Purpose

This report provides demographic information about the officers and enlisted personnel of the United States Army as of 30 November 1978. For purposes of comparison, it also includes selected information gathered from Army-wide surveys in 1973, 1974, 1975, and 1976. Individuals who desire more detailed reports on 1973, 1974, 1975, and 1976 data should consult DAPC-PMP Report No. 4-74-S, Army Personnel Composite as of 30 November 1973, DAPC-PMP Report No. 3-75-S, Army Personnel Composite as of 30 November 1974, DAPC-MSF Report No. 21-76-S, Army Personnel Composite as of 30 November 1975, and DAPC-MSF-S Report No. 58-76, Army Personnel Composite as of 30 November 1976.

Method

The Army Sample Survey is a multipurpose instrument administered worldwide on a triannual basis. Most of the data in this report was collected as part of the 30 November 1978 Army Sample Survey. Statistics from any other sources besides the 30 November 1978 Army Sample Survey are noted on the particular tables.

Sample Population

The sample for all surveys cited in this report consisted of a randomly selected group of active duty officer and enlisted personnel.

FACTORS AFFECTING ACCURACY OF SURVEY DATA

Reliability

a. Definition. Survey precision (reliability) is generally expressed in terms of confidence probability and error intervals. Confidence probability (e.g., 95%) refers to the fact that a certain percentage (95%) of the time the population value will fall within a specified error interval. The error interval (e.g., $\pm 4\%$) is the range of percentage points above and below a given value in which the population value would be expected to fall.

To illustrate, assume the following: the true population value for a survey question is 70% "Yes" and 30% "No". If reliability is 95% $\pm 4\%$, then 95 out of 100 samples would fall within the intervals: "Yes" 66% - 74%, "No" 26% - 34%. For proportions, the major determinant of such error is the size of the sample.

b. Assumptions underlying the reliability levels. Three important assumptions underlie the reliability figures expressed for this survey.

It is assumed that the sample was random. The sampling plan required that respondents be selected by social security numbers so that this assumption would be supported. Although selection procedures differ at the installations, any error is assumed to be randomly distributed.

Secondly, because sampling error is largely a function of sample size, the larger the sample the higher the reliability of its estimates.

Reliability for proportions is also partly determined for each multiple choice response by the degree of unanimity on a given question or item. The greater the unanimity the smaller the standard error. For proportions this source of variation is severely limited since the departure from unanimity can never be more than a 50-50 split. The third assumption is that the data is split 50%-50%. The effect of the 50% assumption is to apply a "worst case" standard of upper limit sample size requirements. Normally, as survey respondents approach unanimity by collectively favoring one choice over another, reliability increases somewhat. For example, for a given sample size, an item on which 90 percent (or 10 percent) of the sample agrees is more reliable than one on which 50 percent agree.

c. Meaning of column notations on crosstabulation tables. The accuracy of the independent variables generally is $95\% \pm 5\%$ or better. However, if a column of an independent variable is annotated (i.e., $\pm 6\%$, $\pm 7\%$, etc.) then the reliability level of data in that column is $95\% \pm X\%$ indicated.

Data having a precision of $95\% \pm 10\%$ to $90\% \pm 10\%$ are marked with an asterisk.

Nonresponse Bias

The overall nonresponse rate was 56%. It was not possible to determine if personnel who did not respond to the survey differed significantly from those who did. Differences between the two groups could bias the results.

Personal Bias of the Respondent

Individual respondents may have had a conscious or unconscious desire to take sides for or against the organization sponsoring the survey, and to protect any personal interest at variance with those of the proponent.

Variable Responses to Items

Included in this factor are different interpretations of the same situation given by the same person or given by different persons. Variability of response may be due to many factors: the psychological state of the respondent, a mismarked response, an intended distortion of the truth, misunderstanding of the question, or computer processing errors.

Comments or Information Request

Comments on this report or requests for other reports cited within should be forwarded to:
