SECURITY CLASSIFICATION OF THIS PAGE(When Data Entered)

20. ABSTRACT (Continued):

Some principal features are:

- (1) a. Classification of areas of each LMVD District in terms of a water resource unit (WRU).
- (2) b. Use of linear interpolation techniques in computing flood effects except for crop damages.
- (3) c. Use of percentage factors for crop damage calculations.
- (4) d. Output directed to the user's time-sharing terminal for immediate use.

PREFACE

This report, a revision of IR K-82-1, describes the general features of a computer program designed to estimate flood damages for the geographic regions of the U. S. Army Engineer Division, Lower Mississippi Valley (LMVD). Work in developing the computer program and preparing this report was done as part of application support provided to LMVD by the Automatic Data Processing (ADP) Center of the U. S. Army Engineer Waterways Experiment Station (WES). Data herein reflect modifications to the computer program of the earlier report.

Mr. Walter L. Enete of the Computer-Aided Design Group (CADG), ADP Center, developed the program and prepared this report under the direction of Mr. Paul K. Senter, CADG. The work was done under the supervision of Mr. William A. Price, Chief, CADG, and Dr. N. Radhakrishnan, Chief, ADP Center.

Liaison was maintained between WES and LMVD by means of office conferences and telephone communications with Mr. Norwyn Johnson, Economics Branch, who was principal coordinator for LMVD. Commanders and Directors of WES during the preparation and publication of this report were COL Nelson P. Conover, CE, and COL Tilford C. Creel, CE. Technical Director was Mr. F. R. Brown.

CONVERSION FACTORS, U. S. CUSTOMARY (NON-SI) TO METRIC (SI)
UNITS OF MEASUREMENT

U. S. customary (non-SI) units of measurement used in this report can be converted to metric (SI) units as follows:

<u>Multiply</u>	<u>By</u>	<u>To Obtain</u>
acres (U. S. survey)	4046.873	square metres
feet	0.3048	metres

USER'S GUIDE TO THE FLOOD DAMAGE ESTIMATION SYSTEM (FLDES)

PART I: INTRODUCTION

Purpose

1. This report describes the general features of a computer program (FLDES) designed to estimate flood damages and presents instructions for its use. It is written for the Waterways Experiment Station (WES) computer and operates in a time-sharing mode.

Computational Procedures

2. Basic computations in the program are performed using data taken from curves developed by plotting area inundated versus water height above mean sea level (msl). Flood impacts are computed in terms of acres flooded, crop losses, property damage, and persons affected. Crop losses are computed by multiplying the cleared acres flooded by the distribution of crops in the flooded area.

Scope of Work

Model

3. The program is designed for coverage of geographic regions within the Lower Mississippi Valley under control of the Lower Mississippi Valley Division (LMVD). Each District in LMVD is uniquely identified to permit consideration of flood damages within it independent of those within any other District or over the entire region. This is done by dividing each District into areas called water resource units (WRU). Damages for each WRU are computed in the program using a linear interpolation algorithm to determine damages from elevation-damage curves. Associated with each WRU are three gages for determining inundation levels in the WRU. These gages are identified as the "local," "with project reference," and "without project reference" gages, respectively. More discussion of these gages follows in paragraphs 10 and 11.

Conditions considered

4. Two basic conditions are considered in the program: flooding under

existing conditions in which all current flood control projects are assumed in place, and flooding under conditions in which all Corps projects are assumed to be removed. Gage readings in feet msl for each of these conditions are required on input.

Method

5. In the calculations of all flood effects except crop damages, a straight linear interpolation procedure is used. For crop damages, the cleared acres flooded are multiplied by the percentage distribution factors for each crop grown in the WRU. The resulting acres are then multiplied by dollar estimates of production and overhead costs lost per acre to give the dollar value of the crop losses. If the per acre dollar estimates are adjusted based upon the time of year, crop losses may be determined at any time.

Generalized program flow

6. Figure 1 presents a generalized flow diagram of the program, beginning with the initial user request and ending with final program termination. See Part III for illustrations and sample executions.

Figure 1. General flow diagram

PART II: METHODOLOGY

Water Resource Unit Specification

7. WRU's are areas subject to flooding directly by a river or by back-water. Each WRU is identified as a protected or unprotected area (unprotected, for example, is that area between a river and a levee). Its features are contained in the program in the form of data sets consisting of points from stage-area, stage-damage, and stage-persons curves as well as other data on the WRU's relationship to states, counties, congressional districts, streams, basins, and Districts.

Types of Flood Effects

8. Four types of flood effects are computed in the program: area inundated in terms of acres; crop damages by crop type, acres, and dollar value; property damage by type and dollar amount; and persons affected, in numbers. Dollar damages are computed in current dollars by indexing the stage-damage curves to current year values. These effects are displayed by WRU, accumulated and displayed by type of flood effect. The user has the option of displaying the effects by geopolitical unit also.

Stage Curves

9. Stage curves can best be understood by referring to a typical one such as that shown in Figure 2. This is a stage-area curve for an area inun-

Figure 2. Stage-area curve

dated within a WRU. Note that the gage readings are converted to feet msl. The program requires the gage readings in feet msl; it does not convert them to msl. Points $p_0, p_1, p_2, \dots, p_6$ are picked off the curve in the form of ordered pairs and stored with their respective WRU. A maximum of 10 such points is used for each WRU. The curves are stored for area inundated, property values by type, and persons affected by flood.

Gage Curves--Specification and Relationships

10. As stated previously, each WRU has three gages associated with it: a local gage, a with project reference gage, and a without project reference gage.* These gages are linked by gage relationships in the data files so that, using only those gages supplied at input, the local gages (if not given) may be computed for use in determining the appropriate flood effects.

11. The with project reference (W-P) gage is used to obtain a reading for the local gage of the WRU when that gage reading is missing and when flood effects are desired for the WRU with the Corps flood control project in place. The without project reference (W/O-P) gage is used to compute a local gage reading when all Corps projects are assumed to be removed. The readings for the local gage are obtained through a linear interpolation process as described in Appendix A. Each reading is computed from stored "gage-gage" curves derived from known hydraulic relationships between the local gage and the W-P gage as well as the local gage and the W/O-P gage.

12. Specifications of the local, W-P, and W/O-P gages for a WRU are very critical to proper processing in the program. These must be selected in such a way that each WRU is essentially locked in with its neighbors by the gages associated with it.

13. Proper program execution requires that a local gage and reading be known for each WRU in order to use stage curves for flood effects calculations. If this information is not provided at input, it must be calculated from the appropriate gage relationship. Normally, the gages and readings provided the program at run time are those on the main stem river.

14. Determination of the local gage reading, when not given, will be made using the gage-gage curves provided by the Districts for all WRU's.

* Currently, no without project reference gage is stored for each WRU.

These curves will relate the W-P and W/O-P gage readings to the local gage so that the local gage reading may be determined if not known. A typical curve for a W-P gage is shown in Figure 3. Use of such a curve in the computer program is by straight linear interpolation. The curve is stored by picking corresponding pairs (b,a) and by inputting via cards the number of pairs and the values for each pair. The values $b_0, b_1, b_2, \dots, b_i, i \leq 10$ represent the water levels in feet msl for the W-P gage. The values $a_0, a_1, a_2, \dots, a_i, i \leq 10$ are the readings for the local gage at the predetermined W-P gage. Space is provided in the file for a maximum of 10 pairs for each gage-gage curve. After storage of the gage pairs, the user is only required to provide readings for any selected gages. The program will use them and compute the local gage readings for all WRU's for which an interdependence can be established between the given gages and the gages for the WRU. Those for which no interdependence can be established are omitted from any flood effects calculations. Refer to Appendix A for a more detailed discussion of the above concepts.

Figure 3. Typical gage-gage curve

PART III: SYSTEM EXECUTION

Data Preparation/Output

15. Minimal data preparation by the user is required for program execution. The number of gages, each gage code with its associated reading, and the per acre crop costs for the eight crop types constitute the data input necessary for the program. These data are entered in free-field format with spaces or commas separating each data item as requested by the program. The user also has the option of entering the gage data from a previously prepared data file. (See paragraph 18 for a discussion of preparing the file.)

16. Program output consists of terminal printer and stored file data. The data listed on the terminal printer are the detailed and summarized damages for the WRU's selected within the program. Selected WRU's are those for which a gage reading is input or computed using the gage-gage algorithm described in Appendix A. Figure 4a* shows an example execution of the user-response sequence of the program. At this point the program will compute and print out flood damages for all WRU's affected. See Figure 4b for an example of the printout.

17. At the user's option, damages may be accumulated and displayed by three geopolitical features: state, county, and congressional district. To permit this, each WRU code is stored in a random access master file along with a series of codes identifying the state, county, and congressional district containing it. A second random access file contains the associated names for the states, counties, and districts within LMVD. The first file is keyed to WRU codes and the second to the state, county, and congressional district codes. Figure 5 is an example of the geopolitical output. As will be noted, the damages vary from one geopolitical entity to the next, reflecting the fact that each is different in composition; i.e., not all WRU's in one congressional district are in the same county.

18. The gage data input file is prepared in free-field format prior to executing FLDES. Multiple data sets may be included in the file. Each set

* A table of factors for converting U. S. customary (non-SI) units of measurement used in Figure 4 and elsewhere in this report to metric (SI) units is presented on page 3.

Figure 6. Sample
data file

consists of a header record followed by the gage data records. The data items in the header record are line number, data set code, and number of gages. The data items in each gage record are line number, gage code, and reading (in feet msl). A sample file showing multiple sets is shown in Figure 6.

19. Multiple executions of FLDES are required since the file has multiple data sets. FLDES allows the user to do this, but each data set is processed independently of the preceding one. The data set code may be any three character variables of the user's choice and is used primarily to distinguish one set of gage data from the next.

Notes on Usage

20. FLDES can be used to compute hypothetical flood effects by projecting a flood through the Mississippi River. The projected gage data can be stored on file, used for a "spring" flood situation and by changing the crop cost factors in a second execution with the same gage data, project the effects for a "fall" flood.

21. Without project conditions require use of the without project gage codes and elevations. The user may input such data by terminal or from prepared file.

22. Appendix B contains listings of the gage files showing the gage codes and elevation points. On pages B1 through B22 are the local reference gage curves and on pages B22 through B32 are the without project actual gage curves. Note that the "actual" gage code may be a local or reference gage in the first listing. Appendix C is a listing of the WRU master file. The user may cross-reference between the two to match WRU's with gages.

23. Appendix D gives the codes and definitions used in the data files in the FLDES data base.

24. Should it become necessary, the user may list the master files of the FLDES data base using the utility file-list program. It permits the user to select the desired data file and to list any or all the WRU's contained in it. The execute command is:

FRN R0KA0FDP/UTLFLST,R

25. Update of the FLDES master files is the responsibility of the data base administrator (DBA) for FLDES. Procedures for this function are documented in a programmer's reference manual used by the DBA.

APPENDIX A: GAGE-GAGE ALGORITHM

1. Figure A1 shows a list of WRU (water resource unit) codes, their local and reference gages, and a gage file of related gages and elevation data. These data come from Figures A2 and A3. These relations form the background for discussing the gage-gage algorithm and the example shown in the following paragraphs.

2. Data for the gage-gage curves are derived from curves similar to those shown in Figure A3 and are stored in the gage master file.

WRU	Local Gage	Reference Gage	WRU	Local Gage	Reference Gage
OXM0001	1	2	OXM0017	3	2
OXM0002	1	2	OXM0018	3	2
OXM0003	1	2	OXM0019	4	3
OXM0005	1	2	OXM0020	4	3

	REF.							
1	2	20	25	30	35	40	44.7	49.5
		15	20	25	30	35	42	46
2	6	2	19	29	38	42		
		6	20	30	40	45		

Figure A1. WRU codes, local and reference gages, and gage file

Figure A2. Typical WRU's

Figure A3. Gage-gage curves

3. Figure A4 illustrates the workings of the gage-gage algorithm. With input of gage data for gages 2 and 6, the program computes readings for gages 1, 3, 4, 5, 7, and 8, all of which are stored for subsequent use. Figure A5 illustrates the computational method used.

Figure A4. Flow diagram of gage-gage algorithm

Figure A5. Gage interpolation

- a. Assume R_I equals gage 2 with reading of 42.5.
- b. Compute interpolation ratio:

$$\text{Ratio} = \frac{R_I - R_L}{R_U - R_L} = \frac{42.5 - 42.0}{46.0 - 42.0} = \frac{0.5}{4.0} = 0.125$$

where

R_I = input gage reading of reference gage

R_L = lower gage reading from reference gage-gage curve (Figure A3)

R_U = upper reading of reference from gage-gage curve

- c. Compute local gage difference at points R_L and R_U for reference gage:

$$\text{Difference} = L_{R_U} - L_{R_L} = 49.5 - 44.7 = 4.8$$

where

L_{R_U} = upper local gage value for reference gage value R_U

L_{R_L} = lower local gage value for reference gage value R_L

d. Compute local gage reading:

$$\begin{aligned} L_{R_I} &= L_{R_L} + (\text{Ratio} \times \text{Difference}) = 44.7 + (0.125)(4.8) \\ &= 44.7 + 0.6 \\ &= 45.3 \text{ ft} \end{aligned}$$

where L_{R_I} is the computed local gage reading for a given input reference gage R_I . This reading, 45.3, is recorded in the gage file for future use. The program stores local gage code 1 and the computed reading for use in computing readings for subsequent gages. At this point, the program loops back as before.

4. Flood effects are determined next, using the stage-damage curves and the stored gage data. Each WRU is processed in sequence. Its local and reference gages are compared with the stored gages. A match will cause the flood effects to be computed. No match causes the WRU to be passed over. For example, WRU OXM0002 has a local gage 1 and reference gage 2. Since gages 1 and 2 are both stored, the program uses the gage 1 reading for flood effects. Similarly, all the WRU effects are determined from the stored gages except for OXN0001. This WRU has no listed reference gage. If gage 8 was not stored, no effects could be computed, and it would thus be bypassed.

APPENDIX D: CODES AND DEFINITIONS

1. The following codes are used in the FLDES master data files in the data base. Many of these are official codes obtained from regulations or government documentation.

Geopolitical Codes and Values

Engineer Districts

2. The four Districts in the Lower Mississippi Valley Division (LMVD) are:

NOD - New Orleans District
VED - Vicksburg District
MED - Memphis District
SLD - St. Louis District

State Codes

3. Parts of the following seven states are in the LMVD.

Arkansas - AK
Illinois - IL
Kentucky - KT
Louisiana - LA
Mississippi - MS
Missouri - MO
Tennessee - TN
Texas - TX

Congressional Districts

4. Parts of the following Congressional Districts are in LMVD.

<u>Arkan- sas</u>	<u>Illi- nois</u>	<u>Ken- tucky</u>	<u>Louisiana</u>	<u>Missis- sippi</u>	<u>Mis- souri</u>	<u>Ten- nessee</u>	<u>Texas</u>
AK 01	IL 20	KT 01	LA 01	MS 01	MO 01	TN 07	TX 01
AK 02	IL 21		LA 02	MS 02	MO 02	TN 08	
AK 03	IL 22		LA 03	MS 03	MO 03	TN 09	
AK 04	IL 23		LA 04	MS 04	MO 08		
	IL 24		LA 05		MO 09		
			LA 06		MO 10		
			LA 07				
			LA 08				
			LA 09 (?)				

Counties Within States

5. Counties within states will be identified by a five-digit code as follows:

XX NNN

County Number

State code from above

The county number will be the number associated with the particular county by SIC.

Gage Codes

6. Gage codes are eight-digit codes using the format

XXXXX-XX.

Such codes may be the ASGS standard code or any user supplied code of eight characters or less.

Crop and Damage Codes			
Crop		Property	
Cotton	R01	Rural residential	R10
Corn	R02	Rural industrial and commercial	R11
Soybean	R03	Rural public property	R12
Rice	R04	Farm buildings	R13
Sugarcane	R05	Public roads	R14
Wheat	R06	Rural equipment	R15
Pasture	R07	Rural supplies	R16
Grain	R08	Rural farm roads	R17
sorghum		Rural fences	R18
		Rural drainage systems	R19
		Urban residential	U10
		Urban industrial and commercial	U11
		Urban public property	U12
