ABSTRACT

This thesis investigated the feasibility of developing a small scale management information system on a micro-computer. The working system was developed around the Operations Research Society of America (ORSA) three tiered review and acceptance process for articles submitted for publication in the ORSA journal.

The management information system was designed using Ashton-Tate's dBaseIII software. As designed, the system will operate on any computer operating under Microsoft's Disk Operating System (MS-DOS). The user must provide his own dBaseIII software.

A similar management information system could be tailored to almost any operation having a need to monitor, control and evaluate time sensitive workloads.

I. INTRODUCTION

A. BACKGROUND

Managers in all industries, including the Department of Defense (DoD), are faced with the task of providing a product or service in a timely and efficient manner. This task becomes more difficult as the work to be accomplished is either more diversified or the manager is required to delegate the responsibilities for accomplishing the tasks or sub tasks to various people within his organization. Complexity increases if the manager must rely on someone outside of his or her immediate authority for input to the final product.

The role of the mid-level manager in the Department of Defense has become more and more diversified and complex as the sophistication of defense systems has increased. The reductions in staffing levels along with limitations on resources available require the manager to not only optimize efficiency but also closely monitor time sensitive issues.

The advent of office automation throughout the Government has proven to have both advantages and disadvantages. The availability of stand alone micro-computers provides for rapid analysis of specific

problems such as statistical computations. The average mid-level manager now has at his disposal powerful hardware and software that he quite often cannot use effectively. These sophisticated tools, in many instances, provide more computational power than the manager needs or has time to learn to use. Elaborate commercially available software has been developed that will provide assistance in a wide range of areas. The typical manager does not require the full capabilities of these packages and therefore cannot afford to devote the time necessary to utilize them efficiently. Quite often, subsets of these commercial packages are all that are needed. Therefore, the manager, lacking either the time or the expertise, does not avail himself or herself of these tools.

What the mid-level managers need is software tailored more specifically to their operations. The use of a small scale management information system could prove highly beneficial to many managers within the Department of Defense.

B. STATEMENT OF PROBLEM

Can a stand alone, versatile and manageable information system be developed to assist the mid-level manager in planning, monitoring and controlling workload along with evaluating operational performance within available resources?

Some other relevant questions that were addressed include but are not limited to:

1. Can existing software be employed or must software be developed?
2. What are the subsequent hardware requirements for the preferred software?
3. How compatible are the software and hardware requirements to existing DoD resources?
4. How flexible is the selected software should future modifications to the system be needed?

The management information model developed in this thesis uses commercially available software. The system will operate on micro-computers operating under the Microsoft Disk Operating System (MS-DOS). The software used allows modifications to the management information system should future requirements change. Micro-computers using MS-DOS are currently in the DoD inventory.

The balance of this thesis will describe the methods used in developing the management information system along with step by step instructions on how the user would access and use the system.

C. SCOPE

The main thrust of this thesis was to determine the feasibility of developing a relatively small scale management information system. Once such a system proved feasible, a model was developed. The system, or one similar to the system developed, will provide the manager with a

resource/decision tool for assisting in fulfilling time sensitive managerial responsibilities.

The management information system actually presented in this paper was designed around the Operations Research Society of America's (ORSA) three tiered process of reviewing and approving articles that are submitted for inclusion into the Society's bimonthly journal.

The Society's review and acceptance for publication of articles that are submitted is based upon a three tiered process. Articles are submitted to the editor who has the overall responsibility for the articles that are eventually published in the ORSA journal. The editor assigns each article he receives to an area editor. The selection of the area editor depends upon subject area of the article submitted. The area editors, in turn, forward the articles to the actual reviewers. There is a special interest group (SIG) chairman for each subject area.

Authors of prospective articles may submit their articles directly to the area editors. In cases where this occurs, the receiving area editor must inform the editor of the proposed articles so that the editor can maintain control over the entire operation.

The editor must assure that articles are reviewed in a timely manner. He must also maintain an overall view of which subject areas have the most activity, what are the

relevant statistics associated with review and publication times, and, what are the acceptance rates of submitted articles within the various subject areas.

The editor has the task of reviewing, accepting and publishing articles for the Society's journal but without definitive authority over the two lower tiers in the review process. He must also respond to the queries of the SIG chairmen and submitting authors concerning the level of activity within the various subject areas, the acceptance status and expected publication dates of articles that were submitted.

II. METHODOLOGY

A. SOFTWARE

The selection of appropriate software was based upon a personal survey of software currently available in the marketplace. Evaluation criteria for the software included:

1. Current availability,
2. Ease of use,
3. Flexibility,
4. Interactive capability,
5. Established reputation with computer users,
6. Programmability and,
7. Available support from the vendor.

Some of the currently available software packages that were reviewed included:

1. Lotus 1-2-3 and Symphony from Lotus Development Corp.
2. Framework and dBaseIII from Ashton-Tate
3. Turbo Pascal and Reflex from Borland International
4. Fortran 77 from Digital Research
5. Microsoft Fortran from Microsoft, Corp.
6. R:base 5000 from Microrim, Inc.

The software used in developing the system was dBaseIII from Ashton-Tate. This software is well accepted by computer

users. The software can be used by novices using the integral interactive mode provided by the package. The dBaseIII package allows programming of functions and procedures that are specialized to the user. A system design within dBaseIII can be operated by a user having minimal knowledge of dBaseIII itself. If the operator can load the software onto the computer, the data base management system that was developed can be accessed and utilized.

The user must provide the dBaseIII software to use the management information system that was developed.

B. HARDWARE

The management information system and dBaseIII can be run on most computers that use the Microsoft Disk Operating System, known in the industry as MS-DOS. The MS-DOS used must be version 2.1 or later.

The management information system was developed on a micro-computer with MS-DOS 2.11. The available storage consisted of a standard 360 kilobyte floppy disk drive and a 10 megabyte hard disk. The system has 640 kilobytes of available random access memory (RAM).

Although a hard disk is a great convenience, the management information system can be used with a system having a minimum of two 360 kilobyte floppy disk drives.

C. DATABASE DESIGN

The databases were developed around the ORSA requirements for reviewing, accepting or rejecting and publishing articles that are submitted for inclusion in the bimonthly ORSA journal. Three different databases were deemed necessary:

1. A publication database to accommodate information specific to each article submitted;
2. An author database for information on authors submitting articles; and,
3. An area editor and SIG chairman database for administrative information on the area editors and the special interest group chairmen.
4. A subject category database containing subject category codes and subject titles. These are assigned to articles depending upon the related subject area.

The size of each field within a database was determined by a combination of sampling and logical interpretation. The size of the fields for article title, author names and author's affiliation were determined by sampling articles that have been published in the ORSA journal over the last three years (1983 - 1985). The results of the sampling are depicted in Table 1.

TABLE 1
SAMPLING RESULTS

	Sample size	Mean Length Characters	Std deviation of Length
Article title	269	67.1	20.7
Author names	433	14.5	2.8
Author affiliations	71	26.5	11.6

The final size of these data fields were increased over their means to all the majority of the article titles, author names and author affiliations to be entered completely into the appropriate databases.

Two additional databases are included in the management information system. These are the historical publications data base and the historical authors database. These two databases allow archiving records that require no further action. This capability to archive records provides two distinct benefits.

1. Statistics on past performance can be retained. This historical database can be removed from the system until it is needed for updates.
2. The primary databases can be purged of historical information thereby reducing the size of the database and providing a savings in processing time.

1. Publications Database

The database structure for the publications database is provided in Table 2.

TABLE 2

STRUCTURE FOR PUBLICATIONS DATABASE

Field Name	Data Type	Field Size	Field Content
TITLE	Character	100	Article title
SUBNUMB	Numeric	5	Submission number
AUTHORS	Numeric	1	Number of authors
SUBDATE	Date	8	Submission date
CATNUMB1	Character	3	1st subject category
CATNUMB2	Character	3	2nd subject category
CATNUMB3	Character	3	3rd subject category
AREA	Character	5	Area editor code
ACCCODE	Character	1	Acceptance status code
MODTIME	Numeric	4	Days in modification
ACRJDATE	Date	8	Accept/reject date
PUBDATE	Date	8	Publication date

Total record length 150 characters

The database structure depicted in Table 2 applies to both the current and historical publications data bases.

2. Authors Database

Both the current authors database and the historical authors database have the same structure. This structure is illustrated in Table 3.

TABLE 3

STRUCTURE FOR AUTHORS DATABASE

Field Name	Data Type	Field Size	Field Content
SUBNUMB	Numeric	5	Submission number
LASTNAME	Character	15	Author's last name
FIRSTNAME	Character	12	Author's first name
AFFILIATE	Character	50	Author's affiliation
ADDRESS1	Character	30	1st address line
ADDRESS2	Character	30	2nd address line
CITY	Character	20	City of residence
STATE	Character	20	State or country
ZIP	Character	10	Zip code
PHONE	Character	12	Telephone number

Total record length 205 characters

3. Area Editors Database

The area editors database is unique in that it contains information about two groups of people. These are the area editors and the special interest group chairmen. The content of this database unlike the publication or author databases is essentially fixed. The information contained applies primarily to the administrative functions of the ORSA operation. The area editor represents the second level of the three tiered review system. The information in this database will need to be updated only when an area editor or a SIG chairman is replaced. The structure of the database is reflected in Table 4.

4. Subject Category Database

The subject category database is provided merely as an online reference to the subject category numbers and the subjects themselves. The subject category numbers are two or three digit numbers that cross reference an article with a specific subject area. Each author is required to suggest three subject areas that the article that is being submitted could be classified under. These category numbers are used for annual indices of articles that were published by the Society.

This database is probably the most static of all the databases provided. The structure of this database consists of only two fields both of which contain character data.

The first is the CATNUMB field which is three characters wide and contains the subject category number. The other is the SUBJECT field which is 60 characters wide and contains the subject title.

TABLE 4

AREA EDITOR AND SIG CHAIRMAN DATABASE

Field Name	Data Type	Field Size	Field Content
AREA	Character	5	Subject area code
TITLE	Character	65	Subject area title
LASTNAME	Character	15	Area editor last name
FIRSTNAME	Character	12	Editor first name
AFFILIATE	Character	75	Editor's affiliation
ADDRESS1	Character	30	1st address line
ADDRESS2	Character	30	2nd address line
CITY	Character	20	City of residence
STATE	Character	20	State or country
ZIP	Character	10	Zip code
PHONE	Character	12	Telephone number
SIGCHAIR	Character	25	SIG's full name
SAFFILIATE	Character	60	SIG's affiliation
SADDRESS1	Character	30	1st address line
SADDRESS2	Character	30	2nd address line
SCITY	Character	20	City of residence
SSTATE	Character	20	State or country
SZIP	Character	10	Zip code
SPHONE	Character	12	Telephone number

Total record length 502 characters

D. MANAGEMENT INFORMATION SYSTEM PROGRAMS & FILES

The programs used in the management information system were written using the language inherent in dBaseIII. This allows any prospective user to merely load dBaseIII onto his system and immediately access the management information system. Once the system is initialized, using the system is simply a matter of selecting options from menus and

responding to prompts. This enables the occasional user to use the elaborate structures within dBaseIII without having to have any intimate knowledge of the software package.

The system is comprised of database files, executable programs, format files, label structure files, and index files.

The database files are the core of the entire system. All other files and programs perform functions and calculations based upon the contents of the database files. The structure of the data base files were previously depicted in Table 2 through Table 4.

The purpose of the remaining files and programs are further detailed in the subsequent sections.

1. Executable Programs

The executable programs perform some action on the databases. There are twenty-seven programs in the system. All of these programs have the file extension .PRG. A flow chart depicting the relationship between the programs and the menu selections available to the user is contained in Appendix A. A full text listing of each of these programs is provided in Appendix B. Table 5 lists the names and functions of the executable programs as they exist on the computer system.

2. Format Files

The format files in dBaseIII serve two purposes. The format file allows the program to specify a specific screen layout for the information that must either be presented to the user or received from the user. This type of file can be created once and used repeatedly in the same or different executable programs. This feature greatly reduces the amount of programming code that must be written. All dBaseIII format files have the extension .FMT. The names and functions of the eight format files used in this management information system are provided at Table 6. Full text listings of these files are also provided in Appendix A.

3. Label Files

The label files provided in this system enable the user to print mailing labels for either the area editors or the SIG chairmen. The format of these files is for standard 3 1/2 inch by 15/16 inch labels. These labels are limited to five lines of text with each line having a limit of 35 characters. In dBaseIII, label files are assigned the extension .LBL. The files TEDITOR and TSIG provide mailing labels for the area editors and the SIG chairmen, respectively.

4. Index Files

Index files in dBaseIII allow programs to access databases in a specific order. These files provide the same function as sorting except that they execute faster, require

less storage space and are automatically updated as items are added to or removed from the database. The default extension for index files is .NDX. This system uses eleven different index files. The names and functions of these files are illustrated in Table 7.

TABLE 5
EXECUTABLE PROGRAMS & THEIR FUNCTIONS

Program	Function
TAGEMNU	Menu for selecting which articles to check the age since receipt or return for modification.
TALLSTAT	Provides statistics on the average times from submission to acceptance/rejection, publication.
TARCDL	Archives and deletes a selected article.
TARCDLP	Archives and deletes all articles that have been published.
TDELETE	Deletes a selected article.
TDELMNU	Menu to delete or archive and delete articles.
TEDIT	Edit an existing record.
TEDITMNU	Menu to select what is to be edited.
TEDSIG	Edit the area editor or SIG chairmen database.
THOLDAGE	Check age of articles that are still in review.
TINPUT	Input new records to the publications and authors databases.
TMENU	Main menu of the management information system.
TMODAGE	Check the time since an article was return to the author for modification.
TPPRTAC	Review or print articles by acceptance status.
TPPRTAL	Review or print all articles in the publications databases.
TPPRTAR	Review or print articles within a specified subject area code.
TPPRTCN	Review or print articles with a given subject category number.
TPPRTSB	Review or print an article with a specified submission number.
TPRTAUTH	Review or print information from the authors databases.
TPRTED	Review or print information about a specific area editor code.
TPRTLBL	Select whether to print mailing labels for the area editors or the SIG chairmen.
TPRTSIG	Review or print information about a specific area SIG chairman.
TPRTSUBJ	Review or print subject category numbers and titles.
TPUBSTAT	Provides counts and percentages for various acceptance status codes on the publications.
TRPRTMNU	Menu to select which database is to be reviewed or printed and in what format.
TRPTPUB	Menu to select how articles will be reviewed or printed.
TSTATMNU	Menu to select statistical options.

TABLE 6
FORMAT FILES & THEIR FUNCTIONS

Program	Function
AUTHEDIT	This file paints the screen for editing author information.
AUTHINPT	Provides the layout to enter information for a new author.
LISTAREA	Constructs a menu layout for selecting a subject area to be acted upon.
PUBEDIT	The format screen for editing information in the publication database
PUBINPUT	Formats the screen for insertion of new articles into the publication database.
TEDITOR	Provides the user with formatted information for the area editors.
TRPRTMNU	Paints the menu for available options in reviewing or printing articles from the publication database.
TSIG	Provides the user with formatted information for the special interest group chairmen.

TABLE 7
INDEX FILES & THEIR FUNCTIONS

Program	Function
TAHSTSBN	Indexes the historical author data base by submission number.
TAREA2	Indexes the area editor and SIG chairman data base by subject area.
TATNAME	Indexes the authors by last and first names.
TAUTHSBN	Indexes authors by submission number.
THATNAME	Indexes the historical author by lastname and firstname.
TPHARSB	Indexes the historical publications by subject area and submission number.
TPHSTSBN	Indexes by submission number the historical publications data base.
TPUBACC	Indexed the publications data base by acceptance status code.
TPUBARSB	Indexes publications by subject and submission number.
TPUBSBN	Indexes the publications by submission number.
TSUBCAT2	Indexes the subject category file by subject category number.

III. MANAGEMENT INFORMATION SYSTEM OPERATION

A. SYSTEM INSTALLATION AND STARTUP

Installation of this system requires only that all the programs provided on the disk be maintained on the same drive. If a hard disk is available, all programs can be copied to that drive. Should space become a problem, especially on a floppy disk, the historical files can be moved to another disk. However, if the historical files are removed from the system disk, archiving and deleting records cannot be accomplished from the menu driven system. It would be necessary to reinstall these files prior to attempting an archive operation.

Accessing the management information system requires two steps beyond computer boot-up. First, dBaseIII must be initialized. Secondly, the command "do TMENU" must be input at the dBaseIII dot prompt. This command and all subsequent commands depicted in this section are input without the quotation marks. From this point on, the entire management information system is menu driven.

B. GENERAL COMMENTS ON THE SYSTEM

The management information system was developed with the user in mind. In all instances, the databases are

safeguarded from normal user errors. If an invalid entry is attempted, the current menu will either be redisplayed or an error message will be given before the user is allowed to retry an entry. Prompts are displayed throughout system execution whenever input is required from the user.

C. START-UP AND MAIN MENU

The first message that is presented when the system is initiated with the command "do TMENU" from the dBaseIII dot prompt is:

Today is Day of Week, Month Date, Year

If this is not the correct date enter N then
reboot your system with the current date.

If the date is correct then hit Y to continue.

Enter N or Y:

For the management information system to operate correctly, it is absolutely necessary that the current date be correct whenever any articles are entered, edited or deleted. Statistics provided by the system also require the correct current date. Many computer systems are equipped with a clock calendar that automatically sets the correct time and date. On other systems, the user is asked to enter the correct time and date as part of the operating system initialization.

Once the correct date is established by answering "Y" or rebooting, the main menu will be presented.

Publications Database System

Make your selection from the following list:

1. Add new entries
2. Edit existing records
3. Review/Print entries
4. Check age of publications
5. Report statistics
6. Delete/Archive records
- X. Exit to DOS

RETURN Exit to DBASE

Enter selection:

Each of these options will be depicted in the sections that follow.

D. ADD NEW ENTRIES

This is the first option available from the main menu. Selection of this option enables the user to enter new articles into the publication database and relevant authors to the authors database. After selecting this option, you will be prompted to enter the title of the article being input into the database. After the title is input, the system will automatically assign the next submission number that is available.

For illustrative purposes assume that the number 8 is the next available submission number. The system will display the following screen:

Submission number (XXXXX): 8
 Title (100 characters max):
 Solving 0-1 Integer Programming Problems Arising from
 Large Scale Planning Models
 Number of authors (X):
 Submission date (MM/DD/YY): 06/11/86
 First subject category number (XXX):
 Second subject category number (XXX):
 Third subject category number (XXX):
 Area editor subject abbreviation (XXXXX):
 DABN DIS DNFP HCSSI ICS NRMEE
 OPT ORP PSIMM SIESM SSPS SPTA

(Hit PgDn to move to author file.)

The system automatically assigns the submission number along with the current date and displays the title that was entered. All information can now be filled in for the article in question. Although automatically entered, the submission number and the submission date can be modified if desired. Modifying the submission number would only be reasonable if an earlier submission number had been deleted and the user choose to reuse that number. Modifying the submission date would be appropriate if the user "batches" several entries before updating the database. The user would simply write over the current date with the actual date of receipt. Any entry can be ignored by hitting the return key. The user may move freely among all data fields by using the up and down cursor arrows. The only exception to this is if the last field of the recrd is completely

filled in or the return key is pressed while in this field. At that point, the system will automatically transfer to the author input screen.

When all the information has been entered, the system will automatically present the user with the entry screen for the authors. This screen will be repeated a number of times equal to the value specified in the "Number of authors" field. The author input screen is depicted below. The submission number is inserted automatically. If the submission number was modified in the article entry screen, the submission number in the author screen must be modified also. The submission number is the linkage between the authors and the publications databases. Therefore, these numbers must match in both the publication database and the author database.

```
Submission number is (XXXXX):           8
Author's last name (15 max):
First name and initial (12 max):
Author's affiliation (50 max):

First address line (30 max):
Second address line (30 max):
City (20 max):
State or Country (20 max):
Zip code (XXXXX-XXXX):
Telephone number (XXX-XXX-XXXX):
```

Hit PgDn for next author.

As before, the user can skip the entry of data for any fields or return to fields to add more information or

correct errors. After the information for all the authors has been provided, the user will be asked to enter the title of the next article. At this point the user may continue to enter information for more articles or return to the main menu by simply hitting the enter key.

E. EDIT EXISTING RECORDS

This is the second option on the main menu. Selection of this option presents the user with three choices.

1. Edit the publications database.
2. Edit area editors and SIG chairmen files.

RETURN - exit this menu.

Enter choice:

Choices one and two both allow the user to edit records that have previously been entered. The procedure is essentially the same regardless of which database is selected for modification. The only significant difference is that the publication database uses the submission number to select the desired record while the area editors and SIG chairman database prompt the user for the subject area code. To continue with our initial example, assume that option one is chosen. When asked for a submission number suppose a value of 8 is entered. If the user is uncertain about the submission number that he wants to edit, option 3 of the main menu should be used to review articles and

verify the submission number. The system next presents the user with the edit screen shown below.

```
Submission number (XXXXX):                8
Title (100 max)
Solving 0-1 Integer Programming Problems Arising from
Large Scale Planning Models
Acceptance code (X):                      H
H: in review  A: accepted  R: rejected
P: published  M: returned for modification

Acceptance/Rejection date (MM/DD/YY):      /  /
Publication date (MM/DD/YY):              /  /
Submission date (MM/DD/YY):               06/11/86
Area editor subject abbreviation (XXXXX):  ORP
DABN  DIS  DNFP  HCSSI  ICS  NRMEE
OPT   ORP  PSIMM  SIESM  SSPS  SPTA

Number of authors (X):                     3
First subject category number (XXX):       181

Third subject category number (XXX):
The first of 3 author(s) is:              Johnson
```

(Hit PgDn to move to author file)

This screen shows all the information that was initially entered for this submission number. The acceptance code (H) was added by the system automatically at the time the record was entered. It is assumed that when an article is first input into the system, it is the beginning of the review process. There should be no concern if the title displayed in the edit screen splits a word at the end of a line. In fact, a break in a word will occur frequently for titles having 76 or more characters. The title which has a field large enough to hold 100 characters is internally massaged to prevent breaks within words when reports are generated.

The author name displayed in this form cannot be modified. It is provided solely for reference purposes. The author records can be modified with the next edit screen.

One word of warning about changing the "Number of authors" field in the publication database: there are no provisions for increasing or decreasing the number of authors for a given article or submission number within the edit module. It was assumed that the number of authors attributable to an article would be known when an article was first received. Should it be necessary to reduce or increase the number of authors, the best method is to delete that submission number and then re-enter it. Some data may be lost for statistical reporting purposes but this should be minimal provided that the change is made within a relatively short period of time after the article was first input into the system.

When all necessary modifications have been made to the record, the system will provide you with the first author screen.

Submission number is: 8
Author's last name (15 max): Johnson
First name & initial (12 max): Ellis L.
Author's affiliation (50 max):
IBM Thomas J. Watson Research Center
First address line (30 max):
Second address line (30 max):
City (20 max): Yorktown Heights
State or Country (20 max): New York
Zip code (XXXXX-XXXX):
Telephone number (XXX-XXX-XXXX):

(Hit PgDn for next author.)

This screen will provide the same information that was initially input. After the last author record corresponding to a given submission number has been modified the user will be asked to enter another submission number. Simply hit enter to return to the previous menu or enter another number to continue editing.

F. REVIEW/PRINT ENTRIES

The third option presents the user with the following menu.

REVIEW & PRINT OPTIONS	Selection:
1. Publications	2. Authors
3. Area editors	4. SIG Chairmen
5. Mailing labels	6. Sub. categories
7. Toggle Current/Historical	Status: C
8. Toggle Screen/Printer	Status: S

RETURN - Exit this menu

This sub-menu provides the options to review or print information from all of the indicated databases. Information can be reviewed or printed in many different forms. These will be illustrated shortly.

A few comments should be made on some of these options. Option 7 and option 8 are toggles to select whether the information reviewed will be on current or historical databases and whether the output device will be the monitor screen or the printer. The defaults for data to be reviewed are the current databases represented by the status letter "C". Selection of option 7 will change the status to "H" for historical database. The default for the output device is the monitor screen represented by status letter "S". Toggling this option will change the status letter to "P" for printer. Both of these toggles can be changed anytime from this menu.

1. Publications

Selection of the first option from this sub-menu provides information on articles in several different forms. The specific selection criterion is chosen by indicating a choice from the following menu.

SELECTION CRITERION FOR REVIEWING ARTICLES

- A. A specific submission number.
- B. A specific area.
- C. A particular acceptance status.
- D. A subject category number.
- E. All entries in the database.

RETURN - Exit this menu

State your preference:

All options on this menu provide the same information for the specified selection criteria. To illustrate, suppose that option "A" is selected. The output is summarized as shown below.

```
NUMB:      8  SUB: 06/11/86 Solving 0-1 Integer Programming
AREA: ORP    A/R:  /  /   Problems Arising from Large Scale
STAT: H      PUB:  /  /   Planning Models
AUTHOR: Johnson      (3) CAT: 181 625
```

Hit any key to continue...Q to abort...

As can be readily seen, this is the same information that was input but formatted more compactly for more efficient printing or reviewing. Had the user selected options "B", "C", "D" or "E" the same type of information would be displayed except that, possibly, multiple records would be provided. If the screen was selected as the output device, four articles to a screen will be displayed followed by a request to hit a key to continue or "Q" to quit. This is done to prevent the information from scrolling off the screen before the user can review it. The "Q" option

provides the user a means to abort review without waiting for all entries to be displayed. If the printer is the selected output device, all articles that meet the selection criteria are printed.

2. Authors

Selection of option 2 will display information on the authors based upon the choice selected from the option menu below.

AUTHOR SELECTION MENU

- A. All authors sorted by last name.
- L. All authors for a given last name.
- N. All authors for a given submission number.

RETURN - to exit.

If "N" for submission number is selected, the user must input the submission number desired. Below is the information for submission number 8 entered.

Johnson, Ellis L. Sub#: 8
IBM Thomas J. Watson Research Center

Yorktown Heights, New York 99999 555-555-5555

This type of review may be used to find an author's telephone number, address or affiliation. Information will be displayed for every author having the selected submission number. Selection of the "A" option will display all the authors in the database alphabetically sorted by last name. Option "L" will prompt the user for a last name. All

authors in the database having the given last name will be displayed. Provisions are available to allow the user to abort the screen display of records at any time.

3. Area Editors/SIG Chairmen

Options 3 and 4, area editors and SIG chairmen provide the same type of information. The difference is only that one option is for the administrative information on the area editors and the other is information on the chairman of the special interest group associated with that area. Though not illustrated here, the information presented is in the same format as for the review of authors.

4. Mailing Labels

This option enables the user to review on screen or print mailing labels for the area editors or the SIG chairmen. The format is designed for printing on standard one wide 3 1/2 by 15/16 inch labels. This size label will accommodate five lines of text with a maximum of 35 characters per line. The example below illustrates the output of this option.

```
*****
*****
*****
*****
*****
```

Do you want more samples? (Y/N)No

David E. Bell
Harvard Business School
Soldiers Field Road
Boston, MA 02163

The sample of asterisks enables the user to properly align the label stock on the printer prior to printing the actual information. One may request as many samples as necessary to properly align the printer forms.

5. Subject Categories

Option 6 will display either individual subject category numbers with the full title or list all numbers and titles to the screen or printer. Individual display is selected by subject category number. This listing is probably most useful as a quick reference to an individual category title.

G. CHECK AGE OF PUBLICATIONS

This module allows the user to determine how long submitted articles have been out for review or how long it has been since an article was returned for modification. The records can be reviewed for ages in four different intervals of time:

- A. More than 3 months but less than 6 months.
- B. More that 6 months and less than 9 months.
- C. Over 9 months but less than one year.
- D. Greater than one year.

The information displayed with each of these options is exactly the same except for the time elapsed since submission or return for modification. These times given in

days will fall within the range of the selected option. The records will be displayed one at a time but the program will search the entire database and display in turn all of the records that meet the selected age. Following is an illustration of what the record would look like.

Submission number is: 4
Review area is: DABN
This is a test of the age checking program.

This document was submitted on 03/07/86.
Days elapsed since submission: 96
The first of 1 author(s) is: Williams

Press any key to continue.....

One further set of options is available for the age check. The check can be conducted for the entire database or for a specified area of review. The area selection menu looks like this.

STATISTICS GENERATED FOR AREA:

- | | |
|---|--|
| A. Decision Analysis | B. Defense & Intl Sec. |
| C. Distribution/Networks | D. Health Care |
| E. Computer Science | F. Natural Resource Mgmt
Energy & Environment |
| G. Optimization | H. OR Practice |
| I. Production/Scheduling/
Inventory/Matls Mgmt | J. Simulation/Evaluation
of Stochastic Models |
| K. Social Sciences
and Public Sector | L. Stoch. Proc & Applicns |
| M. Aggregate (ALL) | RETURN - to exit |

H. REPORT STATISTICS

This segment of the system reports statistics on two different areas. Each of the two options allows the user to select, as in the age-check module, a specific subject area or the entire database.

The first option will provide descriptive statistics from the publications database. These statistics include the count of the number of articles by acceptance code and percentage of the total. Sample output generated with this option is presented below.

Statistics for Publications in ALL

PUBLICATIONS STATISTICS		
	FREQUENCY	PER CENT
HOLDING	31	79.4
ACCEPTED	3	7.6
REJECTED	3	7.6
PUBLISHED	0	0.0
MODIFICATION	2	5.1
TOTAL	39	100.0

The second option will provide in days the mean and standard deviation of the time required to accept, reject, or publish articles. The overall acceptance rate is also provided. Sample output is given below.

SUMMARY IN DAYS for ALL

	Mean	StdDev
Submission to acceptance	365.0	0.0
Submission to rejection	345.0	290.6
Submission to accept/reject	355.0	184.1
Submission to publication	****.	***.
Acceptance to publication	****.	***.
Modification time	100.0	20.0

	QUANTITY	PERCENTAGE	
Accepted	3	50.00	
Rejected	3	50.00	Acceptance Rate
Published	0	0.00	50.0%
Total	6	100.00	

If there are no articles for a specific acceptance code, the fields in the summary statistics will be filled with asterisks. For the quantity and percentage columns the absence of articles meeting a specific acceptance code is reflected by zeros.

1. DELETE/ARCHIVE RECORDS

Three options are available in this module for deleting and archiving records no longer needed in the active databases. The first option will allow the user to delete an article and all relevant authors by inserting an article's submission number. The article is displayed for the user's approval before it is deleted. The user is asked to confirm the deletion of the record.

Option two allows the user to archive an article before deleting it. Selection is again based on submission number. As before, the user is required to verify the record that will be archived and deleted.

The third option is designed to archive and delete all articles that have an acceptance code "P" (published). This option will probably be run at infrequent intervals to simply reduce the size of the active databases. A warning is issued prior to execution of this program that no published articles will remain in the database. A potential impact of running this option is that any statistics generated after this option will not reflect anything about articles that were published.

Upon termination of any of these three options, a message will be displayed alerting the user that files are being packed and that the process will take some time. This will occur even though the user may have decided to abort deleting or archiving. This will cause no problems since packing a file removes only the records that have been marked for deletion. If no records were requested for deletion then packing will not cause any removals.

J. EXIT TO DOS / EXIT TO DBASE

The last two selections on the main menu--X and RETURN--are the termination of execution of this management information system. Exiting to DOS (X) takes the user out

of the management information system and out of dBaseIII, while exiting to dBase--by hitting RETURN--leaves the environment of the management information system and places the user at the dot prompt in dBase.

K. USE OF DBASE DOT PROMPT

For those managers familiar with the dBaseIII software, it is advised that the database files provided on the disk not be modified from the dot prompt. Programs in the management information system check what items are being edited or added. Some of these operations are critical to the reporting of correct and valid statistics. Average times for the various review and processing stages will not be accurately reflected if acceptance status codes are modified outside of the menu environment. Time that an article is returned for modification will not be captured if the acceptance status code of "M" is changed from the dot prompt. One exception to this would be to delete erroneous entries that must re-enter immediately. Should this be necessary, the "BROWSE" command can be used from the dot prompt. The operator must assure that the correct database and indices are present prior to issuing the browse command. For the publications database the command to enter prior to browse is "use TPUB index TPUBSBN, TPUBARSB, TPUBACC". The corresponding command for the authors database is "use TAUTH index TAUTHSBN, TATNAME".

The preferred method of correcting an error is to delete that entire submission number and re-enter the information.

IV. CONCLUSIONS

This project began by investigating the feasibility of developing a stand alone management information system that would assist the mid-level manager in planning, monitoring and controlling workload along with evaluating the operational performance within available resources. Literature research of database development and available commercial software for micro-computers indicated that such a small scale management information system was feasible.

The dBaseIII software package by Ashton-Tate was selected as being appropriate for the development of this system. The necessary databases and programs were developed around the Operations Research Society of America's three tiered review process for accepting and publishing articles in their bimonthly journal. The total system that was developed can be stored on one floppy disk having a total storage capacity of 360 kilobytes. A similar system could most likely be developed using other commercially available software. However, the storage and hardware requirements of other software were not ascertained. This would require designing the entire system with whatever other software appeared to be appropriate.

The dBaseIII software will operate on most micro-computers using the Microsoft Disk Operating System (MS-DOS). This type of computer is currently in DoD inventory and there are no reasons to believe that this hardware will become outdated in the foreseeable future.

Since micro-computers are stand alone units, almost any DoD element could tailor this type of management information system to their particular operation. The dBaseIII software provides great flexibility for any future needed modifications to the system programs. The modular design of the system would not necessitate complete revision of all the programs currently implemented. It is quite likely that required modifications would affect only parts of some programs.

Although the system development was based upon the ORSA scenario, a similar management information system could be developed for any operation that has time critical functions to perform, monitor and evaluate. This type of system is especially suited to control workload and program execution when responsibility for accomplishing sub-tasks of any project lie outside the immediate authority of the responsible manager.
