The Coordinating Research Council, Inc. (CRC) is a non-profit corporation supported by the petroleum and automotive equipment industries. CRC operates through committees made up of technical experts from industry and government who voluntarily participate. The four main areas of research within CRC are: air pollution (atmospheric and engineering studies); aviation fuels, lubricants, and equipment performance; heavy-duty vehicle fuels, lubricants, and equipment performance (e.g., diesel trucks); and light-duty vehicle fuels, lubricants, and equipment performance (e.g., passenger cars). CRC's function is to provide the mechanism for joint research conducted by the two industries that will help in determining the optimum combinations of petroleum products and automotive equipment. CRC's work is limited to research that is mutually beneficial to the two industries involved, and all information is available to the public.

ABSTRACT

4 In the 37th annual statistical survey of current model vehicles conducted by the Coordinating Research Council, Inc., test data were obtained on 383 1983 model vehicles, including 300 US vehicles and 83 imported vehicles. Fifteen laboratories participated in this Survey. Maximum octane number requirements were determined by testing under part-throttle conditions, as well as at maximum-throttle. Requirements are expressed as the Research octane number, Motor octane number, and $(R+M)/2$ octane number of the reference fuel which produced the least audible knock due to either spark or surface ignition, whichever was limiting. Estimated octane number requirements for the US vehicles are weighted in proportion to the 1983 vehicle model production figures and, for the imported models, in proportion to import sales volume in the United States.

I. INTRODUCTION

I. INTRODUCTION

In the 37th annual statistical survey of current model vehicles conducted by the Coordinating Research Council, Inc., test data were obtained on 383 1983 model vehicles, including sixteen knock sensor-equipped vehicles and five select models of special interest. Maximum octane number requirements were determined by testing under part-throttle conditions, as well as at maximum-throttle.* Although octane number requirements were determined according to the 50th percentile acceleration technique in the 1981 and 1982 Surveys, this technique was deleted from the 1983 program. This was replaced by extended part-throttle investigation. Surface ignition was reported, if present.

Passenger cars and light-duty trucks including non-commercial vans (1/2-3/4 ton without four-wheel drive) were tested to represent the 1983 vehicle population in the United States. This year's Survey includes analyses for the following vehicle categories:

- (1) US and Imported Vehicles -- 383 vehicles
- (2) US and Imported Cars -- 359 cars
- (3) US Vehicles -- 300 vehicles
- (4) US Cars -- 283 cars
- (5) Imported Vehicles -- 83 vehicles

It should be noted that the term "cars" designates passenger cars only, while the term "vehicles" includes passenger cars plus vans and light-duty trucks.

The order of testing reference fuels was the same as the 1982 Survey, which was as follows:

- Tank Fuel.....1st
- High Sensitivity Full-Boiling Range Unleaded
(FBRSU) Fuels.....2nd
- Average Sensitivity Full-Boiling Range Unleaded
(FBRU) Fuels.....3rd
- Primary Reference (PR) Fuels.....4th

Fifteen laboratories participated in this Survey; they are listed in Appendix A. Members of the CRC Octane Number Requirement Survey Analysis Panel are identified in Appendix B.

* Maximum-throttle is either full-throttle for manual transmissions or widest throttle position for automatic transmissions that does not cause the transmission to downshift (detent) in each individual car.

II. SUMMARY

II. SUMMARY

A. Vehicles Tested

Data were collected on 383 1983 vehicles. These vehicles consisted of 300 US vehicles and 83 imported vehicles. There were 283 US and 76 imported passenger cars. The remainder consisted of seventeen US and seven imported light-duty trucks and vans. The 1983 Survey included sufficient data for five specific models which were analyzed separately as select models. All select models had automatic transmissions. The average deposit mileage in this Survey was 11,374. The weighted average engine displacement and compression ratio were 3.10 l and 8.66, respectively. Sixteen vehicles were equipped with knock sensors.

B. Octane Number Requirements

Requirements are expressed as the Research octane number (RON), Motor octane number (MON), and (R+M)/2 octane number of the reference fuel which produced the least audible knock due to either spark or surface ignition, whichever was limiting. Estimated octane number requirements for the US vehicles are weighted in proportion to the 1983 vehicle model production figures and, for the imported models, in proportion to import sales volume in the United States.

For the 1981 and 1982 Surveys, knocking tendencies were investigated at maximum-throttle and by the 50th percentile acceleration technique. For the 1983 Survey, the 50th percentile acceleration technique was eliminated. Part-throttle requirements were defined when their requirements were higher than the maximum-throttle requirements or, with FBRU fuels only, when they were within four octane numbers of maximum-throttle requirements. The maximum requirements reported for the 1983 Survey were determined by the same method used in prior Surveys (the greater of maximum-throttle or part-throttle). Maximum (high borderline) and minimum (low borderline) octane number requirements were reported for the knock sensor-equipped vehicles when determined.

This is the first Survey in which requirements for knock sensor-equipped vehicles were included in the distribution. The base analysis case for this report uses the maximum (high borderline) octane number requirements of these vehicles. The following table for FBRU fuels presents maximum 1983 octane number requirements and changes from 1982 for the five sample categories, at the 50 percent and 90 percent satisfaction levels.

FBRU OCTANE NUMBER REQUIREMENTS

1983* AND CHANGES FROM 1982

Maximum Octane Number Requirements

<u>Weighted Population</u>	<u>RON</u>		<u>MON</u>	
	<u>50% Sat.</u>	<u>90% Sat.</u>	<u>50% Sat.</u>	<u>90% Sat.</u>
All US and Imported Vehicles Δ from 1982	90.8 +1.2	96.0 +1.1	83.3 +0.7	86.7 +1.1
All US and Imported Cars Δ from 1982	90.7 +1.0	96.3 +1.5	83.3 +0.7	86.9 +1.3
All US Vehicles Δ from 1982	90.6 +1.0	95.8 +0.8	83.2 +0.6	86.5 +0.8
All US Cars Δ from 1982	90.6 +0.9	96.1 +1.3	83.2 +0.6	86.8 +1.3
Imported Vehicles Δ from 1982	91.3 +1.6	96.5 +1.8	83.7 +1.1	87.0 +1.5

* Note: 1983 data include the maximum (high borderline) requirements for knock sensor-equipped vehicles.

The following table illustrates the impact of knock sensor-equipped vehicles on the five weighted populations for the FBRU fuel series. At the current market penetration levels, inclusion of the knock sensor-equipped vehicles at their maximum (high borderline) requirement reduces the population requirements relative to those calculated by excluding knock sensors on the order of 0.1 RON at low satisfaction levels, and increases the requirements the same order at high satisfaction levels. Calculating the population requirements with the minimum (low borderline) knock-sensor requirements reduces the requirements 0.2 to 0.4 RON.

KNOCK-SENSOR IMPACT ON WEIGHTED POPULATION

FBRU RON REQUIREMENTS

RON Maximum Octane Number Requirements

<u>Weighted Population</u>		<u>30% Sat.</u>	<u>50% Sat.</u>	<u>70% Sat.</u>	<u>90% Sat.</u>

PKC 222A3/KKC 222A3/ DKC 222A3/KEC 222A3 DEC 222A3	21	89.6	95.5	82.5	86.5

C. Maximum Octane Number Requirements at Part-Throttle

Incidence of part-throttle knock with FBRU greater than maximum-throttle knock was slightly higher in 1983 than in 1982. Maximum requirements occurred at part-throttle in 16.4 percent of all 1983 model vehicles with FBRU fuels (63 of 383 vehicles), compared with 12.0 percent in 1982 and 9.8 percent in 1981.

D. Tank Fuel Knock Reported by Trained Raters

In the 1983 Survey, 44.6 percent of the weighted vehicle population knocked on tank fuel, which compares with 41.6 percent in the 1982 Survey and 42.9 percent in the 1981 Survey.

E. Surface Ignition

There were three reports of surface ignition in the 1983 Survey.

F. Road Octane Number Depreciation

Road octane number depreciation of FBRU fuels in the range 88 to 98 RON varied from 1.2 to 2.6, compared with 0.9 to 2.5 in the 1982 Survey. Depreciation of FBRSU fuels in the range of 88 to 99 RON varied from 2.0 to 3.9, compared with 2.3 to 4.1 in last year's Survey.

G. Speed Range Octane Number Requirements

Octane number requirements across engine speed range were determined on 225 vehicles with primary reference fuels.

H. Gear Position for Maximum Requirements

Of the 383 vehicles tested, 77 percent were equipped with automatic transmissions and 23 percent were equipped with manual transmissions. Maximum requirements at maximum-throttle occurred in 83.4 percent of automatic transmission vehicles (11.9 percent in fourth gear, 52.9 percent in third gear, and 18.6 percent in second gear). Maximum requirements at maximum-throttle occurred in 84.1 percent of manual transmission vehicles (67.1 percent in fourth gear, 15.9 percent in third gear, and 1.1 percent in second gear).

III. TEST VEHICLES

III. TEST VEHICLES

This year's Survey tested a total of 383 1983 model vehicles, compared with 438 vehicles in the 1982 Survey. The analysis of the data included 359 passenger cars (283 US and 76 imports) and 24 non-commercial vans and light-duty trucks (17 US and 7 imports). Also included are sixteen knock sensor-equipped vehicles (twelve US passenger cars, three US trucks, and one imported car).

A sufficient amount of data (sixteen or more vehicles) was obtained for five specific engine models which were analyzed as select models. All select models had automatic transmissions, as shown in Table I.

In the 1983 Survey, 77 percent of the transmissions were automatic. Three-quarters of the automatics were three-speed, and the rest four-speed. The manual transmissions were divided into one-fifth four-speed and four-fifths five-speed. Ninety percent of the surveyed vehicles were air-conditioned.

Table II shows the distribution of odometer mileage for both the 1982 and 1983 Surveys. The 1983 distribution is shown as a bar chart in Figure 1. The average odometer mileage was 11,374. The weighted average displacement in 1983 was 3.10 l, compared with 2.94 in 1982. The weighted average compression ratio in 1983 was 8.66, compared with 8.58 in 1982.

The basic timing was adjusted to the manufacturers' recommended setting prior to testing. A total of fifty-three vehicles were adjusted; twenty-three were more than +2 degrees off from the manufacturers' setting. The number of vehicles and their deviation in spark setting are shown in Table III.

Participants were requested to rate specific vehicle models in a pattern which would minimize data bias due to differences in testing and vehicle sampling. The United States was divided into four geographical areas with the requested ratings for a given model divided among laboratories within each geographical area.

IV. REFERENCE FUELS

IV. REFERENCE FUELS

Three series of reference fuels were used in the 1983 Survey: primary reference (PR) fuels; average sensitivity full-boiling range unleaded (FBRU) reference fuels with sensitivities similar to those of normal commercial gasoline; and high-sensitivity full-boiling range unleaded (FBRSU) reference fuels with sensitivities higher than the FBRU fuels.

A. PR Fuels

Isooctane and normal heptane, meeting ASTM specifications, were blended in two octane number increments from 76 to 82 RON, and in one octane number increments from 82 to 100 RON.

B. FBRU Reference Fuels

FBRU fuels were prepared from three base blends (RMFD-344-83, RMFD-345-83, and RMFD-346-83) in two octane number increments from 78 to 84 RON, and in one octane number increments from 84 to 102 RON.

The base blends were prepared from normal refinery components. Inspection data furnished by the supplier are compared with those of the 1982 FBRU fuels in Appendix C, Table C-I. The physical inspections of the 1983 fuels were similar (in most instances) to those of the 1982 fuels; however, the aromatics content of the intermediate fuel is higher in 1983, while its saturates content is lower.

The composition and average laboratory octane data for the 1983 FBRU reference fuel series are presented in Appendix C, Table C-II, with the sensitivities compared with the 1982 fuels in Table C-III. The sensitivities of the 1983 fuels were similar to those of the 1982 fuels up to 90 octane, and had lower sensitivities than the 1982 fuels above 90 octane.

C. FBRSU Reference Fuels

FBRSU fuels were prepared from three base blends (RMFD-347-83, RMFD-348-83, and RMFD-349-83) in two octane number increments from 78 to 84 RON, and in one octane number increments from 84 to 102 RON.

The base blends were prepared from normal refinery components. Inspection data furnished by the supplier are compared with those of the 1982 base blends in Appendix C, Table C-IV.

The laboratory blending octane data for the 1983 FBRSU reference fuels are presented in Table C-V, with the sensitivities compared with the 1982 fuels in Table C-III. The sensitivities of the 1983 fuels were slightly lower than the 1982 fuels below 89 RON, and slightly higher above.

V. TEST TECHNIQUE

V. TEST TECHNIQUE

The test technique (CRC Designation E-15-83, Attachment 2 of Appendix D) specified that octane number requirements be determined at level road acceleration conditions. The order of fuel testing was tank fuel, FBRSU fuels, FBRU fuels, and PR fuels. Knocking tendencies were investigated using both maximum-throttle and part-throttle acceleration techniques. Part-throttle was investigated in each vehicle to determine if the part-throttle requirement was higher than the maximum maximum-throttle requirement. In these cases, the part-throttle requirement search was conducted with all three fuels. Part-throttle requirements were also determined with FBRU fuels down to four numbers below the maximum maximum-throttle requirements.

The 50th percentile acceleration technique, used in the 1981 and 1982 programs, was eliminated from the 1983 program.

The occurrence of other abnormal combustion noise, such as surface ignition, was also reported.

The octane number requirement of a vehicle is defined as the Research or Motor octane number of the highest octane test fuel producing borderline knock which is induced by spark or surface ignition. The maximum octane number requirement of the vehicle is defined as the highest requirement at maximum- or part-throttle. Maximum octane number requirements were obtained over the speed range with PR fuels only.

A modification of the E-15-83 technique was provided for vehicles equipped with knock sensors, and is appended to Attachment 2 of Appendix D. This technique identifies the highest octane fuel that gives borderline knock (maximum or high requirement) and the lowest octane fuel that gives borderline knock (minimum or low requirement).

VI. DISCUSSION OF RESULTS

VI. DISCUSSION OF RESULTS

A. General

Of the fifteen participating laboratories, four used level roads, ten used chassis dynamometers, and one laboratory used both. Sixty-seven percent of the cars were tested on chassis dynamometers.

Average test temperature was 72°F, with a barometric pressure average of 29.73 inches Hg and average humidity of 68.2 grains per pound. Test conditions for individual observations are reported in Appendix E.

B. Distribution of Maximum Octane Number Requirements

The octane number requirement data were used to prepare satisfaction curves and tables for the following samples of 1983 model vehicles: (1) US and Imported Vehicles; (2) US and Imported Cars; (3) US Vehicles; (4) US Cars; and (5) Imported Vehicles. Research and Motor octane number requirements for the five categories at 50 percent and 90 percent satisfaction are shown in Table IV. In preparing the curves and tables, the octane number requirement data were weighted in accordance with final 1983 model-year production data, and with US sales figures in the case of imports. Each curve and table, therefore, provides an estimate of the distribution of octane number requirements of the appropriate vehicle population on the road. The procedure for assigning weighting factors and for calculating the octane number requirement distributions is described in Appendix F.

Vehicles equipped with knock sensors were included in the 1983 models tested. The vehicles with knock sensors (knock-limiter devices) were tested for maximum (high borderline) octane number requirements and minimum (low borderline) octane number requirements. Octane number requirement distributions were calculated for each group of vehicles using the requirements from those vehicles with knock sensors rated at maximum (high borderline) requirement, with their ratings at minimum (low borderline) requirement, and with those vehicles with knock sensors excluded. The results are tabulated in Tables XXV through XXXIX. Maximum octane number requirements for the 1983 model vehicles were considered to be the requirements which included the knock sensor-equipped vehicles at the maximum (high borderline) requirement. The tabulated results of the individual knock sensor-equipped vehicles tested are reported in Appendix H.

1. US and Imported Vehicles

In the 1983 Survey, maximum octane number requirements were determined on 383 vehicles with FBRU fuels, and on 376 vehicles with FBRSU and PR fuels. Sixteen of the vehicles were equipped with knock sensors.

Maximum Research octane number requirements for all three reference fuels are shown in Figures 2a, 3a, 4a (rectangular coordinates) and 2b, 3b, 4b (probability plots). Each plot compares the requirements with knock-sensor ratings at the maximum (high borderline) level, at the minimum (low-borderline) level, and with knock sensor-equipped vehicles excluded. The maximum Research octane number requirements for all three reference fuels are plotted in Figures 5a (rectangular coordinates) and 5b (probability plot). The octane number requirement distributions for each case are very nearly the same. Maximum Research, Motor, and (R+M)/2 octane number requirements are listed in Table V. The 50 percent and 90 percent satisfaction level requirements are as follows:

MAXIMUM OCTANE NUMBER REQUIREMENTS

(US and Imported Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	89.4	89.4	89.4	93.6	93.6	93.6
FBRU	90.8	83.3	87.1	96.0	86.7	91.4
FBRSU	91.5	81.6	86.5	97.4	85.5	91.4

Comparisons of 1983 and 1982 Survey maximum Research, Motor, and (R+M)/2 octane number requirements are shown in Tables VI, VII, and VIII, respectively, for all three fuel series. Distributions of maximum RON requirements are shown in Figure 6 for PR fuels, Figure 7 for FBRU fuels, and Figure 8 for FBRSU fuels. The differences at the 50 percent and 90 percent satisfaction levels are summarized in the following table:

DIFFERENCES BETWEEN 1983 AND 1982 MAXIMUM OCTANE NUMBER REQUIREMENTS

(US and Imported Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	+0.6	+0.6	+0.6	+0.5	+0.5	+0.5
FBRU	+1.2	+0.7	+1.0	+1.1	+1.1	+1.1
FBRSU	+0.3	+0.1	+0.2	+0.9	+0.5	+0.6

Confidence limits for maximum octane number requirement distributions are given in Appendix G, Table G-I. The 95 percent confidence limits for Research octane number requirements varied from $+0.31$ to $+0.46$ at the 50 percent satisfaction level, and from $+0.42$ to $+0.63$ at the 90 percent satisfaction level.

2. US and Imported Cars

Maximum octane number requirements were determined on 359 US and imported cars with FBRU fuels, and on 352 cars in the case of FBRSU and PR fuels. Thirteen of the vehicles were equipped with knock sensors.

Maximum Research, Motor, and $(R+M)/2$ octane number requirements on all three fuel series are given in Table IX. The maximum Research octane number requirement distributions for all three reference fuels are plotted in Figures 9a (rectangular coordinates) and 9b (probability plot). Maximum octane number requirements at the 50 percent and 90 percent satisfaction levels are summarized in the following table:

MAXIMUM OCTANE NUMBER REQUIREMENTS

(US and Imported Cars)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	$(R+M)/2$	RON	MON	$(R+M)/2$
PR	89.3	89.3	89.3	93.8	93.8	93.8
FBRU	90.7	83.3	87.0	96.3	86.9	91.6
FBRSU	91.4	81.6	86.5	97.7	85.7	91.7

The maximum Research octane number requirements for 1983 US and imported cars are compared with 1982 model-year data in Table X for PR, FBRU, and FBRSU fuels. Corresponding comparisons of Motor and $(R+M)/2$ octane number requirements are given in Tables XI and XII, respectively. Differences between 1983 and 1982 data at the 50 percent and 90 percent satisfaction levels are as follows:

DIFFERENCES BETWEEN 1983 AND 1982 MAXIMUM OCTANE NUMBER REQUIREMENTS

(US and Imported Cars)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	$(R+M)/2$	RON	MON	$(R+M)/2$
PR	+0.6	+0.6	+0.6	+0.9	+0.9	+0.9
FBRU	+1.0	+0.7	+0.8	+1.5	+1.3	+1.4
FBRSU	+0.2	+0.1	+0.1	+1.0	+0.6	+0.8

Confidence limits for maximum octane number requirement distributions of 1983 US and imported cars are given in Appendix G, Table G-I. The 95 percent confidence limits for Research octane number requirements varied from +0.34 to +0.51 at the 50 percent satisfaction level, and from ± 0.46 to ± 0.69 at the 90 percent satisfaction level.

3. US Vehicles

Maximum octane number requirements were determined on 300 US vehicles with FBRU fuels, and on 293 vehicles with FBRSU and PR fuels.

Distributions of maximum Research octane number requirements are plotted in Figures 10a and 10b for the three fuel series. Research, Motor, and (R+M)/2 octane number requirements for the US vehicles are given in Table XIII. Octane number requirements at the 50 percent and 90 percent satisfaction levels are listed below:

MAXIMUM OCTANE NUMBER REQUIREMENTS

(US Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	89.0	89.0	89.0	92.7	92.7	92.7
FBRU	90.6	83.2	86.9	95.8	86.5	91.1
FBRSU	91.3	81.5	86.4	97.7	85.7	91.7

Comparisons of maximum octane number requirements of 1983 and 1982 US vehicles for the three fuel series are given in Tables XIV, XV, and XVI in terms of RON, MON, and (R+M)/2, respectively. Distributions of maximum Research octane number requirements are shown in Figure 11 for PR fuels, in Figure 12 for FBRU fuels, and in Figure 13 for FBRSU fuels. Differences between octane number requirements of 1983 and 1982 US vehicles at the 50 percent and 90 percent satisfaction levels are given in the following table:

DIFFERENCES BETWEEN 1983 AND 1982 MAXIMUM OCTANE NUMBER REQUIREMENTS

(US Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	+0.4	+0.4	+0.4	0.0	0.0	0.0
FBRU	+1.0	+0.6	+0.8	+0.8	+0.8	+0.8
FBRSU	0.0	-0.1	0.0	+1.2	+0.8	+1.0

Confidence limits for maximum octane number requirement distributions of 1983 US vehicles are tabulated in Appendix G, Table G-I. The 95 percent confidence limits for Research octane number requirements were from +0.34 to +0.55 at the 50 percent satisfaction level, and from ± 0.45 to ± 0.74 at the 90 percent satisfaction level.

4. US Cars

Maximum octane number requirements were determined on 286 US cars with FBRU fuels, and on 279 cars with FBRSU and PR fuels.

Distributions at maximum Research octane number requirements are plotted in Figures 14a (rectangular coordinates) and 14b (probability plot) for the three fuel series. Maximum Research, Motor, and (R+M)/2 octane number requirements for all three fuel series are given in Table XVII, and summarized below for the 50 percent and 90 percent satisfaction levels:

MAXIMUM OCTANE NUMBER REQUIREMENTS

(US Cars)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	88.9	88.9	88.9	92.7	92.7	92.7
FBRU	90.6	83.2	86.9	96.1	86.8	91.4
FBRSU	91.2	81.4	86.3	98.1	86.0	92.0

The maximum Research, Motor, and (R+M)/2 octane number requirements of US cars tested in the 1983 and 1982 Surveys are compared in Tables XVIII, XIX and XX, respectively, for all three fuel series. The differences at the 50 percent and 90 percent satisfaction levels are as follows:

DIFFERENCES BETWEEN 1983 AND 1982 MAXIMUM OCTANE NUMBER REQUIREMENTS

(US Cars)

Fuel	50% Satisfied			90% Satisfied		
	RON	MON	(R+M)/2	RON	MON	(R+M)/2
PR	+0.3	+0.3	+0.3	+0.3	+0.3	+0.3
FBRU	+0.9	+0.6	+0.7	+1.3	+1.3	+1.2
FBRSU	-0.1	-0.2	-0.2	+1.5	+1.0	+1.2

Confidence limits for maximum octane number requirement distributions of 1983 US cars are given in Appendix G, Table G-I. The 95 percent confidence limits for Research octane number requirements varied between ± 0.37 and ± 0.62 at the 50 percent satisfaction level, and between ± 0.50 and ± 0.83 at the 90 percent satisfaction level.

5. Imported Vehicles

Maximum octane number requirements were determined on eight-three imported vehicles with PR, FBRU, and FBRSU fuels. Maximum Research octane number requirements for all three reference fuel series are plotted in Figures 15a and 15b. Maximum octane number requirements in terms of RON, MON, and (R+M)/2 are given in Table XXI. The 50 percent and 90 percent satisfaction level maximum octane number requirements are listed in the following table:

MAXIMUM OCTANE NUMBER REQUIREMENTS

(Imported Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	90.4	90.4	90.4	96.3	96.3	96.3
FBRU	91.3	83.7	87.5	96.5	87.0	91.7
FBRSU	92.1	82.0	87.1	96.8	85.0	90.9

The maximum Research, Motor, and (R+M)/2 octane number requirements of imported vehicles in the 1983 and 1982 Surveys are compared in Tables XXII, XXIII, and XXIV, respectively, for all three fuel series. The differences at the 50 percent and 90 percent satisfaction levels are as follows:

DIFFERENCES BETWEEN 1983 AND 1982 MAXIMUM OCTANE NUMBER REQUIREMENTS

(Imported Vehicles)

Fuel	50% Satisfied			90% Satisfied		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	+1.0	+1.0	+1.0	+2.2	+2.2	+2.2
FBRU	+1.6	+1.1	+1.3	+1.8	+1.5	+1.6
FBRSU	+1.2	+0.7	+1.0	0.0	-0.2	-0.1

Confidence limits for maximum octane number requirement distributions of 1983 imported vehicles are tabulated in Appendix G, Table G-I. The 95 percent confidence limits for Research octane number requirements were from +0.86 to +1.01 at the 50 percent satisfaction level, and from ± 1.16 to ± 1.36 at the 90 percent satisfaction level.

6. Maximum Requirements at Part-Throttle

The throttle positions for maximum octane number requirements of tested vehicles were reported as maximum-throttle or part-throttle. Maximum part-throttle requirements were defined when their requirements were higher than the maximum maximum-throttle requirements. The number and percentage of vehicles having FBRU part-throttle octane number requirements greater than maximum-throttle requirements are shown below, along with a comparison with the 1982 Survey. The percentages of all vehicles having maximum requirements at part-throttle were 16.4 percent in 1983, compared with 12.0 percent in 1982 and 9.8 percent in 1981.

VEHICLES HAVING FBRU PART-THROTTLE REQUIREMENTS
> MAXIMUM-THROTTLE REQUIREMENTS

(1983 and 1982 US and Imported Vehicles)

	<u>No. Vehicles Tested</u>	<u>No. of Vehicles</u>	<u>% of Vehicles</u>
1983 US and Imported Vehicles	383	63	16.4
1982 US and Imported Vehicles	434	52	12.0

C. 1983 Part-Throttle Investigation

1. 50th Percentile Acceleration Technique

The 50th percentile acceleration technique, employed in the 1981 and 1982 Surveys, was discontinued for the 1983 Survey and replaced by an expanded search for part-throttle requirements, as described in the CRC E-15-83 Technique (Appendix D). Reference to the 50th percentile acceleration procedure may be found in the CRC E-15-83 Technique.

2. Part-Throttle Requirements

Of the 383 vehicles tested, 371 were tested for part-throttle requirements down to four octane numbers below maximum-throttle requirements with FBRU fuels. One of the part-throttle tested vehicles had a requirement below 78 RON, the lowest octane fuel available. Of the remaining, 71 vehicles (19 percent) had part-throttle requirements more than four octane numbers below the maximum-throttle requirements.

D. Select Models

Five select models, representing five engine-chassis combinations, were tested. The select models originally chosen for this year's Survey included one knock sensor-equipped model (see Appendix D, Table D-I); however, that model was tested without knock sensors since the manufacturer's production of that model was delayed. The delay in production precluded locating enough vehicles for testing with adequate mileage for stabilized octane number requirements. The identification and specifications of the engine-chassis combinations of the select models are given in Table I.

Maximum Research, Motor, and $(R+M)/2$ octane number requirements are shown for 50 percent and 90 percent satisfaction levels on PR, FBRU, and FBRSU fuels in Table XL. Maximum octane number requirements for each select model at various satisfaction levels are listed in Appendix I, Table I-I. Maximum Research, Motor, and $(R+M)/2$ octane number requirements for the individual cars of each select model are given in Table I-II.

Maximum Research octane number satisfaction curves for the five select models are shown in Figures 16 through 20 for all three fuel series. The data points plotted on the figures represent the maximum requirements obtained on FBRU reference fuels for individual cars. Each curve was constructed by use of the "Z" method, which is discussed in Appendix F. The 95 percent confidence limits for maximum requirements are shown in Appendix G, Table G-II.

E. Tank Fuel

As required by the program, tank fuel was tested for incidence of knock whenever an owners' questionnaire was obtained, although owners' questionnaires were required to be obtained only when the vehicle tested had a regular driver and the ignition timing did not have to be reset more than two degrees. To gain additional information, however, tank fuel ratings were made by many participants on many other vehicles which did not meet the restrictions listed.

1. Owner/Rater Comparison of Tank Fuel Knock

Although owners' questionnaires were obtained on a total of 149 vehicles, only 129 of these vehicles had both owner/rater tank fuel data with no change in spark timing. Of the 129 1983 vehicles, 59.7 percent were reported by trained raters to be knocking on tank fuel, whereas the owners reported 29.5 percent. This results in an owner/rater knock ratio of 0.49. The 59.7 percent of vehicles found to be knocking by trained raters in 1983 is higher than in the 1982 Survey. The owner/rater comparison of tank fuel knock data for 1983, along with previous Survey data back to 1976, is presented in Table XLI.

2. Objectionable Versus Unobjectionable Knock

Of the owners reporting knock with vehicles which had no change in spark timing, 42.1 percent found knock to be objectionable. This percentage of objectionable knock is lower than the 52.8 percent found in 1982, as shown in Table XLI.

3. Tank Fuel Knock Reported by Trained Raters

Tank fuel knock observations were reported by trained raters on 314 of the 383 test vehicles. The percentages of all 1983 vehicles and the select models knocking on tank fuel are shown in Table XLII. On a weighted basis, 44.6 percent of the 1983 vehicles tested knocked on tank fuel, compared with 41.6 percent in the 1982 Survey and 42.9 percent of the vehicles in the 1981 Survey. As shown in the table, two of the five select models tested had high knocking percentages of 75.0 and 90.9.

F. Surface Ignition

There were three reports of surface ignition in the 1983 Survey.

G. Engine Speed for Maximum Octane Number Requirements

Engine speeds at which maximum octane number requirements occurred for each select model are shown in Table XLIII for PR, FBRU, and FBRSU fuels. Weighted data for all 1983 vehicles are shown in Table XLIV and Figure 21.

H. Road Octane Number Depreciation of FBRU and FBRSU Fuels

Road octane number ratings and road octane number depreciation for FBRU and FBRSU fuels were determined from the octane number requirement data for all vehicles. The results are shown in Table XLV.

In this report, the road octane number rating of FBRU and FBRSU fuels is defined as the primary reference fuel octane level which satisfied the same percentage of vehicles. Depreciation values were established by subtracting the road octane number rating of the fuel from its Research octane number. Depreciation values of FBRU fuels in the range 88 to 98 RON varied from 1.2 to 2.6, compared with 0.9 to 2.5 in the 1982 Survey. Depreciation of FBRSU fuels in the range of 88 to 99 RON varied from 2.0 to 3.9, compared with 2.3 to 4.1 in last year's Survey.

I. Speed Range Octane Number Requirement

Primary reference fuel (PRF) octane number requirements were determined over a range of engine speeds from 1000 to 3750 rpm on 225 vehicles. Individual vehicle data are in Appendix J, Table J-I. For the five select models, speed range data were analyzed on 71 cars. The mean PRF octane number requirement, standard deviation, and number of observations within each speed range are in Table J-II. Mean PRF requirements for the five select models are plotted in Figures J-I through J-5.

J. Gear Position for Maximum Requirements

The throttle/gear position for maximum octane number requirements on FBRU fuels is shown in Appendix K. Of the 383 vehicles tested, 295 (77.0 percent) were equipped with automatic transmissions and 88 (23.0 percent) were equipped with manual transmissions.

Maximum requirements at maximum-throttle occurred in 83.4 percent of the automatic transmission vehicles (11.9 percent in fourth gear, 52.9 percent in third gear, and 18.6 percent in second gear). Maximum requirements at part-throttle occurred in 16.6 percent of the automatic transmission vehicles.

For manual transmission vehicles, 84.1 percent had maximum requirements at maximum-throttle (67.1 percent in fourth gear, 15.9 percent in third gear, and 1.1 percent in second gear). Maximum requirements at part-throttle occurred in 15.9 percent of manual transmission vehicles. Fifth gear for five-speed manual transmissions was not examined per program instructions.

I. INTRODUCTION

The 1983 program of the CRC Light-Duty Octane Number Requirement Survey Group will consist of a survey of the octane number requirements of 1983 model domestic and imported vehicles. For the purposes of this program, the designation "passenger vehicles" will include passenger cars, light-duty (<8500 lb/3856 kg GVW) pickup trucks, and vans. Approximately 450 vehicles will be tested. Most of these vehicles will be sampled in proportion to their relative production or import volume, to provide data from which to estimate the distribution of octane number requirements for the 1983 model vehicle population in the United States. In addition, select models of special interest will be tested in sufficient numbers to estimate their requirement distributions.

Knocking characteristics will be investigated with three series of reference fuels. Tank fuel knock will also be evaluated. Maximum octane number requirements, whether at maximum-throttle or part-throttle, will be established for each vehicle using high sensitivity unleaded full-boiling range reference (FBRSU) fuels, average sensitivity unleaded full-boiling range reference (FBRU) fuels, and primary reference (PR) fuels. If the maximum requirement is at maximum-throttle, then part-throttle requirements are investigated with only FBRU fuels of up to, and including, four octane numbers lower than the maximum requirement.

Octane requirements throughout the speed range will be obtained with PR fuels only.

II. GEOGRAPHICAL AREAS

As in previous years, the 1983 Survey will be conducted on a nationwide basis. The country has been divided into four geographical areas. Participants located in New York, New Jersey, Delaware, and Pennsylvania have been included in the Eastern Area; those located in Ohio, Michigan, and Kentucky comprise the East Central Area; those in Illinois, Texas, and Oklahoma comprise the West Central Area; and California participants make up the Western Area. A coordinator has been appointed for each area as follows:

Eastern Area.....	W. J. Most
East Central Area.....	D. P. Barnard
West Central Area.....	J. B. Baker
Western Area.....	T. Wusz

The area coordinators will contact their area participants periodically regarding the progress of the survey. To expedite this, it is suggested that participants send copies of all correspondence concerning the survey to the area coordinators. This program outlines the survey in broad terms. If more detailed information is desired, it is suggested that the participant contact his area coordinator.

III. VEHICLES

A total of approximately 450 vehicles will be tested in the 1983 Survey. By requesting each participating laboratory to test approximately 25 vehicles and assuming 18 participants, the 450-vehicle total is obtained. These will be divided into two groups: (1) the statistical group, sampled in proportion to US car model production or import volume, and (2) select models of special interest. Approximately 20 of each of these select models will be tested to provide an estimate of the octane requirement distribution of each model. Some of these 20 vehicles will be those already included in the statistical group, and the remainder will be additional vehicles added to the program.

The desired number of vehicles to be tested in each category is as follows:

Statistical Group	400
Additional Select Model Group	<u>50</u>
Total	450

A detailed breakdown of the specific models and the number of each model to be tested will be circulated to the participants in May 1983 after an estimate of vehicle model production has been obtained. Design specifications for select models to be tested in the 1983 Survey are shown in Table D-1. Selection of these vehicles has been based on new or modified design characteristics that might have a significant effect on octane number requirements and high sales volume which allows individual treatment without additional testing.

Wherever possible, specific vehicle assignments to individual participating laboratories will be made in a pattern which tends to minimize data bias. This will be accomplished by apportioning cars of a given model among the four geographical areas, and subsequently among the laboratories within each area, in order to minimize the effect of non-random factors on the results of the Survey.

IV. FUELS

A. Full-Boiling Range Reference Fuels

Two full-boiling range reference fuel series will be used to define the vehicle octane number requirements. The two series will be unleaded and of varying sensitivity. One series will be comparable to the average sensitivity of unleaded commercial fuels (FBRU); the other series (FBRSU) will be about two numbers higher in sensitivity than the FBRU fuels. The Research octane number (RON) range for both fuel series is 77 to 102.

The two series will be blended in increments of two RON up to 84, and one RON above 84 from three base fuels for each series. The base fuels are compounded from normal refinery gasoline components. Limiting specifications for each base fuel for both series are shown in Table D-II.

Research and Motor ratings will be determined for incremental blends of each fuel series by all participants to provide data for establishment of blending curves. The average ratings and blending curves will be circulated to all participants.

B. Primary Reference Fuels

Blends of ASTM-grade isooctane and normal heptane will be prepared in two octane number increments from 76 to 82, and one octane number increments from 82 to 100.

C. Tank Gasoline

Research and Motor octane ratings will be obtained only on gasoline samples from the tank of vehicles with owner questionnaire (Attachment 1). Owner's Questionnaire should be deleted when:

- the vehicle does not have a regular driver;
- the ignition timing had to be reset more than two degrees.

V. TEST TECHNIQUE

All tests are to be conducted using the technique entitled, "Technique for Determination of Octane Number Requirements of Light-Duty Vehicles" (CRC Designation E-15-83). A copy of this technique is included as Attachment 2 to this program. Octane number requirement investigations are to be conducted in all vehicles under level road conditions. Any vehicle obviously in poor mechanical condition or with malfunctioning emission control devices should not be considered for test work. The vehicles must have a minimum of 6000 deposit miles (9656 km), and preferably be privately owned and operated. Vehicles previously used for fuel road octane rating must not be employed in this survey.

Data should be reported on each vehicle tested, even though knock was not encountered on any of the fuels.

The order in which the fuels are to be tested is as follows:

- 1) Tank fuel; 2) FBRSU; 3) FBRU; 4) PR.

VI. DATA FORMS

The test results on each vehicle will be reported on data forms DFMF-11-1183, DFMF-12-1183, DFMF-19-1183, and DFMF-26-1183. Copies of these forms will be mailed to all participants from the CRC office with instructions for their use. Additional instructions are included in the E-15-83 technique.

VII. REPORTING RESULTS

The data forms for each vehicle tested should be submitted to the Coordinating Research Council, Inc., 219 Perimeter Center Parkway, Atlanta, Georgia 30346, as soon as possible, but not later than October 31, 1983.

Color	Clear	Green	Yellow	Deep Purple
		Red		Light Blue

Note: All fuels to contain minimum 5 PTB of a 100% active antioxidant and 5 PTB of corrosion inhibitor.
No manganese added.

Minimum of two units sensitivity difference between corresponding fuels of each series.

* To be compounded from normal refinery components. Oxygenates are not to be used as fuel components.

** 1% maximum Benzene or legal.

*** Sensitivities are shown for the mean Research octane number.

CRC OCTANE NUMBER REQUIREMENT SURVEY

OWNER'S QUESTIONNAIRE

OWNER:

Your vehicle is being tested for fuel octane number requirements by a Coordinating Research Council activity. To help analyze the data, we would like the person who has recently been driving the vehicle to answer the following questions:

1. What grade of unleaded fuel do you normally use?

☐

Regular

☐

Premium

☐

Mixture

2. Has any engine knock (ping) been encountered with the fuel that is now in the tank?

☐

Yes

☐

No

3. Did you consider the knock (ping) objectionable?

☐

Yes

☐

No

Vehicle Make _____ License No. _____

Vehicle Identification No. _____

TECHNIQUE FOR DETERMINATION
OF OCTANE NUMBER REQUIREMENTS
OF LIGHT-DUTY VEHICLES

(CRC Designation E-15-83)

June 1983

TECHNIQUE FOR DETERMINATION OF OCTANE NUMBER REQUIREMENTS
OF LIGHT DUTY VEHICLES

(CRC Designation E-15-83 - Including Annexes A and B)

A. GENERAL

The technique provides for the determination of maximum octane number requirements, whether at maximum-throttle or part-throttle, of a vehicle in terms of borderline spark knock and surface ignition knock on two series of full-boiling range reference fuels as well as on primary reference fuels. If the maximum requirement is at maximum-throttle, then part-throttle requirements are investigated with only FBRU fuels of up to, and including, four octane numbers lower than the maximum requirement. It also provides octane requirements throughout the speed range on primary reference fuels.

Spark knock and surface ignition of tank fuel will also be determined.

B. DEFINITION OF TERMS

1. The following definitions of knock were approved by the CFR and CLR Committees on June 8, 1954, and will be used in this technique. Knock is the noise associated with autoignition* of a portion of the fuel-air mixture ahead of the advancing flame front. The flame front is presupposed to be moving at normal velocity. With this definition, the source of the normal flame front is immaterial; it may be the result of surface ignition or spark ignition.
 - a. Spark Knock: A knock which is recurrent and repeatable in terms of audibility. It is controllable by the spark advance; advancing the spark increases the knock intensity, and retarding the spark reduces the intensity. This definition does not include surface ignition knock.
 - b. Surface Ignition Knock: Knock which has been preceded by a surface ignition. It is not controllable by spark advance.** It may or may not be recurrent and repeatable.

* Autoignition: The spontaneous ignition and the resulting very rapid reaction of a portion or all of the fuel-air mixture. The flame speed is many, many times greater than that which follows normal spark ignition. There is no time reference for autoignition.

** For the purpose of this program, it is not intended that surface ignition knock be identified by manipulation of the spark advance.

2. The following definitions of knock intensity were specifically adopted for use in this technique:

- a. No Knock: This means no spark knock or surface ignition knock.
- b. Borderline Knock: This means spark knock of lowest audible intensity, recurrent surface ignition knock of borderline intensity, or infrequent (three or less) surface ignition knocks regardless of intensity.
- c. Above Borderline Knock: This means greater than borderline spark knock, recurrent surface ignition knock greater than borderline intensity, or frequent (four or more) surface ignition knocks regardless of intensity.

3. Definition of Accelerations

Accelerations are made at maximum-throttle and part-throttle conditions which are defined below:

- a. Maximum-Throttle: The throttle is depressed and held at either full-throttle or the widest throttle position that does not cause the transmission to downshift (detent) throughout the acceleration in each of the required test gears listed in D.3.d.(1)(a). The detent manifold vacuum obtainable on a given model is determined by the transmission characteristics. For manual transmissions, the throttle is depressed fully throughout the acceleration.
- b. Part-Throttle: The throttle is depressed and regulated throughout the acceleration to maintain a desired, constant critical manifold vacuum in highest gear. Part-throttle will constitute any throttle position above detent vacuum (above full-throttle vacuum for manual transmissions) up to the highest road-load vacuum.

C. VEHICLE PREPARATION

The following vehicle preparation steps should be completed before any octane tests are run. Detailed procedures for each adjustment can be found in the manufacturers' shop manuals.

1. Record vehicle identification number and emission control type, Federal, Altitude, or California. Fill in heading on data sheet DFMF-11-1183. (For knock sensor vehicles, use data sheet DFMF-26-1183.) Ford emission calibration numbers are to be recorded.

2. Inspect all vacuum lines and air pump hoses for appropriate connections. Also, check to see if PCV valve, distributor vacuum delay valve, EGR valve, and heated inlet air mechanism are functioning. Engine must be warmed up for these checks.
3. Record engine idle speed and observe anti-dieseling solenoid operation. Adjust to manufacturers' recommended specifications as specified on the under-hood decal.
4. Observe and record basic spark timing at recommended engine speed. Adjust to manufacturers' recommended setting as specified on the under-hood decal.
5. Crankcase oil, radiator coolant, automatic transmission fluid, and battery fluid levels shall be maintained as recommended by the manufacturer.
6. A calibrated tachometer graduated in 100 rpm (or smaller) increments and capable of indicating engine speed from 0-5000 rpm shall be installed on each vehicle.
7. One calibrated vacuum gage, graduated in one-half inch of mercury (or smaller) increments and capable of indicating vacuum from 0-24 inches of mercury (0-81 KPa) shall be connected to the intake manifold.
8. An auxiliary fuel system shall be provided to supply test fuels to the engine. Caution shall be taken to avoid placing auxiliary fuel lines in locations which promote vapor lock. If vehicles with carbureted engines have tank return fuel lines, this return line should be blocked off. Disconnect fuel tank vent line at evaporation control system canister. Instructions for fuel handling with fuel injection systems are given in Annex A.
9. For vehicles with owner questionnaire completed, a sample of the tank gasoline shall be withdrawn for determination of Research and Motor method octane number ratings.

D. TEST PROCEDURE

1. Engine Warm-Up

- a. To stabilize engine temperatures, a minimum of ten miles of warm-up is required. The test vehicle should be operated at 55 mph (88 kph) in top gear with a minimum of full-throttle operation.
- b. During the warm-up period, the general mechanical condition of the vehicle should be checked to insure satisfactory and safe operation during test work.

2. Fuel Changeover

Caution: Because of the installation of catalytic devices on these vehicles, permanent damage may result if the engine runs lean or stalls. Therefore, changeover from one fuel to another must be accomplished without running the carburetor or fuel injection system dry. Fuel handling procedures for vehicles equipped with fuel injection systems are explained in Annex A.

To eliminate contamination of the new fuel with residual amounts of the previous fuel, flush system twice with new fuel.

After fuel changeover, make one maximum-throttle acceleration before beginning Vehicle Rating Procedure.

3. Details of Observations

a. Operating Conditions

All octane number requirements will be determined under level road acceleration conditions.

Tests will be conducted on moderately dry days, preferably at ambient temperatures above 60°F (15.5°C). Tests should not be conducted during periods of high humidity such as prevail when rain is threatening or during or immediately after a rain storm. Laboratories with control capabilities should target for 70°F (21°C) air temperature and 50 grains of water per pound (7.14 gm/kg) of dry air whenever possible.

Air-conditioned vehicles will be tested with air conditioner turned ON. (Normal setting, low fan.) Air conditioner will be ON at all times.

b. Order of Fuel Testing

- 1) Tank
- 2) FBRSU
- 3) FBRU
- 4) Primary

c. Determination of Knock Intensity

Octane requirements will be established by evaluating the occurrence of knock in terms of knock intensity: "N" for none, "B" for borderline, and "A" for above borderline. Establishment of representative knock intensity for a given fuel will be accomplished with the fewest number of accelerations possible. As defined below, the first two duplicating accelerations are sufficient with "N" and "B" intensity.

<u>Number of Accelerations</u>			<u>Representative Rating</u>
<u>1</u>	<u>2</u>	<u>3</u>	
N	N	-	N
N	B	N	N
N	B	B	B
B	N	B	B
B	B	-	B
B	A	-	A
A	-	-	A

All subsequent accelerations will normally be discontinued when "A" knock intensity is experienced, and testing continued with a higher octane number fuel in that series. An exception will be made if "A" knock is experienced on the highest octane fuel which knocks in the engine. In this case, it may be necessary to run additional accelerations to determine the speed of maximum knock intensity. If "A" knock is experienced at initiation of acceleration, as limited by transmission characteristics, this speed will be considered the speed of maximum knock. Otherwise, the midpoint between knock-in and knock-out will be considered the speed of maximum knock. When establishing knock-in and knock-out, back off on the throttle between points to eliminate "A" knock. Tip-in knock and knock at shift points should be ignored.

d. Determination of Octane Requirements

Tests should be run to 60 mph (97 kph) unless required to terminate at 55 mph (88 kph) because of legal speed limits.

The procedure for knock sensor-equipped cars is shown in Annex B.

(1) Vehicle Operating Procedure(a) Establishment of Automatic Transmission Characteristics (for Maximum-Throttle Accelerations)

Obtain the transmission downshift characteristics of engine rpm and manifold vacuum at 25, 35, 45, and 55 mph (40, 56, 72, and 88 kph) incremental speeds (as obtainable in each gear), by movement of the throttle through the detent, i.e., downshift, throttle position. Also determine the minimum attainable road speed. These characteristics are to be determined for each of the gears specified in the table below. For transmissions with converter clutches, determine the minimum road speed for clutch application. At this initial speed and at 10 mph (16 kph), increments up to about 60 mph (97 kph) determine minimum vacuums for application. Record all road speed/engine rpm/vacuum measurements from above on data sheet.

The vehicle brakes may be applied lightly, if necessary, to maintain vehicle speed, except when converter clutch engagement is desired, in vehicles so equipped.

The selection of required test gears, and test gear/converter clutch combinations (if applicable) for various types of transmissions are listed below. Transmissions not explicitly described should be tested in a manner as similar as possible to those listed. Automatic transmission vehicles should be tested with the gear selector in D or O.

TRANSMISSION GEAR SELECTIONAUTOMATICS

Place the selector in "D" or "O" and check for critical condition.

<u>Type</u>	<u>Gears to be Tested</u>
GM 4-speed	4th gear, converter clutch engaged 3rd gear, converter clutch disengaged 2nd gear, converter clutch disengaged

<u>Type</u>	<u>Gears to be Tested</u>
GM 3-speed	3rd gear, converter clutch engaged 3rd gear, converter clutch disengaged 2nd gear, converter clutch disengaged
Ford 4-speed overdrive	4th gear 3rd gear 2nd gear
Other 3-speed	3rd gear 2nd gear

MANUALS

5-speed	4th and 3rd gears
4-speed	4th and 3rd gears
3-speed	3rd and 2nd gears

(b) Maximum-Throttle Requirements - Automatic Transmissions

For maximum-throttle accelerations in each of the gears and gear/converter clutch combinations specified above, accelerate at the detent/application condition according to the speed versus vacuum profiles determined in (a) from the minimum obtainable speed up to 60 mph (97 kph). If the transmission downshifts, abort and start the acceleration again. Start with the highest gear or gear/clutch combination and proceed in descending order.

(c) Maximum-Throttle Requirements - Manual Transmissions

Select the highest gear as specified in the table above. Start at the lowest speed from which the vehicle will accelerate smoothly or 30 mph (48 kph), whichever is higher, and depress the throttle full throughout the acceleration up to 60 mph (97 kph).

Select the next lower gear specified in the table above and accelerate at full throttle from the minimum speed from which the vehicle will accelerate smoothly up to 60 mph (97 kph).

(d) Part-Throttle Requirements (Both Automatic and Manual Transmissions)

Select the highest gear or highest gear/converter clutch combination specified in the table above. To obtain the critical part-throttle vacuum, first operate at road load (constant speed)*, at 25, 35, 45, and 55 mph (40, 56, 72, and 88 kph) incremental speeds (if obtainable in the specified gear). At each speed, move the throttle (in 3 to 5 seconds) from the road-load vacuum to:

1. full-throttle vacuum for manual transmissions;
2. detent vacuum for automatic transmissions without converter clutches;
3. one inch Hg (3.4 kpa) above the minimum vacuum at which the converter clutch disengages for so-equipped automatic transmissions.

The vehicle brakes may be applied lightly, if necessary, to maintain vehicle speed during throttle fanning, except for vehicles with converter clutch transmissions or EGR cut-outs.

If knocking occurs within any of the vacuum ranges, establish the manifold vacuum which gives maximum knock intensity. This is the critical vacuum to be used for all subsequent constant-vacuum part-throttle accelerations from the minimum obtainable speed in the test gear to 60 mph (97 kph), or until the vehicle ceases to accelerate*.

(2) Tank Fuel Observations on Vehicles with Owner's Questionnaire

Investigate for maximum-throttle and part-throttle knock as detailed in Item 3d(1). Define maximum knock intensity as per Item 3c. Record maximum knock intensity, speed of maximum knock intensity, and manifold vacuum at each operating condition.

* To stabilize vacuum advance in vehicles with vacuum delay devices, operate at road load for 40 seconds before fanning the throttle or starting the acceleration.

(3) Vehicle Rating Procedure (for Rater)

Knock rating should be performed while in a normal seated position (head above instrument panel) with floor mats in place.

Step 1 - Using a fuel estimated to give borderline knock in a given fuel series, investigate for incidence of knock under conditions as described in D.3.d.(1)(b) above, and D.3.d.(1)(c) above, whichever is applicable.

Step 2 - If no knock occurs, go to a lower octane number blend in that series and repeat Step 1.

Step 3 - If knock occurs at one or more of the operating conditions in Step 1, continue investigation at the critical condition(s) with higher octane blends until highest octane fuel giving knock is determined within one octane number or one blend. Record maximum knock intensity on all fuels. Record speed of maximum knock intensity and manifold vacuum on highest octane fuel that knocks.

Step 4 - Using the lowest octane blend that did not knock in Step 3, investigate for incidence of part-throttle knock as described in D.3.d.(1)(d). If knock occurs, continue investigation at critical vacuum until requirement is defined. Record maximum knock intensity and critical manifold vacuum on all fuels, and speed of maximum knock intensity on highest octane fuel that knocks.

Step 5 - With FBRU fuel only, if no knock occurs in Step 4, go to a lower octane number blend and repeat Step 4. Discontinue part-throttle investigation if knock is not observed with a fuel four octane numbers lower than determined in Step 3.

The rating procedure is given in arrow diagram form on page D-24.

(4) Octane Number Requirement Over Speed Range

Octane requirements over the speed range will be obtained on primary reference fuels only using throttle position for maximum requirements. These will be established by recording the knock-in and knock-out points during maximum requirement acceleration with each incremental fuel investigated. It may be necessary to test one or two additional lower octane fuels to describe the knocking characteristics over the speed range. Accelerate at maximum requirement throttle position from minimum obtainable speed as determined in 3d(1)(a), up to 3750 rpm, if necessary, in order to define requirements. These should be run to 60 mph (97 kph) unless required to terminate at 55 mph (88 kph) because of legal speed limits. If 3750 rpm cannot be attained in top gear, accelerations shall be discontinued and resumed in the next highest gear from 500 rpm below the engine speed at which top gear accelerations were determined.

When "A" knock is experienced, continue the acceleration, but back off on the throttle to maintain "B" knock until just prior to the knock-out point.

E. INTERPRETATION OF DATA

The data will be recorded on data sheet DFMF-11-1183 (DFMF-26-1183 for knock sensor-equipped vehicles). Octane requirements for all reference fuels shall be determined as follows:

1. If the knock intensity of the highest fuel giving knock is borderline, the requirement shall be reported as the octane number of that fuel.
2. If the knock intensity of the highest fuel giving knock is above borderline, the requirement shall be reported as one-half the difference between the fuel giving knock and the next highest fuel.
3. If the octane requirement in high gear is equal to the requirement in passing gear, report the highest gear data.
4. For part-throttle requirements, report the data from the highest manifold vacuum observations.

Speed range data shall be reported on data sheet DFMF-11-1183 as the engine speed of knock-in and knock-out for the octane number of the primary reference fuel tested.

Record data on all fuels tested, even though knock was not encountered. When transferring data to the summary block, record the higher requirement, either part-throttle or maximum-throttle condition for all fuels. If the higher requirement is not part-throttle, record the part-throttle FBRU requirement. Use proper letter designation (see footnotes on data sheet) to designate requirements outside of the reference fuel limits or FBRU part-throttle requirement more than four numbers below maximum.

Requirements for the various engine speeds will be determined by fitting a smooth curve through the knock-in and knock-out points on work form DFMF-12-1183. Primary reference fuel requirements at various engine speeds should be reported to the nearest one-half octane number and recorded on the speed range summary block.

It is important that the vehicle identification number (VIN) of each vehicle tested be recorded on all data sheets to provide a means of cross-indexing.

* See D.3.d.(1)(a), Page D-18.

ANNEX A
to the
CRC E-15-83 TECHNIQUE

PROCEDURE FOR SETTING UP VEHICLES
WITH FUEL INJECTION

ANNEX A

TO THE CRC E-15-83 TECHNIQUE

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING REFERENCE
FUELS -- VEHICLES EQUIPPED WITH MULTIPLE-PORT FUEL INJECTION

1. To run octane requirements on fuel-injected vehicles it is necessary to run an external fuel line to the inlet of the vehicle fuel injection pump.
2. The fuel return line from the engine to the fuel tank must be disconnected after the fuel pressure regulator (in engine compartment) and before the fuel tank. An auxiliary line long enough to reach the cans must be added to the fuel return line.
3. Make certain that the fuel tank connections are plugged; this means both the normal fuel pump inlet line and the normal fuel return line connection. On vehicles with an in-tank booster pump, this pump must be shut off so it cannot run during the time the vehicle is operating on the external fuel system. If this pump is not disconnected, it will be destroyed.
4. An electric fuel pump (Bendix type acceptable) must be used to draw fuel from the reference fuel can to supply the fuel injection pump on the vehicle. Caution must be exercised to keep the fuel line between the reference fuel cans and the vehicle fuel injection pump full of fuel. If very much air gets into this line, the fuel injection system will become air bound and it is difficult to get the air out of the system.
5. Once the fuel injection pump line and return line have been disconnected, all subsequent operations must be done from an external fuel source.
6. It is possible to use three-way valves in the fuel line between the fuel pump and the fuel tank and between the return line and the fuel tank. When used, the operator must change the return line valve to the auxiliary fuel system while the engine is shut down, to avoid building up excessive pressure in the return line which could damage both the fuel pressure regulator and injection pump.
7. When changing from one reference fuel to another, the following steps must be followed:
 - a. Put fuel inlet line in reference fuel tank with the return line going to a slop fuel can. Do not keep fuel inlet line out of the fuel can any longer than is necessary to move it from one can to the next. DO NOT RUN OUT OF FUEL.

- b. Observe the fuel stream in the fuel return line. As soon as a steady flow of fuel is observed, move the fuel return line to an empty one-quart can (0.946 l). Allow one quart (0.946 l) of fuel to flow into this can before inserting the return line into the chosen reference fuel can. This operation should take about 60 seconds.
- c. When going to the next reference fuel, it will be necessary to repeat Steps a and b.

The fuel injection pumps on most vehicles pump between 30 and 50 gallons (114-189 l/h) of fuel per hour. Therefore, Steps a and b should be followed very closely or there will be gross reference fuel contamination, or you will use a lot more reference fuel than is required to run each test. If Steps a and b are followed exactly, you will be discarding to slop about two quarts (1.892 l) of reference fuel each time you change reference fuels. The two quarts (1.892 l) to slop will be at least as much fuel as is consumed to obtain the reference fuel rating.

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING REFERENCE FUELS
-- VEHICLES EQUIPPED WITH THROTTLE-BODY FUEL INJECTION

The General Motors throttle-body fuel injection system is shown in the attached schematic drawing. The fuel supply system consists of an in-tank electric fuel pump, a full-flow fuel filter mounted on the vehicle frame, a fuel pressure regulator integral with the throttle body, fuel supply and return lines, and two fuel injectors. The injection timing and amount of fuel supplied is controlled by an electronic control module (not shown in figure). To prepare a vehicle with this system for octane requirement testing, an auxiliary electric fuel pump must be installed. The fuel pressure regulator controls fuel pressure at the injectors to a nominal 10.5 psi; therefore, an auxiliary pump capable of at least 10.5 psi outlet pressure must be used for satisfactory engine operation. The following procedure is recommended for preparing a vehicle with throttle-body fuel injection for octane requirement testing and for changing reference fuels during such testing:

1. Disconnect and plug the fuel supply and fuel return lines at the locations shown in the figure. Install an additional line between the fuel supply line and the outlet of the auxiliary pump. Connect the inlet of the auxiliary pump to the reference fuel can. Connect the fuel return line to the reference fuel can through a tee at the auxiliary pump inlet. All auxiliary fuel lines are indicated by dashed lines in the figure.
2. An optional arrangement would be to use three-way selector valves in the fuel supply and fuel return lines at the locations where auxiliary fuel lines are connected. When these valves are used, the operator must change the valves to the external fuel system while the engine is shut off to avoid building up excessive pressure in the fuel return line.
3. Disconnect the in-tank fuel pump so it cannot run during the time the vehicle is operating on the external fuel system. If this pump is not disconnected, it may be destroyed.
4. When changing from one reference fuel to another, the followign steps should be followed:
 - a. Disconenct fuel inlet line from reference fuel can and run engine a short time; do not run out of fuel since this will introduce air into the fuel injection system, and excessive cranking will be required to restart the engine.
 - b. Insert fuel inlet line in desired reference fuel can; operate vehicle for two miles at a maximum speed of 55 mph during which time four part-throttle accelerations are made. This must be done to ensure that the vehicle fuel system has been purged and contains the desired reference fuel for octane rating.
 - c. When changing to another reference fuel, repeat Steps a and b.

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING REFERENCE FUELS
-- VEHICLES EQUIPPED WITH THROTTLE-BODY FUEL INJECTION - (Continued)

THROTTLE BODY INJECTION

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING REFERENCE FUELS
-- FORD VEHICLES EQUIPPED WITH CENTRAL FUEL INJECTION SYSTEM

A vehicle schematic of one of Ford's central fuel injection systems is shown on the following drawing (other systems vary in configuration dependent upon engine/model type - see note 1). This fuel system consists of: an electric in-tank fuel pump, primary and secondary full-flow fuel filters, throttle-body assembly with integral fuel pressure regulator and two fuel injectors, fuel supply and return lines. The following procedure is recommended for preparing the vehicle for octane requirement testing:

1. Relieve pressure in fuel system using valve provided on throttle body. Fuel supply lines will remain pressurized for long periods of time after engine shut down. Disconnect and cap the fuel supply and fuel return lines leading from the fuel tank. Access to connection points may be obtained through either the: rear wheel wells, underbody, or engine compartment, dependent upon vehicle type. Install additional lines to the open supply and return lines and lead these lines back into the vehicle.
2. Connect the added fuel supply line to an auxiliary fuel pump. The fuel pressure regulator in the throttle body controls fuel pressure to a nominal 39.9 psi; therefore, it requires an auxiliary fuel pump capable of providing at least 45 psi outlet pressure (see note 1). The added 5.1 psi is needed to sufficiently overcome the pressure head and line restriction losses. Connect a supply line to the auxiliary pump from the reference fuel can. A fuel filter may be required between the auxiliary pump and reference fuel can to protect the pump. Also, connect the added fuel return line to the fuel reference can and vent the reference can to outside the vehicle.
3. Disconnect the electrical supply to the electric in-tank fuel pump, either by disconnecting the plug on the fuel tank or by disarming the inertia switch located in the trunk. Failure to disarm the in-tank fuel pump may result in a damaged pump. The voltage supplied to the inertia switch may be used as an electrical source for the auxiliary fuel pump. This voltage source is controlled by the on-board computer allowing the auxiliary pump to respond the same as would the in-tank fuel pump. When making this connection, do not "splice" into the wire, instead connect the wire lead to the connector.
4. When changing from one reference fuel to another, the following steps should be followed, or else reference fuels may become contaminated:
 - a. With the engine shut off, disconnect the fuel return line from the reference fuel can and connect it to an extra empty can. Connect the fuel pump supply line to the new reference fuel can and run the engine for approximately 30 seconds, purging the old reference fuel into the extra can (timing is dependent upon length of added fuel lines). After the system is purged, shut the engine off and connect the fuel return line to the new reference fuel can forming a closed fuel loop. Now the vehicle is ready to be tested on the desired reference fuel.
 - b. When changing to another reference fuel, repeat Step a.

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING REFERENCE FUELS
 -- FORD VEHICLES EQUIPPED WITH CENTRAL FUEL INJECTION SYSTEM - (Continued)

**CENTRAL FUEL INJECTION
 FUEL SYSTEM**
 (5.0L LINCOLN/MARK VI)

1/ **NOTE:**

Some vehicles have both a low pressure in-tank fuel pump and a high pressure under body fuel pump. The on-board high pressure pump may be used if supplied with an auxiliary pump. In all cases, it is required that on-board pumps not used, be disarmed. The inertia switch located in the rear of the vehicle will disarm both pumps. Fuel lines on some vehicles may be accessed only in the engine compartment, or by dropping the fuel tank.

CRC E-15-83 TECHNIQUE

ONR MEASUREMENT WITH KNOCK SENSOR-EQUIPPED VEHICLES

ANNEX B
TO THE CRC E-15-83 TECHNIQUE

ONR MEASUREMENT WITH KNOCK SENSOR-EQUIPPED VEHICLES
AUDIBLE KNOCK TECHNIQUE

Integrated electronic controls on some vehicles precludes the use of instrumentation to measure spark retard with knock sensor-equipped vehicles. Being integrated with other systems in the vehicle, there is no reference to a base spark advance; therefore, an audible knock technique must be used.

The audible technique will be used on all knock sensor-equipped vehicles.

Prepare the vehicle according to Section C (Vehicle Preparation) of the E-15-83 Technique. Make tank fuel observations as described in D.3.d(2) of the technique.

Using an estimated non-knocking fuel, accelerate as defined in paragraph B-3. Using lower octane fuels, determine the fuels for the following conditions:

1. Highest octane fuel that gives borderline knock (Maximum Requirement).
2. Lowest octane fuel that gives borderline knock (Minimum Requirement).

These are to be determined with FBRSU, FBRU, and PR fuels. Data should be recorded on data form DFMF-26-1183. Use a separate data form for each reference fuel series.

PROCEDURES FOR PLOTTING
OCTANE NUMBER REQUIREMENT DISTRIBUTION DATA

WEIGHTED VEHICLE/CAR POPULATIONS

Weighting factors for each vehicle model were developed from information supplied by the US vehicle manufacturers and from information published (Ward's Automotive Reports) for imported vehicles. These weight factors were proportioned to the relative production and/or sales volumes of the vehicles tested.

For any vehicle having octane requirements lower (L) than the lowest octane number fuel available within a given fuel series, a number 0.5 Research/0.4 Motor lower was assigned. Similarly, for any vehicle having octane requirements higher (H) than the highest octane fuel available within a given fuel series, a number 0.5 Research/0.4 Motor higher was assigned.

The weighting factors of each vehicle model were divided by the number of vehicles tested to calculate individual vehicle weight factors. The octane requirements for each vehicle were then arranged in increasing order with the appropriate individual weighting factors. The percent of vehicles at each octane requirement level represents the summation of all vehicle weighting factors before that level, plus one-half the sum of the weighting factors at that level. The individual vehicle weighting factors are adjusted so that the summation of all weighting factors is 100.00 for any vehicle population of interest. The midpoint percentiles are plotted versus octane number requirement on arithmetic probability paper and a distribution curve is drawn through the points. These distributions are then plotted point to point on Cartesian coordinates for figures shown in the survey report.

SELECT CAR MODELS

For individual car models, the octane number requirement distribution curves were plotted by the "Z" method as described in "Statistical Estimation of the Gasoline Octane Number Requirement of New Model Automobiles," C. S. Brinegar and R. R. Miller, Technometrics, Vol. 2, No. 1, February 1960.

The procedure is as follows:

For any cars having octane requirements lower (L) than the lowest octane number fuel available within a given fuel level, a number 1.0 Research/0.7 Motor lower was assigned. Similarly, for individual cars having octane requirements higher (H) than the highest octane fuel available within a given fuel series, a number 1.5 Research/1.1 Motor higher was assigned.

Using all observed and estimated octane number values, calculate the mean ($\bar{x}$) and the standard deviation (s) from the data for each car model.

$$1. \quad \bar{X} = \frac{\sum X_i}{n}$$

$$s = \sqrt{\frac{1}{n-1} \left[\sum X_i^2 - \left(\frac{\sum X_i}{n} \right)^2 \right]}$$

Where X_i = Octane number requirement of i^{th} car of a given model

n = Number of cars of that model.

2. Estimate octane number requirements at the percentiles of interest from octane number requirement distribution data by

$$\text{O.N.} = \bar{X} + ks$$

Where k is selected from normal distribution tables.

Values of k used to calculate percentiles in this report are:

<u>Percentile</u>	<u>k</u>
5	-1.645
10	-1.282
20	-0.842
30	-0.524
40	-0.253
50	0
60	+0.253
70	+0.524
80	+0.842
90	+1.282
95	+1.645

The requirements were arranged in increasing order and plotted on arithmetic probability paper; the percent satisfaction for any car is calculated by the following relationship:

$$\text{Percent satisfied: } i^{\text{th}} \text{ car} = \frac{(i-0.5)}{N} 100$$

Where N is the total number of cars tested for a given fuel and i is an integer having increasing values from 1 to N .

3. For this report, straight-line octane number requirement versus percent car satisfaction curves for the select models were drawn via a two-point plot of the mean and standard deviation. From inspection of the curves, revised L and H values may be indicated. An alternate method to obtain the octane number requirement/percent satisfied curves is to fair a curve through plotted points.

A P P E N D I X 6

CONFIDENCE LIMITS OF
OCTANE NUMBER REQUIREMENT DISTRIBUTIONS

CONFIDENCE LIMITS OF OCTANE NUMBER REQUIREMENT DISTRIBUTIONS

Octane number requirements of vehicles presented in this survey are determined at the levels that satisfy certain percentages of specific vehicle populations. In many cases, the recorded octane number requirement is followed by a plus and minus limit, referred to as the confidence interval. These limits give the interval within which the requirement for that satisfaction level would be expected 95 percent of the time in replicate testing.

At the 50 percent satisfaction level, the 95 percent confidence interval is calculated as follows:

$$CI = \pm ts / \sqrt{n}$$

where t = Students t at the proper number of degrees of freedom*

s = Standard deviation, calculated directly from the data or estimated as the difference between the 84.16th and 50th percentiles (assuming normal distribution)

n = Number of vehicles in population.

At other satisfaction levels:

$$CI = \pm ts \sqrt{1/n + k^2/[2(n-1)]}$$

At the 90 percent satisfaction level, k = 1.2817. For other satisfaction levels, appropriate values for k may be found in the standard statistical tables.

Degrees of Freedom	t	Degrees of Freedom	t
1	12.706	18	2.101
2	4.393	19	2.093
3	3.182	20	2.086
