STATUS OF COMPUTER APPLICATIONS IN GEOTECHNICAL ENGINEERING
C A G E PROJECT

The status of CAGE data base packages is summarized on the attached chart (Encl 1). Revision of the boring log plot to add blow counts and a short form of the data base are shown in Encl 2. Menus for the complete data entry modules for the instrumentation package on both the Harris and micro is shown in Encl 3. Menus for a complete (simplified) version of grouting package using Los Angeles District forms for New River Dam is shown in Encl 4.

The status of the slope stability package work is summarized on Encl 5.

MAKE YOUR HIGH PRIORITY NEEDS KNOWN.

CORPS-WIDE SLOPE STABILITY PACKAGE

- o SINCE 1983, TASK GROUP HAS REVIEWED EXISTING PROGRAMS.
- o COMPLETED A CRITERIA DOCUMENT (WES MISC. PAPER GL-85-8)
(DISTRIBUTED TO ALL DISTRICTS AND DIVISIONS),
- o RECOMMENDED THREE INTERIM PROGRAMS, ON CORPS LIBRARY:
 - * SSTAB2 - SPENCER'S METHOD 10026
 - * STABR - MODIFIED BISHOP'S METHOD 10027
 - * DGSLOPE - MODIFIED SWEDISH METHOD, 10025
(KANSAS CITY ARC AND WEDGE)
- o SELECTED "UTEXAS" TO BE MODIFIED TO MEET CRITERIA
FOR ONE TIME DATA ENTRY, GRAPHICS CHECK, USE OF
ANY OF THE ABOVE THREE METHODS, AND COMPLETE
TABULAR AND GRAPHICS OUTPUT.
- o MODIFIED BISHOP AND MODIFIED SWEDISH CIRCULAR AND
NON-CIRCULAR SEARCH HAVE BEEN ADDED. OPERATES
ON CDC, HARRIS, AND MICRO'S. DRAFT USER'S GUIDE
COMPLETED.
- o DURING FY 86, USER'S GUIDE (WITH THEORY, EXAMPLES,
AND HAND CHECKS), AND GRAPHICS MODULE WILL BE
COMPLETED. TO BE RELEASED APRIL 1986.

PREFACE

This user's guide describes the use of a data base package for storing and displaying boring information and subsurface data on a microcomputer. This package matches the data base package used on the Corps-wide time-sharing system and described in Instruction Report GL-84-1. The package is a product of the Computer Applications in Geotechnical Engineering (CAGE) project sponsored by the Office, Chief of Engineers, US Army. Development of this microcomputer version was funded under the Operation and Maintenance, Army (O&MA), Facilities and Investigation Studies Program.

This report was prepared by Mr. W. E. Strohm, Jr., Engineering Geology and Rock Mechanics Division, Geotechnical Laboratory (GL), US Army Engineer Waterways Experiment Station (WES). Development of this CAGE package was carried out under the supervision of Dr. Don C. Banks, Chief, Engineering Geology and Rock Mechanics Division, GL, and under the general supervision of Dr. William F. Marcuson III, Chief, GL. This report was edited by Mr. R. A. Baylot, Jr., Publications and Graphic Arts Division.

Commanders and Directors of WES during development of this data base package and preparation of this user's guide were COL Tilford C. Creel, CE, and COL Robert C. Lee, CE; Technical Director was Mr. Fred R. Brown. During publication of this report, COL Allen F. Grum, USA, was Director of WES; Technical Director was Dr. Robert W. Whalin.

MICROCOMPUTER BORING AND SUBSURFACE DATA PACKAGE:
USER'S GUIDE

PART I: INTRODUCTION

Purpose

1. The purpose of this report is to provide a description and instructions for the use of the microcomputer version of the boring information and subsurface data package entitled BORDBM. The package was developed for Corps-wide use under the Computer Applications in Geotechnical Engineering (CAGE) project. This report must be used in conjunction with other applicable instructions regarding the microcomputer operating system and instructions for creating and manipulation of a data base using a software package called dBASE II (trademark of Ashton-Tate).

Basic Definitions

2. A data base can be defined as items of information and groups of data values stored together in an orderly form such that access to all or any part of the information or data can be readily accomplished. Boring logs and field and laboratory test data stored in a filing cabinet could be classified as a simple form of a data base. A computerized data base is one that uses a computer and associated hardware for data entry, storage, and access. A data base package includes, in addition to the data base itself, all peripheral software that enables the data not only to be quickly and orderly stored, but also accessed, manipulated (or analyzed) by the most useful means, and displayed in the most useful manner for the user. A data base package can therefore be categorized as an engineering tool. It can, if properly used, be a powerful tool that greatly enhances the usefulness and value of geotechnical information and data.

Background

3. The initial boring and subsurface data package was first used in 1982 and refinements and a user's guide were completed in 1984. The US Army Engineer District, Savannah served as the pilot district and used the package on the Corps-wide time-sharing system to store data for several military installations and projects. Other

Districts are using the package for military and civil works projects. The microcomputer version was started in 1983 and modified in 1985 to match the mainframe version. A special set of programs (package) was developed to allow transfer of data from the Corps-wide time-sharing system to the microcomputer system.

Application

4. The data base package BORDBM is intended to provide a convenient means for storing data from field subsurface investigations and laboratory tests and then displaying desired data in the form of tables or graphic plots useful in the design of facilities. The primary benefit is that the type and extent of subsurface information existing in a given area can be quickly determined for a new project. Selected data can be displayed and used in design studies and additional data needs can be readily determined.

Computer Requirements

5. The boring data base programs have been written using dBASE II (trademark of Ashton-Tate) software on a microcomputer with the MS-DOS (trademark of Microsoft Corp.) or the CP/M (trademark of Digital Research, Inc.) operating system. The microcomputer should have a 10-megabyte hard disk to provide sufficient storage for a large number of borings. As a rough estimate, 5,260 bytes are required for storage of data from one boring (see para. 14). A dot matrix printer is needed for simple plots and summary tables. Future graphics enhancements will require an x-y plotter.

Report Organization

6. The remainder of this report is divided into two parts. Part II describes data entry and storage and Part III describes data retrieval and display. Examples of data entry are shown in Appendix A. Special instructions for record deletion are given in Appendix B. Appendix C gives examples of boring location plots and data reports, while the retrieval of data from the version on the Corps-wide time-sharing system is shown in Appendix D. A complete listing of all BORDBM programs appears in Appendix E.

PART II: DATA ENTRY AND STORAGE

Data Base Structure

7. The proprietary software (dBASE II by Ashton-Tate) used to develop the microcomputer version of the boring data package is a relational type of data base system. It uses a file structure that can be visualized as a table with columns for variables (called fields) and rows (records) for values of the variables. The structure for each data base file is created by naming the fields, defining their type (character or numeric) and their size (number of characters or digits and decimal places). Under dBASE II, only 32 fields per file can be used and several data base files were used for the BORDBM package.

8. A diagram of the files for BORDBM is shown in Figure 1. The type of data stored in each file is shown in Figure 2. General information for the boring is stored in the first file (BORMAIN.DBF) while specific data of the types shown in Figure 2 is stored in the other files. The data types are very similar to those shown in Table 1 of Instruction Report GL-84-1.* In both the time-sharing version and the micro version depths can be entered and converted to elevation when the top of hole elevation has been stored. However, in the time-sharing version, only elevations are stored; whereas, in the micro version both depths and elevations are stored.

Data Entry

9. Data entry makes use of the full-screen editing feature of dBASE II that allows a form to be shown on the monitor screen and lets the user fill in the blanks. The data entry segment of BORDBM is menu driven. The main menu selections and data entry submenu for selection 2 are shown in Figure 3.

10. When a new boring is entered, the boring number is checked for duplicates in the data base. If duplicates occur, the user is given the option of seeing the project and site names and project description or reentering a different boring number. A unique system identification number (SID) is automatically assigned to each new boring and after the boring information is entered, key information is copied to a special data base

* William E. Strohm, Jr. and John B. Palmerton. 1984. "Boring Information and Subsurface Data Base Package: User's Guide, Instruction Report GL-84-1, U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi.

Figure 2. Structure for BORDBM data base files

Figure 3. Schematic of BORDBM menu options

file (BORID.DBF) that is used to find and list duplicate borings. Once a new boring is entered, its number should not be changed if supplementary data such as blow count data has been entered. If a boring number is changed in the boring information file, the number is not automatically changed in any of the supplementary files.

11. When other data for a boring are entered, the boring number is asked for and checked. If duplicate numbers exist, the project and site data are shown and the user is asked for the identification number (SID) of the desired boring. If the entered boring number is not found, the user is informed and given the option of reentering the number or returning to the main menu. Thus, supplementary data for a boring cannot be entered until general information for the boring has been entered. The boring number and unique identification number are automatically stored and shown on each new data screen form for supplementary data. Also, when depth data are entered, they are used with the top of hole elevation to automatically calculate and store elevation data.

12. Examples of the data entry forms and data entry are shown in Appendix A. Each data form constitutes a record for the particular data file. Data can be edited (except for boring and SID numbers and elevation data) during data entry or any time after entry is completed. If a depth value is edited, the elevation value will automatically be changed. However, there are no menu options for deleting data records. Record deletion would require reindexing of data files and would take an unacceptably long time. Indexed data files are used to rapidly find desired data. If records must be deleted, then special instructions in Appendix B must be followed.

Data Storage

13. All data entered are stored in the appropriate file. An index file is used with each data file to keep the data ordered by boring number, and in some cases by SID or project and site name plus other variables, such as coordinates. The use of index files speeds up the operation of the boring data package, but requires some additional disk storage space.

14. If the BORDBM programs and data files are on one 5-1/4 in. floppy disk, there is enough space for about 50 borings, assuming that each boring requires about 5,260 bytes (based on data for 44 borings used during data base development). However, on a machine with a 10-megabyte hard disk, 500 borings would require some 2.63 megabytes or 26 percent of the hard disk space. In addition, the package would operate much faster. Thus, a microcomputer with a 10-megabyte hard disk is recommended.

PART III: DATA RETRIEVAL AND DISPLAY

15. Data retrieval and display are done automatically using the selections shown on the menus in Figures 3 and 4. The selections for summary reports are shown on the menu in Figure 3 and the selections for locating and plotting borings are shown in Figure 4. Examples of these selections are shown in Appendix C.

Summary Reports

16. The summary report selections are keyed to a project or site name or to a boring number. Some users may want to use the project name for a building type and the site name for a military base, while others may want to use the site name for a location under a general project name. When a project name is entered in selections 6 through 8 of the menu for reports in Figure 3, all data for the project name are listed and the site names are noted on the summary. When a site name is entered, all data for the site are listed and project names are noted. For selections 3 through 5 on the tabular logs, both the project and site names are listed.

Locating and Plotting Borings

17. The options for locating and plotting borings shown in Figure 4 are generally self-explanatory. A few important points about the programs for these options are mentioned below.

Locating borings

18. The two sets of north-south and east-west coordinates, required in selection 3 for locating borings, can be in any order. The program finds the maximum and minimum values.

Plotting locations

19. The plot of boring locations (selection 4) sets the scale to 1 in.* = 400; 600; 800; 1,000; 1,200; 1,500; 1,800; or 2,000 ft, depending on the maximum and minimum values of the coordinates. If a scale greater than 2,000 ft is required, the user is notified that the scale is too small and map cannot be drawn. Letters are used to show locations (A through Z, then a through z, and finally 0 through 9) to allow as many borings as

* A table of factors for converting non-SI units of measurement to SI(metric) units is presented on page 3.

Figure 4. Options for locating and plotting borings

possible to be shown (a maximum of 62 on one plot). If borings are too close or have the same coordinates, they are noted with the same location letter in the listing at the bottom of the map.

Boring logs

20. The boring log plot (selection 5) shows the feature (strata) name and description and plots these items to the vertical scale selected by the user. An example of the selection process is shown in Figure 4. The limitations of the vertical scale options and the need to ensure that no data are skipped require that all data with an elevation greater than each line elevation be plotted in sequence. Thus when data elevations are closely spaced, the true vertical location may be lower than it should be until a gap in the elevation of data occurs.

APPENDIX A
EXAMPLES OF DATA ENTRY

Notes:

1. One or two screens are shown on a page.
2. User input is circled.
3. Other notations are boxed.

This boring data base package, called BORDEM, uses menus to provide the following options:

- a. Data entry and editing.
- b. List of borings bounded by two sets of given coordinates.
- c. Plot of boring locations on dot matrix printer.
- d. Plot of boring logs on dot matrix printer.
- e. Various summary reports.

Data entry and editing are divided into six categories:

- a. Boring information (stored in BORMAIN.DBF),
- b. Drilling interval data (BORSEG.DBF),
- c. Class. & descr. of soil and rock layers (BORFEA.DBF),
- d. Split spoon test data (BORSFT.DBF),
- e. Summary of test types (BORTST.DBF),
- f. Test results (BORRSL.DBF).

One or more index files are used with the main files to reduce the time for locating data. A special file (BORSID.DBF plus index files) is used to keep track of borings and list pertinent data for duplicate borings.

Hit any key to continue.

WAITING

Identical boring numbers can be used for different projects, sites, or project descriptions, since a unique number is automatically assigned to each new boring entered into the data base. When a new boring is entered, its number is checked and if duplicate numbers exist the user can chose to see a list of the project name, site name and project description. When other data is entered for a boring, the user is asked for the boring number and asked to select the boring system identification (SID), if duplicate boring numbers exist. Thus, boring information should be entered before other data for that boring. Once the top of hole elevation is entered, depths can be entered for other data, since depths are automatically stored and used to calculate elevations using the entered depth and the top of hole elevation.

This package is identical to the boring data base under System 2000 on the Corps-wide time sharing system operated by Control Data Corp. (CDC). A transfer program package is available for transferring data retrieved from System 2000 to this dBase II software package.

APPENDIX B

SPECIAL INSTRUCTIONS FOR
RECORD DELETION

1. Deletion of records from data base files requires that the user be familiar with the several dBASE II commands and operations. The two main commands are DELETE and PACK. DELETE marks a record for deletion, while PACK actually deletes the record or records. The following steps are recommended:

- a. Call up the appropriate data base file with the USE command (e.g., BORMAIN).
- b. Find the record or records for deletion.
- c. Set up all index files with the SET INDEX TO command (e.g., SET INDEX TO BORMAINI). See Appendix F, program BORINIT.PRG for index file names.
- d. Delete the desired records with the DELETE command (e.g., DELETE RECORD 129 or DELETE NEXT 9 RECORDS).
- e. Use the PACK command to delete records and reindex files (e.g., PACK). Considerable time may be required if the data base file is large.

2. If records from BORMAIN.DBF (and BORMAINI.NDX) files are deleted, the corresponding records will also have to be deleted from BORSID.DBF and its four index files. Essential data are copied to BORSID.DBF and its index files when a record is edited or added to BORMAIN.DBF.

APPENDIX D

RETRIEVAL OF DATA FROM SYSTEM 2000
DATA BASE

1. The LIST commands needed to retrieve data from the BORDB data base on System 2000 are shown in Table D1. The retrieved data obtained with each list command shown in Table D1 must be stored in a file with the same name as shown in Table D1 (using MODEM7 or other communications software that is available on the microcomputer). The list commands are broken up in Table D1 to stay within the 132-character limit imposed by System 2000. A count should be made of the number of records that exist (e.g., LIST COUNT(C1) WH C6 EQ ____ OR C6 EQ ____ OR C6 EQ ____) to check the buffer storage required. For example, MODEM7 has a maximum buffer storage of 37,376 characters. If there are 300 records with 132 characters each, the buffer capacity will be exceeded ($132 \times 300 = 39,600$) and the LIST command would have to limit the number of records to 280. Thus, the data specified by the WHERE portion of the LIST command should be limited so that the count value times the number of characters per line does not exceed 280. This limitation may require more than one of the same type .TXT files with slightly different names (e.g., BORFEATC.TXT, BORFEATD.TXT, and BORFEATE.TXT) that can then be combined into one file (BORFEATC.TXT) using a text editor. The buffer limitations are not a problem with software developed for transferring files between microcomputers and mainframes by the Waterways Experiment Station (WES) Automation Technology Center (ATC) (James Jefferson, FTS 542-3985).

2. All the necessary dBASE II data files have been created and are available on a disk with the transfer procedures in one command file called BORTRANS that can be used once the .TXT files of retrieved data have been created, edited to delete unwanted lines, and checked for accuracy. Tables D2-D11 list the structure of the intermediate and final dBASE II files and the command file BORTRANS.PRG and its subprograms.

3. Before the BORTRANS.PRG is used, the retrieved data in the .TXT files should be listed and checked to ensure that there are no unusual gaps in the tabular listing. System 2000 spaces columns of data three characters apart,

based on the length of the data field or field name (used for the column header), whichever is longer. An extra five spaces is used before an integer. An extra 11 spaces occurred in the data from the third LIST command in Table D1 when data were retrieved for the BOR3C.TXT file. It is possible that the same LIST command may not always produce the same spacing of data. The intermediate data files shown in Tables D2-D4 have the necessary spaces (BLNK, BLNK1, BLNK2) to account for the spaces in the System 2000 listings. The structure of these files should be checked against the final .TXT files (modified and combined as necessary) to ensure that the spacing of data matches in both types of files.

4. Once the BORTRANS program is executed and is successfully completed, the intermediate data base files are automatically cleared, but the .TXT files are not cleared. Thus, the .TXT files are available, if needed for a second try in generating the final data base files. The final data base files are filled in and index files are created. Retrieved elevation values are stored and automatically converted to depth values (using the top of hole elevation). The depth values are stored in the new data base files. If the final data base files are incorrect (fields broken up), the program CLRDBF (Table D11) can be used to clear all final data base files. The structure of the intermediate data base files should be checked against the .TXT files and corrections made before trying BORTRANS a second time.

5. Once the final data base files are correct, the .TXT files can be overwritten and used to store more data retrieved from the System 2000 data base. Since BORTRANS appends data from the intermediate data base files and then clears them, the intermediate files are ready for use in transferring more data from the .TXT files.

Table D1

Commands to Retrieve Data From System 2000 Boring Data Base (BORDB)

<u>Commands to List Data from System 2000</u>	<u>Corres- ponding File Name</u>	<u>Number of Characters per Line</u>
