COMBAT SERVICE SUPPORT MISSION AREA
NATEL PLAN (CSS MAMP) USER'S MANUAL
September 30, 1985

Prepared for the US Army Belvoir Research and Development Center, Fort Belvoir, Virginia 22060.

THE BDM CORPORATION

FOREWORD

This technical report is submitted to the US Army Belvoir Research and Development Center (BRDC), Fort Belvoir, Virginia under Contract Number DAAK70-83-D-0019, Task Order 19, by The BDM Corporation, 7915 Jones Branch Drive, McLean, Virginia. This report documents the status of the Combat Service Support Mission Area Materiel Plan (CSS MAMP) software as of 30 September 1985. The software is continually evolving as is the underlying data base, so the reader is cautioned to explore the actual software for further refinements. The text of this document is available on the BRDC Plexus P60 computer for convenient reference and update. The MAMP is implemented on the P60 using the Informix Database Management System of Relational Database Systems, Inc.

This document does not include sample program outputs because they are typically classified. The reader is urged to refer to the three BRDC published CSS MAMP documents of February, May, and September 1985 for the actual output of this software. The February Plan illustrates the historical evolution of the automated MAMP process. The May Plan introduces several new report formats for commodities, projects, systems, and workpackages. The September Plan introduces the funding profiles format for deficiencies and commodities.

CHAPTER I
HOW TO RUN THE CSS MAMP

This chapter presents reasonably concise instructions on how to run CSS MAMP reports. It is intended as an easy reference guide for the Plexus system user who is asked to prepare any of the seventeen specific preprogrammed reports of the MAMP. The text of this chapter is on-line at the file /u/plan/document/howto. Corrections or revisions to this text should be posted to that file.

THE BDM CORPORATION

A. GENERAL

These instructions presume that the reader is able to run the machine and is familiar with informix. Some of the instructions get a bit tricky, so they will be very explicit. The first task is to decide exactly what is going to be in the report to be printed. There are a lot of different individual reports to address a wide variety of questions. So the first requirement is to get an exact description of which reports are desired and in which order.

The MAMP reports are set up to take the page number as a parameter. This is the starting page number for that report. Usually, but not always the first printed page in a volume will be page 1. If more than one report is in the same volume then the next report will start on a page number that is determined by the length of the previous report. The standard UNIX function "tail" can be used to see which page was last printed prior to starting processing on the next report. For example "tail commod.out" will give the last page used in the commodity summary report.

It is possible to set up some shells (which are preprogrammed sequences of operating system commands) such as /u/plan/db/system to take away all the drudgery of running any particular volume. But this presumes that the volume configuration is stable - which it isn't. It also takes all the understanding of the process away from the operator. Therefore, these instructions will focus on doing it the hard way - the way it was done for the May 85 MAMP - and not on the way it can be done using shells.

B. GETTING STARTED

1. Complete all changes to the data base. Data base changes during the process of running the MAMP are deadly. All kinds of strange events have been known to result from last minute changes. All of them are very frustrating.

THE BDM CORPORATION

2. Run spot checks of the data base using informer or some ad hoc reports. These will help identify problems that may be lurking in there. Specifically, you are looking for major defects in the database that will have an obvious impact on the printed reports and which historically have been common. Informer is a perfect tool for this since the problems will change over time. My favorites are:

(a) This is used to find systems which do not have completely specified ssndesc entries. They will show up as complete separate pages in the commodity report.

```
read into a
csscontrol_ssn_no ssndesc_cmd ssndesc_major_system
where ssndesc_cmd=" " or ssndesc_major_system=" "
joining csscontrol_ssn_no=optional ssndesc_ssn_no;
```

(b) This is used to quickly find all the commodity line - command combinations which will be printed in the commodity report. Check for misspelled commodity lines.

```
read into a
unique ssndesc_major_system ssndesc_cmd
joining ssndesc_ssn_no=csscontrol_ssn_no;
```

(c) This is used to find systems which for some reason do not have system titles or mission areas defined. They look bad in the system and deficiency reports.

```
read into a
csscontrol_ssn_no lrpproc_ssn_title lrpproc_miss_name
where lrpproc_ssn_title=" " or lrpproc_miss_name=" "
joining csscontrol_ssn_no=optional lrpproc_ssn_no;
```

(d) This is used to identify the workpackage command names that have been used in the data base. Sometimes there are inconsistent spellings. Also useful in deciding what commands belong to "PM's" and to "Others".

```
read into a unique wkpkg_cmd;
```

THE BDM CORPORATION

3. All obvious data errors should be corrected at this time!!!

4. Rebuild the temporary utility files that are commonly used. These are pseudolink, ssnpri, and assoc. This process takes a while (at least 1 hour), so be sure you are happy with the data contained in the parent files: mergessn, ssndef, and rollup respectively. The following shells are used to rebuild them:

/u/plan/db/buildps - rebuilds the pseudolink file from the mergessn file. This is mandatory if any of the workpackage to system linkages in mergessn have changed. Otherwise they will not be reflected in any of the printed reports.

/u/plan/db/addmergessn - optionally rebuilds mergessn from the pseudolink file. As it does so, it alphabetizes the SSN's and eliminates duplicate entries. Be sure that buildps has been run first so that pseudolink is current.

/u/plan/db/buildssnpri - rebuilds the ssnpri file from the ssndef file. This is mandatory if any of the system to deficiency linkages in ssndef have changed. This is particularly important to the deficiency reports.

/u/plan/db/addssndef - optionally rebuilds ssndef from the ssnpri file. As it does so, it numerically orders the deficiencies and eliminates duplicate entries. Be sure then buildssnpri has been run first so that ssnpri is current.

/u/plan/db/buildassoc - rebuilds the assoc file from the rollup file. Assoc is only used in reconstituting the procurement funding for rollup NSI's. It is mandatory to rebuild it if the rollup to associated SSN linkages have been changed.

/u/plan/db/addrollup - optionally rebuilds the rollup file from the assoc file. As it does so, it alphabetizes the associated SSN's and eliminates duplicate entries. Be sure to run buildassoc first so that assoc is current.

THE BDM CORPORATION

`/u/plan/db/assocrollup` - modifies the procurement funding dollars in `lrpproc` for rollup systems which are NSI's. This is a very time consuming procedure. Direct entry into `lrpproc` is desirable if the associated SSN's will ever settle down. Must run `buildassoc` first. Do not run this if the linkages have not changed.

`/u/plan/db/priority` - rebuilds the two priority ranking files `prior1` and `prior2`. These will change if `ssndef` or `mergessn` have changed. The files `ssnpri` and `pseudolink` should be rebuilt first. This must be run before any of the priority reports.

C. RUNNING THE REPORTS

All reports are run from the `/u/plan/db` directory. Move there using the command `"cd db"`. The `#` symbol used here means to insert the starting page number for the printed report into the command as indicated. The `cmd` symbol means to insert the command name in capital letters into the command as indicated. Use `"tail"` to find out the page number of the last page used.

1. Deficiency Summary

command: `defroll #`
writes to: `defroll.out`
comments: Takes about 1 hour. `Dbstatus` reports and of file errors which should be ignored.

2. Deficiency Funding Profile

command: `defpro #`
writes to: `defpro2.out`
comments: Takes about 1 hour.

3. Commodity Summary

command: `acego commod #`
writes to: `commod.out`
comments: Takes about 20 minutes.

THE BDM CORPORATION

4. Commodity Funding Profile

command: compro #
writes to: compro2.out
comments: Takes about 30 minutes.

5. Commodity Index

command: acego comindex
writes to: comindex.out
comments: Takes about 5 minutes. Page numbers begin with A-1.

6. Project Summary

command: acego peproj #
writes to: peproj.out
comments: Takes about 20 minutes. Includes all CSS funded projects in cssprdte.

7. Project Index

command: acego projindex
writes to: projindex.out
comments: Takes about 5 minutes. Page numbers begin with B-1.

8. System Rollup Summary

command: acego sysrollnew cmd #
writes to: sysrollnew.out
comments: Takes about 10-15 minutes.

9. System Funding Summary

command: acego sysdollars cmd #
writes to: sysdollars.out
comments: Takes about 10-15 minutes.

THE BDM CORPORATION

command: acego sysdolla #
writes to: sysdolla.out
comments: Includes Project Managers.

command: acego sysdollb #
writes to: sysdollb.out
comments: Includes Other Commands.

10. System Resources Summary (w/o 6.3b/6.4 Workpackages)

command: acego sysres cmd #
writes to: sysres.out
comments: Takes about 10 minutes.

command: acego sysresa #
writes to: sysresa.out
comments: Includes Project Managers.

command: acego sysresb #
writes to: sysresb.out
comments: Includes Other Commands.

11. Base Case/Type Classified Streamlined Summary

command: acego basetc cmd #
writes to: basetc.out
comments: Takes about 5 minutes.

command: acego basetca #
writes to: basetca.out
comments: Includes Project Managers.

command: acego basetcb #
writes to: basetcb.out
comments: Includes Other Commands

THE BDM CORPORATION

12. System Index

command: acego sysindex
writes to: sysindex.out
comments: Takes about 5 minutes. Ordered by title.

command: acego sysindex1
writes to: sysindex1.out
comments: Takes about 5 minutes. Ordered by SSN.

13. Workpackage Appendix

command: acego wrkapdxa cmd #
writes to: wrkapdxa.out
comments: Takes about 10 minutes. Writes on pages A-#.

command: acego wrkapdxb cmd #
writes to: wrkapdxb.out
comments: Takes about 10 minutes. Writes on pages B-#.

command: acego wrkapdxc #
writes to: wrkapdxc.out
comments: Takes about 10 minutes. Writes on pages B-#.
Includes Project Manager workpackages.

command: acego wrkapdxd #
writes to: wrkapdxd.out
comments: Takes about 10 minutes. Writes on pages B-#.
Includes Other Command workpackages.

14. Workpackage Index

command: acego wkpinde
writes to: wkpinde.out
comments: Takes about 5 minutes. Page numbers begin with 1

THE BDM CORPORATION

15. System 1 to N Priority Report

command: acego priorcss
writes to: priorcss.out
comments: Takes about 10 minutes.

16. Workpackage 1 to N Priority Report

command: acego priorwpall
writes to: priorwpall.out
comments: Takes about 10 minutes.

17. Priority Rating Schemes Comparison Report

command: pcomp
writes to: pcomp.out
comments: Takes about 30 minutes.

D. BUILDING SHELLS

As stated earlier, a shell is a preprogrammed sequence of commands that is executed as a single command. The sequence can be simple or quite complex. Any operating system command or executable program can be included in the shell and there are a few extra enhancements which can only be done within a shell. It is possible that a single command could execute the entire MAMP.

To create a shell, one uses the standard editor (vi) to type in all the commands just as if they were being entered directly from the keyboard. Inside the editor, mistakes can be corrected and the sequence revised before attempting to run it. When the shell is complete and saved as a file, then the file can be executed by typing in its name. Note that the file's execute flag must be turned on first (chmod +x filename) or the system will reject the command.

A couple of UNIX features are quite useful to shells. These are pipes (|) and input/output redirection (<, >, and >>). The reader should refer to the UNIX text to become familiar with these concepts. Also the reader should

THE BDM CORPORATION

feel comfortable browsing through the UNIX reference manual to examine the meaning of new commands and parameters. Although UNIX is very powerful, it is not very self evident. The best way to learn new features is to see what others have done and to try to figure out why it works by consulting the manual.

A sample shell script to create the entire system volume, /u/plan/db/system, is included below. The reports here are contained in the /u/plan/rpt.Neil directory since they require the page number be input from the standard input file and not as a parameter to the program.

```
echo "SEE SYSTEM.LOG FOR A LOG OF THIS PROCEDURE"
```

```
expr 1 | acego ../rpt.Neil/basetc AVSCOM > system.log
mv basetc.out system.avs
tail -10c system.avs | pagerread.out | acego ../rpt.Neil/sysres AVSCOM >> system.log
tail +2 sysres.out >> system.avs
tail -10c system.avs | pagerread.out | acego ../rpt.Neil/sysdollars AVSCOM >> system.log
tail +2 sysdollars.out >> system.avs
echo "SYSTEM REPORT FOR AVSCOM COMPLETED (system.avs)"

tail -10c system.avs | pageodd.out | acego ../rpt.Neil/basetc BELVOIR >> system.log
mv basetc.out system.bel
tail -10c system.bel | pagerread.out | acego ../rpt.Neil/sysres BELVOIR >> system.log
tail +2 sysres.out >> system.bel
tail -10c system.bel | pagerread.out | acego ../rpt.Neil/sysdollars BELVOIR >> system.log
tail +2 sysdollars.out >> system.bel
echo "SYSTEM REPORT FOR BELVOIR COMPLETED (system.bel)"

tail -10c system.bel | pageodd.out | acego ../rpt.Neil/basetc CECOM >> system.log
mv basetc.out system.cec
tail -10c system.cec | pagerread.out | acego ../rpt.Neil/sysres CECOM >> system.log
tail +2 sysres.out >> system.cec
tail -10c system.cec | pagerread.out | acego ../rpt.Neil/sysdollars CECOM >> system.log
tail +2 sysdollars.out >> system.cec
echo "SYSTEM REPORT FOR CECOM COMPLETED (system.cec)"
```

THE BDM CORPORATION

```
tail -10c system.cec | pageodd.out | acego ../rpt.Neil/basetc ERADCOM >> system.log
mv basetc.out system.era
tail -10c system.era | pageread.out | acego ../rpt.Neil/sysres ERADCOM >> system.log
tail +2 sysres.out >> system.era
tail -10c system.era | pageread.out | acego ../rpt.Neil/sysdollars ERADCOM >> system.log

mv sysindex.out system.idx
acego ../rpt.Neil/sysindex1
mv sysindex1.out system.idx1
echo "SYSTEM INDEXES COMPLETED (system.idx and system.idx1)"
```

E. PRINTING AND SAVING THE REPORTS

Reports are printed on the lineprinter using the lprint command or the lpr line printer spooler command. Lprint can only print one file at a time, and multiple print jobs will confuse the printer. Lpr will queue the jobs and wait for the printer to become available. Lpr also prints a banner and several page ejects with each job, so it will be unacceptable if the print jobs must run on consecutive sheets of paper. Also note that for some reason informix inserts one extra line at the end of each report. If different files need to be printed on consecutive pages then some manual control over the printer platen must be performed to insure that the reports come out centered on the page.

Several of the reports use the command name as a parameter and are run several times in the course of building the entire set of reports. Each time a report is run it will write over the previous file with the same name. Thus if the previous report has not yet been printed, it must be renamed so that it will not be lost. Use the move command (mv) to rename the file.

It is also good practice to save the report files for a while. For example, the printer may mangle the camera ready masters. A good idea is to create a separate directory for every major publication date and store the prepared reports in that directory. The report programs might also be copied to that directory to preserve their current state. Then make a backup tape of that directory for archival purposes.

THE BDM CORPORATION

CHAPTER II

DICTIONARY AND CROSS REFERENCE WITH CSS MAMP REPORTS FOR DATA BASE MAT_PLAN

This chapter presents a detailed description of the `mat_plan` data base file and the data contained in those files. Further, it cross-references that data to the printed reports which are affected if the data is changed. For example, an asterisk in Column F indicates that the data element appears in the project summary, or that it controls which data might be included in the project summary. The text of this chapter is on-line at the file `/u/plan/document/schema`. Corrections or revisions to this text should be posted to that file.

THE BDM CORPORATION

DICTIONARY AND CROSS REFERENCE WITH CSS MAMP REPORTS FOR DATABASE MAT_PLAN

CSS MAMP REPORTS:

(All reports are in the directory /u/plan/rpt.Linda. Some reports with the same name are in /u/plan/rpt.Neil - these are variants where the page number is read from standard input instead of as a parameter. The reports shown here are only those which print formal reports. They are supported by a collection of other programs which maintain the data base and the temporary construction files as described later.)

DEFICIENCY REPORTS:

A	deficiency profiles	(defpro2)
B	deficiency rollups	(defroll)

COMMODITY REPORTS:

C	commodity summary	(commod)
D	commodity profiles	(compro2)
E	commodity index	(comindex)

PROJECT REPORTS:

F	project summary	(peproj)
G	project index	(projindex)

SYSTEM REPORTS:

H	system rollup	(sysrollnew)
J	system funding rpt	(sysdollars, sysdolla, sysdolib)
K	system resource rpt	(sysres, sysresa, sysresb)
L	system basecase rpt	(basetc, basetca, basetcb)
M	system index	(sysindex, sysindex1)

THE BDM CORPORATION

WORKPACKAGE REPORTS:

N	workpackage appx	(wrkapdxa, wrkapdxb, wrkapdxc, wrkapdd)
P	workpackage index	(wkpindex)

PRIORITY REPORTS:

G	system priority	(priorsys, priorcss, pricsscmd)
R	workpackage priority	(priorwp, priorwpall, priorwpcmd)
S	priority comparison	(pcomp)

THE BDM CORPORATION

MAT_PLAN DATA BASE FILES AND DESCRIPTIONS:

FILE assoc

This file relates primary ssns to an associated ssn. It is automatically regenerated by the shell /u/plan/db/buildassoc. No data should be entered into it directly - enter data into rollup instead. This file is not used directly in a printed report but instead is used in the program asroll to compute the total funding for ssns which are nsi's to be inserted into lrproc by the shell /u/plan/db/assocrollup.

FIELDS	TYPES	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R	S
assoc_ssn_no	char 6																	
assoc_ssn1	char 6																	

FILE compro1

This is a temporary file used in the creation of the commodity profile report. It contains RDTE funding totals for each commodity line represented by systems in csscontrol. Data should not be entered into it directly. It is automatically regenerated by executing /u/plan/db/compro.

FIELDS	TYPES	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R	S
compro1_commodity	char 10																	*
compro1_cmd	char 12																	*

THE BDM CORPORATION

FILE mergessn

This file relates a workpackage to up to 10 ssns. Multiple records are used for more ssns. Data should be entered into here. The shell /u/plan/db/buildps automatically transfers this data to pseudolink. The shell /u/plan/db/addmergessn will recreate mergessn from a complete pseudolink file, will remove duplicate entries, and will resort the ssns.

FIELDS	TYPES	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R	S
mergessn_cmd	char 12	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*

THE BDM CORPORATION

FILE rollup

This is the system rollup file, showing which ssns are subsidiary to a primary ssn. The shell /u/plan/buildassoc will automatically turn this data into the file assoc. Each rollup ssn can have up to 10 associated ssns on each record. Use multiple records if there are more than 10. This file can be rebuilt from a complete file assoc using the shell /u/plan/db/addrollup.

FIELDS	TYPES	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R	S
rollup_ssn_no	char 6									*	*							
rollup_ssn1 (to rollup_ssn10)	char 6									*	*							

FILE ssndef

This file relates systems to deficiencies. Up to 10 deficiencies may be described for each system with its contribution value. Use multiple records if there are more than 10. The deficiency source is currently unused but a "T" is entered for TRADOC. This data is transferred to the file ssnpri by the shell /u/plan/db/buildssnpri. The shell /u/plan/db/addssndef will rebuild this file from a complete ssnpri, eliminating duplicates and sorting the deficiencies.

FIELDS	TYPES	A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R	S
ssndef_ssn_no	char 6	*	*	*						*	*	*					*	*

CHAPTER III
CSS MAMP REPORTS

This chapter presents the program text of each of the CSS MAMP Reports. They are included formally in this report to document their current status. It should be expected that they will continue to evolve as management information needs change.

THE BDM CORPORATION

A. DEFICIENCY REPORTS

1. Deficiency Profile Report Generator - Part 1
/u/plan/rpt.Linda/defpro1

This report accumulates the RDTE funding for a range of deficiencies. For each deficiency, the tech base and development funded and unfunded amounts are computed for each year. These amounts are written in ASCII file format for loading into the data base file defpro1. This program is called automatically by the shell /u/plan/db/defpro.

2. Deficiency Profile Report Generator - Part 2

/u/plan/rpt.Linda/defpro2

This report generates the deficiency funding profile for all deficiencies in defcontrol. It accumulates the procurement funding amounts for the appropriate systems and combines that with the precomputed RDTE funding data stored in defpro1. This program is called automatically by the shell /u/plan/db/defpro.

3. Deficiency Summary Report Generator - Part 1
/u/plan/rpt.Linda/syspro1

This program accumulates RTE funding for systems in csscontrol. For each system, the tech base and development funded and unfunded amounts are accumulated. The resulting values are output in ASCII format for loading into the syspro1 file of the data base. This program is called automatically by the shell /u/plan/db/defroll.

4. Deficiency Summary Report Generator - Part 2

/u/plan/rpt.Linda/defrolltry

This report produces the printed deficiency rollup report. It is a variation on the program defroll, but instead accepts system RDTE funding from the file syspro1. This results in a net five-fold improvement in the running speed of this report. This program is called automatically by the shell /u/plan/db/defroll.

B. COMMODITY REPORTS

1. Commodity Summary

/u/plan/rpt.Linda/commod

This report sorts the systems in csscontrol by command and commodity line to produce a report which summarizes the activities ongoing in each major functional area. System procurement funding and BDP deficiencies are also included.

THE BDM CORPORATION

2. Commodity Profile Report Generator - Part 1

/u/plan/rpt.Linda/compro1

This report is similar to defpro1 and syspro1 described earlier. Here, however, the RDTE funding data is accumulated by commodity line rather than by deficiency or system. Values are output in ASCII format for loading into the data base file compro1. This program is called automatically by the shell /u/plan/db/compro.

THE BDM CORPORATION

3. Commodity Profile Report Generator - Part 2

/u/plan/rpt.Linda/compro2

This report is similar to defpro2 described earlier. Here the funding profile is presented by commodity line rather than by deficiency. RTE values from compro1 are combined with accumulated system procurement funding amounts to produce a vertical bar chart of funding levels for each commodity line. It is called automatically by the shell /u/plan/db/compro.

4. Commodity Index

/u/plan/rpt.Linda/comindex

This brief report produces a simple and straightforward listing of the command-commodity line combinations for use as an index to the report. The page number locations are marked with three hyphens "---". After running this report and the commodity summary report, the actual page numbers should be substituted for the hyphens using the editor (vi).

C. PROJECT REPORTS

1. Project Summary

/u/plan/rpt.Linda/peproj

This report produces a funding summary for each CSS funded project in cssprrdte. The summary relates projects and tasks to the systems which are addressed by the RDTE effort. When two or more commands share a same PE-Project number, then two separate reports are printed. Note that this report uses the "input" statement to get the starting page number from the standard input file. The other reports in this document get the starting page number as a parameter to the acego command line.

D. SYSTEM REPORTS

1. System Rollup Summary
/u/plan/rpt.Linda/sysrollnew

This report is the original system summary, where procurement and RTE funding is indicated by symbols rather than by the actual funding amounts. It has not been used in a MAMP lately, but is likely to be included again in the planning phase of the MAMP process.

THE BDM CORPORATION

2. System Funding Summary

/u/plan/rpt.Linda/sysdollars

This report is styled after the System Summary but includes the actual funding amounts rather than using symbols. It is intended to be called for each command since this report is usually interleaved with other system-related reports in the printed MAMP. Two variations of this report, sysdolla and sysdollb, are used to aggregate the PMs and other commands into single reports.

3. System Resources Summary
(w/o active 6.3B/6.4 Workpackages)
/u/plan/rpt.Linda/sysres

This report produces a listing of systems which should but do not have identified 6.3B or 6.4 workpackages. The systems included are classified as developmental or PIP. If printed in the report, the system will have no 6.3B or higher workpackages. Any funding shown represents tech base funding only. Two variations of this report, sysresa and sysresb, are used to prepare reports for the PMs and other command sections of the System Volume of the MAMP.

5. System Index

/u/plan/rpt.Linda/sysindex

This report produces an index for systems in *csscontrol* sorted by system title. The page number locations are marked with three hyphens. After the other system reports have been prepared, then the actual page numbers should be entered using the system editor (vi). A similar index, sorted by SSN is produced by the companion report *sysindex1*.

E. WORKPACKAGE REPORTS

1. Workpackage Appendix

/u/plan/rpt.Linda/wrkapdxa

This report prints a workpackage summary for all workpackages funded by projects included in cssprdte. The summary includes funding data, text description and workplan, and related CSS systems. Wrkapdxa prints pages "A-#" while wrkapdxb prints pages "B-#". Both require a command name as a parameter. Variations wrkapdxc and wrkapdxd are used for the PMs and other command sections of the Appendix. Both variations print pages "B-#"

F. PRIORITY REPORTS

1. System Priority Rating Computer /u/plan/rpt.Linda/prior1

This report computes the system priority rating score using the CSS MAMP methodology. It is subject to revision as differences among the mission area managers as to what constitutes an effective methodology are resolved. It prints the new scores for each system in ASCII format for entry into the data base file prior1. This program is called automatically by the shell /u/plan/db/priority.

THE BDM CORPORATION

2. Workpackage Priority Ratings Computer

/u/plan/rpt.Linda/prior2

This report computes the workpackage priority rating score using the CSS MAMP methodology. This technique is merely the sum of the raw scores of the related system for each workpackage. It prints the workpackage score in ASCII format for entry into the data base file prior2. This program is called automatically by the shell /u/plan/db/priority.

THE BDM CORPORATION

3. System 1 to N Priority Report

/u/plan/rpt.Linda/priorcss

This report rank orders the csscontrol systems which are not base case or type classified. It produces a printed report that shows the ranking, raw score, and the underlying deficiencies and contribution values. A variation of this report, priorcsscmd, prints the same data but limits the systems considered to a single command. Also, the report priorsys is available as a variant of priorcss that prints the scoring data contained in the file prior1.

6. Priority Rating Schemes Comparison Report

/u/plan/rpt.Linda/pcomp

This report, using the data in pcomp0, pcomp1, and pcomp2, compares the results obtained by each of the three alternative system rating schemes. It produces standard statistical reports of difference analysis and correlation coefficients between each pair of methods for an actual data sample. It compares the actual rankings obtained by each method rather than the raw scores.
