Abstract

During late fall of 1984, the R/V *New Horizon* occupied 230 CTD stations in the central and northern Gulf of California. The primary objectives of the cruise were to define the vertical finestructure characteristics in the high current area near Tiburon Island as well as in the Guaymas Basin; to examine the structure and evolution of quasi-permanent density fronts found near Tiburon Island; and to examine the early winter hydrographic characteristics in the northern part of the Gulf, in anticipation of the late winter cruise, Pichicuco 7, carried out in March of 1985 (Bray, Robles and Carrasco, 1986). In this report we present individual profiles of temperature, salinity and density for each station, along with regional composite diagrams of potential temperature vs salinity. A detailed discussion of the techniques used to process the data is also included.

Resumen

A finales del otoño de 1984, la embarcación oceanográfica R/V *New Horizon* ocupó 230 estaciones de CTD en la parte norte y central del Golfo de California. Los principales objetivos del crucero fueron: definir las características de la estructura fina vertical en regiones donde las corrientes alcanzan altas velocidades, tanto en la cuenca de Guaymas como cerca de la isla Tiburón; examinar la estructura y evolución de los casi permanentes frentes de densidad encontrados cerca de la isla Tiburón; y examinar las características hidrográficas de principios de invierno en la parte norte del golfo, con el propósito de preparar el crucero de finales de invierno, Pichicuco 7, llevado a cabo en Marzo de 1985 (Bray, Robles y Carrasco, 1986). En este reporte presentamos perfiles de temperatura, salinidad y densidad para cada estación, junto con diagramas compuestos regionales de temperatura potencial vs salinidad. Se incluye también una detallada discusión de las técnicas usadas para procesar los datos.

1. Introduction

The CTD stations presented in this report are from the sixth Pichicuco cruise in the Gulf of California. The Pichicuco cruises began in 1982 as a cooperative physical oceanography field program between scientists at Centro de Investigación Científica y Educación Superior de Ensenada and Scripps Institution of Oceanography. A wide range of phenomena relating to circulation in the Gulf have been examined during the cruises. The data collected during this cruise (PC6) were intended to study the distribution of fine structure in the central Gulf, the structure of quasi-permanent density fronts found in the vicinity of Tiburón Island, and the early winter hydrographic characteristics in the northern Gulf. Stations are concentrated in several 'yoyo' areas, where multiple casts were taken, and in the northern Gulf along a cross-Gulf section labeled line P (Figure 1, Table 1).

As shown in Table 2, both the Mexican research vessel B O *El Puma* and the U.S. research vessel R V *New Horizon* were used during the Pichicuco cruises. Cruise PC6, aboard the R V *New Horizon*, was conducted under the auspices of Permit No. 091084-333-04-328-3659 (10 Oct 1984) and Diplomatic Note No. 303518 (8 Nov 1984) courtesy of the Government of Mexico. Funding for the cruise came from NSF grant No. OCE83-18288 and ONR contracts N00014-84-C-0257 and N00014-83-C-0104.

We would like here to express our thanks to the many people who made this report possible. In particular, we would like to thank those responsible both in the U.S. and in Mexico for obtaining clearance for the R V *New Horizon* to work in Mexican waters. Vanessa Cunningham and Jennifer Davis most capably kept our customs, shipping and finances in order. The captain and crew of the R V *New Horizon* participated in the work with skill and enthusiasm, contributing substantially to the success of the cruise. Watchstanders on the cruise were Walt Waldorf and Dave Muus (watch captains); Cindy Paden, Antoine Badan, Pedro Calderon, David Stadille and Janet Becker. The consistently high quality of the data is a tribute to their skill and concentration.

1. Introducción

Las estaciones de CTD presentadas en este reporte pertenecen al sexto crucero Pichicuco en el Golfo de California. Los cruceros Pichicuco empezaron en 1982 como un programa de Oceanografía Física entre investigadores del Centro de Investigación Científica y Educación Superior de Ensenada y Scripps Institution of Oceanography. Durante estos cruceros se examinó un amplio rango de fenómenos relacionados con la circulación en el Golfo. Con los datos colectados durante este crucero (PC6) se pretende estudiar la distribución de estructura fina en la parte central del golfo, la estructura de los casi-permanentes frentes de densidad encontrados en la vecindad de la isla Tiburón, y las características hidrográficas de principios de invierno en la parte norte del golfo. Las estaciones están concentradas en varias áreas 'yoyo', donde se tomaron múltiples lances, y en la parte norte del golfo a lo largo de una sección transversal llamada línea P (Figura 1, Tabla 1).

Como se indica en la tabla 2, los cruceros Pichicuco, fueron realizadas en dos embarcaciones, una mexicana, el B O *El Puma* y la otra estadounidense (B O) R V *New Horizon*. El crucero PC6, abordo del R V *New Horizon*, se efectuó bajo los auspicios del permiso No. 091084-3330-04-328-3659 (10 de Oct. de 1984) y el registro Diplomático No. 303518 (8 de Nov. de 1984) cortesía del gobierno de México. Los fondos para el crucero provinieron de la National Science Foundation (NSF) programa No. OCE83-18288 de la Office of Naval Research (ONR).

Este reporte ha sido posible gracias a la colaboración de un gran número de personas. En particular, nos gustaría agradecer a aquellas personas responsables, tanto en Estados Unidos como en México de la obtención del permiso, con lo cual la embarcación *New Horizon* pudo trabajar en aguas mexicanas. Vanessa Cunningham y Jennifer Davis manejaron muy capazmente todo lo referente a cuestiones administrativas. El capitán y la tripulación del R V *New Horizon* participaron con habilidad y entusiasmo, contribuyendo substancialmente al éxito del crucero. Las personas que realizaron las guardias durante el crucero fueron Walt Waldorf y Dave Muus (capitanes de guardia), Cindy Paden, Antoine Badan, Pedro Calderon, David

Particular thanks go to Frank Delahoyde for advice in the early stages of programming our IBM 9000 to acquire CTD data. Final lay-up of the report was done by Mike Clark. The report cover was illustrated by Nancy Hulbirt.

2. Data Processing

This discussion is divided into several sections, organized approximately in the order in which the data is acquired and processed. Program listings can be found in the Pichicuco 7 data report (Bray, et al. 1986). The sections are: acquisition, calibration, error identification, combination of separately digitized fast- and slow-response temperature signals, lag correction and salinity calculations, and pressure averaging.

a) Acquisition

All data described in this report were taken using a NBIS Mark III fish with a separately digitized fast-response thermistor, and an SIO-designed and fabricated deck unit which converts the audio FSK signal into a digital data stream. The digital data is then read by an IBM 9000 computer in real time, is framed and stored on floppy disks. Minimal real time processing is conducted, due to timing constraints on the computer, but subsampled raw scans are scaled and printed to both screen and line printer for check purposes. The acquisition program does check for timing errors (time is a variable in the data stream) and gaps in the incoming data, as well as for input buffer overflows. The acquisition program is called MAR85.FOR.

b) Calibration

The CTD used during PC6 was calibrated at the PACODE laboratory (SIO) for absolute accuracy of pressure and platinum resistance thermometer temperature, temperature response of the pressure sensor and hysteresis in the 0-2000 db pressure range. Results are summarized in Figures 2 and 3. Absolute temperature accuracy is $\pm 0.002^\circ\text{C}$ for the PRT. The pressure sensor has an offset of -4.0 db; hysteresis errors are 0(2 db). Conductivity, temperature and pressure were also calibrated at sea using water samples taken with a rosette sampler during the uptrace of non-yoyo casts. Check sample conductivity

Stadille y Janet Becker. La alta calidad de los datos obtenidos es una consecuencia de su habilidad y paciencia. Agradecemos particularmente a Frank Delahoyde por sus consejos en las primeras etapas de programación de nuestra IBM 9000 para la adquisición de los datos de CTD. El diseño final del reporte fue realizado por Mike Clark. La portada fue ilustrada por Nancy Hulbirt.

2. Procesamiento de datos

Esta discusión está dividida en varias secciones, organizadas aproximadamente en el orden en el cual fueron adquiridos y procesados los datos. Los listados de los programas se pueden encontrar en el reporte del crucero Pichicuco 7 (Bray et al. 1986). Las secciones son: adquisición, calibración, identificación, combinación de las señales de respuesta lenta y rápida de la temperatura que son digitizados por separado, corrección del retardo y cálculo de la salinidad, y promediado de la presión.

a) Adquisición

Todos los datos descritos en este reporte fueron tomados usando una unidad sumergible (NBIS) Mark III, con una unidad de grabación diseñada y fabricada en SIO, la cual convierte la señal audio FSK en datos digitales. Los datos digitales son entonces, leídos por una computadora IBM 9000 en tiempo real, y son ajustados y almacenados en discos flexibles. Se efectúa un mínimo de procesamiento en tiempo real debido a restricciones de tiempo en la computadora, sin embargo, con propósitos de verificación, se imprimen, tanto en la terminal como en la impresora, valores submuestreados de los datos crudos. El programa de adquisición de datos verifica posibles errores de tiempo, (el tiempo es una variable en el flujo de datos) e interrupciones en la llegada de datos, así como saturaciones del "buffer". El programa de adquisición se llama MAR85.FOR.

b) Calibración

El CTD usado durante PC6 fue calibrado en el laboratorio PACODE (SIO) para precisión absoluta, de la presión y la resistencia de platino del termómetro, la respuesta de temperatura del sensor de presión e histeresis en el rango de

ratios were determined using a Hytech salinometer and Wormley standard water batch P-92. Salinities were then computed using PSS78 (Fofonoff and Millard, 1983). Raw CTD values of pressure, slow temperature and conductivity were also recorded for each check sample as it was being taken, for immediate comparison. In addition, the uptraces were later fully processed using a new technique described later in this report, and the check samples compared with the 2 db average points as well as the raw data.

The stations occupied are all shallower than about 1500 m, so there is no stable, isothermal deep water available for check samples. Nevertheless, the processed data agree with the salinometer to within ± 4 ppm for most of the points. In Figure 4 differences between the salinometer and processed salinities are plotted as a function of depth. The deeper points, though few in number, are arguably in better agreement than those in the middle of the depth range. For all points at all depths (128 points) the mean difference in salinity is $-.38$ ppm ($-.00038$ ppt) and the standard deviation is 2 ppm.

Similar comparisons are shown for temperature (Figure 5) and pressure (Figure 6), where check sample values are based on protected and unprotected deep-sea reversing thermometers. For temperature, there were a total of 57 comparisons; the mean difference (thermometer minus processed CTD temperature) is 0.25 mdeg ($.00025$ deg C) and the standard deviation is 3.5 mdeg. For pressure, there were a total of 43 points, with a mean difference of $-.7$ db and a standard deviation of 3 db.

As a result of the excellent statistical agreement between the salinometer and CTD data, no changes were made to the CTD conductivity values during processing. Similarly, temperature was not altered; a pressure offset of -4.0 db was applied to the raw data. Overall accuracy of the data is expected to be better than $\pm .005^\circ\text{C}$, $\pm .005$ psu, ± 5 db.

It should be noted that in the raw data there is a small systematic difference in thermocline T vs S between up- and down-traces. This is apparently due to the slow equilibrium of the pressure housing and electronics in regions of rapid temperature change. The error in tem-

presion de 0-2000 db. Los resultados se resumen en las Figuras 2 y 3. La precision absoluta de temperatura es $\pm .002^\circ\text{C}$ para el RPT. El sensor de presion tiene un desplazamiento de -4.0 db; los errores de histeresis son 0(2 db). La conductividad, temperatura y presion fueron también calibradas en el mar usando muestras de agua tomadas, con una roseta de botellas, durante los ascensos de los lances no-yoyo. Con las botellas de muestreo se determinaron razones de conductividad usando un salinómetro Hytech y agua estándar Wormley del grupo P-92. Las salinidades se calcularon usando PSS78 (Fofonoff and Millard, 1983). Para cada botella de muestreo se registraron valores crudos del CTD de presión, temperatura lenta y conductividad, conforme estas fueron tomadas, para así tener una comparación, inmediata. Además los ascensos fueron completamente procesados usando una nueva técnica la cual será descrita mas tarde en este reporte, y las botellas de muestreo fueron comparadas tanto con puntos promediados cada 2 db como con los datos crudos.

Todas las estaciones ocupadas fueron mas someras que 1500 m, por lo tanto no hay disponible agua isotermal profunda estable para las botellas de muestreo. Sin embargo, los datos procesados concuerdan con el salinómetro en un rango de ± 4 ppm para la mayoría de los puntos. En la figura 4 se graficaron las diferencias entre valores del salinómetro y salinidades procesadas en función de la profundidad. Los puntos mas profundos, aunque pocos en número, estan argumentablemente en mejor concordancia que aquellos localizados en medio del rango de presión. Para todos los puntos en todas las profundidades (128 puntos) la diferencia media en salinidad es $-.38$ ppm ($-.00038$ ppt) y la desviación estandar es 2 ppm.

Comparaciones similares son mostradas para la temperatura (Figura 5) y la presión (Figura 6), donde los valores de las botellas de muestra estan basados en los termómetros, protegido y desprotegido, de inversion de agua profunda. Para la temperatura, hubo un total de 57 comparaciones, la diferencia media (termómetro menos temperatura del CTD procesada) fue de $.25$ mdeg, y la desviación estandar de 3.5 mdeg. Para la presión, con un total de 43 puntos, la diferencia media fue de $-.7$ db y la

perature thus introduced is about 5 mdeg; the corresponding error in salinity (due to the temperature error in the salinity calculation) is 5 ppm. The sense of the error is that downtraces appear warmer and fresher than they should, and uptraces colder and saltier. This error does not occur in the deep water or in the CTD data taken during rosette samples, apparently because the system is nearly in thermal equilibrium. No correction for this error has been applied to any of the data presented in this report.

c) Error Identification

After the data are acquired, a separate program is used for processing (see APROC.FOR and ANAW.FOR for program listings). The first stage of processing is error identification, in which two simple editing criteria are applied. The first is an interval criterion requiring that data fall into set ranges. Ranges used are: 0 to 2000 db for pressure, 0 to 30 °C for temperature, and 30 to 70 mmho for conductivity. In addition, the first differences (scan to scan) of the raw data are constrained to fall within .5 db, 0.10 °C and 0.20 mmho. No further error checking is done on the raw data. Data which is rejected is not interpolated. Rejected scans are flagged in a special error file for each station. No significant data gaps were encountered, and very few errors were found away from the surface and away from rosette bottle trips (where errors are expected).

After processing is completed, the 2 db averaged data are checked visually for bad points. The few points which were altered are listed in Table 3. The new values are arithmetic interpolations between points on either side of the bad points. Uptraces rather than downtraces appear for several stations where the uptrace returns to the surface during a yoyo and is therefore more complete, or where irreparable errors occurred. In most of these latter cases there is a problem with the conductivity signal, apparently due to fouling of the sensor. Stations where uptraces are used are: 21, 24, 28, 41, 44, 46, 47, 49, 51, 62, 64, 71, 81, 83, 98, 125, 131, 134, 136, 149, 153, 157, 159, 171, 185, 205.

d) Combination of Fast and Slow Temperature

desviación estandar de 3 db.

Como un resultado de la excelente concordancia estadística entre los datos del salinómetro y el CTD, no se hicieron cambios en los valores de conductividad del CTD durante el procesado. Similarmente, la temperatura no fue alterada; se aplicó un desplazamiento de presión de -4.0 db a los datos crudos. Se espera que la precisión de los datos sea mejor que $\pm .005$ °C, $\pm .005$ psu y $\pm .5$ db.

Deberá hacerse notar que en los datos crudos hay una pequeña diferencia sistemática, en T vs S en la termoclina, entre el ascenso y el descenso. Esto es aparentemente debido al lento equilibrio térmico entre la envoltura estanca y los circuitos electrónicos en regiones de cambios rápidos de temperatura. El error en temperatura debido a esto es de aproximadamente 5 mdeg; el correspondiente error en salinidad (debido al error de temperatura) es 5 ppm. El significado de este error es que los descensos aparecen más calientes y menos salinos de lo que deberían de ser, y los ascensos más fríos y salinos. Este error no ocurre en aguas profundas o en datos de CTD tomados durante muestras con roseta, aparentemente debido a que el sistema está cercano a un equilibrio térmico. No se hicieron correcciones para este error en los datos presentados en este reporte.

e) Identificación del error.

Después de adquiridos los datos, otro programa es usado para el procesado (ver los listados de los programas APROC.FOR y ANAW.FOR). La primera etapa del procesado es la identificación de errores, en la cual se aplican dos criterios simples de editado. El primero es un criterio de intervalo que ordena a los datos de acuerdo a una serie de rangos. Los rangos usados son: de 0 a 2000 db para la presión, de 0 a 30 °C para la temperatura, y de 30 a 70 mmho para conductividad. Además la primera diferencia de los datos crudos está restringida a caer dentro de .5 db, 0.10 °C y 0.20 mmho, respectivamente. No hay verificaciones adicionales de errores efectuados en los datos crudos. Los datos que son rechazados no son interpolados. Los registros rechazados son identificados y escritos en un archivo de errores para cada estación. No se encontraron interrupciones sig

Signals

The NBIS fish used in these stations has a separately digitized fast response thermistor (FRT) signal and a data acquisition rate of 25 hz. (This differs from the 'standard' Mark III, which samples at 32.5 hz but has a single analog combination of FRT and PRT signals for temperature). A new algorithm for combining fast and slow temperatures was developed for processing these data. It is described more fully in Bray (1986).

Conceptually, the processing problem is the following. The FRT, with a response time of about 80 msec, contains most of the high frequency variance of the true temperature. However, the FRT is not a stable temperature measurement, in that it is a strong function of pressure and temperature. The PRT, on the other hand, is extremely stable, but, with a response time of 270 msec, blurs the true temperature signal over several scans of CTD data (one data scan is 40 msec). Ideally, we would like to combine the stability of the PRT and the high frequency information of the FRT.

The new algorithm is a simple recursive filter applied to both the PRT and FRT. It is a centered running mean boxcar filter with 2300 points, corresponding to 92 seconds or 92 m at a lowering rate of 60 m/min. The filter is applied to the time series data after error checking. The combined temperature T_c is then estimated by

$$T_c(t) = T_s \cdot (t) + T_f \cdot (t)$$

where subscripts are *s* for slow and *f* for fast, and $\cdot$ indicates filtered data. The subroutine which does this calculation is called FAST2. The length of the filter is critical to the success of the algorithm; filters shorter than 1500 points are inferior for subsequent salinity calculations. This is apparently due to the relatively long time scale of the FRT drift. However, little difference was seen in the salinity calculations done using 1500 points and 2300 points.

e) Lag Correction and Salinity Calculations

After the PRT and FRT signals are combined, spectral analyses indicate that there is still a lag of about 2 data scans between the combined temperature and the conductivity sig-

nificantes en los datos y muy pocos errores fueron encontrados lejos de la superficie y lejos de los disparos de la roseta de botellas, donde se suelen esperar errores.

Después de que el procesamiento está terminado, se verifican los datos visualmente, para localizar datos disparados. Los pocos puntos que fueron alterados están listados en la tabla 3. Los valores nuevos son una interpolación aritmética entre los puntos vecinos de los puntos malos. En algunas estaciones los ascensos llegan a la superficie mientras que los descensos empiezan debajo de ella, y por lo tanto estos ascensos proporcionan más información. También a veces aparecieron, en algunas estaciones, errores irreparables en los descensos. En la mayoría de éstos casos hay un problema con la señal de conductividad, aparentemente debido a impurezas del sensor. Las estaciones donde se usaron ascensos son: 21, 24, 28, 41, 44, 46, 47, 49, 51, 62, 64, 71, 81, 83, 98, 125, 131, 134, 136, 149, 153, 157, 159, 171, 185, 205.

d) Combinación de las señales rápida y lenta de temperatura.

La unidad sumergible del NBIS usada en estas estaciones tiene una digitalización por separado de la señal de respuesta rápida del termistor (RRT) y una razón de adquisición de datos de 25 hz. (Esta difiere del modelo estándar Mark III, en el cual las muestras son a 32.5 hz, pero tiene una sola combinación analógica de las señales de temperatura RRT y PRT). Se desarrolló un nuevo algoritmo donde se combinan las respuestas rápida y lenta de las temperaturas para el procesamiento de estos datos. Este es descrito completamente en Bray (1986).

Conceptualmente, el problema de procesamiento es el siguiente. La RRT, con una respuesta en tiempo de alrededor de 80 msec, contiene la variación de frecuencia alta de la temperatura verdadera. Sin embargo, la RRT no es una medida estable de temperatura, ya que esta es una fuerte función de la presión y de la temperatura. La PRT, por otro lado, es extremadamente estable pero con una respuesta en tiempo de 270 msec, por la cual encubre la señal verdadera de temperatura sobre varios registros de datos de CTD (un registro de datos es de 40 msec). Idealmente nos gustaría com-

nal. This is corrected using a scheme similar to that developed by Horne and Toole (1980). In that approach, filters are constructed for pressure, temperature and conductivity according to theoretical descriptions of sensor response as a function of time. Weights used in these filters are given in Table 4; the filters are not recursive. A separate program called ANAW.FOR is used to compute three sets of filter weights which are applied to pressure, temperature and conductivity. The lag correction, while effective, is not as important in the calculation of spike-free salinity as is the combination of fast and slow temperatures. Details of the lag correction scheme are given in Bray (1986). Salinity is calculated from lagged temperature and filtered pressure and conductivity using the subroutine SAL78 (Fofonoff and Millard, 1983) for practical salinity.

f) Pressure Averaging.

After lag correction and salinity calculation, the data are accumulated in 2 db bins (± 1 db about even pressures, starting with 2 db, or the shallowest even pressure deeper than 2 db) and averaged to form an even 2 db series. All data within the range is averaged; no data are discarded. For a uniform lowering rate of 60 m/min, this involves about 2 seconds of data per bin, or 50 data scans. Near the top and bottom of the cast more points are included. Pressure averaging is done in subroutine PRSORT.

3. Data Display Notes

The 2 db data series are plotted on the following pages. All points in the series are plotted, but only subsampled 'standard' depth data are listed.

.....

Important: Temperature traces (in degrees C) are bold solid lines, salinity traces (in practical salinity units) are light solid lines and σ_t traces are dots (actual data points).

.....

binar la estabilidad del RPT y la información de frecuencia alta del RRT.

El nuevo algoritmo es un simple filtro recursivo aplicado a ambos, el RPT y RRT. Este es un promedio corrido de 2300 puntos que corresponden a 92 segundos o 92 metros considerando una razón de descenso de 60 m/min. El filtro es aplicado a las series de datos después de haber sido verificados los errores. La temperatura combinada T_c es entonces estimada por

$$T_c(t) = \frac{1}{2} T_r(t) + \frac{1}{2} T_l(t) = T_r(t)$$

donde el subíndice l indica lenta y r indica rápida, y $\frac{1}{2}$ indica filtrado de datos. La subrutina que efectúa estas operaciones se llama FAST2. La longitud del filtro es crítica para el éxito del algoritmo: filtros más chicos que 1500 puntos son claramente peores para cálculos subsecuentes de salinidad. Esto se debe aparentemente, a que la escala de tiempo de deriva del RRT es relativamente larga. Sin embargo, se obtuvieron pequeñas diferencias en los cálculos de salinidad usando 1500 puntos y 2300 puntos.

e) Correcciones del retardo y cálculos de salinidad.

Después de combinadas las señales RPT y RRT el análisis espectral indica que hay todavía un retardo de alrededor de 2 registros de datos entre la temperatura combinada y la señal de conductividad. Esto es corregido usando un esquema similar al desarrollado por Horne y Toole (1980). Según dichos autores se construyen filtros para la presión, temperatura y conductividad de acuerdo a la descripción teórica de la respuesta del sensor como una función del tiempo. Los pesos usados en estos filtros están dados en la tabla 4; los filtros no son recursivos. Un programa separado llamado ANAW.FOR es usado para calcular los 3 grupos de pesos de los filtros, los cuales son aplicados a la presión, temperatura y conductividad. La corrección del retardo, aunque efectiva, no es tan importante en los cálculos de salinidad libre de picos como lo es la combinación de las temperaturas rápida y lenta. Detalles del esquema de corrección del retardo están dados en Bray (1986). La salinidad es calculada a partir de la temperatura retardada y la presión y conductividad filtradas.

Station header information is also listed on each page. It is mostly self-explanatory, but the following may be of interpretative help. Across the top of each page are: station sequential number, latitude, longitude date, hour (GMT), east depth (in db) and water depth in meters, corrected for depth of hull transducer, but not for sound speed variations.

Below the plot is ancillary header information: the year day with decimal (GMT) time; sea surface temperature, dry and wet bulb air temperatures; wind speed in kt. and CTD identification number. The next two lines are comments. The first is the original comment entered at the beginning of data acquisition, and the second is one entered at the processing stage. It includes header processing date and information about modifications to header information made after the data were acquired. The second comment is primarily for our own use.

4. Potential Temperature vs Salinity Diagrams

The stations are divided into yoyo groups, with a composite potential temperature vs salinity (Θ vs S) plot and location map constructed for each group (Figures 7a to 7j). The groups are: yoyos M1, M2, M3, A1, A2, CAP-1, A3, A4, CPN, and a cross-Gulf line in the northern Gulf, line P.

usando la subrutina SAL78 (Fofonoff y Millard, 1983) para salinidad practica.

f) Presión promediada.

Despues de la correccion del retardo y los cálculos de salinidad, los datos son acumulados en grupos de 2 db (: 1 db alrededor de las presiones pares, empezando con 2 db, o la presión más somera mayor que 2 db) y son promediados para formar una serie cada 2 db. Todas los datos dentro del rango son promediados; ningún dato es descartado. Para una razón de descenso uniforme de 60 m min, esto podría implicar alrededor de 2 segundos de datos por grupo, o 50 registros de datos. Cerca de la superficie y del fondo del lance se incluyeron mas puntos. El promedio de la presión se efectua en la subrutina PRSORT.

3. Notas sobre la exposición de los datos.

Las series de datos cada 2 db son graficadas en las páginas siguientes. Todos los puntos de las series son graficados, pero sólo se enlistan series submuestras a profundidades estandars.

* * * * *

Importante: Los valores de temperatura (en grados °C) estan graficados con lineas gruesa, los de salinidad (en unidades prácticas de salinidad) estan graficados con lineas delgadas y los de σ_t estan graficados con lineas punteadas.

* * * * *

La información sobre la identificación de las estaciones esta tambien enlistada en cada página. Es en su mayoría fácil de interpretar, pero lo que sigue a continuación puede ayudar. En el margen superior de cada página están: el número secuencial de la estación, latitud, longitud, fecha hora GMT, profundidad del lance (en db) y la profundidad en metros, corregida por la profundidad del transductor en el casco del barco, pero no por las variaciones de la velocidad del sonido.

Debajo de la grafica hay información adicional: el día del año con tiempo decimal GMT;

temperatura de la superficie del mar, temperatura del aire seco y humedad; velocidad del viento en nudos y el número del CTD. Las dos líneas siguientes son comentarios. El primero es un comentario original introducido al principio de la adquisición de los datos, y el segundo fue introducido en una etapa del procesamiento. Este incluye fecha e información relacionadas con las modificaciones hechas a la información de la cabecera después de que los datos fueron adquiridos. El segundo comentario es para nuestro uso propio.

4. Diagramas de Temperatura Potencial vs Salinidad

Las estaciones están divididas en grupos 'yoyo'. Para cada grupo existe un diagrama compuesto de temperatura potencial vs salinidad (Θ vs S) y un mapa de localización. Los grupos son: yoyos M1, M2, M3, A1, A2, CAP-1, A3, A4, CPN, y una línea P transversal en la parte norte del golfo.
