INTRODUCTION

The Defense Mapping Agency Hydrographic/Topographic Center (DMAHTC) performs precise orbit computations for Navy Navigation Satellite System (NNSS) satellites, also called TRANSIT, using Doppler observations collected by a worldwide network of stations. Equipment at these sites is configured around either a Tranet II or a Magnavox 1502 DS receiver. Table 1 lists the current stations while Figure 1 shows the tracking network configuration. Recorded Doppler counts, surface weather measurements, and other appropriate data are transmitted daily via satellite communications or over other telecommunication links to DMAHTC for processing, time corrections and orbit determination. There are two classes of NNSS satellites - the "Oscar" and the "Nova". The Nova satellites represent the latest generation of TRANSIT satellites. For Nova satellite 30480 and Oscar satellites 30110, 30130, 30200 and 30300, data were processed in two-day fits. For Nova satellite 30500, data were processed in one-day fits. Table 2 and Figure 2 provide additional information on these satellites.

1986 TRACKING STATIONS

1502 DS Stations

Station Number	Station Location
30690	Herndon, Virginia
35000	Ascension Island
35004	St. Helena Island
35006	Dhekelia, Cyprus
35007	Ewa Beach, Hawaii
35010	Diego Garcia Island
35011	Cambridge Bay, Canada
35012	Bahrain, Persian Gulf
35013	Asuncion, Paraguay
35015	Wichita Falls, Texas
35017	Sioux City, Iowa
35018	Shemya, Alaska
35021	Las Cruces, New Mexico
35022	Quito, Ecuador
35024	Sigonella, Italy
35025	Santiago, Chile
35026	Kinshasa, Zaire
35027	Aurora, Colorado
35028	Bangkok, Thailand
35029	Rapid City, South Dakota
35036	Idaho Falls, Idaho
35037	Flagstaff, Arizona
35038	NAS Fallon, Nevada
35039	NAS Meridian, Mississippi
35040	Grissom AFB, Indiana

Tranet II Stations

545	Smithfield, Australia
547	Brussels, Belgium
548	Mizusawa, Japan
549	Wettzell, West Germany
550	Herndon, Virginia
552	Las Cruces, New Mexico
553	Guam (U.S.)
554	Pretoria, South Africa
555	Sao Jose, Brazil
556	Anchorage, Alaska
557	Thule, Greenland
558	Mahe, Seychelles
559	San Miguel, Philippines
560	Tafuna, American Samoa
561	Austin, Texas
562	McMurdo, Antarctica
563	Calgary, Canada
564	Ottawa, Canada
567	Kerguelen Island
568	Papeete, Tahiti
570	Hermitage, United Kingdom
590	San Fernando, Spain
591	Kourou, French Guiana

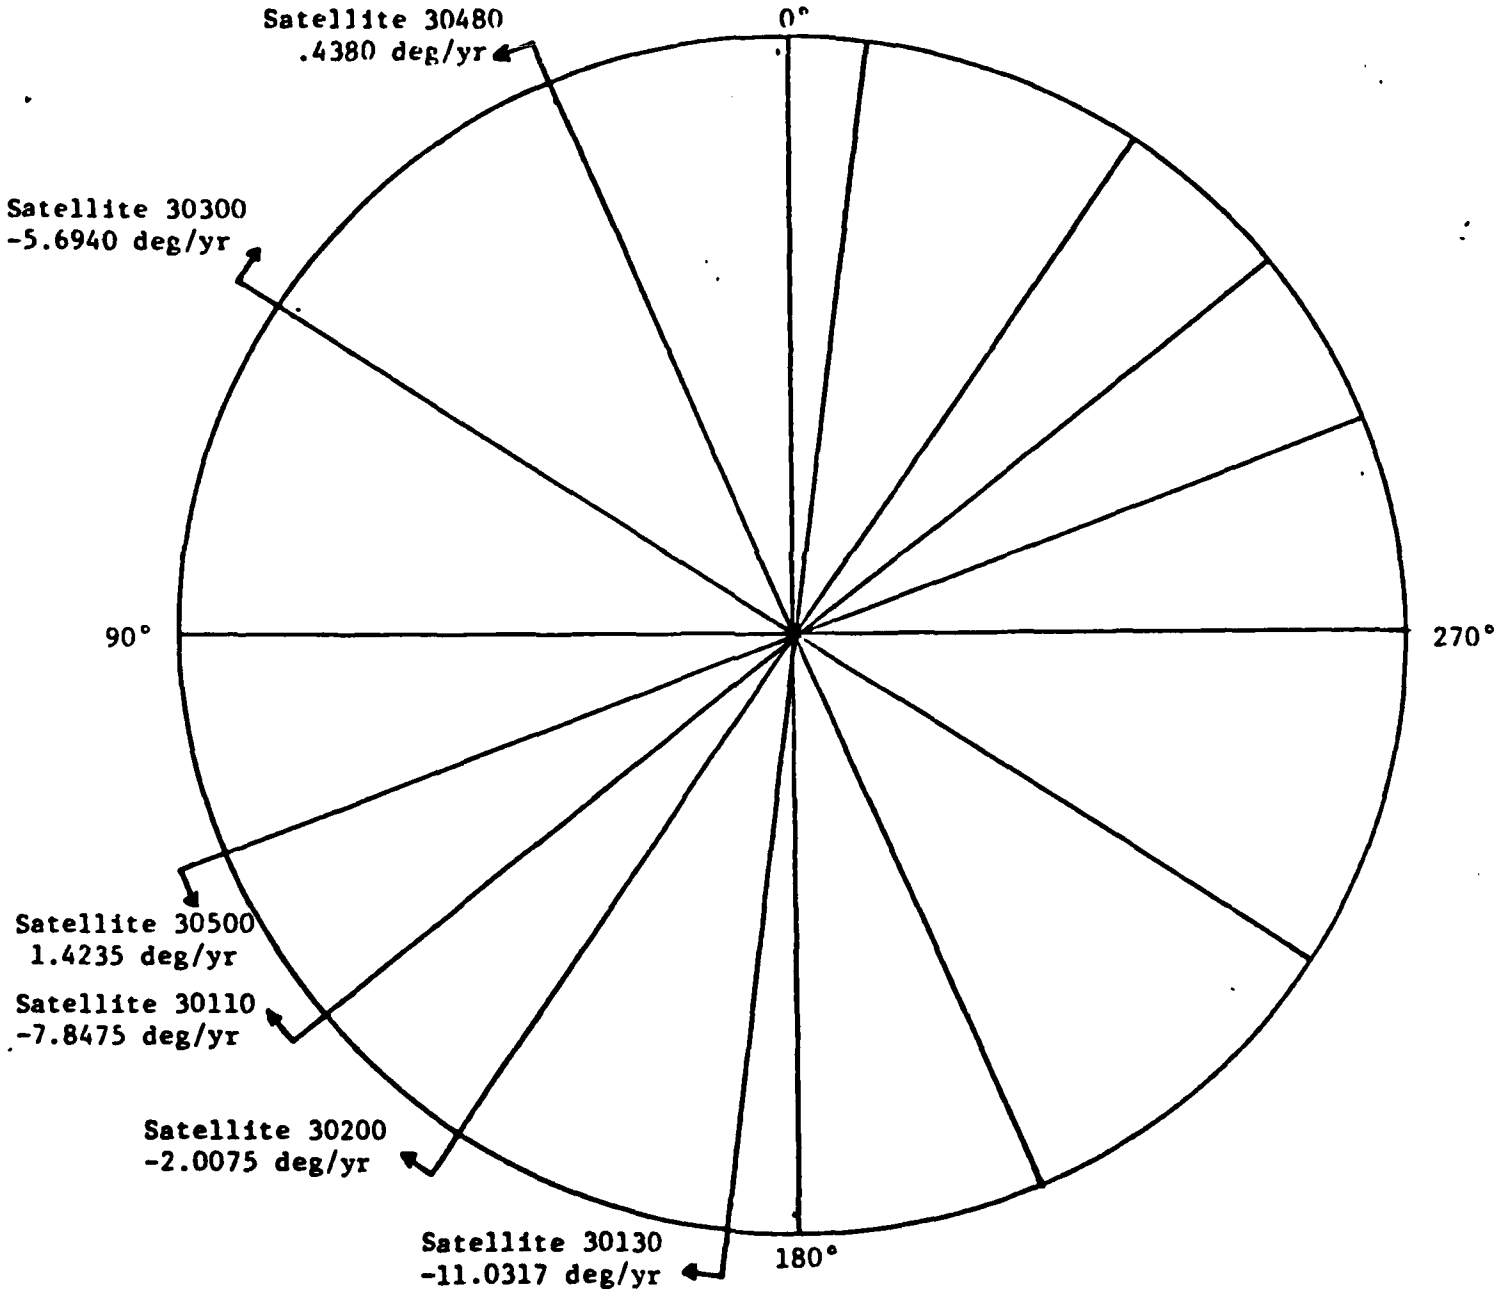
TABLE 2: STATUS REPORT ON USABLE SATELLITES AS OF DECEMBER 1986

TRANSIT Satellite Number	Launched	Status
30130	18 May 1967	Operational for 234 months
30200	29 Oct 1973	Operational for 157 months
30110	28 Oct 1977	Operational for 109 months
30480	15 May 1981	Operational for 64 months
30500	12 Oct 1984	Operational for 24 months
30300	3 Aug 1985	Operational for 16 months

These satellites are controlled by the Navy Astronautics Group (NAG) headquartered at Point Mugu, California.

FIGURE 2: TRANSIT ORIENTATION CHART



Right Ascension Epoch 86342

EPHEMERIDES

Orbits for the six TRANSIT satellites were computed in 1986 on a one-day or two-day basis as previously mentioned, using the CELEST orbit determination program. Ephemerides were computed for the days provided in Table 3.

The orbit computation program provides sufficient diagnostic information to judge the overall quality of estimated ephemerides, the stability of satellite and tracking station clocks, and the performance of the tracking network. One quantity computed within the CELEST program, used as a measure of ephemeris quality, is the station navigation solution. After the satellite ephemeris is estimated, each individual pass of Doppler data acquired during the fit span is used to adjust the geodetic coordinates of the tracking station in directions along and perpendicular to the slant range vector to the satellite at its time of closest approach during the pass. These individual two - parameter station adjustments provide a measure of the consistency of the data with the estimated ephemeris. From these station navigation estimates, a weighted root mean square (RWS) is computed, where the weighting factor for each pass is chosen as the variance of the pass navigation solution.

Table 4 provides the average of the RWS station navigation results for all orbit determinations computed during 1986. These average values, labeled tangential (along - track direction) and radial (slant - range direction), are a measure of the internal consistency of computed ephemerides with the acquired Doppler data.

A measure of orbit repeatability can be obtained by comparing the estimated satellite position at the beginning of each fit span with the estimated satellite position at the end of the previous span. These comparisons are made in the radial, tangential and normal directions using the satellite position and velocity vectors to define the coordinate system. Averages for these quantities for the year 1986 are found in Table 4 under orbit consistency.

TABLE 3: 1986 TRANSIT EPHEMERIS AVAILABILITY

TRANSIT Satellite Number	Day Numbers
30110	1 - 365
30130	1 - 365
30200	1 - 98, 101 - 152, 155 - 365
30300	154 - 365
30480	1 - 365
30500	1 - 365

TABLE 4: SUMMARY OF EPHEMERIS QUALITY
UNITS: METERS

	SATELLITE 30110			SATELLITE 30130			SATELLITE 30200		
	TANGENTIAL	RADIAL	NORMAL	TANGENTIAL	RADIAL	NORMAL	TANGENTIAL	RADIAL	NORMAL

DATA CONSISTENCY	1.6	1.6		1.6	1.6		1.3	1.1	
ORBIT CONSISTENCY	3.0	0.9	0.9	2.2	0.7	1.5	2.2	0.5	0.9

TIME STABILITY

Time stability for the Navy Navigation Satellite System is maintained through the operations of the Naval Astronautics Group at Point Mugu, California. Time is maintained for Oscar satellites through the deletion of cycle counts generated by a satellite crystal oscillator operating at a frequency slightly above a nominal frequency. Fractional frequency fluctuations are compensated for by estimating oscillator instability and by adjusting cycle counts appropriately. An actual time drift will still occur; however, the time error will be maintained within prescribed limits. For Nova satellites time stability is maintained by varying the frequency of the satellite crystal oscillator. This frequency steering occurs daily, as necessary, for 30500 but is not used on 30480 due to a partial failure of the frequency steering mechanism.

As part of the DMAHTC orbit determination solution, satellite frequency bias and drift are estimated. Frequency bias causes a time drift to occur equal to the ratio of the frequency bias to oscillator base frequency multiplied by the effective time span of the bias. Frequency drift causes a quadratic time error equal to the ratio of the frequency drift to oscillator base frequency multiplied by one - half the square of the effective time span of the drift. The long - term frequency stability for the Navy navigation satellites was calculated using the estimated daily frequency bias from CELEST orbit processing. Since this value is readily available on a one or two - day basis, long - term trends in frequency stability were obtained. Figures 3 through 6 give the plots of estimated frequency bias for Oscar satellites 30110, 30130, 30200 and 30300 respectively. Figure 7 gives similar results

for Nova satellite 30480. Based on these data, average annual frequency drifts for each satellite were computed and are given in Table 5.

FIGURE 3: SATELLITE 30110 FREQUENCY ERROR

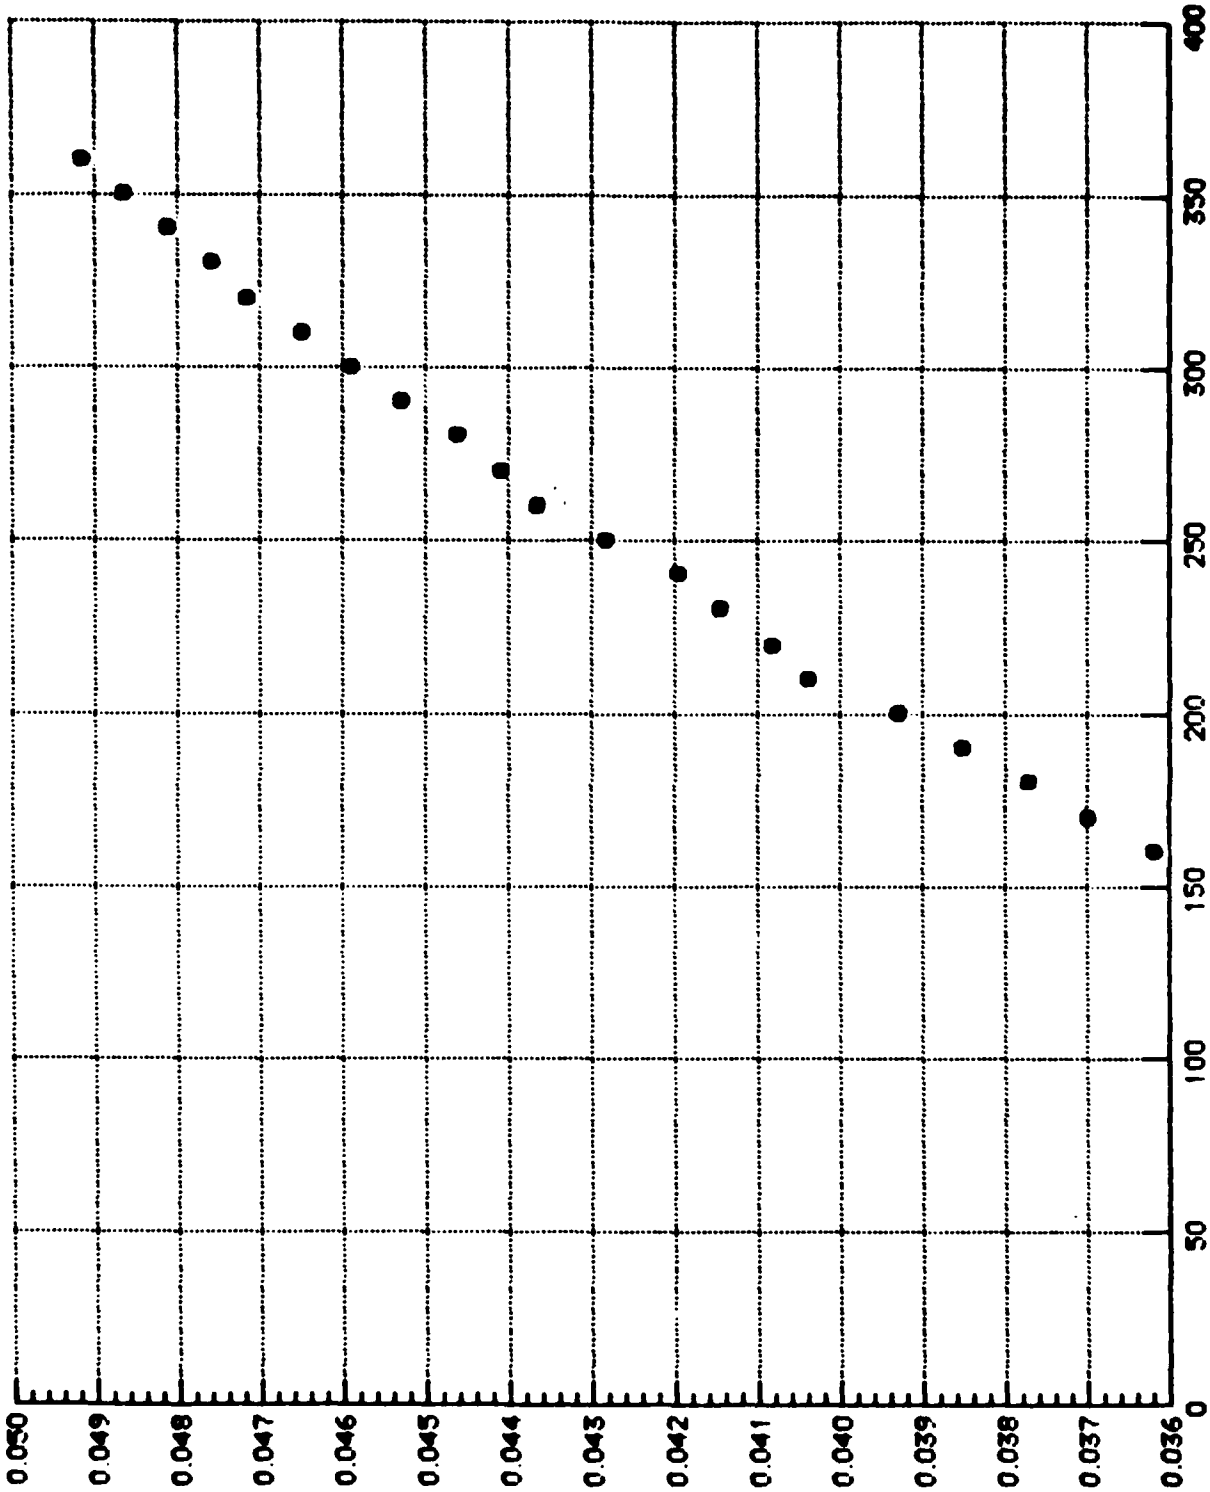

FIGURE 7: SATELLITE 30480 FREQUENCY ERROR

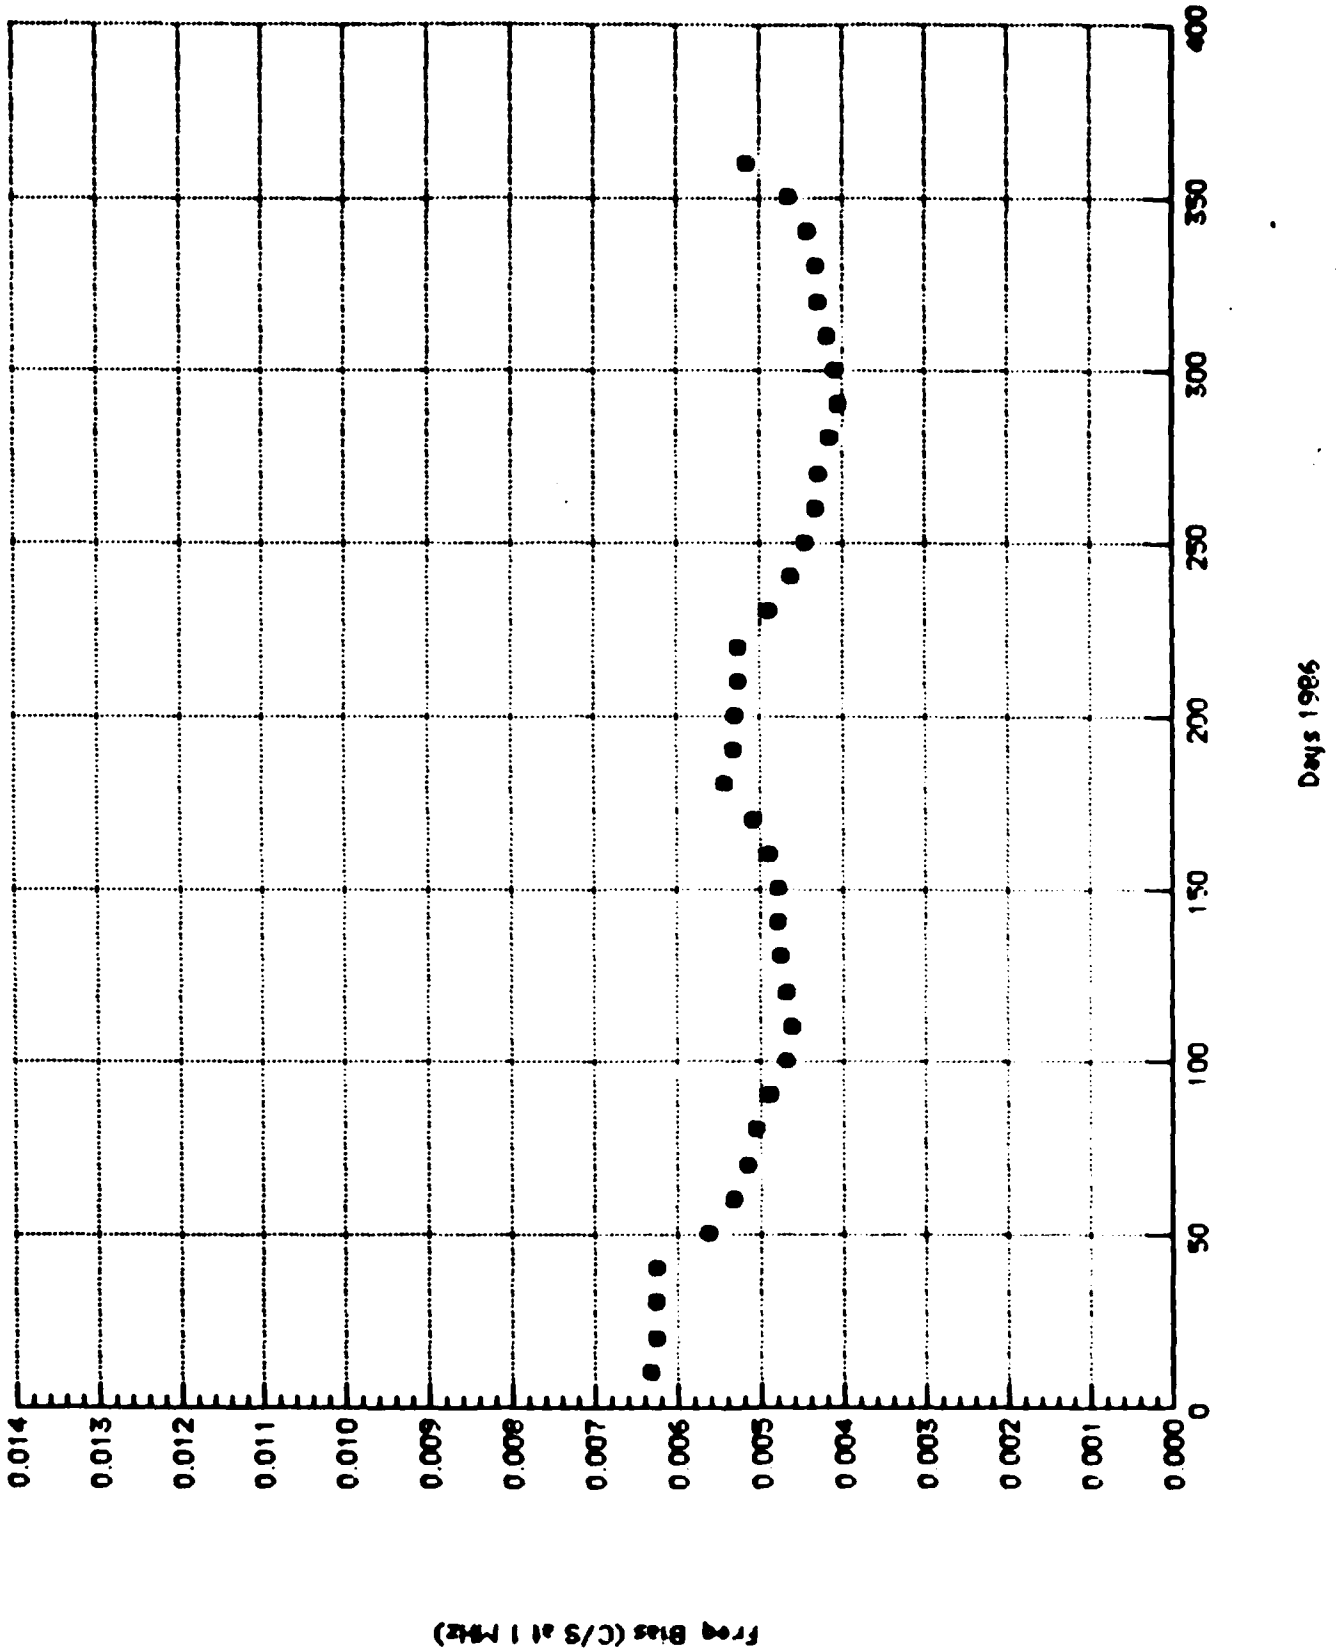

TABLE 5: 1986 MEAN FREQUENCY STABILITY

TRANSIT Satellite Number	Daily Mean Drift *
30110	-37×10^{-5}
30130	36×10^{-5}
30200	40×10^{-6}
30300	11×10^{-5}
30480	13×10^{-6}
30500	**

* Units: Cycles per second per day at 1 MHz

** Stability is maintained by active frequency steering.

POLAR MOTION

Included among the parameters estimated in the orbit determination program is the position of the Earth's spin axis with respect to the pole of the adopted Naval Surface Weapons Center (NSWC) 9Z - 2 terrestial frame. The scheme used to compute daily pole values is as follows: each satellite for which two-day spans of data are used for orbit determination is designated to have an odd or even starting day number. Consequently, for each day of the year, pole positions are determined using less than six satellites. The fit span and two-day designator are provided in Table 6 for each satellite. Satellite data processed daily produce pole position estimates on both odd and even days. Figures 8 through 13 are plots of the 1986 DMAHTC Doppler pole position values for each NNSS satellite. Much of the detail of the plot for Nova satellite 30500 is lost due to the density of data points and their scatter. Table 7 is a comparison of Doppler and BIH polar motion values for 1986.

TABLE 6: 1986 POLAR MOTION PROCESSING SCHEME

TRANSIT Satellite Number	Processing Interval (Days)		Designator
	One - Day	Two - Day	
30110	----	1 - 365	Even
30130	----	1 - 365	Even
30200	----	1 - 98 101 - 152 155 - 365	Odd
30300	----	154 - 365	Even
30480	----	1 - 365	Odd
30500	1 - 365	----	Even, Odd
