20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This document defines the flying qualities characteristics of the CH-46E helicopter. The data are representative of both the metal-bladed and composite-bladed versions. Analytically computed static trim data are presented for a wide range of configurations (gross weight, c.g.) and flight conditions (airspeed, altitude, sideslip, climb, autorotation). Correlation of trim data with available flight test data is provided for validation. (see next page)		

20. ABSTRACT (continued)

Analytically computed static stability and control derivatives are compiled for significant combinations of configuration and flight condition. Time history data relating to dynamic stability, control response and SAS failures are extracted from flight test records obtained during the Contractor's CH-46E SLEP II flight test program.

VOLUME 4

CH-46E TRIM AND STABILITY DERIVATIVES DATA

This Volume contains the trim and stability derivative output data obtained from the Boeing Vertol Tandem Rotor Trim and Stability Analysis Program (A-97), for the CH-46E helicopter. The flight conditions considered are grouped under 15 headings on page 11. The first page in each group catalogs all the trim and derivative cases in that group. Those flight conditions at which stability and control derivatives were obtained are designated by an X in the appropriate column of the catalog.

The trim output parameters are defined in the legend beginning on page 3. These parameters are listed in the order of their appearance on the output sheet.

Each derivative output is broken down into three pages. The first page presents the three force (X, Y, Z) and the three moment ($\mathcal{L}$, M, N) derivatives of the whole helicopter with respect to three velocity perturbations (u, v, w), three angular rate perturbations (p, q, r), four control input perturbations (δ_B , δ_S , δ_R , δ_C), and two aerodynamic incidence perturbations (β , α). The format of the output presents first the derivatives of X-force with respect to these twelve perturbations. Hence XU is the derivative of X-force with respect to u (dX/du), XV is the derivative of X-force with respect to v (dX/dv), and so forth through XALPHA = ($dX/d\alpha$). The X-force derivatives are followed by the twelve Z-force derivatives, twelve M-moment derivatives, twelve Y-force derivatives, twelve $\mathcal{L}$ -moment derivatives and twelve N-moment derivatives. In all cases, the force derivatives are non-dimensionalized by the helicopter mass, and the moment derivatives by the appropriate moments of inertia, which are listed at the top of the first page of derivative output. The definitions, sign conventions and units of the forces, moments and perturbations are set forth on page 8.

The second page of derivative output consists of component derivatives arranged in an array of longitudinal rotor force, rotor flapping, induced velocity and fuselage force derivatives with respect to six longitudinal perturbations, and an array of lateral-directional rotor force, flapping and fuselage force derivatives with respect to five lateral-directional perturbations. The value at the intersection of each line and column of the array is the derivative of the parameter at the extreme left with respect to the perturbation at the head of the column. For example, the derivative of CTR with respect to ALPHA ($dC_{TR}/d\alpha$) is the second entry in the column under ALPHA. The parameters involved in these derivatives are defined under "Component Derivative Parameters" beginning on page 9.

The third page of derivative output consists of four small arrays of supplementary derivatives. The first array presents derivatives of the six helicopter forces and moments with respect to perturbations in rotor longitudinal cyclic pitch and rotor RPM, and the second array presents rotor component derivatives with respect to longitudinal cyclic and RPM. These arrays are read in the same manner as the second page of derivative output. The third and fourth arrays present the derivatives of forward and aft rotor torque with respect to perturbations in aircraft velocity, angular rate, control input and aerodynamic incidence angle. These arrays are read in the same manner as the first page of derivative output. The parameters involved in these derivatives are defined under "Supplementary Derivative Parameters" beginning on page 10.
