1. This report summarizes data collected by the optical

ABSTRACT

This technical note is a summary of data collected by the optical oceanography program, of the Naval Ocean Research and Development Activity (NORDA) on a north-south transect of the central equatorial Pacific Ocean. Data were collected from 14 stations from the surface to a depth of 2900 meters. Parameters presented here include conductivity, temperature, salinity, transmissometry, fluorometry, chlorophyll and phaeopigments, total suspended matter, particle size and nutrients (phosphate, silicate, nitrate, and nitrite). Data are reported as vertical profiles (to 250 m), temperature-salinity plots, and tables of measured and derived values. Collection and analytical procedures are also described.

ACKNOWLEDGMENTS

The authors wish to acknowledge the Optical Oceanography Group at Oregon State University for their contribution to this report (Appendix B). Mr. David Menzies participated in the cruise collecting the optical data. Their report was prepared by Dr. Hasong Pak, Mr. Menzies, and Mr. James Kitchen.

Thanks are due to Dr. Richard A. Feely for the invitation to be a part of this cruise and for his sharing of data. We also thank Captain Robert Ganse and the crew of NOAA SHIP DISCOVERER for providing us with a most workable platform and professional support. The programming assistance of Dr. Denis Wiesenburg and the patient word processing of Ms. Bridget Smith and Ms. Kris Hayley during compilation of the data are greatly appreciated. This work was funded by the Naval Ocean Research and Development Activity under Program Element 61153N, Dr. Herbert C. Eppert, Jr. program manager.

OPTICAL MEASUREMENTS WITH RELATED
CHEMICAL, BIOLOGICAL, AND PHYSICAL PARAMETERS
FROM THE CENTRAL EQUATORIAL PACIFIC OCEAN

NOAA SHIP DISCOVERER, CRUISE RP-9-DI-84
27 FEBRUARY-09 MARCH 1984

INTRODUCTION

This technical note presents data obtained as part of the optical oceanography program conducted by the Naval Ocean Research and Development Program (NORDA). During February and March of 1984, two scientists from NORDA's Biological and Chemical Oceanography Branch of the Oceanography Division took part in a field mission to obtain optical data on a transect from Honolulu, Hawaii to Papeete, Tahiti. Our participation was on Leg II of a major National Oceanic and Atmospheric Administration (NOAA) four-part mission coordinated by Pacific Marine Environmental Laboratory (PMEL) to study CO₂ dynamics in the equatorial Pacific Ocean. NORDA's optics data collection was complemented by cooperation with Oregon State University's (OSU) optical oceanography group. Their presence on the cruise was co-sponsored by NORDA's Ocean Measurements Program.

During this cruise, measurements (vertical profiles) of conductivity, temperature, depth, chlorophyll fluorescence, percent transmission, and spectral K-d (diffuse attenuation coefficient) were made. Samples were also collected for gravimetric analysis of total suspended matter (TSM), and for image analysis of suspended particulate matter.

Appendix A includes vertical profiles of the chemical casts showing temperature, salinity, sigma-t and an optical parameter (either beam attenuation or fluorometry) plotted against depth. Temperature-salinity (t-s) plots are also presented. Appendix A also includes data tables of parameters sampled at discrete depths. Comprehensive CTD data listings in 1-m increments to 500 m and then in 2-m increments deeper than 500 m have been made. These include tables of observed and derived values such as potential temperature, sigma theta, specific volume anomaly, and dynamic height. They are too cumbersome to be included in this report, but are available from the first author at NORDA.

Appendix B, a technical report of the optical group from OSU, consists of a description of their optical system, tabulated station data, and CTD profiles from their casts, as well as profiles of total diffuse attenuation, fluorescence and irradiance.

SYNOPSIS OF CRUISE

The primary purpose of Cruise RP-9-DI-84 on NOAA Ship DISCOVERER, was to conduct the CO₂-Acid Rain Dynamics Experiment. Leg II began in Honolulu, Hawaii, on 27 February 1984. Fourteen stations were occupied on a transect between 15.0°N and 15.0°S at 150.0°W (see Figure 1). DISCOVERER arrived in Papeete, Tahiti, at the completion of Leg II on 9 March 1984.

FIGURE 1: Cruise track and station locations.

NORDA's Neil Brown CTD and NOAA's large volume Rosette sampling system provided the main in situ data collection package for this leg of the cruise. A Guildline Autosol and computer interface (provided by NORDA) were used for on-board salinity determination. Several optical parameters were sampled by the NORDA-OSU group. These data are included in this report. Measurements made solely in support of the NOAA CO₂ Dynamics Experiment are merely listed and include geochemical parameters, bird and mammal counts, and velocity measurements.

Cruise participants are listed in Table 1, along with their affiliation and primary responsibility. A station cast summary is given in Table 2 and cast parameters relating to optics are summarized by Table 3.

STATION PROTOCOL

At stations one and two, separate casts were made for Freon sampling and deep geochemistry sampling with either Freon syringes or 30-liter bottles. On subsequent stations, deep geochemistry and Freon sampling were done on one cast. A separate cast for chlorophyll using 10-liter bottles on the Rosette usually preceded the chemical cast. At nine stations the OSU Spectral K-meter system was deployed as a separate cast. No water samples were collected with the K-meter cast. Bird and mammal counts were done underway and on several stations. Measurements of the velocity distribution were made with an Ametek-Straza Acoustic Doppler Current Profiler on a transect (N-S) before stations 2, 5, 7, 9, 11, and 12.

METHODS

1. Field Data Collection--chemical and chlorophyll casts

The sampling system for the chemical casts consisted of NORDA's Mark III CTD (conductivity/temperature/depth) Probe (Neil Brown Instruments, Cataumet, MA). This instrument, with an extra optical sensor channel, was mated to the NOAA large-volume Rosette sampler and mounted on a large frame with an in situ fluorometer (SeaMartek, Seattle, WA). The package also included 11 nonmetallic water samplers (Niskin bottles) which were tripped by the electronically controlled Rosette Sampler (frame, Niskin bottles, and Rosette Sampler by General Oceanics, Miami, FL) and a 100-cm transmissometer (Sea Tech Inc., Corvallis, OR). The modification of the CTD system with the extra data channel causes a 0-5 V DC analog signal from an external signal to be transmitted as part of the normal CTD data cycle. The optical sensor (fluorometer or transmissometer) was interfaced to the CTD system via this extra channel. Prior to the cruise, the CTD system was calibrated and operationally checked by the Sensor Calibration Laboratory of the U.S. Naval Oceanographic Office and certified to be operating within the manufacturer's specified accuracies. The conductivity calibration is based on the PSS78 Practical Salinity Scale.

On each chemical station, the CTD Rosette package was deployed on a dual conductor oceanographic cable electronically interfaced to the CTD readout/data logging system and the Rosette sampler. As the 2-m high, 900-pound package was lowered through the water column ("downcast"), the serial data transmissions from the CTD are recorded on the analog tape and also digitized in 0.5-1.0 decibar (dbar) averages and stored on digital tape. At a lowering

¹ CTD = NORDA CTD-Optical System; SK = O.S.U. Spectral K-Meter System

² F = chlorophyll fluorescence; %T = % transmission over 100 cm at 660 nm; Kd = Spectral Irradiance; P = Suspended particulates for TSM/SEM study; C = Chlorophyll measurements on discrete samples (provided by V. Thayer, Duke Marine Lab); PSA = Coulter Counter Particle Size Analysis.

speed of 40 m per minute the 0.5-dbar increments usually represent the average of at least three data cycles.

On chlorophyll casts, 10-liter bottles were used and the fluorometer was employed as the optical sensor. On stations 3-14, when both Freon and geochemistry samples were taken on a single cast, Freon syringe samples were attached to the Rosette and the 30-liter Niskins were on the hydrowire. Therefore, water samples were collected on the upcast either by sending a messenger to trigger the bottles on the hydrowire or by halting the CTD package at the desired depth and triggering the Rosette sampler, which closed one Niskin bottle or syringe per triggering cycle. The CTD readings were recorded continuously at each sample depth while the Rosette was used to close the sample bottles. The CTD values reported for each depth are averages of the data collected during the bottle tripping process, which required about 7 sec.

When the bottles and CTD package arrived on deck, salinity samples were obtained for comparison with the CTD data. Postcruise calibration of the CTD system was also done by the Sensor Calibration Lab. Any constant offset found is used to correct the CTD digital data.

Once the CTD-Rosette system was on deck, water samples were drawn from the Niskin bottles as appropriate to the lability of the parameters being measured. The following parameters were measured or calculated on board:

- conductivity
- in situ temperature
- pressure
- depth
- CTD salinity
- Niskin sample salinity
- fluorometry (chlorophyll fluorescence)
- transmissometry (100 cm beam-path light attenuation at 600 nm)
- chlorophyll and phaeopigments

The following parameters were measured from samples or calculated from data brought back to the laboratory:

- potential temperature
- sigma-t
- sigma-theta
- total suspended matter (TSM)
- nutrients (PO_4 , Si(OH)_4 , NO_3^- , NO_2^-)

Analytical methods are described in a later section of this report.

2. Field Data Collection--OSU optical system

The OSU K-meter system provided continuous simultaneous profiles of spectral downwelling irradiance, beam transmittance at 660 nm, fluorescence in the chlorophyll band, and conductivity, temperature, and pressure. A description of their optical system and of the particle size analysis system can be found in Appendix B.

3. Field Data Collection--other

In addition to the hydrographic and optical measurements made by NORDA and OSU personnel, measurements were also made at all stations in support of NOAA's CO₂ Dynamics experiment. These include oxygen, nutrients, Freon tracers, nitrous oxide, total CO₂, calcium, alkalinity and halogen gases. Bird and mammal counts were made and a comprehensive velocity profile of the study area undertaken. Information about these data may be obtained from the NOAA chief scientist on this mission, Dr. Richard A. Feely.

4. Analytical Methods

a. Chlorophyll and phaeophytin

Pigment samples were drawn into rinsed 1-liter brown plastic bottles, filtered through Whatman GF/C glass fiber filters, and extracted in 10 ml of 90% acetone. Chlorophyll "a" and phaeophytin were measured after Strickland and Parsons (1972) using a Turner Designs Model 10 Fluorometer (Turner Designs, Mountain View, CA).

b. Salinity

NORDA's Guidline Autosol with BCD output interfaced to a Hewlett/Packard 9825B desktop computer and an H/P printer with NORDA-provided software was used to analyze discrete salinity samples. Calculations were based on the PSS78 Practical Salinity Scale (Fofonoff and Millard, 1983).

c. TSM

Total suspended matter was collected by vacuum filtration of seawater remaining in the 30-liter Niskin bottles after the chemical sampling was done. Seawater was filtered through preweighed 37-mm diameter, 0.4- μ m pore size Nuclepore filters (Nuclepore Corp., Pleasanton, CA) in specially adapted Teflon in-line filter holders. The filter holders were dismantled in a laminar-flow hood, the filters were rinsed with distilled water and placed in a plastic culture disk (Millepore Corp., Bedford, MA) in a vacuum desiccator to dry overnight. Filters were weighed on shore in a Cahn electrobalance (Cahn Instruments, Inc., Cerritos, CA). Preweighed "blank" filters were stored along with sample filters but no seawater passed through them.

d. Suspended particulates for image analysis

One liter of seawater was filtered through 37-mm diameter 0.4 μ m pore size Nuclepore filters in a laminar-flow hood. After careful rinsing with distilled water, the filter was placed in a vacuum chamber for drying and later optical characterization with NORDA's Chemical/Image Analysis System (ICAS). This system consists of a scanning electron microscope (AMRAY 1000, AMRAY Corp., Bedford, MA), an energy dispersive X-ray spectrometer (Kevex 7000, Kevex Corp., Foster City, CA), and a LeMont DA-10 Image Analysis System (LeMont Scientific, State College, PA).

e. Nutrients

Samples were drawn into 125-ml amber plastic bottles and frozen for on-shore analysis. Sample preparation followed Strickland and Parsons (1972).

Analysis was performed at the University of Washington using a Technican Auto Analyzer (Technican Instruments Corp., Tarrytown, NY).

RESULTS AND DISCUSSION

Table 2 provides complete summary data on each station and cast. Date, time, location, type of cast, external sensor, and number of water samples taken (ST) are provided for each cast. Table 3 lists only optical data obtained at each station.

The following comments apply to the data tables:

1. Time given is GMT. For this cruise local time was GMT minus 10 hours.
2. Where a line appears, no data were collected or reported; where a zero (0) appears, the parameter was below detectable limits.

3. Nutrient data and TSM weights were supplied by Dr. Richard Feely at Pacific Marine Environmental Laboratories, Seattle, WA.

4. Table Legend:

<u>Legend</u>	<u>Unit of Measure</u>	<u>Definition</u>
PRESS	dbars	pressure measured from CTD pressure sensor on chlorophyll casts, from hydrowire position correlated with CTD on chemical casts.
DEPTH	m	depth calculated from pressure reading (Saunders, 1981)
TEMP	°C	in situ temperature from CTD reading on chlorophyll casts and from reversing thermometers on chemical casts
POT TEMP	°C	potential temperature calculated from pressure and temperature readings (Bryden, 1973)
SALINITY	o/oo	salinity of Niskin sample measured with Autosal (PSS78)
SIGMA THETA	(density - 1) x 10 ³	density anomaly using Autosal salinity and potential temperature (Millero et al., 1980)
FLUOR	% of full scale	chlorophyll fluorescence

ATTEN COEFF	m^{-1}	attenuation coefficient calculated from transmissometry
PHOSPHATE	$\mu m/kg$	dissolved orthophosphate phosphorus, PO_4
SILICATE	$\mu m/kg$	dissolved silicate silicon, SiO_4
NITRATE	$\mu m/kg$	dissolved nitrate nitrogen, NO_3
NITRITE	$\mu m/kg$	dissolved nitrite nitrogen, NO_2
TSM	$\mu g/L$ of seawater	Total Suspended Matter
CHLOROPHYLL	$\mu g/L$	total chlorophyll "a"
PHAEOPHYTIN	$\mu g/L$	total phaeopigment (chlorophyll degradation products)

Figure 2 incorporates data from 10 stations contoured to 500 m from 15.0°N to 15.0°S on a transect at 150.0°W. Dr. Richard Feely's permission to include the figure is gratefully acknowledged.

Data acquired on this field mission provides a comprehensive suite of near-simultaneous optical and geochemical measurements for the continual study of the interrelationship between marine optical properties and the biogeochemical character of the environment. Samples were obtained for use in developing the Image Analysis/Scanning Electron Microscopy techniques for application to the optical characterization of marine suspended matter. The availability of the supplementary biogeochemical and physical data with the complementary information on spatial variations of spectral K_d (diffuse attenuation coefficient) gives us a powerful base for working with the optical characterization of water masses.

DESCRIPTION OF THE INSTRUMENT PACKAGE

The Oregon State University K-Meter instrument package consists of a Biospherical Instruments, Inc. Spectroradiometer and the following additional sensors: Seabird Electronics, Inc. temperature and conductivity probes; a Q-Instruments in situ fluorometer; and a 25-cm beam transmissometer (built by the OSU Optical Oceanography group). The spectroradiometer has 11 narrowband filtered photodetectors spanning the visible light spectrum. A microprocessor in the instrument controls an A/D converter, which measures each parameter, averages scans if desired, subtracts background, formats the data string, and sends the results up the single-conductor electromechanical cable to the deck unit. A deck irradiance sensor, using a separate digitizer, adds a record of the surface light intensity to each data scan.

An opal glass spherical collector has been added to the spectroradiometer so that scalar irradiance is measured, rather than the vector irradiance obtained, with the cosine-collector supplied with the instrument. The instrument frame, which supports the components of the underwater package, is wrapped with a black plastic shroud to block light from below a horizontal plane from entering the spherical collector. Thus the collector is only exposed to light entering from the upper hemisphere of the total light field, but is equally sensitive to photons entering at any angle from vertical to horizontal.

The deck sensor used was a Biospherical Instruments, Inc., Solar Reference Hemispherical Irradiance Sensor which monitors the total photosynthetically active radiation (PAR) between 400 and 700 nm. The collector has a shroud to block light from below the horizontal plane and is gimbal mounted at the top of an A-frame away from shadows of nearby structures.

The transmissometer measures the attenuation of a collimated beam of monochromatic light at 665 nm. It is calibrated to give $c(665) = 0.364/\text{m}$ for laboratory-filtered reference water. It contains temperature compensation circuitry to correct for the range of temperatures encountered during this cruise. The downcasts at Stations 3 and 4 show the effect of improper temperature compensation below 125 m. The upcasts are slightly affected but are much closer to the correct value. A different transmissometer was used for the remainder of the cruise.

The Q-Instruments fluorometer is equipped with filters for detection of fluorescence in the wavelengths of the chlorophyll-a peak. Its three major components are a Xenon flash lamp that pulses at 10 Hz, Schott and Genossen BG 18 and RG 665 filters, and a synchronous photodiode detector. Because of the high power requirement of the fluorometer, a separate battery pack is required. Unfortunately, as the battery pack voltage drops, the fluorometer output signal decreases, and the flash rate becomes erratic. Both battery voltage and flash-lamp output are also affected by temperature; therefore, we list the output of the fluorometer only in the electrical unit, voltage.

Empirically, however, fluorometer output was found to have a high positive correlation with extracted chlorophyll pigments. There is a noise reduction filter circuit on the output of the fluorometer that has a 2-second time constant. At the normal lowering speed of 30 m per minute, this will result in a chlorophyll structure hysteresis of 2 or more meters between the down- and upcasts.

The Seabird temperature and conductivity probes have been frequently calibrated at OSU, and their values were compared to the primary CTD casts taken on the same stations. In addition, they were compared to reversing thermometers and bottle salinities obtained from the casts. Although the accuracy of the sensors is satisfactory, the computed salinity structure exhibits some severe spiking when strong temperature structures are encountered. Because of the secondary nature of the hydrographic data, it was decided not to invest the time and effort needed to despike the salinity and density data.

DATA ACQUISITION AND REDUCTION

An Apple II computer system interfaced to the deck unit runs a complex data acquisition program, sorts each scan into 0.5-m depth bins, displays the current conditions on the monitor, and produces a real-time plot of any three parameters versus depth. At the end of the cast, the contents of the depth bins are stored onto floppy disk. Additional programs allow listings and plots of the depth bin averaged data after the cast. Other programs are used in the laboratory to edit the data, correct underwater irradiance for changes in the surface irradiance, compute diffuse attenuations at each wavelength, and save this data for listing and plotting.

K REDUCTION PROCEDURE

We participated on cruise RP-9-DI-84 of the NOAA SHIP DISCOVERER on a ship of opportunity basis; accordingly, we had little control over the work schedule on board. Because of the tight ship schedule and necessity of assigning cast sequence, the irradiance casts were not always taken during optimal light conditions.

The observed underwater light profile will reflect changes in incident radiation, subsurface changes, and the water column attenuation. Our objective is to determine the latter. In order to separate these factors, the underwater measurements are normalized to reflect the synchronous incident radiation variations, as measured by the deck irradiance sensor. Normalizing in this manner, we still obtain erratic profiles due to subsurface effects such as ship shadow and reflections, sea surface wave focusing, and tipping of the underwater package. Therefore, an editing and smoothing program has been developed, and is applied to one spectral profile. We picked 488 nm, since it has the maximum penetration. The editing options of this program allow us to correct for ship shadow and reflections, and for mismatches in time and intensity of cloud effects as seen at the ship and at the depth of the underwater package by altering the deck irradiance values which are the denominators of each ratio. The surface normalized 488 nm profile is then smoothed to correct for any remaining effects by again modifying the deck irradiance. We consider this modified deck irradiance to reflect all the external variations. We obtain K profiles for all spectral bands by then normalizing each with the modified deck irradiance. In this way we can smooth all channels simultaneously.

In order to obtain accurate estimates of diffuse attenuation at low light levels, it is necessary to correct for the sensor voltage of each spectral sensor at total darkness. Otherwise the logarithmic reduction in light with depth will appear curvilinear, as we would be determining the log of the light signal plus a constant offset. The dark current output of the photodiodes used in the irradiance meter changes with temperature and aging. Fortunately, the photodiode array is sufficiently isolated from the water column so that significant changes do not occur during the half-hour period required to take a cast. On the other hand, the conditions on the deck between the casts can significantly alter the array temperature and resultant dark current. If the light level falls below the level of detection in a given spectral channel, it is possible to correct the lighted portion of the cast by a linear offset equal to the average dark potential. If, however, there is still significant signal at the deepest point of the cast, then that wavelength must be corrected more arbitrarily using the shape of the $\log E(\lambda)$ curve or other casts which reached darkness at that wavelength. This step of zero adjustment is the most critical step in obtaining good estimates of diffuse attenuation to the limit of detectability in each spectral channel.

DATA

K-Meter casts were taken at 9 stations and were analyzed for diffuse attenuation at all stations except Station 3 at 6.0°N. Data are presented in two formats: plots and listings. Plots and listing of hydrographic parameters, beam attenuation coefficient $[c(665)]$, and fluorescence for the casts which were not used for spectral attenuation analysis are included for completeness.

EDITOR'S NOTE: OSU stations were numbered sequentially 1-9. After station 4, K-Meter system casts were not done on every NOAA/NORDA station. Therefore the following corrections should be applied:

PARTICLE SIZE DISTRIBUTIONS

NOAA SHIP DISCOVERER
FEBRUARY 27 - MARCH 9, 1984
HAWAII TO TAHITI

Particle size distributions were measured with a resistive-pulse particle counter using 50 μm and 100 μm apertures. The small aperture measured particles with spherical equivalent diameters between 1.75 and 11.1 μm . The large aperture covers the range from 3.1 to 25 μm . Each data window includes particles with volumes between half powers of 2 μm^3 . For example, the first window of the small aperture covers particles with volumes between 2 and 4 μm^3 . There are 8 windows of overlap between the two apertures. Discrepancies between the two were resolved for each of the overlapping windows in one of the following ways in order of preference: (1) averaging the two values or (2) choosing the value of one or the other aperture. The data for the sample was discarded, as none of the overlapping windows agreed well enough to form a smooth number distribution. Disagreements could be caused by electronic noise, partial clogging, or a statistically insufficient number of counts in a given window.

Volume concentrations (ppm) were computed by multiplying the particle concentration in each window by the average of the delimiting volumes for that window. Assuming a power distribution, this method of computing volume concentrations gives a value 0.5 to 2% high for a reasonable range of exponents (slopes).

HSLP is the slope of the regression equation determined for the logarithm of the differential particle concentration (N/D) vs. the logarithms of the particle diameter (D). Assuming that the particle size distribution is fit by a power function, $dN = N D^{-s} dD$, HSLP is equal to the exponent, s . By definition, these differential slopes are 1.0 larger than the cumulative slopes which are often reported. A large slope indicates that a larger percentage of the particles are small. The % VAR is the percent of the variance of logarithms of particle concentration densities removed by the regression.

19 ABSTRACT (Continue on reverse if necessary and identify by block number) This report is a summary of data collected by the optical oceanography program of the Naval Ocean Research and Development Activity (NORDA) on a north-south transect of the central equatorial Pacific Ocean. Data were collected from 14 stations from the surface to a depth of 2900 meters. Parameters presented here include conductivity, temperature, salinity, transmissometry, fluorometry, chlorophyll and phaeopigments, total suspended matter, particle size, and nutrients (phosphate, silicate, nitrate, and nitrite). Data are reported as vertical profiles (to 250 m), temperature-salinity (t-s) plots, and tables of measured and derived values. Collection and analytical procedures are also described.
