I. INTRODUCTION

In December of 1980, the Vulnerability/Lethality Division (VLD) of the Ballistic Research Laboratory (BRL) was tasked by the US Army Materiel Systems Analysis Activity (AMSAA) to perform a Fractional Damage Analysis (special type of vulnerability analysis) of the mission essential components (MEC) of the M578 Light Recovery Vehicle. The objective of the study was to evaluate a typically deployed M578 in a fielded scenario and ascertain the number of MEC expected to need replacement as a function of threat type and threat delivery accuracy.

The first step in the VLD task is the production of a geometric description of the system's major components. Presently, the BRL uses the combinatorial geometry (COM-GEOM) technique of target description. The COM-GEOM technique uses logic-type operators to combine basic geometric solids to produce a three-dimensional computer model of the target. This COM-GEOM target description is used as input to the Geometric Information For Targets (GIFT)^{1,2} computer code. Among other things, the GIFT code traces shotlines through a COM-GEOM description from any specified aspect, listing pertinent information about each component hit. These shotline data are then used as simulated penetrator paths through the target during the vulnerability analysis.

II. SYSTEM BACKGROUND INFORMATION

The M578 Light Recovery Vehicle is used to pick up or tow disabled mechanized equipment, as a crane at repair bases, and as a carrying platform for spare parts and maintenance personnel.

It is a full tracked, self-propelled, diesel powered vehicle with a 30,000 pound boom winch and a 60,000 pound tow winch mounted in an armored cab. It is highly mobile and maneuverable and may be air transported. The vehicle is capable of long-range high-speed operations on improved roads. It can also traverse rough terrain, muddy or marshy ground, sand, snow or ice and can ford streams to a depth of 42 inches without auxiliary fording equipment.

A suspension lockout system and a spade assembly provide a stable platform and increase lifting and winching capabilities of the vehicle. The suspension lockout system, boom, winches, cab, and spade are hydraulically powered. The vehicle is served by a crew of three people: a driver, a crane operator, and a rigger/gunner.

III. COMBINATORIAL GEOMETRY BACKGROUND

This target description was developed in combinatorial geometry (COM-GEOM) as utilized by the Geometric Information For Targets (GIFT) computer code. The GIFT code is a geometry processing code which contains many validation and checking routines to assist the analyst in developing an error free COM-GEOM description.

Familiarization with the COM-GEOM technique and terminology is necessary for understanding any combinatorial geometry description. The following is a brief introduction to COM-GEOM, but a detailed explanation of this method and the requirements of the GIFT code can be found in Reference 1.

Engineering drawings, manuals, photographs, or other illustrative material are required to produce a COM-GEOM description. This information is transformed into a geometric interpretation of the target using twelve basic solids combined under three set theory operations. A complete COM-GEOM description contains a solid table, a region table, and a region identification table.

A solid is defined as one of the twelve geometric figures available for use in COM-GEOM descriptions. A list of these solids appears in Table 1. The parameters of a solid give its location, size, and orientation within the coordinate system established for the target. These parameters, along with the solid type and an assigned solid number, are listed in sequence in the solid table.

A region is the space occupied by a single solid or a combination of solids. Solids are combined using any combination of three set operations: intersection (+), union (OR), and difference (-). The intersection of two solids is only the space in common to both solids, while union is the space occupied by either solid. The difference of two solids is defined as all the space of the first solid that is not contained in the second solid. Figure 1 is the graphic representation of the three defined volumes. Any number of the solids listed in the solid table can be used to determine a region. Each region is uniquely numbered and its defining combination of solids is listed in the region table.

In the region identification table, each region is specified by either an item or space code number. These code numbers identify the region as a component of the target (an item) or as an air space in or around the target. Table 2 lists the groups of code numbers used in this description and the classes of components they represent. Space not described as a region is assigned the air space code 01 by the GIFT code. Since it is not required to describe air inside a target, the 01 code can represent air both on the interior and exterior of a model. However, it is frequently useful to describe inside air regions, which leaves the 01 code designating outside air only. The RAYAIR subroutine of GIFT allows any region identified with a space code to overlap any region assigned an item code or the same space code. Regions with an item code or different space codes cannot overlap.

TABLE 1. GEOMETRIC SOLIDS USED IN COM-GEOM DESCRIPTIONS

<u>Symbol</u>	<u>Solid Name</u>
RPP	Rectangular Parallelepiped
BOX	Box

TABLE 2. IDENTIFICATION CODE GROUPS USED IN THE
M578 LIGHT RECOVERY VEHICLE DESCRIPTION

<u>Space Code</u>	<u>Usage</u>
01	Air
02	Air
05	Air

<u>Item Code</u>	<u>Usage</u>
101-110	Hull Components (Non-Critical)
113-161	Hull Components (Non-Critical)
300-335	Turret Components (Non-Critical)
701-739	Crew Members
1045-1047	Hull Electrical (Power Plant)
1201-1236	Hull Power Plant Components
1301-1318	Hull Drive/Suspension Components
1401-1430	Hull Hydraulic Components
1501-1511	Hull Electrical Components
1600-1630	Hull Miscellaneous Components
1800-1817	Fuel/Lube Oil
2400-2427	Turret Hydraulic
2500-2514	Turret Electrical
2600-2621	Turret Miscellaneous Components

The region identification table also allows for up to 40 alphanumeric characters of descriptive data to be assigned to each region. Included in these 40 characters is a two digit material code for all regions designated by item code. Following this material code is a percentage which indicates for the region the equivalent line-of-sight (LOS) thickness using the indicated material type. If an * precedes the material code number, then the LOS number should be interpreted as the normal thickness in hundredths of an inch. The material code and the LOS thickness are helpful to the vulnerability analyst using a COM-GEOM description. Table 3 lists the material codes and their assigned densities used in the description of the M578 Light Recovery Vehicle.

These three tables - solid, region, and region identification - comprise a complete COM-GEOM target description meeting all requirements for input to the GIFT computer code.

IV. COMBINATORIAL GEOMETRY DESCRIPTION OF THE M578 LIGHT RECOVERY VEHICLE

The M578 Light Recovery Vehicle was described in a typically field deployed configuration, in a buttoned up mode; that is, the spade is lowered, the boom is raised slightly and extended aft of the vehicle, and all hatches are closed. The target description MEC's were described in high detail and as accurately as possible. In addition, all other components considered to provide significant masking were also described as accurately as possible.

The origin of the right-handed coordinate system for the M578 Light Recovery Vehicle is located at ground level directly below the center of the turret ring. The positive X-axis is toward the front of the vehicle, the positive Y-axis is to the left, and the positive Z-axis is upward. Figure 2 depicts the coordinate system superimposed on a computer plot of the M578 Light Recovery Vehicle description. The unit of measure used in this description is the millimetre.

The complete M578 Light Recovery Vehicle description consists of 1006 solids and 1006 regions and is currently stored on magnetic tape and disc at the BRL. Appendix A contains a complete listing of this description. Table A-1 is a listing of the solids, Table A-2 is a listing of the regions, and Table A-3 is a listing of the region identification table. In the past, it has proven useful to include a listing of the region identification table ordered by item number and this is included in Table A-4.

V. VALIDATION PROCEDURE

One of the most important aspects of the target description process is the validation of the target description. This extensive procedure can entail nearly as much time as the actual describing of the target. The M578 Light Recovery Vehicle description has undergone the following thorough validation procedure.

TABLE 3. MATERIAL CODES AND DENSITIES FOR THE
M578 LIGHT RECOVERY VEHICLE DESCRIPTION

<u>Code</u>	<u>Density</u>	<u>Material</u>
1	7.7641	Mild Steel

39	1.3000	Red Fuming Nitric Acid
40	18.7000	Uranium

FIGURE 2 . COORDINATE SYSTEM FOR THE M578 LIGHT RECOVERY VEHICLE .

The CHECK subroutine of the GIFT code pinpoints regions which overlap within a specified tolerance level. By definition, regions overlap when they occupy the same points in space. A tolerance level of 0.25 mm was used for the M578 Light Recovery Vehicle, and any overlaps were corrected.

A particularly difficult problem in the target description validation is the elimination of unwanted voids or undefined spaces. The GRID subroutine of the GIFT code is used to pinpoint this type of problem. GRID is the subroutine which traces shotlines completely through a description from any desired aspect; it lists the line-of-sight (LOS) thicknesses, the normal thicknesses, and the obliquity angles of every item encountered along each shotline. One of the many uses of this shotline information is in locating voids in the target description and often in helping to eliminate them. All voids found in the M578 Light Recovery Vehicle description have been eliminated.

Another step in the validation process is the production and examination of computer plots of the target description for any misplaced regions. These plots are produced by the PICTUR subroutine of the GIFT code. Figures 2 through 5 are examples of the plots produced by PICTUR. Numerous plots of the M578 Light Recovery Vehicle description were carefully examined, and any errors or misplaced regions were corrected.
