOSOLVE ACETATE
2-ETHOXYETHYL ACETATE
TOLUENE DIISOCYANATE
CARBON BLACK
LEAD
CHROMATES

PR. DEVICES : NK

DATA SHEET NUMBER : 161
MANUFACTURER : HUGHSON CHEMICALS
TRADE NAME : CHEMGLAZE THINNER 9954
STOCK/MANUF CODE : NK
HAZARD CODES H : 2 F : 4 R : 0
YEAR DATA SHEET OBTAINED : 1980
SPECIAL HAZARD CODE :
USER CODES : NK
INGREDIENTS : N-BUTYL ACETATE
ETHYL BENZENE
CELLOSOLVE ACETATE

APPENDIX 10

BASIC COMMANDS FOR SYSTEM OPERATION

1. Log on computer system
2. For adding MSDS's to master data file call up the DATASHEET program by keying in ENTER. Instructions will appear on the CRT. To print, key in DATA and follow the further instructions on the CRT.
3. For matching, use the MATCH program by keying in MATCH and then following further instructions on the CRT. Printouts on the matched data are automatically made.
4. For sorting data, use MSSORT program by keying in SORT and following the further instructions on the CRT. Printouts of the sorted data are automatically made.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) FORTRAN computer programs were written in order to store and retrieve material safety data sheet (MSDS) information. The first program is used to add individual MSDS information to the master file whereas the second program allows the master file to be printed. The third and fourth programs allow for manipulation of the data in the master file such as searching and matching for specific information within the different information categories. Under development are programs used to extract certain data from the hazardous materials information system (HMIS) and
