AES report series; sections overviewing the project and methodology; and a chapter explaining how to read and interpret the tabulations.

This text is supplemented by technical appendixes containing an annotated copy of the mail version of the AES instrument (Appendix A); the telephone version of the AES instrument (Appendix B); and coding schemes used to categorize responses to open-ended questions (Appendix C).

The other major component of the tabulation volume is comprised of two-way tables of survey variables crossed with five banner variables. Volume I presents tables of selected survey items for first-term attritees with the following five banner variables: respondent gender, race, AFQT category, time since separating, and term of first enlistment. Volume II contains tables with five different banner variables: respondents' current residence (recruiting brigade), pre-Army education level, marital status at Army separation, military skill groupings, and perceived value of Army experience. Companion volumes are also available for three other separation groups, i.e., first-term separatees, mid-career separatees, and enlisted retirees.

FOREWORD

The Army Experience Survey was sponsored by the Army Research Institute for the Behavioral and Social Sciences (ARI). The research was undertaken to obtain information on the characteristics, experiences, and attitudes of recently separated Army veterans. The survey was designed to answer specific questions raised by the Secretary of the Army, John O. Marsh, Jr., in Spring 1984 which were translated into five research objectives:

- To determine the post-service experiences of enlisted Army separatees and their views toward the separation process and the usefulness of the Army experience;
- To determine their attitudes toward the Army experience, including their motivations for military service and the role and impact of military service on their lives;
- To determine the extent of veterans' continued interest in and attitudes toward the Army through examination of their plans for joining the Reserves or National Guard and whether or not they have encouraged others to enlist;
- To compare the post-service experiences, attitudes, and plans of enlisted soldiers who separated from the Army after a first-term enlistment across selected demographic/service categories; and
- To compare the post-service experiences, attitudes, and plans of enlisted soldiers who separated from the Army after a first-term enlistment with soldiers who separated after second and later enlistments, and with soldiers who left the Army before expiration of their first term of service.

In addition to addressing these specific objectives, the survey effort expanded the availability of data to model Army enlistment and reenlistment processes.

THE 1985 ARMY EXPERIENCE SURVEY:
TABULAR DESCRIPTIONS OF FIRST-TERM ATTRITEES, VOLUME II

EXECUTIVE SUMMARY

Requirement:

To obtain information on the characteristics, experiences, and attitudes of recently separated Army veterans.

Procedure:

Data were collected, using a combined mail and telephone followup methodology, from six groups of Army veterans:

- First-term separatees
- First-term attritees
- Soldiers serving more than 1 term of enlistment, but less than 10 years
- Soldiers serving 10 years or more, but not retired from the Army
- Retirees
- ARI Exit Survey respondents

The sample frame was developed using the loss files from the Enlisted Master File (EMF). Based on a sampling design developed to meet stated levels of precision, 8,734 sample members were randomly drawn from the EMF. Tracing efforts were undertaken to locate the sampled Army veterans. Sample members were sent a prenotification letter, and two waves of survey mailings, with a reminder postcard in between. Nonrespondents to the survey mailings were then followed up by telephone.

In addition to the main survey effort, three experiments were conducted on random subsamples. One experiment was conducted to assess the effectiveness of using an alternative data collection methodology, i.e., attempted telephone contacts with mailings only as necessary. The other two experiments were conducted to verify sample members' addresses, so as to obtain a better estimate of true find and refusal rates.

Survey data received were keyed, edited, coded and weighted. A sourcebook and user's manual, a report on the survey methodology and recommendations, and tabulation volumes were produced.

Results:

The survey effort was successful in locating between three-quarters to over 90% of the different sample groups. By far, the retirees were the easiest group to locate and from whom to obtain responses. Response rates were generally similar among sample members in several key demographic/service categories, although slightly higher response rates were obtained from Whites, individuals with two-year enlistments, and from those who had most recently left the Army. The overall sample response rate was 50%.

Utilization:

The 1985 Army Experience Survey (AES) provides information to Army policymakers regarding Army veterans who are vital to Reserve and National Guard enlistments, and who can affect future enlistments into the active Army. AES provides data needed to model the enlistment-reenlistment decisionmaking process. Data can also be analyzed further for methodological assessments of different data collection strategies. The AES data can provide valuable information to Army planners and policymakers related to the level of veteran support and interest in joining veteran organizations, assisting in local recruiting efforts, and in receiving regular Army publications. As a result of the high level of interest expressed by veterans toward assisting local recruiters, early efforts have begun to examine the feasibility of developing a Hometown Alumni Recruiting Program utilizing veteran volunteers.

INTRODUCTION

The purpose of this document and a companion volume, The 1985 Army Experience Survey: Tabular Descriptions of First-Term Attritees, Volume I, is to provide an initial examination of the survey results from first-term attritees completing the 1985 Army Experience Survey (AES). This report is one of ten reports produced to document the approach and results obtained from the 1985 AES. Readers desiring a detailed examination of the project background, approach, and recommendations are referred to the project final report, The 1985 Army Experience Survey: Methodology and Recommendations for Future Administrations. Other readers may be interested in examining the construction of recoded variables and in obtaining access to the survey data files; these readers are directed to the codebook documentation, The 1985 Army Experience Survey: Data Sourcebook and User's Manual. The initial survey results for other separation groups are also reported in separate documents:

- The 1985 Army Experience Survey: Tabular Descriptions of First-Term Separates, Volumes I and II;
- The 1985 Army Experience Survey: Tabular Descriptions of Mid-Career Separates, Volumes I and II; and
- The 1985 Army Experience Survey: Tabular Descriptions of Enlisted Retirees, Volumes I and II.

Volume I in each set of tabular descriptions presents tables of AES survey responses crossed by respondent gender, race, AFQT category, elapsed time since separation, and initial term of enlistment. Volume II crossing variables include current residence, pre-enlistment education, marital status at time of separation, military skill grouping, and perceived value of Army experience. Each volume contains an introduction, brief project overview, and a chapter on how to use the volume. The tabulations follow, preceded by an index identifying the page location for tables of each survey item. Additional information is provided in three technical appendixes to each report.

Organization of Tabulation Volume II--First-Term Attritees

This document, Tabulation Volume II, provides both an overview of the Army Experience Survey as well as tabular entries for the survey items by the first five crossing variables. Volume II is organized into four major sections: an introduction and project overview; a chapter on "how to use the volume;" tabulations for first-term attritees using the first five crossing variables; and three technical appendixes.

This first chapter introduces Volume II of the tabular descriptions for first-term attritees within the context of the

ten-volume series of reports produced to document The 1985 Army Experience Survey. The structure and organization of the report is described here followed by a brief overview of the AES project.

The second chapter of this report is a guide to reading and interpretation of the crosstables. This section explains how to read the tabulation pages, provides tabulation volume conventions, describes the sample weighting adjustment and chi-square approximation, and explains how to use the tabulation index.

The next major component of this document is comprised of the tables themselves. Each survey item appears in five two-way tables corresponding to each of the first five crossing variables. Tables of survey items are presented in the order of their occurrence in the 1985 AES instrument.

The report is supplemented by three technical appendixes. The appendixes contain: a copy of the mail version of the survey instrument with notations explaining regrouping of survey items, omission of items from the tables, wording differences between the mail and telephone versions of the survey, and a table describing the sources of each of the ten crossing variables (Appendix A); the telephone version of the survey instrument (Appendix B); and coding schemes used to categorize responses to open-ended questions (Appendix C).

Project Overview

The 1985 Army Experience Survey (AES) was conducted to obtain information on the characteristics, experiences and attitudes of recent enlisted Army veterans. Developing a better understanding of what veterans feel and say about their Army experience was viewed as an important aspect of this research effort for two major reasons. First, Army veterans represent a major source of enlistments into the Reserve and National Guard components. Second, Army veterans are seen as key influences on the public's opinion of the Army. More specifically, the words and actions of Army veterans can have either positive or negative impacts upon future enlistments. In order to better develop, monitor, and forecast enlistment and reenlistment trends, military policy makers need to understand: (1) how veterans view their Army experience, (2) how their experiences impact upon their enlistment for reserve duty, and (3) what veterans say to potential enlistees.

The 1985 AES was designed to answer specific questions raised by the Secretary of the Army in Spring 1984, as well as to provide information that would allow comparison of results with

other ARI and DoD surveys. Questions raised by Secretary Marsh which guided the development of this survey effort were:

- As veterans return to civilian life, where do they go? What do they do?
- Has the Army experience been helpful to them? Is it something they are glad they did?
- How do they rate the Army as an institution?
- Are they favorably disposed to joining the Reserve components?
- Do they view their service in a citizenship role?
- Do they have misgivings? If so, can anything be done to improve the service for future enlistees?

The population of interest for the AES was defined as enlisted soldiers who separated from service between October 1981 and September 1984. The target population sampling frame was constructed from Army personnel records maintained on the FY82, FY83, and FY84 versions of the Enlisted Master File (EMF). Systematic random samples of veterans separating from the Army during FY82-FY84 were drawn by separation status and selected demographic/service characteristics. Six different groups of enlisted Army veterans were originally sampled:

- (1) First-term separatees - soldiers separating upon completion of their first term of service;
- (2) First-term attritees - soldiers separating from Army service prior to completion of their first term of enlistment;
- (3) Veterans who separated from the Army after serving more than 1 term of enlistment, but less than 10 years;
- (4) Veterans who separated after 10 or more years of service, but who did not retire from the Army;
- (5) Enlisted retirees; and
- (6) Exit Survey respondents - a group of 1,597 first-term separatees who completed questionnaires between September and December 1983 in the ARI Exit Survey.

Groups (3) and (4) above were later combined to form the mid-career separatee group.

The sample group of primary interest was that of the first-term separatees. The sample of first-term separatees was designed to meet sampling reliability specifications to provide

95% confidence intervals within ± 4 percentage points for estimated response percentages in each of fifteen demographic/service categories:

Race: White, not Hispanic; Black, not Hispanic;
Hispanic

Gender: Male, Female

Initial Term
of Enlistment: 2 years, 3 years, 4 or more years

AFQT Level: 1 & 2, 3A, 3B, 4 and below

Time Elapsed
Since Separation: 1 year, 2 years, 3 years

Data were also obtained from first-term attritees, mid-career separatees, retirees, and 1983 ARI Exit Survey respondents, for comparative purposes and to serve as an initial database for future efforts. The sample of first-term attritees was designed to meet specifications to provide 95% confidence intervals within ± 9 percentage points for comparison of response percentages between first-term separatees and first-term attritees for each of the above fifteen demographic/service categories.

A sample design was adopted that provided a representative sample of the desired size for each demographic/service category. This was accomplished by drawing a basic systematic random sample of the population frame, and, as necessary, supplementing the basic sample to achieve the desired sample size in each demographic/service category for the first-term separatee and attritee groups. Supplementation was accomplished by drawing additional independent systematic random samples of separatees with the specified characteristics.

The AES data collection methodology involved a multi-method approach. Sample members were sent prenotification letters and two waves of survey mailings with a reminder/thank you postcard in between. Nonrespondents to the survey mailings were followed up by telephone interviewers. To accommodate this methodology, both mail and telephone versions of the survey were developed. Although both versions of the survey included identical questionnaire items, the transition statements between survey sections and item pronouns were worded differently to reflect distinctions between self-administered and interviewer-administered questionnaires. Copies of the mail and telephone versions of the survey appear in Appendixes A and B, respectively. Differences in question wording between the two versions are noted next to each survey item in Appendix A.

In addition to the main survey effort, three experiments were conducted on random subsamples. One experiment was conducted to assess the effectiveness of using an alternative data

collection methodology, i.e., attempted telephone contacts, with mailings only as necessary. The other two experiments were conducted to verify sample members' addresses, so as to obtain a better estimate of true find and refusal rates.

In March 1985, the Defense Manpower Data Center (DMDC) performed a search of several different military personnel files to locate address information for the population of separatees. A substantial proportion of the AES sample proved difficult to locate, thus requiring more extensive tracing and location procedures. Respondent tracing procedures were employed for cases in which: (1) no address was available from DMDC, (2) survey mail was returned with no forwarding address, and/or (3) telephone followup was required. A variety of sources were employed to assist in locating addresses and/or telephone numbers for sample members. Sources consulted include: National Personnel Record Center (NPRC), Reserve Component Personnel Administration Center (RCPAC), the U.S. Postal Service, the Johns Holding Company (Credit Bureau listings), Telematch, and Directory Assistance.

Survey data were processed through survey receipt control and sample management systems. Data were also keyed, edited, coded, and weighted. The coding schemes developed to classify written responses to the open-ended questions are provided in Appendix C along with a brief discussion of coding procedures for open-ended responses. Sample weighting is briefly described in the next chapter.

The survey effort was successful in locating between three-quarters to over 90% of the different sample groups. By far, the retirees were the easiest group to locate and from whom to obtain responses. Response rates were generally similar among sample members in key demographic/service categories, although slightly higher response rates were obtained from Whites, individuals with two-year enlistments, and from those who had most recently left the Army. The overall sample response rate was 50%.

The 1985 Army Experience Survey (AES) provides information to policymakers regarding veterans who are vital to Reserve and National Guard enlistments, and who can affect future enlistments into the Active Army. AES provides data needed to model the enlistment-reenlistment decisionmaking process. Data can also be analyzed further for methodological assessments of different data collection methods. Based upon survey responses to a variety of questions pertinent to veterans' desires for future affiliation with the Army, policymakers may use AES data to investigate the feasibility of using veterans to assist local Army recruiting efforts, and developing publications and organizations to maintain contact with Army veterans.

APPROPRIATE USE OF THE TABULATION VOLUMES

The major purpose of this research was to collect information on the Army experiences of enlisted soldiers who successfully completed one full term of service (FIRST-TERM SEPARATEES). However, data were collected from other separation groups (FIRST-TERM ATTRITEES, MID-CAREER SEPARATEES, and ENLISTED RETIREES), but only to allow for over all comparisons between first term separatees and others who had left the army. Consequently, data from these other separation status groups should not be interpreted in the same way as data from first term separatees.

Interpretations of existing relationships between survey items and crossing variables as discussed in the "Chi Square Approximation" section (see pp 16-19) only pertain to data from first term separatees. Interpretation of such relationships for each of the other separation groups will not be appropriate in most cases, because the number of respondents within particular subgroups (e.g. Males, Females; Blacks, Hispanics, Whites; etc.) are often too small to allow for valid comparisons. However, the TOTAL number of respondents for each of these other separation status groups is sufficiently large and representative of their respective populations to allow for comparisons among them and first term separatees. In all cases, when comparing first-term separatees to each of the other separation groups only TOTAL percentages (far right column on each of the tables) should be considered.

HOW TO USE THIS VOLUME

The purpose of this chapter of the Tabular Descriptions is to provide assistance in reading the 1985 AES tabulations and to explain the arrangement of the tabulation index. The first section in this chapter briefly reviews the tabulation volume composition. The next sections in this chapter provide: (1) examples of the two types of tabulation formats; (2) discussions of survey sample weight adjustments; and (3) interpretation of the chi-square approximation. This is followed by a brief discussion of the use of the tabulation index to locate specific tables, and finally presentation of the index itself.

Tabulation Composition

The purpose of the tabulation volumes is to provide an overview of survey results for AES respondents by separation group. Each two-volume set of tabular descriptions provides, by separation group, tables of AES survey items crossed by ten demographic/service characteristics. Four two-volume tabulation sets are available for four separation groups: First-Term Separates, First-Term Attritees, Mid-Career Separates, and Enlisted Retirees. No separate tabulation set was produced for the recontacted 1983 ARI Exit Survey respondents. However, AES survey data for these respondents are available from the Army Research Institute.

Volume I in each tabular set contains tables of survey items with the following five crossing variables: (1) respondent gender, (2) race, (3) AFQT category, (4) time since separating, and (5) term of first enlistment. Volume II in each set contains tables of the same survey items with five additional crossing variables: (6) the region of current residence (recruiting brigade), (7) pre-Army education level, (8) marital status at Army separation, (9) military skill groupings, and (10) perceived value of Army service.

Contents of a Tabulation Page

There are two different types of tabulation formats presented in this volume. The two formats correspond to whether the survey item provided a set of response alternatives (a close-ended question) or whether the respondent was requested to write in an answer (an open-ended question). Examples of each of the two presentation formats are provided in this section.

Tabulation pages contain descriptive information about the survey item as well as presenting the tabled data. Descriptive information provided includes: statement of survey item, variable name, variable label, response alternatives (values and labels), and item location on the 1985 AES instrument. When the

survey item has been altered from its original presentation in the instrument, the notation "recoded" will precede statement of the survey item. Typically, "recoded" versions of survey items were developed for one of the following reasons:

- (1) Response alternatives were regrouped to reduce the original number of answer categories to make reading the crosstable easier;
- (2) Limits were set which established valid value ranges for particular items (e.g., year of birth could not be prior to 1941 for first-term separatees); or
- (3) The original survey variable contains the responses of individuals who should not have answered that particular question (e.g., persons never married were asked to skip over spouse-related questions).

In the case of point (3) above, a rule of thumb was used to determine when the rate of skip pattern violations (i.e., respondents answering questions which they should have skipped) was sufficiently high to warrant attention. When 0.5% or more of respondents to a particular survey item failed to follow a specified skip pattern correctly, their responses were excluded from the tabulations for that item. AES survey items which were affected by skip patterns contain a footnote, on the bottom center of the first page containing tables of the item, which specifies which respondents did not answer (were instructed to skip) the question. Only two other types of footnotes actually appear on tabulation pages. Additional notes relevant to specific survey items appear in Appendix A.

Appendix A contains an annotated copy of the mail version of the 1985 AES instrument. That appendix provides explanations of variable recoding that was done. Also noted are differences in question wording across the two survey versions, survey items omitted from the tabulations, and groups of persons who should have skipped certain questions.

In addition to the items listed above, each tabulation page also contains information to aid in the interpretation of the tables themselves. This includes: the number of completed surveys obtained for the separation group, table title (survey item by crossing variable), labels for the categories of the crossing variable, the actual number of respondents falling into each category of the crossing variable, the total number of individuals answering the particular question, value categories for the survey item, the weighted percentage of responses within each category of the crossing variable, and an approximation to Pearson's chi-square statistic (cell-adjusted for weighted data) with its associated degrees of freedom and probability.

The number of tabled responses may differ from table to table as well as in comparison with the reported number of com-

pleted surveys. This is due to item non-response (i.e., respondents who failed to answer the question, provided more than one answer, or wrote an uninterpretable response), and also due to skip patterns in which certain respondents were excluded from answering questions deemed irrelevant to them (e.g., unemployed individuals were not asked about their current job).

Separation group sampling rates varied across veterans' demographic/service characteristics. Accordingly, the table percentages have been weighted. Unweighted percents restrict table results to be applicable only to the sample itself. Thus, the weighted percentages may be used as estimates of the percentages that would have been obtained if all members of the separation group under examination had been surveyed. The numbers (N) provided are not weighted and therefore represent the actual number of responding individuals in each category.

Tabulation Conventions

Tabulations for Close-Ended Variables. Figures 1 and 2 provide examples of tabulation pages for recoded close-ended and open-ended survey items, respectively. The numeric indicators on Figure 1 are identified and their referents described on subsequent pages.

Figure 1. Example of a tabulation page for a close-ended survey item.

EXPLANATION OF FIGURE 1
CONTENTS OF A TABULATION PAGE FOR A CLOSE-ENDED SURVEY ITEM

- ① Page number (within tabulation section of document).
- ② Variable name for tabled survey item.
- ③ Variable label.
- ④ Notation indicating that the survey item has been altered from its original format. Changes are usually due to regrouping of response alternatives, or to eliminating the responses of individuals who were excluded from answering the questions because of a skip pattern. See Appendix A for notations on specific survey items.
- ⑤ Statement of survey item as it appears in the mail version of the questionnaire.
- ⑥ Actual/recoded values of tabled survey item.
- ⑦ Value labels for tabled survey item.
- ⑧ Question location on 1985 AES instrument.
- ⑨ Total number of completed surveys received from specific separation group. This number is an unweighted count based on the survey sample. In this example, it indicates that 2,566 first-term separates returned completed surveys. Within each separation group, the number of completed surveys will not vary.
- ⑩ Table title (survey item by crossing variable label).
- ⑪ Value labels for crossing variable. In this example, the labels describe the categories of gender which can only be male and female. Each of the five crossing variables have unique value labels which will remain the same across survey item/table presentation.
- ⑫ Frequency counts of responses to survey item broken down by category of the crossing variable. These may be referred to as 'marginal N's' since they provide an overall count or number of responses within each category of the crossing variable. There are 2,090 responses to Q1A from males, and 437 responses from females. Marginal N's are unweighted counts based on the survey sample.
- ⑬ Total number of valid responses. This is a marginal N of total responses to this survey item across crossing variable categories, i.e., there are 2,527 total responses to Q1A across Gender. In contrast to item 9 (N of completed surveys), this N will necessarily vary across tables due to missing values on particular survey items; however, this number will always be less than or equal to the number reported in item 9.
- ⑭ Survey item values. Only item values are presented in the actual tables to preserve clarity; however, these values are described (labeled) at the top of the tabulation page (see item 6).
- ⑮ Estimated population percentages broken down within crossing variable categories. These percentages are adjusted for the sampling ratio (i.e., weighted) to estimate the distribution of population responses based on sample responses. In this example, 21.2% of males in the population of first-term separates had completed less than a high school degree when they entered the Army, whereas 3.5% of females in the same population had completed less than a high school degree. (See the next section in this chapter for a discussion of weighting.)
- ⑯ Estimated percentages of population responses across crossing variable categories. These percentages are presented for each survey item category. Within the total population of first-term separates, 19.3% are estimated as having completed less than a high school degree, 6.4% as having obtained the G.E.D., a certificate of completion or attendance, and so on.
- ⑰ Total column percents. These column percentages will equal 100% in all tables, since the percentages of estimated population response within each crossing category must account for the total estimated responses within that crossing category.
- ⑱ Value of the chi-square approximation statistic.
- ⑲ Degrees of freedom (D.F.) associated with the chi-square approximation statistic.

Figure 2. Example of a tabulation page for an open-ended survey item.

Tabulations for Open-Ended Variables. Figure 2 presents an example of a tabulation page for an open-ended survey item. The components on Figure 2 are very similar to those identified on Figure 1 for a close-ended survey item. The main difference in the two formats is in the naming conventions for the survey item, and in the presentation of the table itself and the chi-square approximation statistic(s).

The name given to the open-ended survey items on the tabulations had to be altered somewhat in order to reference the unique table format. As discussed in the next paragraphs, all responses to the open-ended survey items were summarized in a single table. Originally, each open-ended question allowed space to record up to five different responses. In the summary table presented in the tabulations, all responses are combined and categorized according to response "theme" or content area. The reference to survey item on the tabulation page therefore includes a notation (either A E, or 1_5) indicating that the table summarizes all five possible responses. For example, on Figure 2, the survey item number listed is Q28A_E. The actual question number was 28; the "A E" indicates the inclusion of all (up to five per respondent) open-ended responses. On other open-ended questions, such as Q16A, numbers are appended to the end of the question, e.g., Q16A1_5, to indicate the inclusion of all five possible responses per individual.

A special format was developed especially for presentation of the open-ended survey items. Major themes were identified in the responses provided to each open-ended question. Codes were associated with these content areas (and their specific sub-categories) and were used to categorize respondents' answers (for a brief overview of the open-ended coding procedures see Appendix C). Dichotomous variables, indicating whether or not the respondent mentioned the category in his/her answers, were developed for each of the major content areas. The weighted percentage of individuals mentioning the category in their written responses was input to the summary table shown in the tabulations. Each row in the summary table contains a different variable corresponding to one of the major content areas used to code the question. Each summary table, then, consists of a series of related variables tabled with a crossing variable. Using the example in Figure 2, the summary table for Q28 actually represents six 2x2 tables. Row D represents the 2x2 table:

Q28 by Gender

	Male 458	Female 142	Total 600
Mentioned "p"	37.8	36.9	37.6
Did Not Mention "p"	62.2	63.1	62.4

Chi-Square Approx. 0.0 DF 1 Probability 0.8497

Each row in the summary table for Q28 represents a table which includes both the weighted percentage of individuals mentioning the content area as well as the weighted percentage of respondents who answered the question but did not mention the particular content area. For conciseness, only the weighted percentage of individuals mentioning a particular content area was presented in the summary table.

Interpretation of Row D in the summary table shown in Figure 2 is as follows:

- 37.8% of all weighted male responses to Q28 (Specifically, what would you tell a good friend about joining or not joining the Army?) were categorized as being positive toward joining the Army; 62.2% of weighted male answers to Q28 did not mention a response which could be categorized as a recommendation to join the Army. Similarly, 36.9% of weighted female responses were categorized as recommending that a good friend join and 63.1% of their weighted responses could not be so categorized. The weighted population percentages of all responses to Q28 categorized 37.6% as positive toward joining the Army and 62.4% were classified in other content areas.
- The chi-square approximate statistic associated with Row D in the summary table is testing the relationship between gender and whether or not content area "D" was mentioned in the respondent's answer to Q28. The chi-square value at 0.0, with 1 degree of freedom, yields the probability 0.8497. This is not considered a statistically significant difference. [See the next section in this chapter for a discussion of the interpretation of the chi-square approximation statistic.]

As in the example above, the other rows in the summary table for Q28 may also be interpreted as if the percentages of individuals not mentioning the content area were presented. The chi-square approximation statistics were calculated using this complete information.

The next sections in this chapter discuss the use of weighted data including an example of sample weight calculations, and interpretation and use of the chi-square approximation statistic.

Survey Sample Weighting

The AES data were weighted for presentation in the tabulations in order to provide estimates of the percentages that would have been obtained if all members of the separatee group had been surveyed. AES sample weighting was necessary primarily to compensate for unequal sample selection probabilities introduced by

the supplements. Sample weighting also aided in the reduction of sampling error and in dampening the effects of biases due to "no finds" and nonresponse (see the AES methodology report, The 1985 Army Experience Survey: Methodology and Recommendations for Future Administrations for a more detailed treatment of these issues).

In the project overview it was mentioned that the AES survey sample of first-term separatees was designed to meet sampling reliability specifications included in the contract statement of work (SOW). Specifically, the SOW stated that for the first-term separatee status group, the sampling precision requirement was that a 95% confidence interval about any estimated percentage must be no greater than ± 4 percentage points. In addition, the SOW specified that this level of precision must be maintained within each of fifteen demographic/service categories of separatees.

This level of sampling reliability required a sample of at least 750 individuals in each of the demographic/service categories. AES sampling was implemented using a two-stage process. First, a systematic random sample of first-term separatees was drawn from Enlisted Master File (EMF) records. The individuals selected in this manner were then classified according to their demographic/service characteristics. In the second sampling stage, each demographic/service category not meeting sample size requirements was then supplemented by the drawing of an additional sample of individuals in that category from the EMF. The categories that required supplementation were those for which the number of individuals in the separation group were too small to provide a sample of 750 individuals when sampled at the initial rate.

Due to the supplementation required to meet the reliability specifications, the probability of an individual's selection from the EMF varied according to his or her demographic/service characteristics. Members of those categories, therefore, were sampled at a higher rate than categories not supplemented. A consequence of using different sampling rates is the necessity of using sample adjustment weights to make population projections. A simple example should clarify both the calculation and use of adjustment weights.

Calculation and Use of Adjustment Weights: An Example.
Suppose that in a particular month 10,000 individuals (9,000 males and 1,000 females) separated from the Army and further that the Army wished to determine what percentage of these separatees would be willing to help local recruiters identify potential recruits in their area. If the Army wished only to determine what percentage of all separatees would be willing (with a 95% confidence interval of ± 5 percentage points), a total sample of 400 individuals would be required, assuming a 100% response rate. From the population of 10,000, then, 1 in 25 separatees must be sampled ($(1/25) * 1,000 = 400$).

If, on the other hand, the Army needed to know the same percentage by gender category with the same precision, the overall 1 in 25 sampling rate would not be adequate. Using this rate one would obtain 360 males ($1/25 * 10,000 * .9$) and only 40 females ($1/25 * 10,000 * .1$). This sample yields too few individuals of either gender group. To remedy this, the idea of an overall sampling rate is dropped and separate rates are devised for males and females. In this case, a sampling rate for males of 1 in 22 would yield a sample of 409 males. The necessary rate for females, though, would be 1 in 2.5 ($(1/2.5) * 1,000 = 400$). This hypothetical example is analogous to the AES sample. A degree of sampling reliability was required within specified groups that could not be efficiently addressed using a single, overall sampling rate. Noting these differential sampling rates, how are sampling weights calculated and how might they be used to obtain population projections?

Survey sample weights are calculated to adjust for the differential probabilities individuals have of being selected in the sample. In the hypothetical example we are using, female separatees are nearly nine times more likely to be sampled than males ($(1/2.5 \div (1/22)) = 8.8$). Weights for males and females, then, must reflect this disparity. To accomplish this, male and female counts are each weighted by the inverse of their probability of selection. That is, the adjustment weight for each male is $22/1$ while that for females is $2.5/1$.

These adjustments assure that weighted counts for males and females will reflect the composition of the population, rather than sample counts. This is very important as sample counts and percentages could be very misleading. Suppose that in this example 100 females and 300 males respond that they would be willing to participate in a program to assist local recruiters. Given a total sample size of 809, it appears that about half of all separatees might participate ($400/809 = .49$). In fact, a much greater proportion in the population would respond positively. If male and female responses are weighted, the positive counts for males and females become 6,600 ($300 * (22/1)$), and 250 ($100 * (2.5/1)$), respectively. Expressed as a percentage of the total weighted N of approximately 10,000 ($(409 * (22/1)) + (400 * (2.5/1)) = 9,998$), the estimated percentage of separatees responding positively to the program becomes 69% ($6,850 \div 9,998$). This weighted finding is quite different from what might be inferred using unweighted sample data. For this reason, we recommend that in all applications of the AES data the weighted data be used.

Chi-Square Approximation

Each table in this volume reports, in addition to marginal counts for the crossing variables and weighted percentages for cell entries, an approximate chi-square statistic for the table.

The use of a statistic approximating chi-square rather than the standard Pearson's chi-square was necessary due to the use of weighted data. The chi-square associated with a table is a test of statistical significance which helps the reader determine whether a systematic relationship exists between the crossing and survey variables. Using generally accepted social science conventions, if a chi-square yields a probability equal to or less than .01, it may be inferred that an association exists between the crossing and survey variables.

Chi-square is computed by comparing observed cell frequencies with those that would be expected if no relationship existed between the two variables. Figure 3 presents both observed and expected cell entries for a hypothetical crossing of gender with willingness to participate in a recruiting program.

Willing To Participate?	GENDER		Totals
	Male	Female	
Yes	250 (190) *	125 (185)	375
No	75 (135)	190 (130)	265
Totals	325	315	640

Chi-Square Statistic	Value 92.766	D.F. 1	Prob. 0.0000

*Counts reported in parentheses are expected cell counts.
Frequencies reported above are observed cell counts.

Figure 3. Hypothetical table for gender by participation willingness.

In each of the four cells in this table, the expected value is calculated by multiplying the two relevant marginal totals together and then dividing this result by the total number of respondents (N) for the table. For males willing to participate, the male marginal (325) is multiplied by the willingness marginal (375) and then divided by the table N (640) to obtain the value expected for this cell (190) based on the assumption that no relation exists between gender and willingness. Once expected

values are computed for each cell, chi-square is easily calculated using the following steps: (1) the difference between observed and expected counts is taken, (2) this difference is squared, then divided by the expected value for the cell, and (3) the sum of step (2) for all cells is taken. This sum is the chi-square value for the table.

The chi-square calculated for this hypothetical table is 92.8, with one degree of freedom (DF=1). By consulting a chi-square table, the probability of this or a larger value being observed, if there were no relation between the crossed variables, is obtained.

It is important to note that the reported chi-square evaluates only whether a relation may exist--it does not provide information as to the form of the relation. In the example provided, it is obvious that males are more willing to participate than females, so the form of the relation is clear. However, considerably more complex tables are presented in the tabulation volumes. In more complex cases, this caveat is necessary: it may be impossible through visual inspection to determine the exact nature of relationships between variables (or even which observed cell counts deviate significantly from expected values). If the user of this tabulation volume desires more detailed information regarding significant differences across individual cells or the form of the relationship between variables, further analyses are required. The reader is cautioned not to employ standard parametric statistics in further examining these weighted data, as the results obtained will not be accurate. The interested reader is referred to The 1985 Army Experience Survey: Data Sourcebook and User's Manual for a discussion of these issues.

A final comment should be made regarding the chi-square approximation reported in the tabulation volume. This statistic has been computed based on weighted counts--not unweighted sample counts as presented in the example above. As demonstrated in the previous section, the weighting adjustment consists of an inflation factor which multiplies sample values by the inverse of an individual's probability of selection (e.g., 22/1 for males and 2.5/1 for females). This weighting has the effect of adjusting for unequal sampling probabilities and so is appropriate for the estimation of population values. Weighting adjustment, however, has the additional effect of increasing the contribution of each cell in the table to the chi-square statistic by a factor equal to the weight applied to that cell. This inflation of chi-square is not desirable. To compensate, the chi-square approximations reported in the tabulation volumes have been scaled to approximate sample N's within each cell of a table. The chi-square approximation for a table, then, may be interpreted as discussed above. (If the weight of all individuals in a given cell were the same, the inflation could be exactly compensated by dividing the contribution of the cell to chi-square by that weight. In the AES, the weight of sample individuals in a given cell can

differ since they can belong to more than one supplemented group. While not exact, the scaling procedure used has been found to provide a useful approximation to the chi-square probabilities.) Details of the actual procedure used can be found in the Sourcebook/User's Manual referenced above.

Interpreting the Chi-Square Approximation Statistic

The chi-square approximation statistic reported for each table in this tabulation volume is a measure of the relationship between the survey item and crossing variable. In addition to reporting this statistic, each table also presents the probability (abbreviated as "PROB.") that a significant relationship exists between the survey item and crossing variable.

As a guide to readers of this volume, it is suggested (following accepted social science conventions) that only tables with chi-square probabilities of .01 or less (e.g., .0090, .0050, .0001, .0000, etc.) be interpreted as statistically significant. That is, if a table crossing AFQT with education has a chi-square probability of .0098, the reader may conclude that there is a statistically significant relation between education and AFQT. Any table having a probability greater than .01 (e.g., .0600, .1000, .2500, .8999, etc.) should not be interpreted as significant.

The chi-square statistic, then, indicates which variables are statistically related. This statistic does not, however, inform the reader about the form of the relation. In the example above, a relationship was said to exist between AFQT and education. Based upon the chi-square statistic we cannot say whether individuals in the higher AFQT categories are relatively more educated than those in the middle or lower categories or vice versa: it only implies that there is a reliable difference between the groups; it does not imply that each group differs from every other group. To determine the form of the relationship between the variables, additional statistical tests are required.

Use of the Tabulation Index

The tabulation index on the following pages provides a table of contents for the tabulations. The index provides four pieces of information for each survey item: item question number, variable name for the survey item, variable label, and page number. The index listing for each survey item is presented in the same sequence as they were presented in the 1985 AES instrument. The index should be used as one would use a table of contents to locate crosstables for particular survey items.

APPENDIX A

THE 1985 ARMY EXPERIENCE SURVEY INSTRUMENT: ANNOTATED MAIL VERSION

This appendix contains a specially marked copy of the mail version of the 1985 Army Experience Survey. Notations appear to the left of each question in which at least one of the following conditions were met:

- (1) Response alternatives were regrouped for presentation in the tabulations as a "recoded" survey item and/or as a crossing variable;
- (2) The wording/question structure in the telephone version of the survey differs from the mail version;
- (3) The question was omitted from the tabulations;
- (4) Certain subgroups of respondents were excluded from answering the question (e.g., spouse-related questions are not asked of individuals who had never married).

Questions on the survey instrument which did not require special notation are marked not applicable in the left column.

NOTES

Responses to Q9 are not included in these Tabulation Volumes due to large number of out-of-range values. The direction to report values "within \$100" may have led people to report the value in hundreds of dollars-- for example, a reported value of "3" may mean \$300 rather than \$3.

ORIGINAL SURVEY ITEM

THE NEXT QUESTION ASKS YOU ABOUT YOUR USE OF SERVICE BENEFITS. (NOTE: IF YOU HAVE NOT RECEIVED ANY BENEFITS SINCE LEAVING ACTIVE SERVICE, CHECK HERE AND SKIP TO Q. 10.)

Q 9 Below is a list of benefits. First, circle the letter next to each benefit you have received or are currently receiving, since leaving the service.

Then, if you have received the benefit, place the amount of money within one hundred dollars that you have received to date, or are currently receiving per month, in the space provided to the right of the benefit.

BENEFIT (CIRCLE LETTER FOR EACH BENEFIT RECEIVED)	AMOUNT RECEIVED (within \$100)
a. ARMY COLLEGE FUND (ACF)	\$ _____ to date
b. VETERANS EDUCATIONAL ASSISTANCE PROGRAM (VEAP)	\$ _____ to date
c. GI BILL EDUCATION BENEFITS	\$ _____ to date
d. RETIREMENT PAY	\$ _____ per month
e. OTHERS (PLEASE SPECIFY AND WRITE WHETHER AMOUNT IS "TO DATE" OR "PER MONTH")	
_____	\$ _____
_____	\$ _____
_____	\$ _____
_____	\$ _____

WE WOULD NOW LIKE TO TURN TO ANOTHER TOPIC AND ASK YOU SOME QUESTIONS ABOUT YOUR SERVICE IN THE ARMY.

NOTES

(1) Respondents who answered in Q33 that they have joined a Reserve or Guard unit were excluded from Q33c.

(2) Some respondents wrote in their own answer rather than circling one of the seven choices provided. The written comments indicated that respondents, e.g., "are going to apply, have applied, haven't heard yet." Since these were reasonable answers, an additional category was added to the original 7 choices.

Responses to Q34 were categorized based on type of organization. Refer to Appendix C for categories.

Hello, my name is (YOUR NAME). May I please speak to (RESPONDENT)?

IF RESPONDENT: I am calling from Westat, a research firm in Rockville, Maryland, on behalf of the Army Research Institute. We are conducting a survey to help the Army learn more about the experiences of former soldiers. While you may choose not to answer any question, the information you give us is protected under the Privacy Act of 1974. This means your answers will be kept confidential and your identity will never be known to anyone except the research project staff.

A. First, are you currently an active service member in the regular Army?

APPENDIX C

CODING SCHEMES USED TO CATEGORIZE
RESPONSES TO OPEN-ENDED QUESTIONS

APPENDIX C

CODING SCHEMES USED TO CATEGORIZE RESPONSES TO OPEN-ENDED QUESTIONS

This appendix contains the coding schemes developed for the open-ended responses to the following survey items:

<u>Question Number</u>	<u>Content Area</u>
9E	Veteran benefits
16	Value of Army experience
22	Most important reason for Army separation
23	What Army could have done to prevent separation
24A	One thing with which most dissatisfied in outprocessing/separation experience
28	What would you tell <i>good</i> friend about joining/ not joining Army
31	Suggestions for improving Army service
34	Names of veteran associations to which you belong

Using the responses from a sample of approximately 10% of all respondents, categories were iteratively developed to classify the answers to the open-ended questions. The coding schemes were devised in a hierarchical format, i.e., broad response categories were subdivided into more specific categories. For example, in answer to question 16a ["Whether you were satisfied or not, how valuable was your Army experience to you?], please explain why you feel this way," a respondent might have written, "The Army allowed me to work while continuing my education." The first step in categorizing the response would be to determine that the response pertained to job and education factors; the second step in response classification would be to assign it into a subcategory regarding the respondent's evaluation that continuation of one's education was a valuable Army experience.

The coding schemes used two-digit codes; the first digit represented the broad content area. The second digit stood for the subcategory. Alphanumeric characters were used to designate the broad content areas, and numerals to classify the subcategories. In the coding scheme for the previous example, the letter "D" was used to identify job and education-related factors; the subcategory regarding continuation of one's education was identified by the numeral "3"; thus, the open-ended response was coded, "D3." In addition to the content codes, the coding schemes for each open-ended question contained categories for classifying responses such as "nothing" or "none," "don't know," and "no comment," as well as any extraneous or unusable responses (i.e., miscellaneous responses which either did not pertain to the question or were uninterpretable).

Some times respondents provided responses that were interpretable and useful but which were not directly within the focus of the question posed. For instance, in the same question used in the previous example, Q16a, some respondents elaborated on their answer to question 15, which asked how satisfied they were with their Army service. This occurred even though respondents were specifically requested to disregard how satisfied/dissatisfied they were in making an assessment of the value of their experience. In order to retain the information provided, a special content labelled satisfiers/dissatisfiers area was developed to classify answers related to factors which led to their satisfaction/ dissatisfaction with Army service. This broad content area, "I" in the coding scheme for Q16a, was further subdivided into more specific areas which were cited as having had an impact upon respondents' satisfaction/dissatisfaction with their Army experience. For example, some people reported dissatisfaction with their service experience due to the poor treatment they received (e.g., sexual harassment, lack of respect for individuals' rights); others reported satisfactory service experiences citing good leadership, opportunities for fulfilling one's patriotic duties, and so on.

In answering open-ended questions, some respondents directed their remarks to particular subgroups of enlistees. For instance, Q31 asked for suggestions that would improve Army service for future enlistees. Some respondents focused their remarks on improving the Army's treatment of women (rather than general improvement in the Army's treatment of all enlistees). Code "D3" on Q31 categorizes such suggestions. Examples of such responses include the following suggestions: women should be allowed to serve in combat roles; women enlistees' physical training program should be made harder; others wanted easier training for women; the Army should return to a separate corps for female soldiers (reestablish WAC).

Open-ended coding proceeded by providing coders with verbatim responses that had been keyed from completed surveys. The first coding task was to unitize or to separate the responses into distinct thoughts or themes. The unitization was a necessary step in the coding process since respondents often included several different answers to a question in the same sentence or simply listed explanatory phrases. After unitization, codes were assigned from the coding schemes.

Actual responses were assigned the more refined subcategory codes (e.g., A1, D2) in the actual coding operations; however, these subcategories were collapsed into the major categories (e.g., E1 and E0 collapsed into E) for reporting purposes in the tabulations.
