INTRODUCTION

The Air Force Office of Scientific Research Technical Report Summaries are published quarterly as of March, June, September, and December of each calendar year. They consist of a brief summary of each AFOSR technical report received in the Technical Information Division and submitted to the Defense Technical Information Center (DTIC) for that quarter. The summaries contain two indexes for easily locating the technical reports that may be of interest to the user. These are followed by abstracts of the reports.

1) SUBJECT INDEX

- a. Subject Field
- b. Title of Report
- c. AD Number (Accession Number)

2) PERSONAL AUTHOR INDEX

- a. Primary Author
- b. Title of Report
- c. AD Number

AFOSR does not maintain copies of technical reports for distribution. However, you may obtain any of these reports if you are a registered government agency or government contractor with DTIC, by requesting the AD number of that report from the DTIC, Cameron Station, Alexandria, Virginia, 22314.

PURPOSE

The purpose of this report is to inform Air Force Laboratories about the science that the Air Force Office of Scientific Research is supporting.

A

AFOSR MISSION

The Air Force Office of Scientific Research (AFOSR) is the Single Manager of the Air Force Defense Research Sciences Program (Program Element 61102F) and the primary Air Force agency for the extramural support of fundamental scientific research. The AFOSR is organizationally under the DCS/Science and Technology, Air Force Systems Command.

AFOSR awards grants and contracts for research in areas of science relevant to the needs of the Air Force. Research is selected for support from unsolicited proposals originating from scientists investigating problems involving the search for new knowledge and the expansion of scientific principles. Selection is on the basis of scientific potential for improving Air Force operational capabilities, originality, significance to science, the qualification of the principal investigators, and the reasonableness of the proposed budget.

KEY TO READING THE DATA

The summaries consist of two indexes and the abstracts. From one of the two indexes, locate the AD number of the report that is of interest to you. Use this number to locate the abstract of the report in the abstracts section. The first report submitted to DTIC during the quarter (the one with the lowest AD number) appears on the last page of the abstracts section. The last report submitted to DTIC during the quarter (the one with the highest DTIC number) appears on the first page of the abstracts section. The following terms will give you a brief description of the elements used in each summary of this report.

DTIC Report Bibliography - DTIC's brief description of a technical report.

Search Control Number - A number assigned by DTIC at the time a bibliography is printed.

AD Number - A number assigned to each technical report when received by the DTIC.

Field & Group Numbers - (appearing after the AD number) First number is the subject field and the second number after the slash is the particular group under that subject field.

Corporate Author/Performing Organization - The organization; e.g., college/university, company, etc., at which the research is conducted.

Title - The title of the technical report.

Descriptive Note - Gives the type of report; e.g., final, interim, etc., and the period of the time of the research.

Date - Date of the technical report.

Pages - Total number of pages contained in the technical report.

Personal Author - Person or persons who wrote the report.

Contract/Grant Number - The instrument control number identifying the contracting activity and funding year under which the research is initiated.

Project Number - A number unique to a particular area of science; e.g., 2304 is the project number for mathematics.

Task Number - An alphanumeric number unique to a specific field of the main area of science; e.g., 2304 is the project number for mathematics and A3 is the task number for computational sciences.

Monitor Number - The number assigned to a particular report by the government agency monitoring the research. The number consists of the government monitor acronym, the present calendar year and the technical report assigned consecutively; e.g., AFOSR-TR-83-0001 is the first number used for the first technical report processed for Calendar Year 1983.

Supplementary Note - A variety of statements pertaining to a report. For example, if the report is a journal article, the supplementary note might give you the journal citation, which will include the name of the journal the article it appears in, and the volume number, date, and the page numbers of the journal.

Abstract - A brief summary describing the research of the report.

Descriptors - Key words describing the research.

Identifiers - Commonly used designators, such as names of equipment, names of projects or acronyms, the AFOSR project and task number, and the Air Force Research Program Element number.

ERO-FLU

UNCLASSIFIED

Deconvolution of Luminescence Decay Data with a Scattered-Light Component.
AD-A144 405

Single Pulse Temperature Measurements in Flames by Thermally Assisted Atomic Fluorescence Spectroscopy.
AD-A147 150

Methyl Salicylate Fluorescence as a Probe of the Geometry of Complexation to Cyclodextrins.
AD-A147 151

*FLUORINATED HYDROCARBONS

Synthesis of Bis-Pentafluorotelluriumoxide Fluorocarbons.
AD-A147 075

*FLUORINE COMPOUNDS

Reactions of Pentafluorotellurium Hypohalites with Fluorolefins.
AD-A147 081

*FLUOROPOLYMERS

Reactions of Pentafluorotellurium Hypohalites with Fluorolefins.
AD-A147 081

*FORECASTING

Credibility Approximations for Bayesian Prediction of Second Moments.
AD-A144 896
On 'Update Semantics and Relational Views'.
AD-A145 822

*FORMALDEHYDE

Stimulated Emission Spectroscopy: A Complete Set of Vibrational Constants for X 1A1 Formaldehyde.
AD-A144 348

*FREE ELECTRONS
Free Electron Lasers.
AD-A145 108

Summary Discussion: Theoretical Aspects of XUV Free Electron Lasers.
AD-A145 475

*FREQUENCY AGILITY
Spread Spectrum, Acquisition and Tracking.
AD-A144 533

*FREQUENCY SHIFT
Spread Spectrum, Acquisition and Tracking.
AD-A144 533

*FUELS

Molecular Interactions of High Energy Fuels and Jet Fuels with Oncogenic Viruses and Endogenous Viruses.
AD-A145 484

*FUNCTIONS(MATHEMATICS)

Stationarity and Superlinear Convergence of an Algorithm for Univariate Locally Lipschitz Constrained Minimization.
AD-A144 878
Uniform Consistency of a Class of Regression Function Estimators.
AD-A145 014
Total Positivity. A Review.
AD-A145 205

Limit Theory for the Sample Covariance and Correlation Functions of Moving Averages.
AD-A145 488

*GALLIUM ARSENIDES

Development of Short Gate FET's.
AD-A147 033

*GAS EXCHANGE(BIOLOGY)

Interaction of Anti-G Measures and Chest Wall Mechanics in Determining Gas Exchange.
AD-A145 445

*GAS TURBINES

Contamination and Distortion of Steady Flow Field Induced by

Discrete Frequency in Aircraft Gas Turbines.
AD-A147 092

Current Problems in Turbomachinery Fluid Dynamics.
AD-A147 127

*GATES(CIRCUITS)

Development of Short Gate FET's.
AD-A147 033

*GD AGENT

Nerve Agent Toxicity and Its Prevention at the Neuromuscular Junction; an Analysis of Acute and Delayed Toxic Effects in Extracellular and Skeletal Muscle.
AD-A144 972

*GEOMETRY

Minigrant Program. A differential Geometric Approach to Electromagnetic Lens Design.
AD-A144 238

*GEOPHYSICS

United States Air Force Geophysics Scholar Program, 1982-1983.
AD-A144 144

*GLASS

Relationships between Electronic Structure and Stability of Metallic Glasses.
AD-A145 141
Preparation and Properties of Halide Glasses and Glass-Polymer Composites.
AD-B087 004L

*GLOBAL

Approaches for Updating Databases with Incomplete Information and Nulls.
AD-A144 318

*GRATINGS(SPECTRA)

Detection of Gratings Hidden by Diffusers Using Intensity Interferometry.

Reactions of
Pentafluorotellurium Hypohalites with Fluoroolefins.
AD-A147 081
Preparation and Properties of Halide Glasses and Glass-Polymer Composites.
AD-8087 004L

*HEAT OF REACTION
Experimental Investigation on the Effects of Chemical Heat Release in the Reacting Turbulent Plane Shear Layer.
AD-A144 482

*HELIUM
Electronic Structure of the Helium Molecular Anion He2.
AD-A144 392

*HIERARCHIES
Research on Parallelism in Problem-Solving Systems.
AD-A144 414

*HIGH POWER
Material Problems for High-Temperature, High-Power Space Energy-Conversion Systems.
AD-A145 940

*HILBERT SPACE
Canonical Decompositions of Completely Nonunitary Contractions.
AD-A146 218

*HOLOGRAPHY
White-Light Optical Information Processing and Holography.
AD-A148 938

*HYDROGEN
Surface Production of Negative Hydrogen Ions.
AD-A145 437

*HYPEROXIA
Combined Effects of Breathing Resistance and Hyperoxia on Aerobic Work Tolerance.
AD-A146 004

*HYPERSONIC FLOW
Turbulent Boundary Layers Over Rough Surfaces Hypersonic Flow.
AD-A145 040

*HYSTERESIS
Input-Output Stability Analysis with Magnetic Hysteresis Non-Linearity - A Class of Multipliers.
AD-A145 729

*IMAGE PROCESSING
Multi-Disciplinary Techniques for Understanding Time-Varying Space-Based Imagery.

AD-A144 357
Hierarchical Multisensor Image Understanding.
AD-A144 593
Design of Edge Detectors for Reduced Images.
AD-A145 700
The Prism Machine: An Alternative to the Pyramid.
AD-A145 725
Automatic Recognition and Turbulent Objects.
AD-A145 908

*IMAGE RESTORATION
Shift-Variant Multidimensional Systems.

Research Progress.
AD-A145 554
A Mathematical Theory of Command
and Control Structures.
AD-A145 608

*MATRICES(MATHEMATICS)
Multiplicativity of I. sub p
Norms for Matrices. II.
AD-A145 794
Multiplicativity of I. sub p
Norms for Matrices. I.
AD-A146 228
On Generalizations of the Perron-
Frobenius Theorem.
AD-A146 370
A Complete Characterization of
Triply Balanced Matrices with
Applications to Survey Sampling.
AD-A147 083

*MEASUREMENT
Single Pulse Temperature
Measurements in Flames by Thermally
Assisted Atomic Fluorescence
Spectroscopy.
AD-A147 150

*MEMORY DEVICES
Parallel Searching and Merging
on ZMOB.
AD-A145 424

*METAL COMPOUNDS
Application of Quantum Chemistry
of Atmospheric Chemistry.
AD-A147 035

*METAL OXIDE SEMICONDUCTORS
Novel Techniques for the
Fabricating and Characterization of
GaAs MIS (Metal Insulator
Semiconductor) Structures.
AD-A145 768

*METALS
Erosion Mechanisms of Metals.
AD-A144 194

*METHANE
Unimolecular Dissociation of
Methane: A Trajectory Study Using
Metropolis Sampling.
AD-A144 404
Monte Carlo Transition-State
Theory: $XH(4)$ Yields $XH(3) + H$
($x=c, Si$).

AD-A147 137

*MICROCRACKING

Markov Processes Applied to Control, Replacement, and Signal Analysis.
AD-A144 225

*MILLIMETER WAVES

High Power Millimeter Wavelength Coherent Radiation Sources.
AD-A144 481

*MODELS

Approaches for Updating Databases with Incomplete Information and Nulls.
AD-A144 318

*MODULES(ELECTRONICS)

Functional Semantics of Modules.
AD-A146 923

*MOLECULAR ENERGY LEVELS

INDO Study of Sn2 Reactions and Related Processes.
AD-A147 045

*MOLECULAR STATES

Excited-State Lifetime Measurements: Linearization of the Forster Equation by the Phase-Plane Method.
AD-A144 348

*MOLECULAR STRUCTURE

Electronic Structure of the Helium Molecular Anion He2.
AD-A144 392

*MOLECULAR VIBRATION

Vibrational State Dependence of Radiationless Processes in 18(2 Micrometers) Benzene.
AD-A146 995

*MOLECULES

Excited-State Lifetime Measurements: Linearization of the Forster Equation by the Phase-Plane Method.

AD-A144 348

*MOMENTS

Analytic Solution of the Spencer-Lewis Angular-Spatial Moments Equations.
AD-A144 808

*MONITORING

Operator Alertness/Workload Assessment Using Stochastic Model-Based Analysis of Myoelectric Signals.
AD-A144 535

*MONOTONE FUNCTIONS

On Complementary and Independent Mappings on Databases.
AD-A145 557

*MONSOONS

Plateau Monsoons of the Northern Hemisphere: A Comparison between North America and Tibet.
AD-A147 077

*MONTE CARLO METHOD

Monte Carlo Transition-State Theory: $XH(4)$ Yields $XH(3) + H$ ($X=C, Si$).
AD-A147 137

*MULTIPLICATION FACTOR

Multiplicativity of L sub p Norms for Matrices. II.
AD-A145 794

*MULTIPROCESSORS

A Multiprocessor Network Suitable for Single-Chip VLSI Implementation.
AD-A146 980

*MULTIVARIATE ANALYSIS

On the Rate of Mean Convergence of Finite Linear Predictors of Multivariate Stationary Stochastic Processes.
AD-A145 808

Multivariable Stability-Margin Optimisation with Decoupling and

Output Regulation.

AD-A145 722

Return Difference Feedback Design for Robust Uncertainty Tolerance in Stochastic Multivariable Control Systems.
AD-A145 881

Dual Adaptive Control Based upon Sensitivity Functions.

AD-A146 941

*MUSCLE FIBERS

Stretch-Induced Growth in Chicken Wing Muscles. A New Model of Stretch Hypertrophy.
AD-A145 931

*MUSCLES

Stretch-Induced Growth in Chicken Wing Muscles. A New Model of Stretch Hypertrophy.
AD-A145 931

*NATURAL LANGUAGE

Knowledge Representation and Natural-Language Semantics.
AD-A146 025

*NAVIER STOKES EQUATIONS

Development of a Navier-Stokes Rotor/Stator Analysis.
AD-A146 967

*NEOPLASMS

Benzamide Derivatives as Protective Agents against the Action of Xenotoxic Agents on Human Cells.
AD-A145 396

*NERVE AGENTS

Nerve Agent Toxicity and Its Prevention at the Neuromuscular Junction: an Analysis of Acute and Delayed Toxic Effects in Extraocular and Skeletal Muscle.
AD-A144 972

*NETWORKS

Assessing the Reliability of Computer Software and Computing

*NIOBIUM ALLOYS
A 15 Nb-Sn Tunnel Junction Fabrication and Properties.
AD-A144 248

*NITRIDES
Synthesis and Characterization of Superconducting Electronic Materials.
AD-A144 137

*NONLINEAR ALGEBRAIC EQUATIONS
Resonant Modal Interactions and Adiabatic Invariance for a Nonlinear Wave Equation in a Variable Domain.
AD-A145 852

On the Inverse Scattering Transform of Multidimensional Nonlinear Equations Related to First-Order Systems in the Plane.
AD-A146 942

*NONLINEAR ANALYSIS
Analysis and Regulation of Nonlinear and Generalized Linear Systems.
AD-A144 871

Power Transformations When Fitting Theoretical Models to Data.
AD-A144 987

*NONLINEAR DIFFERENTIAL EQUATIONS
Inverse Problems. Optimization and Algorithms.
AD-A145 397

*NONLINEAR PROGRAMMING
Marginal Values and Second-Order Necessary Conditions for Optimality.
AD-A144 968

*NONLINEAR SYSTEMS
Analysis and Regulation of Nonlinear and Generalized Linear Systems.
AD-A144 871

Stability of Interconnected Systems Having Slope-Bounded Nonlinearities.
AD-A145 851

*NONPARAMETRIC STATISTICS
Nonparametric Maximum Penalized Likelihood Estimation of a Density from Arbitrarily Right-Censored Observations.
AD-A145 569

*NUCLEAR EXPLOSION DETECTION
An Attenuation Bias Measurement for the Semipalatinsk Test Site from Multiple S Phases.
AD-8086 251L

*NUCLEAR EXPLOSION TESTING
Source Models and Yield-Scaling Relations for Underground Nuclear Explosions at Amchitka Island.
AD-A144 471

*NUCLEAR SHELL MODELS
Atomic Inner-Shell Transitions.
AD-A144 386

*NUMBERS
Some Weak and Strong Laws of Large Numbers for $D(0,1)$ - Valued Random Variables.
AD-A144 845

*NUMERICAL ANALYSIS
Effect of the Basset Term on Particle Relaxation Behind Normal Shock Waves.
AD-A145 446

*NUMERICAL METHODS AND PROCEDURES
An Anisotropic Lens for Launching TEM Waves on a Conducting Circular Conical System.
AD-A144 140

Solution of the Boltzmann

Transport Equations for a Permeable Base Transistor.
AD-A144 989

Computational Methods for Complex Flowfields.
AD-A145 219

Asynchronous Discrete Control of Continuous Processes.
AD-A145 570

Control and Identification of Time Varying Systems.
AD-A145 838

Numerical Methods for Singularly Perturbed Differential Equations with Applications.
AD-A145 839

An Operator Method for Computing the Asymptotics of a Collision Resolution Interval.
AD-A146 837

Numerical Methods and Approximation and Modeling Problems in Stochastic Control Theory.
AD-A146 927

*OCULOMETERS
Gaze Control during Horizontal and Vertical Target Tracking.
AD-A144 484

*OLEFIN POLYMERS
Reactions of Pentafluorotellurium Hypohalites with Fluoroolefins.
AD-A147 081

*ONCOGENIC VIRUSES
Molecular Interactions of High Energy Fuels and Jet Fuels with Oncogenic Viruses and Endogenous Viruses.
AD-A145 484

*OPERATORS (MATHEMATICS)
Approximation of Feedback Controls for Parabolic Systems.
AD-A144 615

Canonical Decompositions of Completely Nonunitary Contractions.
AD-A146 219

*REASONING
Memory-Based Expert Systems.
AD-A145 612

*REGRESSION ANALYSIS
Power Transformations When
Fitting Theoretical Models to Data.
AD-A144 987
Uniform Consistency of a Class
of Regression Function Estimators.
AD-A145 014
An Asymptotic Theory for
Logistic Regression When Some
Predictors Are Measured with Error.
AD-A145 873

*REINFORCED CONCRETE
Development of Advanced
Constitutive Model for Reinforced
Concrete.
AD-A145 050

*RELAXATION
Relaxation Dynamics of
Photoexcited Benzene-Rare Gas van
der Waals Complexes.
AD-A147 136

*RELIABILITY
Sequential Decision Models in
Reliability.
AD-A144 181

*RESEARCH MANAGEMENT
United States Air Force
Geophysics Scholar Program, 1982-
1983.
AD-A144 144
Interim Scientific Report. Grant
AFOSR-81-0122, 1 June 1983 - 31 May
1984.

AD-A145 498
Life Distribution Properties of
Devices Subject to Deterioration.
Research Progress.
AD-A145 554

*RESIDUALS
Tests for Properties of Residual
Life.
AD-A145 618

PUL-RES

UNCLASSIFIED

- *RESPIRATION
Combined Effects of Breathing
Resistance and Hyperoxia on Aerobic
Work Tolerance.

- *RICCATI EQUATION
Approximation of Feedback
Controls for Parabolic Systems.
AD-A144 815
- *ROTORS
Development of a Navier-Stokes
Rotor/Stator Analysis.
AD-A148 967
- *RUTHENIUM COMPOUNDS
Interactions of Ruthenium(II)
photosensitizers with Nonionic
Surfactants: The Binding Region and
Specific-Anion Effects.
AD-A144 476
Replacement of Hydro-Ligands
in Triphenylphosphinegold Complexes by
Triphenylphosphinegold Groups.
Crystal Structures of (AuRu3-(mu-
COMe)(CO)10(PPh3)), (AuRu3(mu-
H)2(mu3-COMe)(CO)9(PPh3)), and
(Au3Ru3(mu3-COMe)(CO)9(PPh3)3).
AD-A147 002
- *SALICYLATES
Methyl Salicylate Fluorescence
as a Probe of the Geometry of
Complexation to Cyclodextrins.
AD-A147 151
- *SCATTERING
The Development of New Methods
for Solving the Target
Identification or Inverse
Scattering Problem for Time-
Harmonic Acoustic and
Electromagnetic Waves.
AD-A148 821
Laser-Induced Neutralization and
Negative-Ion Formation in Surface
Scattering.
AD-A145 878
- *SCHEDULING
Constraint-Based Scheduling in
an Intelligent Logistics Support
System: An Artificial Intelligence
Approach.
AD-A145 613
- *SEARCHING
Fast Search Algorithms for
Vector Quantization and Pattern
Matching.
AD-A148 929
- *SEISMIC DATA
Source Models and Yield-Scaling
Relations for Underground Nuclear
Explosions at Amchitka Island.
AD-A144 471
An Attenuation Bias Measurement
for the Semipalatinsk Test Site
from Multiple S Phases.
AD-B086 251L
- *SEISMIC WAVES
Large-Scale Numerical Analysis
of Three-Dimensional Seismic Waves.
AD-A144 810
Nonlinear Wave Propagation
Study.
AD-A147 011
Deployment of a Regional Array
in Norway.
AD-A147 032
Short Period Guided Waves Over
Oceanic and Continental Paths.
AD-A147 053
- *SEMANTICS
On 'Update Semantics and
Relational Views'.
AD-A145 522
Knowledge Representation and
Natural-Language Semantics.
AD-A148 025
Functional Semantics of Modules.
AD-A148 923
- *SEMICONDUCTOR DEVICES
Novel Techniques for the
Fabricating and Characterization of
GaAs MIS (Metal Insulator
Semiconductor) Structures.
- AD-A145 766
- *SEMICONDUCTORS
Direct Writing of
Microstructures for
Microelectronics.
AD-A144 528
Research on Materials and
Components for Opto-Electronic
Signal Processing.
AD-A145 808
Studies of Grown-In Defects
Versus Growth Parameters in III-V
compound Semiconductors.
AD-A145 864
- *SEQUENCES(MATHEMATICS)
Realization of Covariance
Sequences.
AD-A145 082
- *SET THEORY
Set-Theoretic Problems of Null
Completion in Relational Databases.
AD-A145 045
- *SHOCK WAVES
Effect of the Basset Term on
Particle Relaxation Behind Normal
Shock Waves.
AD-A145 448
Optimum Replacement of a System
Subject to Shocks.
AD-A145 811
- *SHOCK(MECHANICS)
Optimum Replacement of a System
Subject to Shocks.
AD-A145 811
- *SHOPS(WORK AREAS)
Constraint-Based Scheduling in
an Intelligent Logistics Support
System: An Artificial Intelligence
Approach.
AD-A145 613
- *SHOT NOISE
Shot-Noise-Limited Detection
Scheme for Two-Beam Laser
Spectroscopies.

*SIGNAL PROCESSING

AD-A145 748 Signal Processing Algorithms.

AD-A145 748

Research on Materials and Components for Opto-Electronic Signal Processing.

AD-A145 808

Fast Search Algorithms for Vector Quantization and Pattern Matching.

AD-A146 925

White-Light Optical Information Processing and Holography.

AD-A146 938

Studies in Statistical Signal Processing.

AD-A147 130

*SILANES

Monte Carlo Transition-State Theory: $XH(4) \text{ Yields } XH(3) + H$

($X=C, Si$).

AD-A147 137

*SILICON

Theoretical Investigations of Elementary Processes in the Chemical Vapor Deposition of Silicon from Silane. Unimolecular Decomposition of SiH_4 .

AD-A144 456

*SILICON COMPOUNDS

Hexamethylsilirane. 5. Conversion to Five-Membered Ring Silicon Compounds by 'Two-Atom' Insertion Reactions of Aryl Olefins, 1,3-Dienes, and Conjugated Acetylenes.

AD-A144 943

Hexamethylsilirane. 6.

Conversion to 1-Oxa-2-Silacyclopentanes by 'Two-Atom' Insertion Reactions of Aldehydes and Ketones.

AD-A145 012

Structural and Synthetic Organosilicon Chemistry.

AD-A147 101

*SILICON NITRIDES

Silicon Nitride Joining.

AD-A145 686

*SIMULATION

Simulation Uses of the Exponential Distribution.

AD-A144 940

*SINTERING

Strengthening and Strength Uniformity of Structural Ceramics.

AD-A144 302

*SITE SELECTION

Evidence for Chemisorption Site Selection Based on an Electron-Donor Mechanism.

AD-A144 599

*SLEEP

Mathematical Models of the Circadian Sleep-Wake Cycle.

AD-A145 712

*SOLAR CORONA

Studies of Solar Flares and Coronal Loops.

AD-A145 009

*SOLAR FLARES

Studies of Solar Flares and Coronal Loops.

AD-A145 009

*SOLID ROCKET PROPELLANT BINDERS

Thermophysical Property Testing Using Transient Techniques.

AD-A147 085

*SOLID ROCKET PROPELLANTS

Deflagration to Shock to Detonation Transition of Energetic Propellants.

AD-A144 489

*SOLUBILITY

Effect of Toluene on the Solubility of Biohazardous Volatile Synthetic Organic Compounds.

AD-A145 188

*SOLUTIONS(GENERAL)

Solution of the Boltzmann Transport Equations for a Permeable Base Transistor.

AD-A144 969

*SPACE BASED

Multi-Disciplinary Techniques for Understanding Time-Varying Space-Based Imagery.

AD-A144 357

*SPACE SYSTEMS

Material Problems for High-Temperature, High-Power Space Energy-Conversion Systems.

AD-A145 940

*SPATIAL FILTERING

Optical Waveguide Spatial Filters.

AD-A145 674

*SPECTROSCOPY

Properties of Osmium(II) photosensitizers in Aqueous and Sodium Lauryl Sulfate Micellar Media.

AD-A144 458

Determination of Trace Alkali and Alkaline Earth Metals in Orange Juice Using the DC Plasma and the Inductively Coupled Plasma Atomic Emission Techniques.

AD-A146 894

Pulsed Laser Spectroscopic Study of the Photoisomerization of Azo Labels at Three Different Locations on a Polystyrene Chain.

AD-A147 164

*SPECTRUM ANALYSIS

Spatio-Temporal Spectral Analysis by Eigenstructure Methods.

AD-A144 361

*SPEECH

Pitch Synchronous Transform Coding of Speech at 9.6 Kb/s Based on Vector Quantization.

AD-A146 962

Turbulent Boundary Layers Over Rough Surfaces Hypersonic Flow.
AD-A145 040

*SYMPOsia
IEEE Pulsed Power Conference (4th) Held at Albuquerque, New Mexico on 6-8 June 1983.
AD-A145 262

*SYNTHESIS(CHEMISTRY)
Heterogeneous Preparation of Singlet Oxygen Using an Ion-Exchange-Resin-Bound Tris(2,2'-bipyridine)-ruthenium(II) photosensitizer.
AD-A144 505
Synthesis of Bis-Pentafluorotelluriumoxide Fluorocarbons.
AD-A147 075

Structural and Synthetic Organosilicon Chemistry.

AD-A147 101
Synthesis and Molecular Structure of (Au3Ru4(Micron-3-H)(CO)12(PPh3)3).
AD-A147 153
Synthesis of Liquid Crystalline, Extended-Chain Polymer Compositions in Poly(Phosphonic Acid).
AD-B086 585L

*SYSTEMS ANALYSIS
Sequential Decision Models in Reliability.
AD-A144 181
Control and Identification of Time Varying Systems.
AD-A145 636

*SYSTEMS ENGINEERING
Robust Redesign of Adaptive Control.
AD-A147 144

*TARGET RECOGNITION
Hierarchical Multisensor Image Understanding.
AD-A144 593

*TELEMETERING DATA
An Attenuation Bias Measurement for the Semipalatinsk Test Site from Multiple S Phases.
AD-B086 251L

*TELLURIUM COMPOUNDS
Synthesis of Bis-Pentafluorotelluriumoxide Fluorocarbons.
AD-A147 075

*TEMPERATURE
Single Pulse Temperature Measurements in Flames by Thermally Assisted Atomic Fluorescence Spectroscopy.
AD-A147 150

*TEST BEDS
Test-Bed for Programmable

Automation Research. Phase I.
AD-A145 872

*TEST CONSTRUCTION(PsYCHOLOGY)
Estimating the Number and Duration of Cognitive Processes Using the within-Task Subtractive Method.
AD-A144 617

*TEXTURE
Visual Representations Subservient Texture Perception.
AD-A145 412

*THEOREMS
On Generalizations of the Perron-Frobenius Theorem.
AD-A146 370
A Non-Commutative Quasi Subadditive Ergodic Theorem.
AD-A146 810

*THEORY
Updating Logical Databases.
AD-A144 937
A Mathematical Theory of Command and Control Structures.
AD-A145 608

*THERMOPHYSICAL PROPERTIES
Thermophysical Property Testing Using Transient Techniques.
AD-A147 085

*THIN FILMS
Research on Electroluminescence in Thin Film Yttrium Oxysulfide.
AD-A146 909

*THORAX
Interaction of Anti-G Measures and Chest Wall Mechanics in Determining Gas Exchange.
AD-A145 445

*TIME SERIES ANALYSIS
Estimation in Nonlinear Time Series Models I: Stationary Series.
AD-A145 614
Estimation in Nonlinear Time

Distribution limited to U.S. Gov't. agencies only; Test and Evaluation; 28 Sep 84. Other requests must be referred to Air Force Office of Scientific Research, Attn: XOTD, Bldg. 410, Bolling AFB, DC 20332.

ABSTRACT: (U) Research has been carried out on two families of solids. The first one involves fluoride, chloride and bromide glasses. The second one involves microporous silica glass and gels impregnated with organic polymers as well as inorganic crystals. The viscosity, vibrational spectra, chemical durability, fiber preparation and effects on oxygen on the properties of fluorozirconates have been studied. A number of new halide glasses were prepared. Microporous silica glass impregnated with PMMA was found to be highly transparent in the visible and possesses abnormal properties. Many crystals impregnated into silica glass were found to have their melting points depressed and some crystallographic transitions were also suppressed. (Author)

ABSTRACT: (U) One of the fundamental problems in monitoring nuclear explosion treaties is the accurate estimation of yield on the basis of teleseismic data. Absorption along the raypath is one of the most significant factors to be accounted for in interpreting the data. This factor is particularly difficult to treat because body wave attenuation exhibits substantial lateral variation. This means that though we may be able to measure Q in some regions of the world using locally recorded data, we cannot necessarily extrapolate our results to foreign test sites. Recently, we have made some progress in remote sensing by using the multi-bounce phase SS to estimate Q beneath these foreign sites. This technique was applied to the Kazakh region, resulting in estimates of t sub alpha bias similar to those expected for a stable shield, namely δt sub alpha = 0.2 sec.

UNCLASSIFIED REPORT

ABSTRACT: (U) This project is an exploration of dynamical features of chaotic physical systems with the emphasis upon turbulent fluids. The specific areas of investigation involve (1) the development of techniques that discriminate measurable differences in the observed behavior of theoretical models for chaotic behavior, (2) the application of these techniques to experimental studies, and (3) the study of bifurcation behavior in multiparameter families of differential equations. The transition to chaotic behavior in fluids has received intense experimental study during the past ten years. Various 'routes to chaos' have been studied, and a satisfying picture has emerged of how this transition proceeds in low dimensional dynamical systems. Our primary interest is in the behavior of a system after it has undergone the transition. Of central concern is the question of determining when low dimensional chaotic models provide a good description of the physical system.

UNCLASSIFIED REPORT

ABSTRACT: (U) The present report develops electrical analogs to investigate multiple cracks on simple beams and more complex frame structures. Analog networks provide the economic tool to analyze such structures. The effect of multiple cracks on the natural frequencies of simple structures is studied in detail. It is shown that closely spaced multiple cracks are indistinguishable from an effective single crack. A severe crack on a structure can be identified if there are only minor cracks in addition to the major one. If, on the other hand, there is more than one severe crack, then the damage cannot, in general, be diagnosed with only three frequencies measurable. Nevertheless, a minimum number of cracks which are likely to be present in the structure can be established. Characteristic equations are developed in the form of linear systems for cantilever beam and general frame structures with multiple cracks. Usefulness of relative-frequency-change curves are demonstrated and rough guidelines are provided to aid the damage diagnosis process. Several numerical examples are included which illustrate the effect of multiple cracks on frequencies. (Author)

ABSTRACT: (U) Several new results in the modeling, analysis and prediction of nonstationary second order processes have been developed. They include (1) the derivation of constant-parameter lattice filters for general nonstationary processes; (2) the development of fast algorithms for adaptive filtering with fixed-order transversal filters, including modifications necessary to ensure stability and convergence with finite precision computations; (3) the invention of a new adaptive beam-forming array for separating coherent (completely correlated) signals and interference. Two Ph.D theses have been completed during this period, H. Lev-Ari, 'Nonstationary Lattice-Filter Modeling', December 1983 and J. M. Cioffi, 'Fast Transversal Filters for Communications Applications', March 1984.

ABSTRACT: (U) A multi-investigator program on problems of current interest in turbomachinery fluid dynamics is being conducted at the MIT Gas Turbine and Plasma Dynamics Lab. Within the scope of this effort, four different tasks, encompassing both design and off-design problems, have been identified. These are: 1) Investigation of fan and compressor design point fluid dynamics (including formation of design procedures using current three-dimensional transonic codes and development of advanced measurement techniques for use in transonic fans); 2) Studies of basic mechanisms of compressor stability enhancement using compressor casing/hub treatment; 3) Fluid mechanics of inlet vortex flow distortions in gas turbine engines; and 4) Investigations of three-dimensional analytical and numerical computations of flows in highly loaded turbomachinery blading.

UNCLASSIFIED REPORT

ABSTRACT: (U) The strong point of computer program testing has always been failure. When a test fails, it is clear what to do, and this has led to the maximum that the goal of testing is finding faults. Testing theory, on the other hand, has tried to connect test success to program correctness. Call the kind of testing that seeks failures 'debug testing', and the other 'confidence testing'. A confidence-testing technique might in principle be used for debugging, but debugging tools cannot establish confidence. Debug testing is an activity intertwined with the whole of program development, and its theory must take account of this sociological context; debugging is a human craft. On the other hand, confidence testing theory may take program and test as given, without their human origins. Only by separating the two kinds of testing can reasonable goals be set for testing theory. The difference between debug- and confidence-testing theory is illustrated by detailed analysis of partition testing, and of experiments to validate debugging test tools. Goals for each kind of theory are proposed. Originator-supplied keywords include: Noise-rubbing effect, and probabilistic correctness.

ABSTRACT: (U) This annual technical report covers the first year, Phase I activity of a research program initiated in January 1, 1983. The main objective of the present program is to investigate the influence of Reynolds stresses of organized origin - induced by discrete frequency disturbances - in deforming and affecting the steady internal flow of aircraft engines. In particular, attention of the present research is focused upon the effect of orderly disturbances such as (A) the vortex whistle upon the Ranque-Hilsch effects and (B) Karman vortex street in causing temperature separation within the wake of bodies.

UNCLASSIFIED REPORT

ABSTRACT: (U) Transient techniques were applied to the study of energetic materials (AP, HMX, RDX and HTPB) used in solid rocket fuel to carbon/carbon materials used as rocket nozzles. Studies on AP included single crystals, pressed powders and AP/HTPB mixtures. It was found that the conductivity of AP can be considered isotropic, even the orthorhombic phase. The conductivity values for pure AP calculated from the AP/HTPB mixtures were somewhat larger than those measured directly on single crystals due to imperfections in the relatively large single crystals. Conductivity values for Beta HMX obtained on pressed powders are believed to be 20% below those that would be obtained on good single crystals if they were available. Delta phase values are believed representative. Conductivity data useful for modeling AP/binder and HMX/binder fuel from RT to combustion were obtained. Successful techniques for determining in-situ conductivity values for carbon fibers and matrix in c/c composites were developed. The relative roles of the fibers and matrix in c/c subject to transient heat fluxes were delineated. The advantages of off-axis testing were revealed. Diffusivity values corresponding to thermal

ABSTRACT: (U) $R \times L$ triply balanced matrices arise in cross validation studies and in estimating the mean square errors of nonlinear statistics in many large scale survey samplings. It is shown that: (1) Any $R \times L$ triply balanced matrix and an orthogonal array $OA(R, L, 2, 3; \lambda)$ are one and the same object up to a possible notational change of the two symbols of the array to + and - respectively. (2) R is a multiple of 8 and $L < \text{or} = R/2$, and (3) The problem of the construction of $R \times L$ triply balanced matrices, $3 < \text{or} = L < \text{or} = R/2$, is completely resolved modulo the existence of Hadamard matrices of order $R/2$. ABSTRACT: (U) Task A: 1--Evaluate the usefulness of Pg
and Lg to estimate yield for Eurasian and Africa events,
2--Investigate possible caused of amplitude variation (i.
e. source and recording site geology), and 3--Analyze the
regional phases for use in discrimination and yield
estimation; Task B: 1--Continue the analysis of data from
Wake Island Hydrophone Array in cooperation with
personnel at Hawaii Inst. of Geophysics and assist in
guiding the operation of the array, 2--Conduct
comparative studies of (long-range) oceanic Pn/Sn and
continental Lg (Pg) using, especially, data from the
Catskill Seismic Array and the Wake Array, in comparison
with theoretical seismograms for different source types,
focal depth, and velocity structures, and 3--Evaluate the
detection capability, also compare them with other high
quality continental stations and the DARPA/NORDA MSS;
Task C: 1--Install, maintain, and operate high quality
three component broad band digital seismographs in the
Stone Ridge, NY area, and 2--Development analysis
techniques and software to obtain source and propagation
path characteristics from broad band three component
digital data.

ABSTRACT: (U) The second year of AFOSR support at the University of California, Santa Barbara has allowed us to make significant strides in exploring the potential of vector quantization for source coding. Some of this work is described in the attached list of references. Some of the studies were completed, including predictive vector quantization and rate distortion modeling of speech using a composite source model to obtain rate distortion bounds on performance of vector quantization. Particularly important results in the second year include the development of a new family of fast search algorithms for pattern matching and the development of Hierarchical Vector Quantization. Several other promising studies, including compander/lattice coding, were still in progress when the grant terminated. (Author)

ABSTRACT: (U) The goal of this work was to investigate the performance limit of the standard GaAs FET structure. During the contract period we have constructed an AsC13 epitaxial system used to provide buffer layers for our FET structures. We have developed a submicron lithographic process using deep U.V. techniques and, using these techniques we have produced working .5 micron gate devices. In addition, we have investigated the 'gettering' of substrates as a technique to improve the mobility of ion implanted layers. The result of this experiment showed a correlation between hall mobilities and gettered substrates. Finally, a investigation of a self aligned source drain structure has commenced and several theoretical studies are reported. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The purpose of the development of an experimental regional array in Norway is to take advantage of the extremely good propagation of high-frequency energy for regional seismic phases in Eurasia. Since Norway is located within the same geologic plate boundary as the Soviet Union, the deployment of such an array in Norway will provide important new insight with respect to the projected performance of possible future in-country stations in the U.S.S.R.

UNCLASSIFIED REPORT

ABSTRACT: (U) At the present time there still exists an element of uncertainty regarding the definition of an effective radius, which can be used to separate the nonlinear near-field regime adjacent to an explosion from the linear far-field seismic regime. This report presents results of a study of the response of Westerly granite to sinusoidal loading. The amplitude of transition from linearity to non-linearity can be defined. Results are compared to previous studies. Nonlinear effects were observed in a cylindrical test specimen of Westerly granite which was subjected to both flexural and torsional modes of resonant vibration. Nonlinear effects in shear are observed when the shearing strain exceeds approximately 0.000001, increasing slightly with increasing effective pressure. Nonlinear effects in flexure are also observed when the extension/compression strain exceeds 0.000001, also increasing very slightly with increasing effective pressure. These transition amplitudes probably represent a lower limit on the amplitude of transition from linear to nonlinear behavior for the primary elastic pulse propagating in the near-field of an explosion. Using these measurements it is not possible to determine whether the nonlinear effects observed in flexure are primarily an extensional or compressional feature. This is a critical issue and in

ABSTRACT: (U) An important problem in axial flow turbomachinery is that of flow through a turbine or compressor stage in which interaction occurs between the rotor and the stator. Although several experimental efforts have focused upon this problem, relatively little analysis has been applied to this problem. The present effort applies a Navier-Stokes analysis to the rotor/stator problem. The effort consists of several tasks. These include assessment of an existing Navier-Stokes analysis for time-dependent flows, exploration of appropriate boundary conditions, development of an appropriate coordinate system and a demonstration calculation. The present annual report discusses the time-dependent assessment, exploration of boundary conditions and the coordinate system problem.

UNCLASSIFIED REPORT

ABSTRACT: (U) The evolution of unsteady boundary layers on the plane of symmetry of a slender prolate spheroid in uniform motion at constant angle of attack after an impulsive start has been studied for the case of prescribed pressure distribution. Calculated results have been obtained for angles of attack ranging from 30 degrees to 50 degrees and show, for example, that the unsteady-state solutions approach the steady-state solutions rapidly on the windward and leeward sides for $\alpha <$ and α sub c (approximately - 41 degrees). This is also so on the windward side for $\alpha >$ α sub c. On the leeward side for $\alpha >$ and α sub c, however, the unsteady boundary layer is initially unseparated but develops a region of reversed flow with increasing time. Subsequently, the streamwise displacement thickness develops a pronounced peak which leads to a singularity of the type observed by van Dommelen and Shen on a circular cylinder started impulsively from rest. (Author)

ABSTRACT: (U) A new adaptive dual control solution is
presented for the control of a class of multivariable
input-output systems. Both rapidly varying random
parameters and constant but unknown parameters are
included. The new controller modifies the cautious
control design by numerator and denominator correction
terms. This controller is shown to depend upon
sensitivity functions of the expected future cost. A
scalar example is presented to provide insight into the
properties of the new dual controller. Monte-Carlo
simulations are performed which show improvement over the
cautious controller and the Linear Feedback Dual
Controller of two previous publications. (Author)

ABSTRACT: (U) Progress has been made on the white-light optical information processing and holography research program. Work was completed on a broad band color image deblurring and this technique was extended to the restoration of 2-D out-of-focused color photographic images. A new technique of white-light density pseudocolor encoder was developed for three primary colors. This white-light pseudocolor encoder is very cost effective and offers a high image resolution, which would be an excellent alternative for the digital counterpart. We have also in this period conducted a measuring technique for the degree of coherence in the Fourier plane of the grating-based white-light signal processor. We have shown that high degree of coherence is achievable with a signal sampling grating at the input plane. Thus the white-light technique is capable of processing the information in complex amplitude and it is very suitable for color signal processing. In this phase of research we have also studied the effect of coherence due to source encoding, signal sampling and spectral band filtering, as applied to the white-light signal processing.

ABSTRACT: (U) Research during this period continued in the following topic areas: (1) Nonlinear filtering; (2) Large deviations problems; (3) Stochastic control of piecewise-deterministic processes; (4) Stochastic variational calculus; (5) Approximating multiple Itô integrals with band-limited processes; (6) Large deviations methods and asymptotic properties of recursive algorithms; and (7) Approximation and modelling for distributed stochastic systems. Progress is summarized and a list of publications supported by the grant is included in the report. (Author)

ABSTRACT: (U) Because large-scale software development is a struggle against internal program complexity, the modules into which programs are divided play a central role in software engineering. A module encapsulating a data type allows the programmer to ignore both the details of its operations, and of its value representations. It is a primary strength of program proving that as modules divide a program, making it easier to understand so do they divide its proof. Each module can be verified in isolation, then its internal details ignored in a proof of its use. This paper describes proofs of module abstractions based on the functional method of Mills, and contrasts this with the Alperd formalism based on Hoare logic. (Author)

ABSTRACT: (U) Thin films of a rare-earth oxysulfide phosphor, yttrium oxysulfide:europium, were evaluated for use in a thin film electro-luminescent emitter (TFEL). For the first time, emission typical of the rare earth activator was observed in a rare earth host TFEL emitter. The films were characterized for optical spectrum, brightness-voltage characteristic, photoluminescence, crystal structure, and compared to efficient cathodoluminescent powder phosphors. Yttrium oxysulfide:europium, as well as high efficiency TFEL emitters of zinc sulfide:manganese. The E-beam deposited films exhibited considerable photoluminescence and cathodoluminescence after a high temperature anneal (800 C). However, the anneal induced cracks in the phosphor film, which in turn limited the maximum applied voltage and electroluminescent brightness to less than 1 ft-L. Alternate substrate materials and process schedules minimized the cracking, but did not eliminate this fundamental problem.

ABSTRACT: (U) During the year progress was made in a number of directions: (1) The investigators developed in significant detail a language for representing an agent's understanding of aspects of how a device works, and also developed a compiler which can produce a diagnostic expert problem solving system from this deep level functional representation. (2) The researchers continued their investigation of how design knowledge can be organized as plans and design problem solving can be viewed as design refinement by plan selection and redesign. They have completed the construction of a prototype design expert system called AIR-CYL, which designs a moderately complex mechanical component called an air cylinder for a range of specifications. (3) They continued investigation of high-level languages for expert system construction; in particular they have refined their design of the CSRL language for diagnostic expert system, and implemented it in Interlisp for the Xerox family of Lisp machines. (4) They have initiated a new investigation in reasoning about the behavior of physical systems by qualitative simulation by using a novel technique called consolidation, which infers the behavior of a composite component from the behaviors of its subcomponents.

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this research was to develop the mathematical formalism necessary to treat a number of unsolved problems in lattice statistics. Toward that end the investigators have considered the following problems: (1) The occupational degeneracy of particles of various shapes on lattice spaces of various dimensionalities and structures. (2) The nearest neighbor degeneracy for various kinds of particles on lattice spaces of various dimensionalities and structures. (3) The kth neighbor problem for simple particles on a one dimensional, rectangular lattice space. Utilizing set theoretic arguments they have been able to construct shift operator matrices that, in principle, permit them to establish recursion relations that describe exactly the occupational degeneracy for any shape particle on a lattice space of any dimensionality and structure. Similar techniques allow the investigators to determine the composite nearest neighbor degeneracy for simple particles, dumbbells and lambda-bell particles on quasi-two dimensional rectangular lattices. They have utilized the foregoing formalism to treat the thermodynamics (canonical and grand partition functions) for such systems. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The investigators present an operator method for obtaining upper and lower bounds for the expected length of a collision resolution interval for various protocols. The method is elementary in that it circumvents the intricate and ingenious complex variable methods of Fayolle, Flajolet and Hofri (1983). It is also noted that the method can be applied to computing upper and lower bounds for the conditional delay. The problem of computing upper and lower bounds for the variances by this method remains open. (Author)

ABSTRACT: (U) This work is a contribution to the non-commutative pointwise ergodic theory which has been developed recently in a series of papers by a few authors. These authors extended to the von Neumann algebra context the classical Birkhoff's type theorems. This documents main goal is to prove a non-commutative version of a subadditive ergodic theorem.

ABSTRACT: (U) During this period research progressed in
these areas: (1) a thorough analysis of the problems
involved in communicating reliably in the presence of
hostile jamming, and (2) the design of effective 'anti-
jam' (A/J) countermeasures at the systems level. In the
short-term, research is presently focused on the detailed
mathematical analyses of several specific A/J modulation
and coding strategies of the investigator's own design,
which are applicable to modern spread-spectrum
communication systems. (Author)

ABSTRACT: (U) Progress in several areas regarding the integration of photodetectors with optical waveguide structures is presented. In the area of formation of photodetector arrays on layers of laser-recrystallized polycrystalline silicon, progress has occurred in using antireflection stripes to control the location of grain boundaries. Large areas free of grain boundaries are then available for photodetector fabrication. A 6mm x 5mm test chip containing photodetector arrays, switching MOS transistors, and a number of other test devices has been designed and masks fabricated. This test chip has been fabricated with operation just demonstrated. Detailed testing of this chip is now underway.

ABSTRACT: (U) The moving finite element (MFE) method is a new approach for numerically solving partial differential equation (PDE) systems; it is particularly well suited for resolving PDE solutions which may contain large, multiple gradients over highly disparate scales in both space and time. These types of PDE's abound in such basic technical disciplines as aerodynamics (with emphasis on shear layers, shocks and their possible interactions), combustion, plasma physics, material interface phenomena, continuum mechanics, and other transport processes.

ABSTRACT: (U) The purpose of the investigation here was to test four inorganic cementing materials, and screen out from further investigation those that are obviously unsuitable for the fulfillment of the requirements for emergency repair of concrete runways under war conditions. The four materials are SET-45 cold formula; SET-45 hot formula; Aluminum phosphate (AIP cement; and Jet cement. In addition, a 50/50 blend of the SET-45 cold and hot formulas was investigated, and a portland cement of Type III was tested for the sake of comparison. The SET-45 formulas and the AIP cement are based on magnesium oxide. The Jet cement is a modified portland cement. A combination of mechanical testing and physicochemical examinations was used. The mechanical testing concentrated on the early strength developing capabilities of the cements under room temperature. On this basis the cements of magnesium oxide content, that is the SET-45 formulas appear to be the most suitable for the project. For instance, the SET-45 cold formula can produce compressive strengths in excess of 10,000 psi at the age of 1 hour with low water contents. Even with high water content, enough to produce flowing consistency, the 1-hr strengths are regularly over 3,000 psi. The corresponding setting time of this formula, however, is usually less than 10 minutes even at room temperature. The setting time of SET-45 hot formula is much longer.

AD-A146 139

UNCLASSIFIED

PAGE 40

however its one-hour strength is also reduced. The blend of the two formulas displays in-between strengths and times of setting.

ABSTRACT: (U) Central to almost all aspects and applications of artificial intelligence is the representation and manipulation of large bodies of knowledge about the world. When viewed from the perspective of their ability to express facts about the external world, however, most knowledge representation schemes currently used in artificial intelligence are constrained by the limits of first-order logic. That is, they provide terms for referring to individuals, predicates for expressing properties and relations of individuals, and mechanisms that achieve some of the effects of propositional connectives and quantifiers. Much research effort has been expended on ways of organizing knowledge bases and developing information retrieval mechanisms; in terms of pure expressive power, however, existing representation systems are rather limited. This issue is brought into sharp focus when one seriously attempts to analyze the semantic content of expressions in natural language, since many types of linguistic expressions seem to require something beyond first-order logic to represent their meaning perspicuously. This project undertakes a program basic research in knowledge representation, focusing on the representation of concepts needed for the semantic analysis of natural language. The objectives of the project are to produce formalisms, suitable for manipulation by computer, for the representation of specific concepts that are important for natural-language semantics, and to give an independent account of the

UNCLASSIFIED REPORT

ABSTRACT: (U) Locating object boundaries in images is an important but difficult problem. Intensity-based edge detection provides ambiguous or misleading boundary information in many situations, such as textured regions. Motion-based techniques can provide more reliable results in these cases. At object boundaries where occlusion occurs, surface regions will typically appear or disappear over time when motion is present. These regions of changing visibility may be used to indicate both object boundaries and the side of the boundary corresponding to the occluded surface. Thus, in dynamic scenes, regions of surface accretion or deletion can be found using matching technique similar to those used to determine optical flow in an image sequence. Regions in one frame that are not adequately matched by any region in previous frames correspond to accretion. Regions that have no matches in subsequent frames correspond to deletion. In either case, an occlusion boundary is present. Furthermore, by associating accretion or deletion regions with a surface on one side of a boundary, it is possible to determine which side of the boundary is being occluded. This association can be based purely on visual motion - the accretion or deletion region moves with the same image velocity as the remaining visible surface to which it is attached.

ABSTRACT: (U) High-temperature, high-power space energy-conversion systems follow an evolutionary path through continually expanding materials frontiers. Exponential growth trends point to requirements for ultimate alloys comprising the most refractory metals and metalloid additives. Therefore understanding properties, transport tendencies and interaction characteristics of these ultralloy components is a crucial essentiality. Studies of such thermophysicochemical phenomena and their detailed parametric dependencies and influences for refractory materials receive intensive and extensive support in the USSR and other iron-curtain countries. But all potential users also recognize the generic ductility, embrittlement enigmas of the highest-temperature alloys--and the related implications of recrystallization. This latter category is the research area of concentration for these studies.

ABSTRACT: (U) Detailed studies of an atomic oxygen-singlet oxygen-dimethyl hydrogen phosphite (DMHP) gas phase reaction system have been performed. Decay of singlet delta oxygen was modeled and a reaction mechanism which explains the experimental observations was derived. Semilog plots of O₂ singlet delta emission intensities in the presence of O-atoms and DMHP versus time obtained show an initial rise in the emission followed by a straight line decay.

ABSTRACT: (U) The goals of this project were to: Explore and develop programmable automation techniques for robot manipulation, sensing, and industrial vision; and Extend our programmable assembly station as a test-bed for generating and demonstrating those techniques. Five research tasks were concerned with two general problems: determining the location of parts, and moving a manipulator safely, without collisions. A sixth task was the extension of SRI's programmable assembly station. The tasks were: Analysis of Locational Uncertainty; Acquisition and Analysis of Range Data; Characterization of Feature Detectors; Multisensor Collision Avoidance; Coordination of Multiple Manipulators; and Extension of a Programmable Assembly Station.

ABSTRACT: (U) The objectives of this research are to conduct: (1) A detailed analysis of the grown-in defects and radiation induced defects in GaAs and other III-V materials grown by the LEC, VPE, LPE, and MOCVD techniques under different growth and annealing conditions, (2) Theoretical modelling of the native defects for identifying the physical origins of the deep-level traps in GaAs and other III-V materials, (3) Theoretical and experimental study of the potential well of electron traps from analyzing the electric field enhanced emission rates deduced from the nonexponential DLTS data, and (4) Study of one-Mev electron irradiation induced deep-level defects in GaAs, AlGaAs, and InP materials. The main research accomplishments are summarized.

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of the research has been to develop engineering methodologies applicable, but not limited, to aerospace automatic control design problems in which there are performance specifications requiring precise control of system behavior in the presence of stochastic disturbances (e.g., wind gusts) and large-but-bounded uncertainties in the dynamical response of the system (e.g., parameter uncertainty, unmodeled nonlinearities, and so forth). During the past three years of research, a cohesive body of theory has been developed that enables engineers to relate the ability of feedback control systems to meet such specifications directly and quantitatively to the 'return difference matrix' associated with the system's feedback loops. New results enabling the infinity optimization of returned difference singular value Bode plots promise to be of great value in robust multivariable feedback controller synthesis. Continuing research is currently being aimed at further tightening the links between this theory and the most recent developments of modern stochastic linear optimal control synthesis theory, and extending the results to admit more practical problems so that this theory may be used more effectively by engineers to efficiently and systematically design the feedback gains that determine a feedback system's return difference

UNCLASSIFIED REPORT

ABSTRACT: (U) The research in this effort has been directed into two main research areas -- nonlinear distributed parameter control systems, and nonlinear continuum dynamics with an emphasis on phase transitions. In the first year, the investigator has formulated a theory of feedback stabilization of a one dimensional string using non-local 'pseudo-punctual' magnetic controls. In the second area, work has centered on materials exhibiting first order phase transitions. This should provide a unified theory of dynamic phase transitions and their numerical computation. Ten papers were prepared for presentation or publication during this period. (Author)

DESCRIPTORS: (U) *Control theory, Feedback, Continuum mechanics, Dynamics, Nonlinear systems, Phase transformations

IDENTIFIERS: (U) Phase transitions, State spaces, PE81102F, WUAFOSR2304A1

ABSTRACT: (U) During this period, the single investigator investigated two topics. On the inverse scattering problem he wrote 1 book, 8 research papers and 7 survey papers. On the inverse Stefan problem he wrote 3 research papers and 1 survey paper. The papers on inverse scattering derive and numerically implement new, stable methods for solution, obtain a variety of uniqueness theorems and investigate the class of far field patterns associated with the scattering of plane waves by a bounded obstacle. (The set of far field patterns is in general not dense in the space of square integrable functions defined on the unit sphere when the wave number is an eigenvalue of the interior problem. This suggests new methods of solution currently being investigated.) The papers on the inverse Stefan problem derive and numerically implement new methods for solution in two space variables, prove in a new way the strong maximum principle for the heat equation and obtain expansion theorems for analytic solutions for the heat equation.

UNCLASSIFIED REPORT

ABSTRACT: (U) A system is subject to shocks which cause the system to deteriorate. In previous studies, distribution properties of such systems are discussed for different types of deterioration processes. At best these processes are right continuous Markov processes. Our interest in this paper is to tackle a related but different problem: we assume that the normal cost of running the system is 'a' per unit of time and that each shock to the system increases the running cost by 'c' per unit of time. The cost of completely replacing the system is c sub 0. The system is to be completely replaced at times $T, 2T, \dots$. Such replacement policies are known as periodic replacement policies. Since each shock weakens the system and makes it more expensive to run, it is desirable to determine a replacement time for the system. Boland and Proschan (4) consider periodic replacement of the system and give sufficient conditions for the existence of an optimal finite period, assuming that the shock process is a non-homogeneous Poisson process and the cost structure is time dependent, still requiring that the shock process is a nonhomogeneous Poisson process. We show, via a sample path argument, that the results of (3) and (4) hold for any counting process whose jump size of one unit magnitude.

ABSTRACT: (U) A number of papers representing the accumulated research results on the chirped grating lenses have been prepared and submitted for publication. They are summarized in this report. A new direction of research to investigate the use of III-V compound semiconductors has shown that very large electro-optical effects may be expected in this wavelength range. (Author)

ABSTRACT: (U) Optical flow can be used to locate dynamic occlusion boundaries in an image sequence. Derived an edge detection algorithm sensitive to changes in flow fields likely to be associated with occlusions. The algorithm is patterned after the Marr-Hildreth zero-crossing detectors currently used to locate boundaries in scalar fields. Zero-crossing detectors are extended to identify changes in direction and/or magnitude in a vector-valued flow field. As a result, the detector works for flow boundaries generated due to the relative motion of two overlapping surfaces, as well as the simpler case of motion parallax due to a sensor moving through an otherwise stationary environment. It is then shown the approach can be extended to identify which side of a dynamic occlusion boundary corresponds to the occluding surface. The fundamental principal involved is that at an occlusion boundary, the image of the surface boundary moves with the image of the occluding surface. Such information is important in interpreting dynamic scenes. Results are demonstrated on optical flow fields automatically computed from real image sequences. (Author)

ABSTRACT: (U) Research on the development of new photoinitiator systems for spatially selective photochemical machining with lasers has continued smoothly and is progressing well. The porphyrin systems developed during the second quarter continue to look particularly promising. Further experiments on the 2-component photoinitiator systems comprised of 9,10-dibromoanthracene and naphthalene sulfonyl chloride have confirmed that photopolymerization can be selectively enhanced by 2-beam irradiation. This is the first report of a 2-photon, 2-component polymerization system, to our knowledge. (Author)

ABSTRACT: (U) Organometallic chemical vapor deposition (OMCVD) of Al2O3 on GaAs has been investigated as a means of fabricating metal-insulator-semiconductor field effect transistors (MISFET). Deposition at temperatures less than 400C forms high-quality films of Al2O3. Diffusion can alter the composition during high-temperature anneals. In-situ etching of the GaAs just prior to depositing the Al2O3 markedly reduced surface generation velocities, but inversion at the interface was not conclusively demonstrated. (Author)

Transmission Over Terrestrial and Satellite Channels.

ABSTRACT: (U) During this period the single investigator
refined his technique for symbolic integration,
implemented it in a computer program in MACSYMA, and
produced and presented a paper describing his achievement
entitled, An experiment toward a general quadrature for
second order linear ordinary differential equations by
symbolic computation. A measure of his success is that he
was able to integrate successfully 90% of the 542
equations in Kamke's famous table. (Since 50 of these
equations involved arbitrary functions, etc., for which
the programs was not designed, the success rate is more
appropriately 96%.)

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes the status of this
AFOSR sponsored research program during the reporting
period. This research program is designed to examine high
frequency (40-80 Hz) Steady-State Evoked Potentials as a
tool for providing information about human sensory and
performance capability. In particular, a measure of
relative transmission time through the visual system is
to be evaluated. This report details the configuration of
the test and data collection facility and reports the
results of control and pilot studies. Some of this data
suggests that there may be a frequency 'masking' effect
in the visual system when multiple visual frequencies are
simultaneously presented. If this is verified, it may
represent a previously unobserved basic property of the
visual system response to flashing stimuli.

ABSTRACT: (U) The prism machine is a stack of n cellular arrays, each of size $(2$ to the n power $\times 2$ to the n power). Cell (i,j) on level k is connected to cells (i,j) , $(i+2$ to the k power $,j)$, and $(i,j+2$ to the k power) on level $k+1$, $1 < k < n$, where the sums are modulo 2 to the n power. Such a machine can perform various operations (e.g., Gaussian convolutions or least-squares polynomial fits) on image neighborhoods of power-of-2 sizes in every position in $O(n)$ time, unlike a pyramid machine which can do this only in sampled positions. It can also compute the discrete Fourier transform in $O(n)$ time.

ABSTRACT: (U) A study was conducted to determine the effects of crystallographic orientation and rhodium content on the creep behavior of a single crystal nickel-base superalloy. Creep tests conducted at 982 C and 220 MPa (32 ksi) on Alloy 444 single crystals show that there is an increase in creep strength as the specimen axis is varied from (001) to 28 C from (001). This orientation effect is favorable for use of nickel-base superalloy single crystal as turbine blade materials. Substitution of rhodium for tungsten in Alloy 444 increases creep strength. The mechanism for this effect is the subject of a continuing investigation.

ABSTRACT: (U) This contract funded a Satellite Symposium
on the Mathematical Modeling of Circadian Systems which
was held on June 21, 1981 in conjunction with the Annual
Meeting of the Association for the Psychophysiological
Study of Sleep (APSS) from June 17-21, 1981, at Dunfey's
Hyannis Hotel on Cape Cod, Massachusetts. The Satellite
Symposium brought together the leading investigators
concerned with modeling the circadian system to ensure
that the various proposed models were critically reviewed
and their strengths and weaknesses in predicting periodic
biological phenomena were fully understood. The papers of
each participant and an edited transcription of the
discussion were published as a book entitled
'Mathematical Models of the Circadian Sleep-Wake Cycle'
by Raven Press in 1984. The published volume serves as an
important source of all those who are concerned about the
temporal organization of human and animal behavior and
physiology. (Author)

ABSTRACT: (U) In an earlier paper a general framework was introduced for analyzing estimates in stationary nonlinear time series models. In this present paper the framework is enlarged to include certain nonstationary and nonlinear series. General conditions for strong consistency and asymptotic normality are derived both for conditional least squares and maximum likelihood type estimates. Examples are taken from threshold autoregressive, random coefficient autoregressive and doubly stochastic (dynamic state space) models. The emphasis in the examples is on conditional least squares estimates. (Author)

ABSTRACT: (U) Single crystals of a model Ni-base superalloy were heat treated so as to obtain two different gamma prime distributions; solutioned and quenched and fully aged. Surface replicas of slip occurring after small amounts of plastic deformation were analyzed using TEM techniques as a function of crystal orientation. Slip bands were clearly composed of a large number of fine slip lines. These slip lines were spaced approximately 50 nm apart. A model which describes the mechanism by which these slip lines spread and form slip bands is proposed and substantiated with TEM thin foil micrographs of the deformed alloy. (Author)

ABSTRACT: (U) Nine normal human subjects were measured by electrooculographic and video tape of the eyes during performance on a human/animal analog of the serial probe recognition task. The task was modified to distinguish attention (the missed signal) errors from decision (failure to make same versus different discrimination) errors. Two types of eyelid closing and reopening sequences were observed to be progressive with time-on-task with the earlier, Type I sequence being indicative of correct responses. The velocity of the eyelid in motion over the pupil also significantly discriminated decision correct from decision error trials. The results were interpreted to support the hypothesis that information processing function progressively deteriorates over time-on-task and is indicated by variations in oculomotor patterns.

UNCLASSIFIED REPORT

ABSTRACT: (U) The development of algorithms to extract informational features from imagery is an area of active research. These algorithms enable computerized devices to automatically locate and identify objects in the field of view of a sensor. An important Air Force application is automatic target identification and weapon guidance. Edges in an image contain much of the information necessary to classify objects. This investigation has centered on finding methods for reducing an image so as to maximize the retention of edge information which was subsequently extracted. The Hotelling transform which reduces image data so as to minimize intensity mean-square error (IMSE) in the reconstructed image was also found to have significantly better edge retaining ability than simple averaging. The reconstructed edges were quantitatively compared to those in the original images using MSE and receiver operating characteristic based measures. One such measure used was the gradient mean-square error (GMSE). Both the reconstructed IMSE and GMSE using the Hotelling transform tend to decrease as the encoding block size increases. An equation relating GMSE to IMSE was developed. For image gradient blocks that are independently reconstructed, the linear transformation matrix A that minimizes the reconstructed GMSE and in that sense maximizes edge retention was derived. UNCLASSIFIED REPORT

ABSTRACT: (U) Integrated or Guided-Wave Optics is an emerging technology that has the ultimate potential of integrating miniature optical components such as laser light sources, modulators, switches, deflectors, lenses, prisms, and detectors in a common substrate. The resultant integrated optic circuits and subsystems are expected to have a number of advantages over the conventional bulk optical systems in certain areas of applications. Some of the advantages include smaller size and lighter weight, wider bandwidth, lesser electrical drive power requirement, greater signal accessibility, and integratability. The integrated optic circuits are also expected to possess advantages in stability, reliability, ruggedness, and ultimate cost. It has been recognized for some time that the most immediate applications of integrated optics lie in the areas of wideband multichannel communications and signal processing (for both civilian applications such as fiber optic systems and military hardware such as sensors and radars). The general objectives of this research program are to study the basic physical mechanisms/phenomenon of new and novel guided-wave devices with application to wideband multichannel optical information processing. The major tasks that have been carried out during this program year include theoretical and experimental research on the following two major topics: (1) Wideband

ABSTRACT: (U) This document considers a local measurement error theory for logistic regression which is applied to four different methods: ordinary logistic regression without accounting for measurement error, a functional maximum likelihood estimate, an estimate based on linearizing the logistic function and an estimator conditioned on certain appropriate sufficient statistics. This asymptotic theory includes a bias-variance trade off, which is used to construct new estimators with better asymptotic and small sample properties. (Author)

ABSTRACT: (U) The results obtained in the third year of a continuing investigation into a method of joining silicon nitride with an oxide glass are described. Mechanical behavior of joints at room temperature and the criteria for strong joints are detailed. Two approaches were taken to strengthen the joints: heat treatments to crystallize the glass in the joint and surface preparation. The high temperature behavior of various Si3N4/glass systems was investigated by means of high temperature mechanical tests, mass spectrometry, theoretical calculations, and mass transport studies.

ABSTRACT: (U) During this reporting period, three main topics were investigated: (1) Design of fault tolerant computers using read-only memories as basic building blocks; (2) Design of programmable logic arrays and sequential networks for testability; and (3) Design of fault tolerant multiprocessor network architectures. Some titles of the resulting papers are: Sequential network design using extra inputs for fault detection; A class of unidirectional error correcting codes; A uniform representation of permutation networks used in memory processor interconnections; and A fault tolerant communication architecture for distributed systems.

UNCLASSIFIED REPORT

ABSTRACT: (U) During this period research was continued on the development and application of numerical methods for singularly-perturbed (or stiff) boundary value problems for ordinary differential equations and initial-boundary value problems for partial differential equations. The author concentrated most heavily on extensions to the adaptive finite element methods for partial differential equations. In particular, the stability of several mesh moving schemes was analyzed and local refinement techniques developed. The author also has some encouraging preliminary results on mesh moving methods in two dimensions. The investigators are applying their methods to several interesting physical problems, such as elastic-plastic solids, combustion, and a nonlinear Schrodinger equation which exhibits self focusing. (Author)

ABSTRACT: (U) Current research is summarized for the parameter identification of a class of polynomial differential systems via the modulating function method. The underlying computations involve calculating a finite number of Fourier coefficients of the input-output data which can be determined using a fast Fourier transform algorithm. Current research is also described for devising stabilizing feedback control laws for a class of differential-delay systems using a spectral factorization of the state space.

ABSTRACT: (U) A duopigatron has been used to accelerate ion and neutral beams of hydrogen, argon krypton, and xenon. An important class of ion source plasma instabilities has been investigated. The frequency of source plasma oscillations scale as the square root of ion mass. Ion extraction efficiencies for the various mass species show excellent agreement with theory in the transition from the space charge limited regime to the ion saturation regime. Displaced aperture grids with geometric focusing have been studied. Ruby laser ablation plasma experiments are underway and the ablation plasma parameters have been measured. Theoretical research has been directed towards developing analytic expressions for neutral beam stopping in solid matter in order to compare with ion beam stopping. A second part of the theoretical effort concerns coupling of three computational physics models to simulate the interaction between a neutral/ion beam with a target ablation plasma.

UNCLASSIFIED REPORT

ABSTRACT: (U) A shared database encompasses data of
interest to a variety of users. A database view provides
a class of users with an image of a portion of the data
presented according to the needs of these users. The
ability to translate updates specified against the view
into updates specified against the database is necessary
to allow more effective use of views. Since a user
accessing the database through a view has limited
knowledge of the entire domain of the database, it is
necessary to limit the effect on others of a particular
user's view update. Furthermore, there may be many ways
to translate a particular view update into database
updates. Bancilhon and Spryatos propose the notion of a
constant complementary view, which partially solves the
problem of view updates by addressing these two issues.
The authors present a reasonable view update translator
that does not preserve any complement. This illustrates
the restrictive consequences of the requirement that a
complement remain constant. (Author)

ABSTRACT: (U) The concept of weighted distributions can be traced to the study of the effects of methods of ascertainment upon the estimation of frequencies by Fisher in 1934, and it was formulated in general terms by the author in a paper presented at the first International Symposium on Classical and Contagious Distributions held in Montreal in 1963. Since then, a number of papers have appeared on the subject. This paper reviews some previous work, points out, through appropriate examples, some situations where weighted distributions arise and discusses the associated methods of statistical analysis. The importance of specification of the class of underlying probability distributions (or stochastic model) in data analysis based on a detailed knowledge of how data are obtained is emphasized. Failure to take into account the conditions of ascertainment of data can lead to wrong conclusions.

ABSTRACT: (U) A general framework for analyzing estimates in nonlinear time series models is developed. Ergodic strictly stationary series are treated. General conditions for strong consistency and asymptotic normality are derived both for conditional least squares and maximum likelihood type estimates. Examples are taken from exponential autoregressive, random coefficient autoregressive and bilinear time series models. Some nonstationary models and examples are treated in a sequel to this paper. (Author)

ABSTRACT: (U) This report summarizes the progress of research performed during the contract period from March 1982 to March 1984. A theory of hierarchical, opportunistic constraint-directed reasoning for the scheduling of job shops has been the focus of the research. In addition, new research in the areas of constraint-directed diagnosis, and reactive scheduling was initiated. An experimental software system, called ISIS, has continued its evolution and has been tested on simulated plant data.

UNCLASSIFIED REPORT

ABSTRACT: (U) During this period the investigators produced four papers with titles including, knowledge reorganization and reasoning style, Assignment of responsibility in ethical judgments, Generating hypotheses to explain prediction failures, and Learning, explanation, and a little history. They are developing a model of expertise that more closely resembles the way in which humans become experts, namely, through experience. They assume that the rule-base is not the primary repository of knowledge, but rather rules are derived from experience. Their model addresses the three problems given above as follows. (1) The knowledge-base is derived primarily from the enumeration of specific cases or experiences. They have found that a human expert is much more capable of recalling experiences than articulating internal rules. They suggest that the reason for this difference is that the human expert may not in fact be using rules in the first place. (2) As problems are presented to the system for which no specific case or rule can match exactly, the system can reason from more general similarities to compute up with an answer. This second level of reasoning should more closely resemble human problem solving behavior when people are confronted with novel situations. (3) A cornerstone to this method is automatic learning. The system's memory of experiences will be changed and augmented by each additional case that is presented. The system will remember the problems that it has encountered and use that information to solve

ABSTRACT: (U) The elements of a mathematical theory for the analysis and design of organizations are presented. The focus of the research has been on information processing and decisionmakers organizations supported by Command Control and Communications(C3) systems. The mathematical framework used in modeling the individual decisionmakers, as well as the organization, is that of n-dimensional information theory. Petri Net representation of the organizational structure is used to model the interactions between organization members as well as their interactions with the C3 system. Comparison and evaluation of alternative organizational forms is accomplished by considering organizational performance, individual workload and the sets of satisfying decision strategies. A brief description of research on distributed estimation and on information storage and flow in C3 systems is also included.

UNCLASSIFIED REPORT

ABSTRACT: (U) In some situations, discrete failure time distributions are more appropriate to model lifetimes than continuous distributions. Very few results for the discrete case have been given in the literature. This paper provides three families of discrete parametric lifetime distribution which are quite versatile in fitting Increasing Failure Rate (IFR) and Decreasing Failure Rate (DFR), and constant failure rate models to either uncensored or right-censored life-test data. The maximum likelihood estimation (MLE) of parameters, survival probabilities, and mean lifetimes is investigated, and the MLEs are shown to be easily computed by simple numerical methods. An example is given for each of the models, allowing the comparison of the proposed models. The example illustrates that the discrete models presented can provide a better fit to discrete data than previously proposed discrete distributions.

ABSTRACT: (U) The research during this second contract year continued to deal with the development of sound theoretical models for asynchronous systems. Two criteria served to shape the research pursued: the first, that the developed models extend and generalize previously developed research for synchronous discrete control; the second, that the models explicitly address the question of how to incorporate system transition times into themselves. The following sections of this report concisely delineate this year's work. Our original proposal for this research identified four general tasks of investigation: (1.1) Analysis of Qualitative Properties of Asynchronous Hybrid Systems; (1.2) Acceptance and Control for Asynchronous Hybrid Systems.

ABSTRACT: (U) This document defines the notion of independent views to indicate whether the range values of the two views may be achieved independently. The concepts of complementary views indicates when the domain element can be uniquely determined by the range values of the two complementary views. The relationship between independent and complementary views is considered. In unrestricted domains, a view (but not the identify or empty view) can have more than one complementary, independent view. Databases, however, are more restricted domains: They are finite power sets. A view is monotonic if it preserves inclusion. However, in finite power sets when all views are monotonic, if a given view has another view which is independent and complementary, then this view is unique.

UNCLASSIFIED REPORT

ABSTRACT: (U) This research has led to new developments for solving nonlinear optimization problems involving functions that are not everywhere differentiable and/or are implicitly defined. For the single variable case a method has been given which combined polyhedral and quadratic approximation, and automatic scale-free penalty technique and a safeguard that insures convergence to a stationary point, but does not detract from rapid convergence. Under relatively weak convergence rate assumptions the algorithm exhibits a new type of better than linear convergence. The safeguard also has the practical advantage of keeping apart points that are used in denominators of difference quotients for approximating second derivatives. A practical single resource allocation problem with several bounded decision variables has been solved very efficiently via a dual technique that used the single variable method in a nested manner to solve both the outer dual problem and the inner Lagrangian subproblems. The new concept of better than linear convergence form the single variable case has been generalized to the multivariable case. Author supplied key words also include: constrained minimization, and line search.

ABSTRACT: (U) Distributed parameter models of large
flexible space structures subject to various control
techniques have been studied. The main thrust has been to
develop qualitative results which are independent of
truncation or discretization approaches by treating the
fully distributed model. Emphasis has been on controlling
the transient response of non-conservative linear partial
differential equation models of such structures subject
to a few point actuators. (Author)

ABSTRACT: (U) Amorphous MgZn alloys have been obtained in the form of thin films by co-evaporation under ultra-high vacuum on cold sapphire substrates ($\approx$ approx. 10K), for Zn concentrations between 25 and 35 at.%. These films crystallize at about 350K. Their d.c. electrical resistivity and their optical properties between 0.8 and 4 eV have been investigated in situ. The resistivity versus temperature behaviour is roughly similar to that reported for quenched bulk alloys but the resistivity values are significantly larger. The complex dielectric constant follows the free-electron Drude model at low energies up to 1.8 eV. The optical free electron parameters are discussed and compared to those obtained on other free-electron-like amorphous alloys. Special attention is paid to the average effective number of conduction electrons per atom, which is found to be smaller than expected. (Author)

ABSTRACT: (U) This document surveys some of the more important theoretical results about the structure of the reliability function of a k out of n system, and indicates how these results may be used to obtain easily calculable bounds for the reliability of a specified k out of n system. (Author)

ABSTRACT: (U) Document describes a moving average process which have regularly varying tail probabilities with index $\alpha > 0$. The limit distribution of the sample covariance function is derived in the case that the process has a finite variance but an infinite variance but an infinite fourth moment. Furthermore, in the infinite variance case ($0 < \alpha < 2$), the sample correlation function is shown to converge in distribution to the ratio of two independent stable random variables with indices α and $\alpha/2$, respectively. This result immediately gives the limit distribution for the least squares estimates of the parameters in an autoregressive process. (Author)

ABSTRACT: (U) The objectives of this research were to develop rapid in-vitro assays, to evaluate the carcinogenic potential of chemicals used by the U.S. Air Force. Snyder-Theilen Feline Sarcoma Virus (ST-FeSV), quantitatively transforms human skin fibroblasts following second order kinetics. These studies were performed in order to determine whether chemicals altered ST-FeSV transformation in a predictable manner and to correlate the alteration with the carcinogenic or non-carcinogenic activity of the test chemical. The results, to date, show diverse carcinogens classed as: aromatic amines, polycyclic hydrocarbons, aminofluorenes, hydrazines, asbestos and mycotoxins inhibited virus transformation when virus infected cells (2 hours post-infection) were exposed to test chemical, while non-carcinogenic chemicals had no significant effect on transformation. Triton X-100, acetone, petroleum and shale oil derived JP5, RUS and diesel fuel, marine, demonstrated non-carcinogenic activity while formalin demonstrated carcinogenic activity. Experiments designed to show the specificity of the antagonistic effect of known carcinogens are reported.

UNCLASSIFIED REPORT

ABSTRACT: (U) Small particles and droplets encounter normal shocks in a variety of applications. The particle-shock interaction subjects the particles to large unsteady drag forces behind the shock front. In this paper, an analysis has been made of the relative importance of the Basset history integral for particle displacement and velocity behind a normal shock wave. The effect of the Basset integral has been related to gas stagnation conditions and the local gas Mach number. In the present theoretical study it has been demonstrated that the particle velocity and displacement relative to the gas back of the shock is unaffected by the inclusion of the Basset term until the latter stages of particle relaxation. The effect of the Basset history integral, which results from diffusion of vorticity from the decelerating particle, has been shown to decrease the particle drag or increase the displacement of the particle back of the shock. The effect is magnified with increasing stagnation pressures and particle diameters but with decreasing gas stagnation temperatures.

ABSTRACT: (U) This project represents an extension of an earlier project designed to examine factors influencing gas exchange during acceleration stress. Included in this report are studies dealing with the influence of the chest wall on regional intrapleural pressure during +Gz stress; influence of G-suit abdominal bladder inflation on gas exchange during +Gz stress; influence of the chest wall on gas exchange during mechanical ventilation; characterization of in vivo pressure-volume relationships of the pig's respiratory system; and mechanics of the pulmonary vasculature. Results indicate that the chest wall plays a significant role in determining gas exchange parameters during +Gz stress, during application of +Gz protective measures and during mechanical ventilation. ABSTRACT: (U) This research program was concerned with the physiological mechanisms that underlie the phenomenon of jet-lag and was aimed at developing therapeutic techniques to minimize the performance and physiological deficits that occur in rapid transmeridian air travel. During the course of this project, the circadian pacemaker responsible for the timing of the daily rest-activity was identified in the brain of the diurnal primate, the squirrel monkey (*Saimiri sciureus*). The suprachiasmatic nuclei were also identified in the human brain. A number of other significant advances included: developing a model of the circadian sleep-wake cycle, characterizing how phase shifts of the light-dark cycle reset the timing of the sleep-wake cycle, and identifying pharmacological agents which can phase-reset the circadian system.

ABSTRACT: (U) Production of negative hydrogen ions by sputtering adsorbed hydrogen from a molybdenum surface bombarded with cesium ions has been investigated. The negative hydrogen yield (number of negative hydrogen ions sputtered per incident cesium ion) is largest when the workfunction of the surface is minimized by appropriate cesium coverage. The yield has a maximum value of 0.5 at cesium ion energy of 750 eV and approaches zero at 150 eV cesium energy. The angular distribution of the hydrogen ions is close to a gaussian distribution with a standard deviation of 3 degrees, approximately independent of the bombarding energy. This means that the negative hydrogen ions have a Maxwellian distribution in parallel energies with a temperature between 0.3 to 0.5 percent of the bombarding energy.

ABSTRACT: (U) The spectrum, angular distribution, polarization and coherence properties of the radiation emitted by relativistic electrons undulating through a quasiperiodic tapered magnetic field are studied. Tapering the wavelength and/or field strength along the undulator's axis has the effect of spreading the spectral line to higher frequencies; interference over this broader spectral range results in a more complex line shape. The angular dependence, on the other hand, is not affected by the amount of taper. The polarization of the radiation in the forward direction is determined by the transverse polarization of the undulator, but the polarization changes off axis. The radiation patterns predicted here are distinct from those of untapered undulators, and their detection is now feasible. They will provide useful diagnostics of electron trajectories and threshold behavior in free-electron-laser oscillators using tapered undulators. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) One of the most difficult issues that must be addressed when studying a class of parallel algorithms is the problem of choosing a model that captures the inherent difficulty of implementing these algorithms on a multiprocessor architecture. Shared memory models have proven to be an effective tool for deriving lower bounds on the complexity of comparison problems. In particular, a speed-up of $lg(P)$ is possible for the problem of finding an element in an N -element sorted list, and speed-ups of $P \lg P$ and P are possible for merging N -element sorted lists of P processors for the cases $N=P$ and $P < N$ respectively. In practice, these speed-ups are not attainable since the shared memory models ignore many practical considerations in multiprocessor systems, such as interprocessor communications, distribution of data on local memories and limited fan-out of memory locations. In this paper we introduce a model for parallel computation that is strictly weaker than the shared memory models. The model is based on an actual machine currently being constructed (ZM08). We examine the communication facilities available in the model and show that lower bounds for merging and searching on shared memory models are attainable (within a constant).

ABSTRACT: (U) The ongoing research investigates the representations of visual texture and the processes that detect discontinuities and structure in visual texture. Psychophysical experiments have investigated the salience of bar orientation and the effect of groupings in texture segmentation. We are examining the role of elongated receptive field mechanisms in computing both local measures of orientation and their possible role in texture segmentation. We have found such mechanisms, however, to be less appropriate for determining one-dimensional groupings of (collinear) discrete items of texture. Combined psychophysical and computational studies have provided evidence for place tokens in groupings, and current work is directed towards understanding how these tokens may be defined in fine-scale texture detail. To support this work, a vision laboratory has been established based on a Symbolics 3600 Lisp Machine. (Author)

EV1198

UNCLASSIFIED REPORT

ABSTRACT: (U) The effects of physical exercise and heat exposure on the pharmacokinetic behavior of some model drugs were investigated in normal volunteers. Drugs were chosen to represent particular kinetic processes. Exercise was mild to moderate and environmental temperature was either 22 C or 40 C. Under heat exposure and exercise, theophylline exhibited prolonged half-life and reduced clearance, suggesting the need for dosage adjustment in moderately active individuals. Exercise influenced digoxin kinetics by shortening the time to peak, probably by enhancing the drug's absorption. The plasma kinetics of quinidine were unchanged under exercise conditions. However, urinary excretion of the drug was significantly higher during exercise than at rest, and this correlated with increased urinary output during exercise. Exercise and heat exposure prolonged the time of distribution of intravenously administered propranolol, while other pharmacokinetic parameters relating to propranolol remained unchanged. The half lives (T1/2) of both sulfamethoxazole and trimethoprim that were administered as co-trimoxazole were not significantly altered. The absorption of methylsalicylate that was applied on the skin was markedly influenced by the conditions tested. Thus, the amount of salicylate that was absorbed increased three fold while the subjects were exposed to either heat or exercise or both.

ABSTRACT: (U) In addition to finding that benzamide can
intervene in carcinogen induced neoplastic transformation
that is cell cycle dependent, we also developed a
procedure for detecting the presence of a malignant
phenotype in sarcoma tumor tissue. Monoclonal antibodies
(McAb) were developed against the transformed phenotype
that cross reacted with the chemically transformed cells.
We were able also to use this McAb for the detection of
sarcomatous invasive lesions in human tissue in the
presence of normal stroma. Using these procedures
described above combined with the analysis of competitive
inhibitory kinetics of poly(ADP-ribose) polymerase
activity we have now been able to identify eleven of
these inhibitors that interfere in the neoplastic
transformation process, (to be published in 1984-85).
During this time period we were also able to establish
human skin xenografts on nude mice and apply these
technologies to human skin in vivo situations. We have
also introduced a new technology for examining
modification of DNA by the carcinogen, i.e. post labeling
of the modified DNA that only requires 2 x 10 to the 6th
power cells and ca. 190-200 ng of DNA.

ABSTRACT: (U) Continuing its expansive growth, nearly 600 participants attended the 5th IEEE Pulsed Power Conference with 38 individuals from nine foreign countries - Canada, England, France, Israel, Japan, West Germany, Italy, Switzerland, and Denmark. The number of technical contributions was 220 resulting, for the first time, in a conference with four parallel sessions. In addition to the many fine comments on the technical content of the meeting, we received ample praise for the accommodations, special events and general excellence of the facilities at the Albuquerque Convention Center. It is with reluctance that we leave these facilities for the 1983 conference. The Executive Committee voted to hold the 5th IEEE Pulsed Power Conference in the Washington, D. C. area on June 10, 11, and 12, 1985. Frank Rose of the Naval Surface Weapons Center was elected as Conference Chairman with Peter Turchi, R and D Associates, as the Technical Program Committee Chairman.

ABSTRACT: (U) The development of solution algorithms for complex flowfields is the continuing objective of the research. Major focus is on use of coupled subdomains and descriptions which are either preselected or adapted to fit the physical events when necessary. The non-adaptive embedded mesh algorithm has completed airfoil solutions with an allowance for highly stretched meshes, alternate grids and reducing smoothing. A new algorithm is combining features from cell and nodal-centered methods to permit general embedded topology. Adaptive embedded mesh procedures have been extended to and carried out for two-dimensional Euler, subsonic, transonic and supersonic flows. An optimal distribution of local Courant numbers has been considered as a basis for accelerating the solution approach to a steady state. (Author)

ABSTRACT: (U) An important element of piloting high-performance jet aircraft is the human ability to perform spatial orientation information processing, particularly when it involves the use of video display instrumentation. Spatial disorientation has consistently been the cause of numerous accidents throughout the history of flight. A study was conducted to further evaluate the Manikin Task, a complex reaction time task previously developed by the RAF as a test of spatial orientation. The objectives of the study were to (1) thoroughly evaluate the training characteristics of the task including variation in performance related to individual stimuli characteristics, (2) determine the task's speed vs. accuracy tradeoff characteristics, and (3) assess performance on the task under the influence of ethyl alcohol. Response times and accuracy were measured on five subjects under various conditions over a five-week period. Analysis of the data indicated a substantial dependence of response times on certain stimuli characteristics. In addition, there was a definite decline in accuracy corresponding to a forced decrease in response time. However, the relationship could not be adequately represented by the proposed speed-

AD-A145 211

accuracy tradeoff functions. The effect of alcohol was evidenced primarily by a change in the slope of the speed-accuracy tradeoff relationship.

ABSTRACT: (U) The solubility of toluene, benzene, 1,1,2, trichloroethylene and p-cresol singly in high purity water at 20 degrees C was determined under dynamic and static conditions. Toluene present in an aqueous solutions enhanced the benzene solubility, decreased the time for solubility to be attained and increased the rate at which solubility was attained. Toluene present in the water caused little difference in the time for 1,1,2 trichloroethylene to reach solubility equilibrium, but caused a more rapid rate in attaining solubility equilibrium and increased the solubility equilibrium concentration. The effect of toluene on the solubility kinetics of p-cresol was to reduce the time in attaining solubility equilibrium, increase the rate in achieving solubility equilibrium and caused little change in the solubility concentration. EV119B

ABSTRACT: (U) A general analysis of periodic three-dimensional vortical disturbances of streaming motions around streamlined and bluff bodies is developed using a unified approach wherein the mathematical problem is reduced to solving a single inhomogeneous wave equation with non-constant coefficients. In the limit of vanishing Mach number, the problem is formulated in terms of an inhomogeneous Fredholm integral equation of the second kind. The analysis is first applied to study the unsteady aerodynamics of an airfoil of arbitrary shape moving at low Mach number in a three-dimensional periodic gust pattern. Because the homogeneous equation has a non-trivial solution, a special procedure was developed for its solution and uniqueness is obtained by applying the Kutta condition at the trailing edge. Results were compared with those obtained from a nonlinear two dimensional gust theory and linear oblique gust analyses. Comparison shows a very strong influence of the airfoil geometry and mean flow angle of attack and of the gust parameters on the unsteady lift and moment coefficients. In fact, depending on the conditions considered, the unsteady lift and moment coefficients can be several times larger or smaller than those obtained from linear theories. A superposition principle was derived whereby the unsteady lift and moment acting on a thin airfoil

ABSTRACT: (U) Further support of the LANL experiment and the strong-field synchrotron instability has used the periodic window for optical mode analysis. Using the LANL parameters current and magnetic field strength, the effect of the resonator or mode stability was examined. It was found that as much as 20% loss/pass was necessary for the FEL to run without sidebands. When the losses were dropped to 14% pass, a single sideband appeared in the untapered FEL planned at LANL. When the losses were lowered to 1% (as eventually planned), the optical field became chaotic and the FEL went broad band. (Author)

SUPPLEMENTARY NOTE: Prepared in cooperation with University Coll., Dublin. Dept. of Mathematics.

ABSTRACT: (U) This paper examines the problem of positivity in relation to the partial realization of scalar power series. An exact criterion of positivity is proved for second-order realizations. The general case is currently unsolved. Even the special results contained here show that the so-called maximum entropy principle cannot be applied to the realization problem in the naive sense in which it is employed by physicists. It would be better to call this principle a prejudice because it does not fully utilize the information inherent in the data and does not provide a realization with natural (minimal) mathematical properties. (Author)

ABSTRACT: (U) The objective of this research was to develop an advanced, nonlinear, multiaxial constitutive theory for reinforced concrete which provides a modeling capability that is superior to existing models, especially in the nonlinear response regime. The problem of constructing such a theory is partitioned into two major tasks, which have been pursued concurrently. One task consists of formulating a procedure (mixture theory) for analytically mixing reinforcing steel and plain concrete, so that the interaction between the two, which plays a key role in the overall behavior of reinforced concrete, is properly modeled. The other task consists of developing a model of plain concrete, which accurately portrays its nonlinear, multiaxial behavior and which is computationally feasible for use in conjunction with the mixture theory. The mixture theory is designed to synthesize the global constitutive properties of reinforced concrete from the properties of plain concrete, steel, interfaces and reinforcing geometry. The progress made during the course of the program toward achieving the above research objectives is summarized. A detailed

ABSTRACT: (U) When considering using databases to represent incomplete information, the relationship between two facts where one may imply the other needs to be addressed. In relational databases, this question becomes whether null completion is assumed. That is, does a (possibly partially-defined) tuple imply the existence of tuples that are less informative than the original tuple. We show that no relational algebra, that assumes equivalence under null completion, can include set-theoretic operators that are compatible with ordinary set theory. (Author)

ABSTRACT: (U) A method for predicting the downstream development of momentum thickness, skin friction, and heat transfer in a supersonic turbulent boundary layer over a rough flat plate based on ideas of Van Driest, Rotta, and Bradshaw is derived and discussed. Admissible thermal boundary conditions include the case of prescribed wall temperature and the case of an adiabatic wall. The velocity profiles for compressible nonadiabatic flow are expressed as transformations of the corresponding velocity profiles in incompressible adiabatic flow. Analytical curve fits to the experimentally determined law-of-the-wall (including the sublayer region) are given, as are analytical representations of the effects of sand grain roughness based on the well known data of Nikuradse. A FORTRAN source code for implementing the method is included as are sample calculations of the momentum thickness, skin friction, and heat transfer for several roughness heights. (Author)

ABSTRACT: (U) The objectives of this research were to improve our understanding of solar flares and solar flares and solar coronal loops. The specific approach to the flare objective was to analyze and interpret solar flare data, using theoretical methods developed as part of the research. The specific approach to the coronal loop objective was to investigate their thermal and magnetohydrodynamic stability for various physical models. The principal result of the flare research was to demonstrate that, in two well-observed flares, the mechanism of chromospheric evaporation accounts for the observed amount of flare X-ray plasma. The dominant energy transport mechanism is thermal conduction. Heating by energetic electrons is of secondary importance. The principal results of the magnetohydrodynamic stability analyses were demonstrations of the role of radiative energy loss, compressibility, magnetic field line twist, foot-point magnetic field line tying, and radial plasma pressure gradient.

UNCLASSIFIED REPORT

ABSTRACT: (U) Credibility theory refers to the use of linear least-squares theory to approximate the Bayesian forecast of the mean of a future observation; families are known where the credibility formula is exact Bayesian. Second-moment forecasts are also of interest, for example, in assessing the precision of the mean estimate. For some of these same families, the second-moment forecast is exact in linear and quadratic functions of the sample mean. On the other hand, for the normal distribution with normal-gamma prior on the mean and variance, the exact forecast of the variance is a linear function of the sample variance and the squared deviation of the sample mean from the prior mean. Suhleinn has given a credibility approximation to the variance in terms of the sample mean and sample variance. This paper presents a unified approach to estimating both first and second moments of future observations using linear functions of the sample mean and two sample second moments; the resulting least-squares analysis requires the solution of a 3 x 3 linear system, using 11 prior moments from the collective and giving joint predictions of all moments of interest. Previously developed special class follow immediately. For many analytic models of interest, one can replace the 3-dimensional joint prediction with three independent credibility forecasts using the natural

ABSTRACT: (U) The nerve agent soman (0.080 mg/kg s.c.), as well as other organophosphates in concentrations that cause cholinergic symptoms, DFP (1.5 mg/kg s.c.), paraoxon (0.23 mg/kg s.c.), and tertiary (0.2 mg s.c.) and quaternary phospholine (0.080 mg/kg s.c.) induced a progressive, dose-related necrosis in rat skeletal muscle fiber. The severity of the myopathy depended on a critical decrease and duration of AChE inhibition. The fast type II fibers appeared to be the more affected fibers in all muscles tested. The necrotic nerve fibers were repaired within one week. Examination of muscle fibers 2 and 3 weeks after a single injection of soman showed a large number of ragged red fibers in the diaphragm and soleus muscle. Following AChE inhibition, the 4S molecular form of AChE showed the fastest recovery as compared with the 10S, 12S and 16S forms. The half-time recovery rate of AChE after inhibition depended on the inhibitor used and the tissue investigated. In general, half-time rate of recovery was slowest in brain and nerve and fastest in SOL and EDL muscle. AChE activity of peripheral nerve was barely inhibited by soman and had recovered to control activity within 24 hours.

ABSTRACT: (U) Work thus far has focused on a class of tricyclic antidepressants (TADS) whose action has a gradual onset associated with the metabolic response to the drugs. Chronic treatment of rats with TADS sensitized synaptosomal adenylate cyclase (AC) to activation with guanyl nucleotides. The research has attempted to describe anatomical and functional localization of the response, probe the biochemical mechanism of observed effects; and look for behavioral correlates of biochemical changes. An interesting finding is that unlike the hypothalamic or cortical enzyme, enzyme, cerebellar synaptosomal AC is not sensitized to nucleotide activation. Other TAD associated changes are seen in cerebellum. A number of plausible biochemical mechanisms for the observed TAD responses have been investigated, and several additional possibilities have been identified. The precise mechanisms involved remains unclear. Several behavioral tests were employed to attempt to quantify observed behavioral differences between control and TAD-treated animals. The most significant observed differences was in the range and variance of responses between groups. More sophisticated and sensitive experimental paradigms are being developed.

ABSTRACT: (U) This paper indicates how exponential random variables can be efficiently used in a variety of simulation problems. One of the problems is the simulation of order statistics from a normal population. The authors discuss the general problem of simulating order statistics and then consider the normal case. They start by showing how the Von-Neumann rejection approach via the exponential can be modified to become an efficient algorithm for generating a normal and then present a method for generating normal order statistics. They show how to use the exponential to efficiently simulate random permutations with weights. They consider the problem of simulating a 2-dimensional Poisson process both for a homogeneous and nonhomogeneous Poisson process. (Author)

SUPPLEMENTARY NOTE: Prepared in cooperation with IBM Research Lab., Jan Jose, CA.

ABSTRACT: (U) The authors suggest a new approach to database updates, in which a database is treated as a collection of theories. They investigate two issues: simultaneous multiple update operations, and equivalence of databases under update operations. (Author)

ABSTRACT: (U) Pointwise Weak Law of Large Numbers and
Weak Law of Large Numbers in the norm topology of $D(0,1)$
are shown to be equivalent under uniform convex tightness
and uniform integrability conditions for weighted sums of
a sequence of random elements in $D(0,1)$. Uniform convex
tightness and uniform integrability conditions are
jointly characterized. Marcinkiewicz-Zygmund-Kolmogorov's
and Brunk-Chung's Strong Laws of Large Numbers are
derived in the setting of $D(0,1)$ - space under uniform
convex tightness and uniform integrability conditions.
Equivalence of pointwise convergence, convergence in the
Skorokhod topology and convergence in the norm topology
for sequences in $D(0,1)$ is studied. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) To a great extent the techniques for analysis and restoration of images has been developed under the assumption that the system is linear shift-invariant (LSI). These techniques are successful in some cases because a system which is diffraction-limited or a system whose object plane undergoes uniform linear motion perpendicular to the system reference axis does indeed satisfy these assumptions. However, LSI systems are singled out for study mainly because of the widespread understanding of the Fourier Transform theory along with well-known fast algorithms for its implementation. In comparison with LSI systems, very little work has been done on linear shift-variant (LSV) systems. Most of the research on two dimensional LSV systems has been done on restoration techniques by means of coordinate transformations. This technique, decomposes the LSV system into a distortion of the input plane followed by a shift-invariant operation and terminated by a distortion of the output plane. The primary objective of this research is to provide not only a mathematical structure for the state-space modeling of discrete LSV systems but to apply this model to the problems of efficient analysis and deconvolution of multidimensional systems.

UNCLASSIFIED REPORT

ABSTRACT: (U) Research on new photoinitiator systems and improved photopolymers for photochemical machining with lasers has resulted in the successful laboratory demonstration of crossed-beam polymerization, although some single-beam polymerization still occurs under the condition examined to date. Porphyrin sensitizers and acrylate polymers have given the best results so far, especially when the samples are first degassed under vacuum to remove oxygen. A computer-controlled three-axis translation stage has been constructed to move the sample relative to the (fixed) laser beams. Future work will be directed toward continued improvement of the polymer materials. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This research was directed towards developing a methodology for partitioning choice-reaction time into component parts, using both the additive-factor and the subtractive method. This methodology involved the use of a modified Sternberg task in which the subjects viewed two horizontally presented letters and were required to classify each of the letters into either the positive or negative set. The classification procedure was performed by depressing two response keys on the same trial. Latency measures were obtained for the elapsed time between stimulus onset and the first response and between the first response and the second response. Input and output times were then derived. In addition, three different types of interruption stimuli (auditory, visual and auditory-visual) were presented at various times prior to and after the onset of the classification stimulus. Input and output latencies were differentially influenced by the different types of interruption stimuli and by the onset time of those interruption stimuli.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report concludes our study of large-scale vectorized numerical analysis applied to time domain seismic wave phenomena in filled basins. Applications include calculations of waves from simple surface or buried sources in a variety of idealized 2-D Basin and Range models (36,000 to 120,000 nodes) described in an interim report, and one large 3-D model (400,000 nodes) from Yucca Flat, Nevada Test Site, described here. Analysis is based on an explicit, finite element, elastic wave solver designed for vectorized execution on the CRAY-1. The primary result of the present 3-D study is that, given the database available from investigations in Yucca Flat, Nevada Test Site, the size of feasible 3-D computational models on the CRAY-1S is adequate to simulate elastic wave fields and interpret arrivals for comparison with existing 3-D ground motion data. Synthetic seismograms from a 400,000 element 3-D simulation of the COALORA event at Yucca Flat indicate that a significant source of transverse motion on radial lines through the source is diffraction from a discontinuity in the Rainier Mesa tuff layer across the Yucca fault. Successful time-domain simulations in 3-D are feasible with pipelined supercomputers but optimal processing requires careful tailoring of the algorithm to vectorize inner code loops and eliminate nonessential

ABSTRACT: (U) An exact solution for the angular-spatial
moments of the Spencer-Lewis equation is given, along
with methods for reconstructing the electron density
function. The new solution techniques is implemented in a
computer code and several sample calculations are carried
out with monoenergetic plane sources of electrons in
infinite media of aluminum and carbon. The sample
calculations produce the electron distribution in space
and path length rather than some integrated quantity such
as the energy deposition profile. Such analytic solutions
are intended to serve as benchmarks for testing numerical
electron transport codes. (Author)

ABSTRACT: (U) This report describes the research results
on Honeywell's Hierarchical Multisensor Image
Understanding program. Honeywell is developing a unified
framework for the different hierarchical levels of image
processing such as segmentation, detection,
classification, and identification of outdoor scenes and
across different sensor modalities such as millimeter
wave, infrared, and visible. Current activities on the
project are reviewed under the following headings: (1)
artificial-intelligence-based generic image segmentation
and object recognition; (2) evidence-confidence paradigms
for image understanding; (3) hierarchical systems theory
for control structures; and (4) invariant methods in
image understanding. Also discussed are scene analysis
and attributed graphs.

UNCLASSIFIED REPORT

ABSTRACT: (U) This interim report documents the work done to this point on Autoregressive Integrated Moving-Average (ARIMA) model-based analysis of myoelectric signals. The ARIMA modelling procedure and the hardware required for collecting myoelectric data are described in detail. Pattern analysis methods for characterizing the myoelectric signals under different levels of alertness/workload are discussed. Additionally, the various tasks in the Experimental Control Package that subjects must perform while being monitored are described. Finally, an analysis of data obtained during experimental sessions is provided giving some indication of discriminability of the ARIMA signatures over different task difficulty levels and subjects. Results of this analysis indicate that the first AR parameter is the most useful feature in differentiating workload/alertness level. Additionally, this feature was shown to be reliable for each underlying level of alertness or load in a given task.

DESCRIPTORS: (U) *Operators(Personnel), *Performance(Human), *Pilots, *Workload, *Electromyography, *Monitoring, *Mathematical models, Muscles, Vigilance, Attention, Stochastic processes,

ABSTRACT: (U) This report discusses the following subjects: A New Rapid Acquisition Technique for Direct Sequence Spread Spectrum Communications. The rapid acquisition technique described here can be used in direct sequence spread spectrum systems. The technique employs a double threshold which defines when a decision can be made. These thresholds change at each examination instant. Using this technique a significant reduction in the acquisition time of a direct sequence spread spectrum signal is obtained. A New Double Threshold Acquisition Scheme Applied to the Fading Channel in Frequency Hopping Spread Spectrum.

UNCLASSIFIED REPORT

ABSTRACT: (U) Human velocity discrimination depends on
the precise detection of minute time variations (under 1
msec). A physiological summation process called
'sequential recruitment' is responsible for this
remarkable temporal sensitivity. Precise velocity
discrimination is possible with very brief target
durations (less than 100 msec). The oculomotor systems
used this sensory signal to initiate smooth pursuit eye
movements.

ABSTRACT: (U) An intense relativistic electron beam
cannot propagate in a metal drift tube when the current
exceeds the space charge limit. Very high charge density
and electric field gradients (100 to 1000 MV/m) develop
at the beam front and the electrons are reflected. When a
neutral gas or a plasma is present, collective
acceleration of positive ions occur, and the resulting
charge neutralization enables the beam to propagate.
Experimental results, theoretical understanding, and
schemes to achieve high ion energies by external control
of the beams front velocity will be reviewed. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) A theoretical study has been made of the shallow donor and Wannier exciton within a one-dimensional quantum well. The variational method was used with a cylindrical Gaussian basis set. In order to facilitate comparison with future experimental measurements of excited states of these systems, an external magnetic field was assumed perpendicular to the interfaces between the barrier material and the well. Calculations reveal that the choice of matching conditions used at the interfaces has little effect on the binding energies of the ground or first few excited states of the shallow donor, except for well widths considerably smaller than the effective Bohr radius. The results of calculations of the shallow donor ground and first few excited states are presented for a variety of well sizes and magnetic field strengths. Similar results are given for the ground state of the Wannier exciton. (Author)

ABSTRACT: (U) The Honeywell oculometer has a noise level of about 0.1 deg(2); eye tracking is noisier than head tracking; vertical eye tracking is noisier than horizontal eye tracking. It has about 25% crosstalk of the horizontal channel into the vertical channel. It has an 84 ms time delay. It is not effective at detecting and rejecting eye blinks; typical eye blink artifacts last 50 to 200 ms. The human tracks best when tracking with eyes alone. Although tracking with head and eyes should be more natural, the human does worse when he uses his head. Head only tracking is the worst of the three conditions.

ABSTRACT: (U) A chemically reacting shear layer between various gases was investigated in a new type of blow-down wind tunnel. The gas streams were inert (helium, nitrogen or argon), but carried up to 10% concentration of reactants, one being ozone and the other nitric oxide. The resulting reaction, $O_3 + NO$ yields $NO_2 + O_2$, was essentially diffusion limited and spontaneous, enabling the temperature rise to be varied at will from zero up to 200 C mean. Flows of Reynolds number up to 5×10^5 to the fourth power were investigated.

ABSTRACT: (U) During the reporting period, Cerenkov laser resonators with a rectangular configuration were analyzed, constructed and experimentally tested. All of the previous work was based upon cylindrical resonators, a choice which was convenient because of the intrinsic symmetry of the beam transport and focussing. In many potential applications, however, an amplifier would be more useful than an oscillator and a structure which, coupled to a linearly-polarized field would then be far more convenient. It was for this purpose that the rectangular dielectric slab waveguide structures were analyzed and tested.

ABSTRACT: (U) It is well known that explosive-based propellants are susceptible to detonation from the controlled deflagration mode of combustion. In some instances a confined zone of granulated propellant adjacent to a zone of cast propellant can provide a rapid enough pressure-rise rate to shock initiate the cast material. If the cast propellant has voids, the detonation will initiate at some location ahead of the granulated bed/cast material interface. This report is a summary of the research activities that focus on the analysis and modeling of the physics of such highly transient flows.

ABSTRACT: (U) In an effort to understand certain ideas and concepts associated with multi-grid iterations the authors give an in-depth study of a particular simple problem. They consider a standard finite-difference system associated with a two-point boundary value problem. $-(pu' + bu' + qu = 0, u(0) = u(1) = 0$. The operators $Ih2h$, $Ih2h$ are 'operator' based interpolation and projection operators while the smoothers are the damped Jacobi iterations with parameter $\alpha > 0$. This document determines the exact rates of convergence for the two-grid scheme and upper bounds for the multi-grid schemes. Experimental results are discussed. (Author)

ABSTRACT: (U) In electrophysiology, the Event Related Potential is assumed to be composed of several underlying component wave forms. Principal Component Analysis is a statistical technique that has been used to uncover the components by analysis of the observed wave form. The mathematical assumptions behind Principal Component Analysis are examined, and their plausibility is questioned. It is pointed out that under certain conditions the component forms may not accurately be recovered by Principal Component Analysis. Under other circumstances violations of some of the mathematical assumptions does not appear to affect the accuracy of recovery of component waveforms. The points made are illustrated by an analysis of simulated wave forms constructed from known components.

UNCLASSIFIED REPORT

ABSTRACT: (U) This analysis is aimed at the near-wall processes in an injected, axisymmetric, viscous flow. It is a part of an overall study of solid propellant rocket instability, in which cold flow simulation is evaluated as a tool to elucidate possible instability-driving mechanisms. One such prominent mechanism seems to be visco-acoustic coupling, as indicated by earlier detailed order of magnitude analysis. The major component of the overall study involves numerical simulation of the full set of coreflow equations of motion (nonsteady, axisymmetric) by a modified McCormack integration technique. To clarify some of the physical interactions inherent in the various regimes of the flowfield, two (separate) singular perturbation analyses have been carried out. The head-end boundary regime, and the injected sidewall layer, both involve appreciable viscous dissipation, and hence are characterized by predominantly parabolic differential systems. The inverse square root of the injection Reynolds number serves as a small-perturbation quantity.

ABSTRACT: (U) We examine methods of implementing queries about relational databases in the case that these queries are expressed in first-order logic as a collection of Horn clauses. Because queries may be defined recursively, straightforward methods of query evaluation do not always work, and a variety of strategies have been proposed to handle subsets of recursive queries. We shall express such query evaluation techniques as 'capture rules' on a graph representing clauses and predicates. The essential property of capture rules is that they can be applied independently, thus providing a clean interface for query evaluation systems that use several different strategies in different situations. We show how rules suggested previously can be fit into this framework, and we propose some new capture rules and generalizations of old ones.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes the progress to date on work to date under the contract. Research on planning and problem-solving systems was begun at SRI International in September 1979. Progress has been described in detail in three annual reports (1980, 1981, and 1982). The main task of this research program is to develop powerful methods of representing, generating and executing hierarchical plans that contain parallel actions. Execution involves monitoring the state of the world and possibly replanning if things do not proceed as expected. Two different approaches to these problems are being pursued under this contract. The first is heuristic; it involves building an actual computer program that provides a representation from which it then generates plans. This approach comprises the majority of the effort on this project. The second approach is to investigate the theoretical foundations of planning. This will not, in all likelihood, result in a program, but it will formalize the planning problem and one solution to it. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This paper presents new algorithms for
estimating the spatio-temporal spectrum of the signals
received by a passive array. The algorithms are based on
the eigenstructure of the covariance and spectral-density
matrices of the received signals. These allow partial
correlation between the sources and thus are applicable
to certain kinds of multipath problems. Simulation
results that illustrate the performance of the new
algorithms are presented. (Author)

ABSTRACT: (U) A multi-disciplinary program for space-
based image processing is reported. This project combines
optical and digital processing techniques and pattern
recognition, image understanding and artificial
intelligence methodologies. Time-change image processing
was recognized as the key issue to be addressed. Three
time-change scenarios were defined based on the frame
rate of the data change. This report details the recent
research on: various statistical and deterministic image
features, recognition of sub-pixel targets in time-
varying imagery, and 3-D object modeling and recognition.

SUPPLEMENTARY NOTE: Presented at the IEEE Computer Data Engineering Conference Proceedings, Los Angeles, CA, Apr 84.

ABSTRACT: (U) In this paper we consider approaches to updating databases containing null values and incomplete information. Our approach distinguishes between modeling incompletely known worlds and modeling changes in these worlds. As an alternative to the open and closed world assumptions, we propose the modified closed world assumption. Along with the discussion of updating, we address some issues of refining incompletely specified information. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The goal of this work is to identify the processing flaws that limit the strength of sintered ceramics, and to engineer uniform microstructures which either eliminate or minimize the size of these processing flaws. During the first year, a major advance was made by uncovering the fact that agglomerates in powders produce crack-like voids that severely limit the strength of sintered ceramics. Crack-like voids produced by the differential sintering of agglomerates relative to their surrounding powder matrix can be the most detrimental strength degrading flaw in sintered ceramics. As detailed and summarized in the review prepared for a 1984 ASM Conference on Materials for Future Energy Systems, colloidal approaches to powder processing and consolidation can minimize the size of soft agglomerates (those that can be broken apart with surfactants) and hard agglomerates (eliminated by sedimentation of colloidal suspensions). Work has shown that the elimination of the large, soft agglomerates with surfactants increases the average strength of a transformation toughened Al2O3/30 v/o ZrO2 (2.5 v/o Y2O3) composite from 550 MPa (80,000 psi) to 930 MPa (135,000 psi).

ABSTRACT: (U) The combined results of the first three years of the program are presented, with emphasis on the stress corrosion cracking and hydrogen embrittlement of the PM 7090 Al alloy. Additional results on 7075 are also given. In particular, the role of temper and loading mode in susceptibility were examined for three test methods---time to failure of notched round bar specimens in a brine solution; straining electrode tests on notched round specimens under cathodic charging; and tensile tests on hydrogen pre-charged notched round specimens. These tests form the basis for an extensive, completed Ph.D. thesis which is summarized here. Stress corrosion testing has also been conducted on 7075 in aluminum chloride solutions and on HP 7075. We remain confident that we have established the basis and a good portion of the results necessary to understand, predict and model the role of hydrogen in stress corrosion cracking of high-strength aluminum alloys.

UNCLASSIFIED REPORT

ABSTRACT: (U) The problems investigated under this
minigrant arose in the author's research on
electromagnetic (EM) lens design. This research was
concerned with an EM lens design technique developed by C.
E. Baum for transitioning TEM waves between cylindrical
and conical transmission lines.

UNCLASSIFIED REPORT

ABSTRACT: (U) This article considers the problem of determining the optimal value and corresponding optimal point of a real function F in M variables. Only function values are given and the computation of derivatives is either not practical or are not available. Bremermann introduced an ingenious and useful optimization algorithm that is guaranteed to converge for polynomials in several variables up to fourth degree. The heart of this method is the use of random directions of search together with a Lagrangian interpolation scheme. This author, having had extensive experience with this algorithm, found that the method has fast convergence at the early stages and tends to stagnate in the neighborhood of the optimal point. Motivated by the usefulness of random directions it is the purpose of this article to present an algorithm based on the proper use of interpolation schemes; (a) Lagrangian interpolations (such as those in Bremermann's methods); (b) spline approximations with variable nodes; (c) pseudo Newton steps using the spline derivatives (not the function); together with a search procedure along weighted random directions. The directions are chosen to be orthogonal using the Gram Schmidt orthogonalization procedure. This algorithm was extensively used for problem solving in mathematical biology, chemical kinetics, and general dynamical systems.

ABSTRACT: (U) The brushless direct current (DC) machine theoretically offers wide speed range torque characteristics like unto the commutator DC machine. However, in brushless DC motor drive systems there exists a performance deficiency in that at near zero speeds driven mechanical loads can respond to the pulsating component of developed torque when simple rotor position-activated switching is utilized. This report analytically develops a pulse width modulation control philosophy that reduces torque pulsations to an acceptable level. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This final report summarizes the experimental approach was to initially study a single alloy which exhibits a transition from brittle to ductile type erosion response at room temperature. At a later stage, the dynamic hardness of several substrate materials, both pure metals and alloys, was measured in order to provide a material property obtained under dynamic conditions similar to those during an actual erosion event. The results can be conveniently separated into two phases as follows: Erosion Material Removal Mechanisms, and Correlation Between Dynamic Hardness and Erosion.

ABSTRACT: (U) The report describes molecular-beam studies of ion-pair production, charge transfer, and measurements of the fraction of excited Na atoms in a composite beam of ground-state and excited Na atoms. Some of the experiments involved laser excited Na as a reactant. Included are investigations of the Na-Br, doubly charged Ar-Ar, Ne ion-metastable He, excited Na-Na, and Li-Na systems.

UNCLASSIFIED REPORT

ABSTRACT: (U) The Geophysics Scholar Program was initiated as a pilot program to provide new Research Scholars with one year appointments to the Air Force Geophysics Laboratory. Extensive mailings were made to technical departments at universities around the United States where programs of prime interest to the Geophysics Laboratory were established. These included Atmospheric Studies, Geophysics, Meteorology and related applied sciences. Ten Scholars were appointed beginning in September 1982 and extending through December 1982, for 12 months duration. Six of these were subsequently continued in the Geophysics Scholar Program under another contract for a second year. Five technical papers were presented by the Scholars during the year. The final technical reports on the Scholar's work are included in this report. This pilot program was judged to a success by both the Scholars and their Laboratory Associates. Their comments were solicited by questionnaire and are included. The Scholars were judged to be beneficial to the Laboratory. The opportunity of having new Research people on a short term basis was felt to be very stimulating and worth while. Their interaction with the Laboratory was very positive. At the initiation of this program, travel funds were provided only for travel to the Laboratory site at the state of the appointment and return funds at the end. Some difficulties were

subsequently encountered in transferring funds and authorizing travel to technical meetings. This caused some distress among the Scholars. However, overall, the Scholars felt their experience at the Laboratory were constructive steps in their professional development. (Author)

ABSTRACT: (U) A differential impedance and transit-time matching approach is used in the design of an anisotropic lens for launching TEM waves from a small source, through the lens, and onto a conducting circular conical system. This approach leads to a system of ordinary differential equations which may be solved exactly to obtain the lens parameters. An approximate solution, which would be applicable to a design procedure, is also given. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The effect of temperature, pressure and time on the rate of densification of submicron alumina powder during hot isostatic pressing has been determined using a dilatometer to continuously monitor volumetric changes. A Fortran computer program is used to make corrections for thermal expansion of the alumina and the stainless steel can, to determine the relative density of the alumina compact at any point, and to produce report ready graphs depicting the relationship between any two prescribed variables. Analysis of other errors associated with the use of the dilatometer shows that these are negligible compared with thermal expansion effects. The rate of densification is controlled by an interface reaction mechanism never previously observed in the densification of alumina. Mass transport is limited by the movement of grain boundary dislocations which act as sites for atoms to detach from grains. The actual rate limiting process is the diffusion of solute in the lattice since the motion of solute atoms can result in a large number of atoms being freed from a grain boundary dislocation. Once separated from the dislocation the atoms quickly diffuse away.
