19 ABSTRACT (Continue on reverse if necessary and identify by block number) There is an increasing requirement from high levels within the Government that the Navy's aircraft cost estimators and analysts provide explicit estimates for the sub-elements of Aircraft System Test and Evaluation (AST&E) efforts. The data required to produce more accurate and detailed estimates represent lower levels in the Aircraft Work Breakdown Structure (WBS) than previously available. This is a two volume thesis. Volume I examines the WBS and Contractor Cost Data Reporting (CCDR) system with a description of current reporting practices and implementation shortcomings. Recommended courses of action to improve reporting requirements and thereby improve data quality and cost estimates

are proposed. Major cost drivers for AST&E, from both the perspective of Defense Contractors and Military Flight Test Centers, are discussed. Beginning in Volume II, a relational data base system is introduced to more easily evaluate AST&E cost elements and physical/performance characteristics. A Contractor Flight Test Cost estimating relationship (CER) is developed through step-wise multiple regression analysis of data gathered from Defense Contractors and Naval Air Systems Command (NAVAIR).

I. SURVEY OF CURRENT DATA AND STRUCTURE

A. INTRODUCTION

All companies interviewed provided data in some form or another. Some data were better and more complete than others. Not all aircraft data requested were provided. Various reasons were given, including, (i) data too old and not available or would not be of use; (ii) aircraft were commercial derivatives and flight test data not applicable; or (iii) data were for internal use only. A synopsis of the data received, by company, is included below. This summary includes: the type of aircraft reported against, how much data was given, what form the data was in, and a short overview of the companies data collection methods.

B. DESCRIPTION BY CONTRACTOR

1. Boeing

Boeing's initial data include a breakdown of the B-52 and the KC-135 aircraft. Flight Test, Wind Tunnel Test, Static Test, Fatigue test, Flight hours, Wind Tunnel Occupancy Hours and other data were provided. The flight test data were time phased. In the case of the B-52, only block 1 aircraft were time phased, available from 1952 through 1958 in six-month intervals. With the KC 135 six-month interval data blocks 1 through 4 aircraft were

included ranging from 1953 through 1959. For wind tunnel static and fatigue test, only data for the B-52 were provided. Flight test hours were provided by serial number, and wind tunnel occupancy hours were given for both B-52 and KC-135. Other data include the B-52 prototypes flight test and mockup hours. Other KC-135 data include other block 1 data, i.e., maintenance trainers, support equipment, static test, wind tunnel test, airframe and structure ground test, avionics ground test, other ground test, other system test, class I M/U, class II M/U, and class III M/U. Graphs were plotted in the section on wind tunnel occupancy to show the time phased usage of the wind tunnel. Additional Flight test and Wind Tunnel data on the KC-135-1, XB-52, YB-52 and YC-14 were provided.

All the data given was stored in a historical data base within the company owned and developed called Executive Information System (EIS). This system is a matrix-type structure with cost elements and programs forming the parents with many children, matched against the Work Breakdown Structure (WBS) down to the fifth level elements (see Figure 1-1). All cost data is from the official company accounting system and auditable to work in progress ledgers. Data can be retrieved per user desired reports or formats in tabular or graphic display (i.e., total man-hours by cost element (CE), detailed manhours (CE/WBS),

EIS Data Base Matrix

Figure 1-1. EIS Data Base Matrix

time-spread cumulative unit cost, and program and product data). Boeing also has a current on-line system to handle ongoing projects. Once these projects are completed, the information is transferred to the historical data base.

2. Rockwell International, Columbus

Rockwell Columbus provided data on the A-5A, OV-10 and the T-2. Data included total hours and dollars for Contractor Flight Test, Wind Tunnel, Static and Fatigue Test. Contractor Flight Test and Wind Tunnel were not broken down into any sub-elements; Static and Fatigue Test did not include the Engineering hours for the article test. Flight hours are time phased. Engineering and manufacturing hours are the only hours reported.

It was not understood whether or not Rockwell has an computerized data base. If they do, it is not likely real time since definitions are not standard through the company.

3. Fairchild Aircraft

Fairchild provided data on the F-105. Information was given on engineering paper and looked to be a copy of the total records kept of the aircraft. Fairchild does not have a data base. All records are apparently kept by hand. Like Rockwell, the definitions are not standard company wide.

4. Grumman Aerospace Corporation

Grumman provided data on the F-14. Initially, cost data only were provided. Later, a detailed breakdown of the

system test and evaluation for Contractor Flight, Static, Wind Tunnel, and Fatigue test were offered, together with a Test to Cost Study performed by the Flight Test Department which included extensive information relating to the F-14 and other aircraft.

Grumman has a data base and a standard accounting system. Data are structured down to Level 9 of the WBS in the data base. Grumman uses the contract dictionary down to Level 5 or 6. Data below Levels 5 and 6 are defined by Grumman's Planning and Controls section. The company's definitions are standardized.

5. Rockwell International, Los Angeles

Only cost data on the B-1 were provided by Rockwell L.A.. Cumulative system test hours were made available for Static Test and Fatigue Test. These hours were broken down by unit number.

Rockwell has a computer data base accounting system. During the interview, they did not share any detail on its level of information. We were referred to the Air Force system project office for all our data requests. We were only provided dollar figures on the CCDR required reports.

6. LTV Aerospace and Defense

LTV delivered data on A-7, TA-7, XC-142A, F-8U and as a sub-contractor, S-3A and C-17. Of these, statistics on the A-7 and the TA-7 were abundant. Flight hours were time phased starting in September 1965 for the A-7 and December

1976 for the TA-7. Labor hours were divided into engineering and manufacturing, and reported for Instrumentation, Flight Test Spin Program, Night and Delivery, and Misc. For the TA-7, labor hours were not divided between engineering and manufacturing. Total hours were reported against the same items as the A-7 except for an additional item reporting category of General Flight Support.

The company's financial management department maintains the WBS to the third level. The Work Management System is a system listing by task and correlates to WBS sub-tasks. LTV does not currently have a data base that allows for retrieval of historical data by cost element. Work is in progress to implement such a data base system.

7. General Dynamics Corporation

General Dynamics provided data on the YF-16, F-111, F-16 and the B-58. Data included hours and dollars for Direct Labor Hours, Administration, Engineering, Tooling, Manufacturing, Mod and Test, Electric Fabrication Center, Q.A. and Production Support. Only dollar figures were reported for Overhead, Material and Subcontract, Material Burden, Other Direct Charges and General and Administrative Expense. In addition, a Program Overview was given along with Aircraft Characteristics, Program Unique Features, Schedule Data, and WBS Definitions.

General Dynamics maintains a company-wide MIS with matrix translation to input individual project cost data. This system captures actual cost data with dollars normalized to a midpoint for the cost period. The internal data base is used to establish cost estimation relationships.

8. McDonnell Douglas Corporation

McDonnell Douglas provided a schedule for the Static Airframe, Fatigue Airframe, and Fatigue Test Article development. They also provided a historical F/TF-15 Category I Flight Test Plan, but no data was released.

WBS accounting is kept at one level below contract requirements. If contract is at Level 3, internal records will be maintained at Level 4. Their current data base maintains information at the following levels:

- Job order--large component level
- Item level--segregates major tasks (i.e., fatigue testing)
- Cost code--sub-task of item level (i.e., forward fuselage side panel).

Cost accounting is standardized company wide in a corporate data base system used by McDonnell Douglas with each sector of the company records are maintained separately in sub-groups for specialized information.

9. Lockheed Georgia Company

Lockheed released data on the C-5, C-141 and a limited amount on the C-130. The C-5 data was broken down

by Production Manhours, Engineering Manhours, Tooling Manhours, and Material Dollars. In addition, a description of the WBS used on the C-5 was provided. The C-141 data was broken down by Engineering Manhours, Tooling Manhours, and Material Dollars. A WBS description and a test and update highlights chart was provided. The limited data on the C-130 included total flight hours, number of months from 1st flight to completion of tests, and average flight hours per month.

Cost items are tracked by work order, subdivided into major class, minor class, and suffix. Suffix data has been used by different divisions of Lockheed Georgia for their own data tracking, complicating insertion of lower level cost elements into a standard company database. The work order information generally follows the work breakdown structure format. The accounting and record keeping department utilizes Boeing's information system shell to support the internal data structures. The Tops (terminal on-line pricing system) will work with the Glides (GELAC Integrated Data Bank Estimating System) system for cost estimating and analysis. As this system is fully implemented, the outer ring or system shell will be standardized company-wide. The inner ring will be tailored for departmental use. Due to differences in past job order tracking, a significant amount of time has been spent in standardizing cost data. For government contracts, they use

the Sentinel system (Cost schedule control system) to track CCDR reporting requirements only. This was the basic system previously used to track work order information.

10. Lockheed California Company

Lockheed California provided data on the S-3A, this data was given in hours and dollars. Data was provided for the majority of the requested catagories. Flight hours were provided by aircraft. Engineering hours were further broken down into subcategories of the WBS.

Cost items are tracked the same as with Lockheed Georgia except that an on line data base is expected to be operational in the near future. At present, historical test data is maintained separately for each major program and not standardized company wide.

11. Naval Air Test Center

It was intentional not to gather data from the Naval Air Test Center. However, some information on an accounting system that is to be introduced in March 1987 were made available. This system is called STAFS (Standard Automated Financial System). It is not used as a real time data base and will not provide real time access to System Test and Evaluation type data.

12. Air Force Test Flight Center

The Air Force Test Center provided data on the B1-B, F-15 and the F-16. Units (hours); actual and estimated, dollars; estimated total, actual total, estimated

reimbursable and actual reimbursable were reported for job order numbers. Cost-centers were broken down by JON (job order numbers), PIN (product identification number), REN (resource identification number), and EEIC (elementary element identification code).

This test center is unique in that it is a Combined Test Facility. Contractors and the test center share data collected on System Test and Evaluation aircraft. Contractors do their testing on site using the Test Centers facilities.

The Air Force Test Flight Center uses an accounting system called MISTE (Management Information System for Test and Evaluation). This system tracks and updates the test data according to the JON, PIN, REN, and EEIC numbers. It also provides the capability to create reports, standard and nonstandard.

13. NAVAIR

Additional information was provided by NAVAIR. This data was on the S-3A aircraft and came from the NAVAIR data base where the CCDR report information is held. The data was time phased in six-month intervals, standardized and reported against the WBS. This information was used as a tool to evaluate the other S-3A data.

C. SUMMARY

All data furnished can be used, however for the initial analysis, only test labor hours, as opposed to dollars, are appropriate. Therefore Rockwell's cost data will not be utilized. Also the data contributed by the Air Force Test Flight Center is not appropriate because of the inability to distinguish between Contractor Flight Test and Operational Flight Test.

Data furnished by the contractors need to be standardized and compared to the individual companies' CCDR reports held at NAVAIR before they can be used for statistical purposes. Once this task is accomplished, the data could be ready for analysis. However to facilitate the analysis process, the data should be re-arranged in a cohesive and consistent framework. This could be accomplished by developing a data base structure where data could be maintained. This would also facilitate the ease of use as well as the analysis.

II. A SURVEY OF PARAMETRIC TECHNIQUES FOR ESTIMATING COST OF AIRCRAFT SYSTEMS

A. INTRODUCTION

A parametric equation which is derived from theoretical considerations is called a model. The parameters occurring in a model usually represent quantities that have physical significance. The validity of a model rests on the procedures used to obtain values of the parameters, e.g., estimators that not only fit the data well, but also come, on the average, close to the true values and do not vary excessively from one set of experiments to the next. The process of determining parameter values with these statistical considerations in mind is termed model estimation. The utility of parametric estimation models has been effectively applied to several branches of science. (BARD, 1974, pp. 15-16) These parametric techniques are also applicable to the area of cost estimation.

Parametric cost estimating, when applied to aircraft systems, primarily utilizes physical and performance characteristics, as well as costs of previously procured items to identify the anticipated costs for a new system. A combination of system parameters, such as physical dimensions, weight, speed, etc., can be related to the total system cost. Relationships can be established in the form of mathematical equations and are referred to as Cost

Estimating Relationships (CERs). Cost elements, such as labor hours, are chosen as the dependent variable in a CER. System parameters are evaluated as independent variables in the relationship. These parametric methods can be applied to individual segments of a system life cycle or estimations can be aggregated to reflect a composite--resulting in total system cost. In the acquisition of aircraft systems, parametric cost estimating lends itself readily to developing relationships before the details of design are certain. Cost comparisons on alternative designs can also be evaluated early in the preliminary design stage as varying parameters of system cost are tested. Parametric cost estimating is a possible tool, provided accurate and sufficient data is available to evaluate the aircraft physical characteristics, performance tradeoffs, and cost impact alternatives.

Several research studies have applied parametric cost estimating methods to develop models for aircraft systems. Included are two studies that focus on software and avionics estimating methods.

B. PARAMETRIC COST ESTIMATION STUDIES

1. Planning Research Corporation (PRC R-547-A) April 1967

An early excursion into estimating airframe development and production costs was attempted by the Planning Research Corporation (PRC). The study centered on

developing suitable techniques for use in program planning, cost-effectiveness studies, and evaluation of contractor proposals. This model consisted of three separate cost elements: direct manufacturing labor, manufacturing materials, and engineering and tooling (aggregated as a single element). Tooling and engineering costs were combined in order to separate recurring and nonrecurring costs for these two categories. (Sanchez, 1967, p. I-1) The model was developed by stepwise regression on a sample of forty-one propeller driven and turbojet aircraft dating from as early as 1940. Aircraft characteristics used as independent variables included speed, weight, and functions of these (e.g., speed squared). Production program characteristics included quantity produced, delivery rate, and a weight growth factor. Contractor discontinuity variables were used to represent differences in accounting practices. Time-related characteristics expressed changes in the technological state-of-the-art from 1940.

Separate estimating equations were developed for each cost element at production unit quantities of 10, 30, 100 and 300. These estimates were then used to derive cost-quantity curves to enable cost estimation for a desired quantity of production. Graphed on a logarithmic scale, the four units of production estimate points were analyzed with best fit straight line through the vertical axis. This log-linear functional form was used to provide an estimate

for a single unit of production. Twelve equations were developed, four for each cost element across the levels of production, to derive three cost estimating curves. The evaluation of separate levels of production allowed for derivation of a learning curve to be expressed in unit costs. This provided for a more uniform procedure to be applied for aggregating cost elements into total costs. (Sanchez, 1967, p. I-6)

The study did not develop separate cost equations for prototype and production aircraft. The sample data utilized a wide variety of aircraft types, period of development and production, and range of manufacturing technology.

2. RAND (R-761-PR) February 1972

This report provided a set of relationships for estimating costs of military aircraft airframes in a long-range planning context. The relationships included costs of development and production with a separate set of CER equations for prototype aircraft development. The cost elements used in developing these relationships included engineering, development support, flight test operations, tooling, manufacturing labor, manufacturing material, and quality control. (Levenson, 1972, p. 1)

The relationships were obtained through analysis from data on post-World War II cargo, tanker, fighter, bomber, and trainer aircraft. The aircraft were of aluminum

construction with range in speed from low subsonic to Mach 2.2. The data sample included production programs from ten different defense contractors. The estimating equations were derived by statistical multiple regression techniques. These techniques related costs or man-hours to aircraft physical and performance characteristics and to airframe production quantity. Although other potential equation forms and explanatory variables were considered and tested, exponential regression equations primarily used three independent explanatory variables: aircraft weight, speed and quantity. These three variables provided the most useful relationships for the cost elements evaluated. Little or no predictive improvement was gained by including additional physical and performance variables in determining total airframe costs. (Levenson, 1972, p. 3)

Flight test operations were evaluated as a separate cost element and comprised all costs incurred by the contractor to carry out flight tests except the cost of test aircraft. Flight test operations costs were available for 27 aircraft. Data on several aircraft were not consistent with the majority of the sample. However, because no systematic criterion for rejecting specific aircraft was apparent in the sample, the complete sample was used.

Flight test operations cost was related to speed, weight and number of test aircraft with the resulting equation (Levenson, 1972, p. 14):

$F = .001244 A^{1.160} S^{1.371} Q^{1.281}$
coefficient of correlation (unadjusted) = .97
coefficient of variation = 34 percent

where F = flight test operations cost in 1970 constant
dollars

A = AMPR weight (lb)

S = maximum speed at best altitude

Q = number of flight test airframes

The uncertainty in predicting costs was addressed by this study. Since cost estimation is frequently treated as an attempt to obtain a best single-valued prediction of the cost of a new item, a level of confidence assigned to the cost equation may explain variations between initial predictions and the actual cost outcome. Factors that account for these variations may be analyzed to assess this confidence. Three primary sources of cost estimation uncertainty occurring in aircraft systems acquisition were indicated as:

1. Changes requested by the customer
2. Difficulties encountered by the contractor
3. Statistical uncertainty inherent in the estimating method--e.g., uncertainty due to failure to include all of the relevant independent variables, uncertainty due to inherent randomness in the process being modeled.

The study maintained that the effectiveness of a parametric cost model could only be analyzed with respect to the third source of uncertainty. The effects of the first two sources

of uncertainty on the validity of a model could possibly be observed by analyzing the planned weight and speed against actual weight and speed of the finished aircraft in the regression model. (Levenson, 1972, p. 33)

3. J. Watson Noah Associates (FR-103-USN) September 1973

The original intent of this report was to examine aircraft Research and Development costs and derive cost relationships for their estimation. Due to the difficulty in isolating historic R & D costs, production costs were also examined.

Data from thirty-five aircraft systems were included in the research study. Airframe cost elements included engineering, tooling and manufacturing labor, and materials costs. The costs were divided into non-recurring and recurring costs. The non-recurring costs included primarily much of what is considered as Research, Test, Development and Evaluation.

These cost estimating relationships were developed using multiple regression analysis through several logical steps. First, a large number of variables in different combinations and functional forms were screened. An examination of conventional regression statistics resulted in the elimination of several alternatives. The preferred CER was developed and a prediction interval computed. The equation was then used to predict known costs for one or

more aircraft which had been temporarily excluded from the data base as a form of validation and verification. If these results proved satisfactory, then all of the observations were included in the CER development and the coefficients were reestimated. (Noah, 1973, pp. 44-45)

The following candidate variables for non-recurring airframe costs were selected:

S = Maximum Speed

A = AMPR Weight

R = Ratio of gross takeoff (GTO) weight to AMPR weight

T = Technology Index

D = Complexity Dummy

Aeronautical Manufacturers' Planning Report (AMPR) weight provided a standard for consistent evaluation. Maximum speed was used for an aircraft's best altitude. Gross takeoff weight represents design gross weight for an aircraft's primary mission. The technology index variable explained the changes which occurred in airframe manufacturing technology through time trends. The complexity dummy variable was included because the CERs underestimated the costs of four aircraft (F-102, F-106, B-58 and F-111). The use of the dummy variable was justified for these aircraft due to mission or performance parameters which required significantly new and complex technology. (Noah, 1973, pp. 47-48)

The non-recurring airframe costs relationship, derived through regression analysis, resulted in the following CER predictor:

$$\text{Cost} = -5.945 + .00663 S + .05138 T - 1.4071 R + 6.74926 D$$

(6.43) (1.645) (3.18) (7.54)

$$N = 32$$

$$R^2 = .847$$

Numbers shown in parentheses are t-ratios expressed in absolute value. All logarithms are understood to be to the base 'e'. (Noah, 1973, p. 66-67)

Cost estimation relationships for separate elements of airframe non-recurring total costs were not developed in this model.

The significance of avionics cost in aircraft system development with a current lack of avionics CERs to estimate either development or production costs was addressed in this study. Avionics CER development had not been successful up until that time due to poor data availability and quality. The study recommended categorization and reporting of avionics costs by function through required contractor cost reports.

4. RAND (R-1693-1-PA&E) May 1975

The cost estimation model developed in the 1972 RAND study (R-761-PR) elicited user concern centering on three perceived shortcomings of the model: (1) the only two major explanatory variables were weight and speed; (2) all aircraft were lumped together rather than treated as

separate classes; and (3) no provision was made for taking into account changes in airframe structural materials and manufacturing methods. (Large, 1975, p. 2) As information on several new aircraft became available, the Office of the Assistant Secretary of Defense -Program Analysis and Evaluation (OSD-PA&E) sponsored a new RAND study to address these problems. The study plan called for:

1. Review of airframe data in the RAND files to ensure accuracy and consistency of definition and acquisition data on new aircraft
2. Consideration of additional explanatory variables that would make the model better able to deal with characteristics peculiar to individual aircraft, e.g., variable-geometry wing, oversize fuselage
3. Examination of the cost impact of major changes in manufacturing technology over time and of the use of different structural materials. (Large, 1975, p. 2)

In the time available, all questions concerning data consistency were not resolved. Their search for other explanatory variables that would improve the accuracy of estimates were less fruitful than they hoped. The variations in cost that were not explained by weight and speed were not explained by any other objective indexes that they could find. Since the data sample consisted largely of aluminum aircraft, the shift to other materials such as steel, titanium, and composites raises a question about the value of equations derived from that sample for estimating the cost of future aircraft. Some qualitative considerations were addressed concerning a statistical

analysis trend toward higher material costs and reduced manufacturing man-hours.

The estimation model developed was similar to other RAND models in that it allowed estimates to be made of individual cost elements. The study contends that results obtained from individual cost estimates are comparable to the accuracy achieved by estimating at the total program level recommended by the 1973 Noah study (FR-103-USN).

An attempt to analyze the data sample by aircraft type (bombers, fighters, cargo aircraft, etc.) was addressed. Despite the intuitive appeal of stratifying the sample in that way, two factors discouraged this approach. First, when the data were plotted, no natural boundaries appeared. Trainers were mixed with fighters, fighters with bombers, and bombers with cargo aircraft since many category types were similar in both weight and speed. Second, the sample size for individual aircraft types was too small to be representative except in the case of fighters. They held that in cost estimation, as is usually the case, the new aircraft will be substantially different from the historical data base and it is better to have a larger group of more diverse aircraft as a data sample.

Numerous explanatory variables that could impact aircraft development cost were evaluated. Seventeen separate physical characteristics were considered as possible variables for analysis. Other factors influencing

program cost were explored: **schedule, management, funding, state-of-the-art advance, availability of labor, investment in capital tools, and time.** However, these factors were considered to be inconsistent and not appropriate to a parametric cost model based on data from a wide assortment of programs insensitive to small changes. (Large, 1975, p. 14)

Utilizing a stepwise least-squares procedure, the explanatory variables were evaluated. The most statistically significant characteristics and dependable predictors of cost remained **weight and speed.** (Large, 1975, p. v)

Flight test costs were also addressed in this study as a separate cost element. The independent variables found to be significant here, other than weight and speed, were the **number of flight-test aircraft** and a **dummy variable** to distinguish between cargo aircraft and all other types. The rationale for the dummy variable focused on added cost of instrumenting the test aircraft as an important portion of flight-test cost. Thus, cost should increase as the number of aircraft increases. Cargo aircraft supposedly require less flight testing than fighters and bombers due to a relative complexity factor, so cargo aircraft flight test costs would be lower. The flight test estimating equation was presented as follows (Large, 1975, pp. 36-37):

where FT = Flight Test Cost (1973 \$ in Thousands)

Wt = Airframe Unit Weight (lb)

Speed = Maximum Speed (kn)

N = Number of Test Aircraft

DV = Dummy Variable (2 - Cargo, 1 - All others)

$$FT = .13(Wt)^{.71} (Speed)^{.59} (N)^{.72} (DV)^{-1.56}$$

(.99) (.92) (.99) (.99)

$$R^2 = .81$$

The number under each independent variable is the level of significance of that variable.

The study provided a suggested direction for future research emphasizing not only deterministic physical and performance characteristics but also trying to understand the influence of program differences. Factors such as **schedule, experience, efficiency, economic conditions, labor scarcities**, and all other contractor and governmental concerns do have a cost impact on each individual aircraft system acquisition. (Large, 1975, pp. 53-54)

5. RAND (R-1854-PR) March 1976

This report described the development of a substantially revised RAND computer model, DAPCA III (Development and Procurement Costs of Aircraft), which superceded the previous version reported in RAND report R-761-PR. This model is based partially on airframe methodology described in R-1693-1-PA&E with all airframe costs calculated as functions of airframe unit weight and

maximum speed at best altitude. Other explanatory variables found to be significant were time of first flight for manufacturing labor and for manufacturing materials, and the dummy variable for cargo or non-cargo aircraft in flight test cost. (Boren, 1976, p. 2)

No cost estimation relationships were developed for avionics packages to be included in the total system cost. Avionics development cost was entered into this model only as a throughput. Estimations for follow-on avionics packages were adjusted to follow a 95% learning curve factor since the package usually consisted of old as well as new equipment.

6. TRW Defense and Space Systems Group (ASD-TR-80-5025) September 1980

This study does not address the acquisition of the total aircraft system, rather it focuses on the software cost analysis and estimating procedures of avionics operational flight programs (OFP). It assumes limited knowledge of the software product in the early planning phases, increased knowledge before the release of the Request For Proposal (RFP), and more complete knowledge at the time of proposal evaluation and source selection. (Wolverton, 1980, p. 1) Several cost estimating methodologies and alternatives were provided to support and evaluate the validity of an initial cost estimate.

The study reviewed five traditional approaches to software cost estimation. The approaches described were

top-down, similarities and differences, ratio, standards, and bottom-up estimating. It was recommended that two approaches should always be used in order to cross-check one against the other. This provided a systematic basis that would account for any observed difference in the total cost.

Four cost estimating models, that could be utilized for initial estimates or cross-checking, were described by purpose, input, computational procedures, and output. These models, believed to be most useful, included: Boeing Computer Services Cost Model, IBM Walston-Felix Cost Model, Putnam's Software Life Cycle Cost Model, and RCA PRICE Software Cost Model. These parametric estimation models predominantly use a combination of the following inputs: units of delivered source statements, lines of source code, number of source instructions, type of software to be developed, programming language and programmer skill, programming techniques, labor cost, available manpower or similar type descriptors. Utilizing various parametric techniques, the models provides cost estimation information in the form of man-month requirements, project duration, development cost, time phasing of effort, and sensitivity analysis to adjusted input variables.

The study recommends that each separate cost estimate be verified through comparison with an alternate prediction method.

7. RAND (N-1685-AF) March 1981

This research project was directed at providing cost estimating methods and relationships for both whole avionics suites and individual avionics systems for combat aircraft. The study centered on a sample of 17 combat aircraft and the avionics equipment installed in each. Possible explanatory variables were selected based upon interview inputs from defense contractors. Multivariate regression analysis techniques were used to evaluate potential CERs for both whole suites and individual avionics systems.

The explanatory variables determined to be most statistically significant for the avionics suites were:

1. Aircraft Empty Weight
2. Avionics Suite Weight
3. System Power Requirements (kilovoltamperes)
4. Avionics Suite Volume
5. Year of First Flight (technology variable)
6. All-weather capability dummy variable.

Four individual cost estimating relationship equations were developed based upon aircraft characteristics, avionics suite weight, avionics suite volume, and avionics suite power requirements. (Dryden, 1981, pp. v-vi)

Analysis of individual avionics systems, broken down into 11 functional groups, did not yield cost estimating relationships that were as robust as those provided for a whole avionics suite. This grouping provided relatively

homogeneous subsamples with potential estimating relationships based on weight, volume and power variables. A technology variable added little to the effectiveness of tested relationships with an undesirable amount of unexplained variance remaining.

A major problem expressed in this study was the difficulty in capturing and representing the rapid change characterizing the electronics technology of avionics. Advances in that technology have consistently led to the accomplishment of more individual functions per unit size of avionics equipment. To meet increasing mission requirements, more functions have been included in the design of avionics suites with an overall increase in total cost. (Dryden, 1981, p. 2)

C. SUMMARY

The studies discussed in this chapter were developed to provide parametric cost estimating models for both development of total aircraft systems and separate cost elements of those systems. The models describing airframe costs were developed as long ago as 1967. Avionics and software costs have emerged as growing elements in the acquisition of new aircraft systems. All of these cost models were developed through multiple stepwise regression using various size databases. The statistical samples were updated and evaluated with newer aircraft designs as

manufacturing methods and materials also changed. Despite the difference in samples and statistical approaches each study used for estimation, the two primary aircraft characteristics or variables/drivers for airframe cost remained weight and speed. Comparing airframe design alternatives for a new aircraft system, cost and performance tradeoffs could not be readily identified by using current estimation models unless weight and speed are significant factors in the analysis. Figure 2-1 compares four airframe cost studies by identifying cost elements and independent aircraft characteristic variables. Other physical and performance characteristics provided the most easily quantifiable descriptors of an aircraft system but did not yield the statistical qualities required to be considered for inclusion in an accurate cost model.

The need for identification of more reliable independent variables, that would provide statistical stability for cost estimation, was a salient issue addressed in these research studies. The structure and implementation of acquisition record keeping systems to provide the depth and accuracy of cost data for analysis was also considered an important focal point.

III. DEVELOPMENT OF DATA BASE

A. REQUIREMENTS FOR BUILDING DATA BASE SYSTEM FOR T & E

1. Current Data Base

The system currently employed at NAVAIR is on three VAX-780's. This system does not facilitate either easy access to, amendment of, or rapid manipulation of the stored data due to heavy use by all branches of NAVAIR. The need for separate applications and more natural access to the data became evident in discussions with the sponsor. This need must also be filled by a system that is MS-DOS compatible that will integrate with their current on-line applications and other projected applications. The discussion in the next two sections suggests that a relational database would best fit the purpose of this study. A relational DBMS provides more timely information, better data integrity, data independence, better data management, and economies of scale. (Kroenke, 1983, p. 17)

2. Need for Data Manipulation

Constructing a data base would be greatly simplified if the only requirements were to estimate total program cost or total development and total production costs. For long-range planning studies, estimates at such aggregated levels may suffice, but they are of little use in understanding why a new program is estimated to cost a certain amount. An analyst often wants to be able to compare major cost drivers

with their counterparts to determine whether they seem reasonable and to make adjustments wherever indicated by special characteristics of the proposed aircraft (Large, 1975, p. 8), or to make design or programmatic decisions involving tradeoffs at low levels of detail. These ad hoc inquiries necessitated a tailored data base applications program that could be easily manipulated and readily interfaced into a separate statistical analysis software package such as Statsgraphic, version 2.1 or later.

3. Need for Standardization

Achieving a perfectly consistent data base when the data have been compiled by so many different contractors is extremely difficult because accounting practices differ so greatly among companies. (Large, 1975, p. 7) Thoroughly reviewing the data supplied by the contractors (levels below the required CCDR reports) and comparing them to archival data, available through NAVAIR (CCDR reports), allowed for some standardization and normalization (see Appendix A, DATA DICTIONARY). Upon completion of this step, it then becomes necessary to select an appropriate data base package for the tailored design and implementation.

B. DESIGN AND IMPLEMENTATION

Given that the data base would be used in a Local Area Network (LAN) MIS office environment, a desk top-based DBMS with advanced user interface and full transfer capabilities to the VAX-780s would be ideal. Several excellent relational data base shells are available commercially.

dBase III+ was selected for its application parameters, user friendliness and availability of technical support. The research indicated that the basic relational composition of the data base required the ability to combine aircraft specifications and test data in many different configurations as depicted in the Bachman Diagram of the logical system (Figure 3-1).

Figure 3-1. Bachman Diagram

The data was broken down at the third normal form (3NF) using the aircraft model as the key attribute. A number of predefined procedures (see Appendix B, PROGRAMS) for the manipulation of the data were compiled and a hierarchical chart was developed to enable visualization of the interrelationships of those procedures (Figure 3-2).

Figure 3-2. Basic Hierarchy Chart

Further decomposition led to the hierarchy depicted in Figure 3-3. The thirty-one (31) attributes and their structure (see Appendix C, DATA STRUCTURES) used in the programs evolved from this decomposition.

C. DATA BASE UTILIZATION AND BENEFITS

A User's Manual (see Appendix D, USER'S MANUAL) was developed to enhance the maintenance and portability of the applications programs. When a new aircraft is to be developed, all the available data can be inserted into the data base. Corrections to existing data as well as deletion of outdated data or entire records have also been simplified. Perhaps the major benefit of the program is its ability to merge files based on any attribute or sub-sets of attributes the analyst wishes to examine. Ad hoc queries can be processed and the analyst can review the report in a printed form (see Appendix E, REPORTS) as well as entering this newly created file into Statsgraphic, a statistical software package, to expedite the analysis process.

Figure 3-3. Hierarchy Chart

IV. DATA ANALYSIS OF SYSTEM TEST AND EVALUATION

A. DISCUSSION OF DATA STRUCTURES

As discussed in Chapter I, the data received were broken down into two basic categories, dependent and independent variables. These two types of variables are further described below. Appendix C (DATA STRUCTURE) lists all these variables as they are grouped into categories in the data base.

1. Dependent Variables

In the analysis process, we are trying to determine a relationship between the physical and performance characteristics of an aircraft and its test costs. The System Test and Evaluation data requested from the Defense Contractors and NAVAIR focused on direct labor hours. Direct labor hours have proven consistent in evaluating costs without regard to inflationary dollar values. Engineering, manufacturing, tooling, quality control, logistic support and total direct labor hours for the Work Breakdown Structure sub-elements of Contractor Flight Test, Static Test, Fatigue Test and Wind Tunnel Test are used as dependent variables for analysis. Standardized Work Breakdown Structure definitions of these direct labor hour cost elements as provided in Volume I, Chapter III.

2. Independent Variables

Data on aircraft physical and performance specifications are provided by Defense Contractors, NAVAIR, Aircraft Cost Handbooks (Noah, 1973; Day, 1982) and Jane's All the Worlds Aircraft reference series (1948 to present). This reference material allows an initial grouping of independent variables for estimation. The potential variables are chosen based on the availability of data, identification as proven cost drivers in previous research and expert recommendations (i.e., contractors, NAVAIR and Flight Test Centers). These specifications are separated into the following sub-categories:

- a. Characteristics -
 - Number of Crew
 - Date of First Flight
 - Aircraft Wetted Area
 - Fuselage Volume
 - Wing Loading
 - Carrier Capable
 - Number of Avionics Boxes
 - Number of Engines
 - Number of Store Stations
 - Thrust
- b. Ratios/Factors -
 - Limit Load Factor
 - Ultimate Load Factor
 - Empty Weight Divided by
 - Structure Weight

Empty Weight Divided by _____

Aircraft Volume

Gross Takeoff Weight Divided by

Structure Weight

c. Weight -

Structure Weight

Airframe Unit Weight

Empty Weight

Gross Takeoff Weight

Uninstalled Avionics Weight

Installed Avionics Weight

Maximum Structural Store Weight.

d. Performance -

Maximum Speed at Optimum Alt

Maximum Speed at Sea Level

Cruise Speed

Combat Ceiling

Service Ceiling

Combat Radius

The complete data structure listing of both the dependent and independent variables are contained in Appendix C (DATA STRUCTURE).

3. Statistical Analysis Data Format

Multiple linear and non linear regression were performed. The process started by developing correlation matrices and then selecting initial independent variables with the highest correlation relating to the dependent variables and low inter-variable correlation with other

independent variables. The regression procedure fits a model relating one dependent variable to one or more independent variables by minimizing the sum of the squares of the residuals for the fitted line. Linear, multiplicative and exponential models were used. In the multiplicative and exponential models, the dependent variable is first transformed by taking its natural logarithms. Then, the model parameters are estimated. The results are then plotted using the fitted lines.

B. EVALUATION OF DATA

1. Statistical Value of the Data

The data available for analysis are given in Appendix D. During the screening process, it was determined that only Engineering hours and Total hours cost elements within the Contractor Flight Test WBS sub-category contained sufficient data points to permit statistically valid analysis. Although much of the Static Test, Fatigue Test and Wind Tunnel Test data were consistent and complete for several aircraft, there were not enough data reported in these sub-categories to lend statistical significance for the use of these cost elements as dependent variables.

The data representing both dependent and independent variables were entered into a data base to facilitate analysis and grouping of the data. The specific data points available for analysis in this study are represented in

Appendix E. Due to the proprietary nature of the data, the presence of data is represented by an 'XX' corresponding to a the applicable cost element or physical/performance characteristic.

NAVAIR supplied standardized data from historical records. This data was used to validated some of the labor hours provided by Defense Contractors. Not all of this data was able to be standardized as discussed in Chapter I. However, it was determined that this data should be included so that initial analysis could be conducted with the largest possible sample size. It is envisioned that NAVAIR will continue further collection and standardization of this data so that more definitive statistical analysis can be accomplished as data becomes available.

C. ANALYSIS OF COST DRIVERS

As independent variables were initially evaluated for consideration as cost drivers, a one-sample analysis was performed to indicate data consistency (Statgraphics, 1986 p. 11-2). A histogram plot of variables with greater than ten data points was developed. This enabled an analysis of both data groupings and variable comparison of physical/performance characteristics. The resulting one-sample analysis and histograms are contained in Appendix F.

All of the independent variables were considered for potential analysis. Several were evaluated as not having

sufficient data points required for successful multiple regression techniques. The following cost drivers were considered to have the most significant impact for cost estimation modeling: Number of Crew (CREW), Date of First Flight (FF), Wing Loading (WL), Carrier Qualified (CQ), Number of Engines (ENG), Thrust, Empty Weight Divided by Structure Weight (WEOWS or WE/WS), Gross Takeoff Weight Divided by Structure Weight (GTOWOWS or GTOW/WS), Structure Weight (WS), Empty Weight (WE), Gross Takeoff Weight (GTOW), Uninstalled Avionics Weight (WAVU), Installed Avionics Weight (WAVI), Maximum Speed at Optimum Altitude (VMAXA), Maximum Speed at Sea Level (VMAXS), Cruise Speed (VCRUISE), Combat Ceiling (CBCEIL), Service Ceiling (SERCEIL) and combinations of the above.

D. DEVELOPMENT OF COST DRIVER MODELS

Both stepwise least-squares procedures and single step multiple regression techniques were used to determine the best cost driver models. All of the potential independent variables were tested with respect to dependent variables of Contractor Flight Test Engineering and Total direct labor hours. During the initial regression, a F-ratio of 4.0 was used as a threshold for inclusion of independent variables in the equation. Past historical studies showed that certain particular variables were not determined to influence the cost (Rand, 1975, p.16). However, we

eliminated the independent variables based solely on their statistical insignificance. The multiple-regression package used calculates the usual statistical measures of fit and provides plots of the fit. This package eliminates observations with missing data points thereby decreasing the sample size for analysis. These results are shown with the development of each equation in APPENDIX G. In selecting preferred equations, a high coefficient of determination (R^2), the F statistic for tests concerning the equality of the independent variables standard deviations, and the independent T values are the basis for variables initially being included in the regression. Both linear and logarithmic regression were used. Although logarithmic regression minimizes relative errors, some extremely valuable linear equations were found which had as good if not better statistical significance.

1. Contractor Flight Test Total Labor Hours

a. Weight and Speed Variables

The independent variables initially used with the Total Hours cost element were selected from the outcomes of previous studies and expert opinion, in this area, focusing on aircraft weight and speed. All variables of weight and speed, including ratios of both, were evaluated as potential cost drivers. It was found that the non-availability of complete data created a wide variation in the outcomes of the analysis. With a large sample size, the

statistical significance of the equation was less than that of one with a small sample size.

Utilizing only two independent variables--weight and speed--the following log-linear equation resulted:

EQUATION 1 (Refer to pp. 184, 185)

$$\text{TOTALHRS} = -1.64 (\text{VMAXA})^{1.67} (\text{WEOWS})^{-2.89}$$

$$R^2 = .59$$

$$F\text{-Ratio} = 11.56$$

19 Observations

Utilizing stepwise regression, including all the weight, speed and weight ratio variables, the most conclusive relationship developed, resulting in the following log-linear equation and relating statistics:

EQUATION 2 (Refer to pp. 186, 187)

$$\text{TOTALHRS} = -10.89 (\text{WS})^{.99} (\text{VMAXS})^{1.47}$$

$$R^2 = .95$$

$$F\text{-Ratio} = 69$$

10 Observations including: A-10, A-4, A-5, A-6,
F-14, F-15, F-4, F/A-18, S-3, T-38

Both of these relationships are statistically sound. What also must be considered is the observation size which was reduced by the inclusion of other independent variables with less data availability.

b. Consideration of Other Variables

As the other potential cost drivers were also considered, several variables emerged as being consistently reliable. These included characteristics, performance and avionics weight factors. Interestingly, avionics weight emerged as particularly significant independent variable when used as a percentage factor of either Aircraft Structure Weight (WS) or Empty Weight (WE). This component provided a sizing factor for avionics that provided an easy comparison across all types of aircraft. The integration of avionics accounts for a large number of direct labor hours in the Contractor Flight Test effort. This allows for consideration of avionics as an important cost driver. In the past, avionics was overlooked. It was only considered as a portion of total airframe weight.

With these variables considered, the analysis yielded the following estimated equation:

EQUATION 3 (Refer to pp. 196, 197)

$$\text{TOTALHRS} = -6726.84 + 2.33 (\text{VMAXA}) + 35.22 (\text{WL})$$

$$+ 97.29 (\text{WE/WAVI}) + .13 (\text{WE})$$

$$R^2 = .95$$

$$F\text{-Ratio} = 36.4$$

12 Observations

As more physical and performance characteristics were introduced, the sample size evaluated through stepwise multiple regression decreased again due to missing data

points. This small sample size consisted of a more homogeneous grouping of aircraft by type and weight (<100,000 lbs.). The evaluation of this sample grouping with more independent variables yielded a statistically significant result. The following was obtained from the analysis:

EQUATION 4 (Refer to pp. 220, 221)

$$\begin{aligned} \text{TOTALHRS} &= 6.87 (\text{VMAXA})^{.70} (\text{WS/WAVI})^{18.75} (\text{WAVU})^{2.43} \\ &\quad (\text{GTOW})^{-17.03} (\text{GTOW/WS})^{17.13} \\ R^2 &= .98 \\ \text{F-Ratio} &= 62.1 \\ &11 \text{ Observations} \end{aligned}$$

EQUATION 5 (Refer to pp. 222, 223)

$$\begin{aligned} \text{TOTALHRS} &= -6.32 (\text{VMAXA})^{.82} (\text{WS/WAVI})^{1.12} \\ R^2 &= .92 \\ \text{F-Ratio} &= 57.1 \\ &13 \text{ Observations} \end{aligned}$$

EQUATION 6 (Refer to pp. 224, 225)

$$\begin{aligned} \text{TOTALHRS} &= -6765.36 + 2.34 (\text{VMAXA}) + 30.94 (\text{WL}) \\ &\quad + 101.32 (\text{WS/WAVI}) + 0.15 (\text{WE}) \\ R^2 &= .95 \\ \text{F-Ratio} &= 41.5 \\ &13 \text{ Observations} \end{aligned}$$

2. Contractor Flight Test Engineering Hours

a. Weight and Speed Variables

The independent variables used with the Engineering direct labor hours cost element were selected with the same criteria and constraints as in Total Hours.

Utilizing only two independent variables--weight and speed--the following log-linear equation were derived:

EQUATION 7 (Refer to pp. 230, 231)

$$\text{ENGHRS} = 0.23 (\text{VMAXA})^{1.29} (\text{WEOWS})^{-2.67}$$

$$R^2 = .48$$

$$F\text{-Ratio} = 6.8$$

18 Observations

Utilizing stepwise regression, including all the weight, speed and weight ratio variables, the most conclusive relationship emerged, resulting in the following linear equations and related statistics:

EQUATION 8 (Refer to pp. 232, 233)

$$\text{ENGHRS} = -664.71 + 0.23 (\text{WS}) + 1.73 (\text{VMAXA}) - 0.04 (\text{GTOW})$$

$$R^2 = .91$$

$$F\text{-Ratio} = 25.02$$

11 Observations including: A-10, A-4, A-5, A-6,
AV-8B, F-14, F-15, F-4, F/A-18, S-3, T-38.

Both of these relationships are statistically valid with the considerations as mentioned with Total Hours.

b. Consideration of Other Variables

The same independent variables used in Total Hours were evaluated. With these variables considered, the following relationship of cost drivers yielded the following results:

EQUATION 9 (Refer to pp. 236, 237)

$$\text{ENGHRS} = 165.13 + 3.21 (\text{VMAXA}) + 67.20 (\text{FF})$$

$$- 2143.66 (\text{THRUST/WE})$$

$$R^2 = .71$$

$$F\text{-Ratio} = 10.6$$

17 Observations

A smaller sample size of aircraft with Gross Takeoff Weight less than 100,000 lbs. resulted in the following analysis:

EQUATION 10 (Refer to pp. 242, 243)

$$\text{ENGHRS} = - 574.34 + 0.72 (\text{VMAXA}) + 7.85 (\text{WL})$$

$$+ 29.2 (\text{WS/WAVI}) + 0.37 (\text{WAVU}) + 0.22 (\text{WE})$$

$$- 0.07 (\text{GTOW}) - 18.22 (\text{FF}) - 706.75 (\text{CREW})$$

$$R^2 = .998$$

$$F\text{-Ratio} = 170.17$$

11 Observations including: A-10, A-4, A-5, A-6,

AV-8B, F-14, F-15, F-4, F/A-18, S-3, T-38.

EQUATION 11 (Refer to pp. 244, 245)

$$\text{ENGHRS} = 1.1 (\text{VMAXA})^{.89} (\text{WS/WAVI})^{2.24} (\text{GTOW})^{-1.52}$$

$$R^2 = .79$$

$$F\text{-Ratio} = 12.7$$

14 Observations

E. SUMMARY

Contractor Flight Test Total direct labor hours proved to be a more stable dependent variable than Engineering direct labor hours. The best cost drivers were determined using a sample size with Gross Takeoff Weight restricted to less than 100,000 lbs. In most relationships, the avionics weight percentage factor emerged as particularly significant independent variable.

No best cost model can be recommended at this point due to lack of data causing variance in observation size between cost estimating relationships.

V. SUMMARY

The purpose of this research was to review the current cost estimating structure in Aircraft Systems Test and Evaluation and provide better cost estimation models, with particular emphasis on Contractor Flight Test elements.

A. SUMMARY OF RESULTS

As a result of extensive field investigation, data collection, database design and implementation and parametric modeling, the major findings of this research are enumerated below:

1. Propositions for a better implementation of the CCDR

The Contractor cost Data Reporting (CCDR) system was established to provide the DOD with continual ability to develop and use valid cost estimates (Chapter II, Volume I). However, from a cost estimation standpoint, current practices of the CCDR system suffer from numerous shortcomings. First, CCDR reports have often been inconsistent across contractors due to ambiguity in defining cost elements. Second, dual source and sub-contracts are more than frequently granted. Contractors habitually cannot, or do not want to cooperate with other contractors. Third, cost data have not been reported regularly enough for time-series analysis.

This research proposed a number of courses of action that could at least correct some of these shortcomings for more meaningful and accurate data analysis: (1) factor the Work Breakdown Structure (WBS) into lower levels, (2) provide time-phased data reporting, and (3) implement a well-defined CCDR data base system (Chapter III, Volume I). Furthermore, this study suggested an eventual restructurization of the WBS by revising the hierarchy of the WBS elements.

2. Elicitation of experts' opinion to identify the most important cost-drivers in System Test and Evaluation

Past scientific studies have primarily considered weight, speed and the number of aircraft as the most statistically significant cost estimators. Due to technological innovations, other cost drivers have recently emerged. This study conducted a nation-wide field investigation. The following factors were identified as essential cost drivers: mission, aircraft weight, aircraft speed, avionics complexity, software, power supplies, data reduction, number of test aircraft, delivery schedule, joint contractor/ military testing and political environment (Chapter V, Volume I).

The interviews with defense contractors and military test centers also resulted in numerous recommendations for improvement of the current process of System Test and Evaluation. Among these, the following strategies have triggered substantial interest: (1) use of simulation in

software testing, (2) use of structured analysis and design methodology to develop software, (3) implementation of distributed systems using parallel process, (4) development of more efficient power units to reduce weight and volume of avionics of aircraft, (5) reduction of the required number of test aircraft, and (6) delivery of aircraft in a block (phase program). In addition, in a longer perspective, further studies are necessary to determine if joint testing is producing the highest quality and most cost-efficient aircraft.

3. Survey of Current Data and Structure Maintained by Defense Contractors and Military Institutions

As an effort to gather data for cost modeling, this research gathered data from defense contractors and military test centers. Data were provided by Boeing, Rockwell International at Columbus, Fairchild, Grumman Aerospace Corporation, Rockwell International at Los Angeles, LTV Aerospace and Defense, General Dynamics, McDonnell Douglas, Lockheed Georgia, Lockheed California, the Naval Air Test Center, the Air Force Test Flight Center, and NAVAIR. It was found that some data were better and more complete than others. It was also found that some data requested could not be obtained (Chapter I, Volume II).

4. Survey of Parametric Techniques for Estimating Cost of Aircraft Systems

Avionics and software costs have emerged as growing elements in the acquisition of new aircraft systems.

Despite the difference in samples and statistical approaches each study used for estimation, the two primary aircraft characteristics or variables/drivers for airframe cost remained weight and speed.

The need for identification of more reliable independent variables, that would provide statistical stability for cost estimation, was a salient issue addressed in these econometric estimations. The structure and implementation of acquisition record keeping systems to provide the depth and accuracy of cost data for analysis were also considered an important focal point.

5. Development of a Cost Estimation Relational Data Base System

The current NAVAIR system does not facilitate either easy access to, amendment of, or rapid manipulation of the stored data for cost estimation due to heavy use by all branches of NAVAIR. The need for separate applications and more natural access to the data became evident in discussions with the sponsor. This need must also be filled by a system that is MS-DOS compatible and will integrate with current on-line applications and other projected applications.

Given that the data base would be used in a Local Area Network (LAN) MIS office environment, a desk top-based DBMS with advanced user interface and full transfer capabilities to the VAX-780s would be ideal was implemented using dBase III Plus (Chapter III, Volume II).

6. Development of New Parametric Cost Estimation Models

Contractor Flight Test Total direct labor hours proved to be a more stable dependent variable than Engineering direct labor hours. The best cost drivers were determined using a sample size with Gross Takeoff Weight restricted to less than 100,000 lbs. In most relationships, the avionics weight percentage factor emerged as a particularly significant independent variable (Chapter IV, Volume II).

B. SUGGESTIONS FOR FUTURE RESEARCH

The conclusions developed through the statistical analysis are extensions and improvements on the previous studies cited. As more data are collected, standardized and inputted the equations developed should increase in accuracy. The rapidly changing "state of the art" in avionics and its commensurate effects on cost estimation and analysis of aircraft systems that have been previously identified, continues to be of concern. This effect on cost estimation will not be solved until a method of collection of engineering and total hours in the WBS and CCDR is adopted at lower levels than previously used. This paucity of data hampered this research and undoubtedly will hamper future research and consequently the accuracy of estimation on proposed aircraft. The groundwork had been laid, this takes that groundwork but one step further. It is hoped

that this thesis will be of value to both the public and private sectors. The challenge to future research lies in the adoption of measures to insure clarity across both contractor and government lines. Then, precision and accuracy can be insured.

APPENDIX A: DATA DICTIONARY

AIRCRAFT	=	MODEL + MISSION + MFG
AVBX	=	Number of avionics boxes in aircraft system
AWA	=	Aircraft wetted area
CBT_CEIL	=	Maximum rated combat ceiling
CBT_RADIUS	=	Radius of operation for combat purposes in miles
CHAR	=	MODEL + CREW + FIRST_FLT + AWA + VOL + WL + CQ + AVBX + ENG + SSTA + THRUST
CREW	=	Number of crew members
CQ	=	Is the aircraft carrier qualified
ENG	=	Number of engines
ENGHR	=	Number of engineering hours spent on flight testing
FATIGUE	=	MODEL + FTMOS + FTHRS + FENGHRS + FMFGHRS + FTOOLHR + FQCHRS + FILSHRS + FTOTHR
FENGHRS	=	Number of engineering hours spent on fatigue testing
FILSHRS	=	Number of integrated logistic support hours spent on fatigue testing
FIRST_FLT	=	Date of first flight since 1952
FLIGHT	=	MODEL + FLTHRS + TEVTS + ENGHR + MFGHR + TOOLHR + QCHR + ILSHR + TOTHR
FLTHRS	=	Number of hours the aircraft spent in actual flight testing
FMFGHRS	=	Number of manufacturing hours spent on fatigue testing
FQCHRS	=	Number of quality control hours spent on fatigue testing
FTHRS	=	Number of hours the aircraft spent in actual fatigue testing

FTMOS	=	Number of months the aircraft underwent fatigue testing
FTOOLHR	=	Number of tooling hours spent on fatigue testing
FTOTHR	=	Total number of hours spent on fatigue testing
GTOW	=	Gross takeoff weight
GTOW/WS	=	Gross takeoff weight/Structure weight
ILSHR	=	Number of integrated logistic support hours spent on flight testing
LLF	=	Load limit factor
MAXWSS	=	Maximum structure stores weight
MFG	=	Manufacturer's Name
MFGHR	=	Number of manufacturing hours spent on flight testing
MISSION	=	[ASW Attack Bomber Early War EW Fighter Patrol Recon Trainer Transport]
MODEL	=	Aircraft's model number
PERFORMA	=	MODEL + THRUST + VMAXA + VMAXS + VCRUISE + CBT_CEIL + SER_CEIL + CBT_RADIUS
QCHR	=	Number of quality control hours spent on flight testing
SENGHRS	=	Number of engineering hours spent on static testing
SER_CEIL	=	Maximum rated ceiling
SILSHRS	=	Number of integrated logistic support hours spent on static testing
SMFGHRS	=	Number of manufacturing hours spent on static testing
SQCHRS	=	Number of quality control hours spent on static testing

SSTA	=	Number of aircraft store stations
STATIC	=	MODEL + STMOS + SENGHRS + SMFGHRS + STOOLHR + SQCHRS + SILSHRS + STOTHR
STMOS	=	Number of months the aircraft underwent static testing
STOOLHR	=	Number of tooling hours spent on static testing
STOTHR	=	Total number of hours spent on static testing
TEVTS	=	Number of separate specific tests performed during the flight testing
THRUST	=	[Pounds of Thrust Shaft Horsepower Horsepower]
TOOLHR	=	Number of tooling hours spent on flight testing
TOTHR	=	Total number of hours spent on flight testing
ULF	=	Unlimited load factor
VCRUISE	=	Normal cruising speed in knots
VMAXA	=	Maximum speed at optimum altitude
VMAXS	=	Maximum speed at sea level
VOL	=	Fuselage volume
WA	=	Aircraft unit weight
WAVI	=	Installed avionics weight
WAVU	=	Uninstalled avionics weight
WE	=	Empty weight of the aircraft
WE/VOL	=	Empty weight/Volume
WE/WS	=	Empty weight /Structure weight
WEIGHT	=	MODEL + WS + WA + WE + GTOW + WAVU + WAVI + MAXWSS

WENGHRS	=	Number of engineering hours spent on wind tunnel testing
WILSHRS	=	Number of integrated logistic support hours spent on wind tunnel testing
WIND	=	MODEL + WTMOS + WTHRS + WENGHRS + WMFGHRS + WTOOLHR + WQCHRS + WILSHRS + WTOTHR
WL	=	Wing strength measured in pounds per square foot
WMFGHRS	=	Number of manufacturing hours spent on wind tunnel testing
WQCHRS	=	Number of quality control hours spent on wind tunnel testing
WS	=	Structure weight
WTHRS	=	Number of hours the aircraft spent in actual wind tunnel testing
WTMOS	=	Number of months the aircraft underwent wind tunnel testing
WTOOLHR	=	Number of tooling hours spent on wind tunnel testing
WTOTHR	=	Total number of hours spent on wind tunnel testing

APPENDIX D: USER'S MANUAL

1. PRELIMINARY INFORMATION:

1.0 INTRODUCTION:

This User's Manual is designed to assist the NAVAIR Cost Systems, Research and Methods personnel in the use of the programs. All of the programs used are MENU DRIVEN to make this system as user friendly as possible. This manual is not designed to replace a programmer's guide.

*** This manual presupposes a basic working knowledge of dBASE III+ ASSIST functions. The three asterisks (***) symbol is used as a prompt in this manual to alert the user when the ASSIST function is required to complete the menu option.

1.1 TIGER MAIN MENU:

Allows the user to select what basic actions are to be performed on the database. The selections are:

1. LIST STRUCTURES
2. BROWSE FILES
3. JOIN FILES
4. MODIFY RECORDS
5. CREATE REPORTS
6. CREATE QUERIES
7. PRINT REPORT
0. EXIT (to dBASE III+ ASSIST menu)

1.2 LIST STRUCTURES:

Allows the user to view the structure of a file. The selections are:

1. LIST BASIC STRUCTURES
2. LIST ANY STRUCTURE
0. EXIT (to the TIGER MAIN MENU)

1.2.1 LIST BASIC STRUCTURES:

This option allows the user to view the structure of the basic files. The selections are:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the LIST STRUCTURE MENU)

1.2.2 LIST ANY STRUCTURE:

This option allows the user to view the structure of any selected file. The selections are:

1. DISPLAY STRUCTURES
2. LIST FILES
0. EXIT (to the LIST STRUCTURE MENU)

1.3 BROWSE FILES:

When the user selects this option there are three selections available:

1. BROWSE BASIC FILES
2. BROWSE ANY FILES
3. EXIT (to the TIGER MAIN MENU)

1.3.1 BROWSE BASIC FILES:

This option allows the user to view the basic data files. The selections are:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the BROWSE FILES MENU)

1.3.2 BROWSE ANY FILES:

Allows the user to view the current data base files.
The selections are:

1. BROWSE ANY FILE
2. LIST FILES
0. EXIT (to the BROWSE FILES MENU)

1.4 JOIN FILES:

When the user selects this option there are four selections available:

1. LIST EXISTING FILES
2. JOIN FILES
3. JOIN TO FORM SPECS
0. EXIT (to the TIGER MAIN MENU)

1.4.1 LIST EXISTING FILES:

Allows the user to view a listing of existing files.

1.4.2 JOIN FILES:

Allows the user to join files on the model field.

1.4.3 JOIN TO FORM SPECS:

Allows the user to join all the current basic files to form a specifications structure to facilitate ad hoc queries.

1.5 MODIFY RECORDS:

When the user selects this option four selections are available:

1. ADD AIRCRAFT MODEL
2. EDIT RECORDS
3. DELETE RECORDS
0. EXIT (to the TIGER MAIN MENU)

1.5.1 ADD AIRCRAFT MODEL:

This program assists the user in adding a new model aircraft to all of the nine basic files concurrently. This also does an automatic sort to place the new aircraft in alpha-numeric order.

1.5.2 EDIT RECORDS:

This program assists the user in editing records in the nine basic files. The selections are:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the MODIFY RECORDS MENU)

1.5.3 DELETE RECORDS:

This program assists the user in deleting records from the nine basic files concurrently. In addition, it displays the following selections:

1. YOU ARE ABOUT TO PERMANENTLY DELETE SELECTED RECORDS FROM FILES
0. EXIT (to the MODIFY RECORDS MENU)

1.6 CREATE REPORTS:

Allows the user to create ad hoc reports. The selections are:

1. CREATE NEW REPORT
2. LIST EXISTING REPORT FILES
0. EXIT (to the TIGER MAIN MENU)

1.6.1 CREATE NEW REPORT:

Defaults the user to the dBASE III+ ASSIST menu.

1.6.2 LIST EXISTING REPORT FILES:

Allows the user to view all report files.

1.7 CREATE QUERIES:

Allows the user to create ad hoc query relationships. The selections are:

1. CREATE NEW QUERY
2. LIST QUERY FILES
0. EXIT (to the TIGER MAIN MENU)

1.7.1 CREATE NEW QUERY:

Defaults the user to the dBASE III+ ASSIST menu.

1.7.2 LIST QUERY FILES:

Allows the user view all query files.

1.8 PRINT REPORTS:

Allows the user to print reports that come from the data files. The selections are:

1. PRINT BASIC REPORTS
2. PRINT ANY REPORT
0. EXIT (to the TIGER MAIN MENU)

1.8.1 PRINT BASIC REPORTS:

Allows the user to print the basic reports by inputting a file name.

1.8.2 PRINT ANY REPORT:

Allows the user to print a report based on the primary data files. The selections are:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST.RPT
9. WIND TUNNEL TEST.RPT
0. EXIT (to the PRINT REPORTS MENU)

2.0 INTRODUCTION:

The TIGER data base system is used to provide a relational method to input, access and compare data on the Test and Evaluation cost drivers of military aircraft. This program will allow the user to work with existing files, add data, edit data and delete records from the following nine applicable files:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST

2.1 Procedures:

This program is designed to be operated using dBASE III+ with an IBM-PC and hard disk drive to contain the required files. Ensure the required files are resident on the hard disk drive prior to operation.

1. Commands to perform.
 - a. Type: DBASE (enables the db.exe file).
 - b. Type: DO TIGER or F9 function key (activates main menu).

2.2 TIGER MAIN MENU:

This menu is displayed to provide the user access to the data base and the following options to view and manipulate data:

1. LIST STRUCTURES
2. BROWSE FILES
3. JOIN FILES
4. MODIFY RECORDS
5. CREATE REPORTS
6. CREATE QUERIES
7. PRINT REPORT
0. EXIT (to dBASE III+ ASSIST menu)

2.2.1 SELECTING SUB-MENUS:

Select an option from the TIGER MAIN MENU by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, or 0 <cr>

3.0 LIST STRUCTURES:

The LIST STRUCTURES menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to view and print the structure of a data file with the following selections:

1. LIST BASIC STRUCTURES
2. LIST ANY STRUCTURE
0. EXIT (to the TIGER MAIN MENU)

SELECTING LIST STRUCTURES OPTIONS:

Select an option from the LIST STRUCTURES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2 or 0 <cr>

3.1 LIST BASIC STRUCTURES:

The LIST BASIC STRUCTURES menu is displayed when called as an option from the LIST STRUCTURES menu. This menu provides the user the opportunity to view and print the structure of the nine basic data files with the following selections:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (exit to the LIST STRUCTURES MENU)

SELECTING DATA FILE OPTIONS:

Select an option from the LIST BASIC STRUCTURES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, 8, 9 or 0 <cr>

3.1.1 SELECTED DATA FILES:

These data files are called from the LIST BASIC STRUCTURES menu and allows the user to view and print the structure of the selected data file.

When this option is selected the monitor will query the user:

"Direct this output to the printer? (Y/N)"

If printed copy is desired:

1. Command to perform:
 - a. Type: Y<cr>

If printed copy is not desired:

1. Command to perform:
 - a. Type: N<cr>

After selecting Y/N the list will scroll on the screen and display the requested structure.

RETURN FROM SELECTED DATA FILE OPTION:

To return from viewing a selected data file structure, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.1.2 LIST ANY STRUCTURE:

The LIST ANY STRUCTURE option is called from the LIST STRUCTURES menu and allows the user to view and print the structure of any data file by typing a specific database filename.

1. Commands to perform:
 - a. Type: <filename><cr>

When this option is selected the monitor will query the user:

"Direct this output to the printer? (Y/N)"

If printed copy is desired:

1. Command to perform:
 - a. Type: Y<cr>

If printed copy is not desired:

1. Command to perform:
 - a. Type: N<cr>

After selecting Y/N the listing will scroll on the screen and display the requested structure.

RETURN FROM LIST ANY STRUCTURE OPTION:

To return from viewing a data file, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.2 BROWSE FILES:

The BROWSE FILES menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to view but not manipulate applicable files with the following selections:

1. BROWSE BASIC FILES
2. BROWSE ANY FILE
0. EXIT (to the TIGER MAIN MENU)

SELECTING SUB-MENUS:

Select an option from the BROWSE FILES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2 or 0 <cr>

3.2.1 BROWSE BASIC FILES:

The BROWSE BASIC FILES menu is displayed when called as an option from the BROWSE FILES menu. This menu provides the user the opportunity to view but not manipulate the nine basic data files with the following selections:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the BROWSE FILES MENU)

SELECTING DATA FILE OPTIONS:

Select an option from the BROWSE BASIC FILES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, 8, 9 or 0 <cr>

3.2.1.1 SELECTED DATA FILES:

These data files are called from the BROWSE BASIC FILE menu and allows the user to view but not manipulate the data contained in the selected file.

RETURN FROM SELECTED DATA FILE OPTION:

To return from browsing a selected data file, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.2.2 BROWSE ANY FILE:

The BROWSE ANY FILE menu is displayed when called as an option from the BROWSE FILES menu. This menu provides the user the opportunity to view but not manipulate any files with the following selections:

1. BROWSE ANY FILE
2. LIST FILES
0. EXIT (to the BROWSE FILES MENU)

SELECTING SUB-MENU OPTIONS:

Select an option from the BROWSE ANY FILE menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2 or 0 <cr>

3.2.2.1 BROWSE ANY FILE:

The BROWSE ANY FILE option is called from the BROWSE ANY FILE menu and allows the user to view a specific database file by typing a specific database filename.

1. Commands to perform:
 - a. Type: <filename><cr>

When this option is selected the monitor will query the user:

"Direct this output to the printer? (Y/N)"

If printed copy is desired:

1. Command to perform:
 - a. Type: Y<cr>

If printed copy is not desired:

1. Command to perform:
 - a. Type: N<cr>

After selecting Y/N the requested file will scroll on the screen.

RETURN FROM BROWSE ANY FILE OPTION:

To return from viewing a database file, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.2.2.2 LIST FILES:

The LIST FILES option is called from the BROWSE ANY FILE menu and allows the user to view a directory listing of current database files.

RETURN FROM DATABASE FILE LISTING OPTION:

To return from viewing a database file listing, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.3 JOIN FILES:

The JOIN FILE menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to list existing files and join files with the following selections:

1. LIST EXISTING FILES
2. JOIN FILES
3. JOIN TO FORM SPECS
0. EXIT (to the TIGER MAIN MENU)

3.3.1 LIST EXISTING FILES:

The LIST EXISTING FILES option is called from the JOIN FILE menu and allows the user to view and print a directory listing of existing database files.

When this option is selected the monitor will query the user:

"Direct this output to the printer? (Y/N)"

If printed copy is desired:

1. Command to perform:
 - a. Type: Y<cr>

If printed copy is not desired:

1. Command to perform:
 - a. Type: N<cr>

After selecting Y/N the requested listing will scroll on the screen.

RETURN FROM EXISTING FILES LISTING OPTION:

To return from viewing an existing files listing, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.3.2 JOIN FILES:

The JOIN FILES option is called from the JOIN FILE menu and allows the user to join two selected data files on the MODEL field with a <FILENAME> specified for the new join file.

When this option is selected the monitor will query the user:

"Enter filename 1..."

1. Commands to perform:
 - a. Type: <FILENAME> <cr>

"Enter filename 2..."

1. Commands to perform:
 - a. Type: <FILENAME> <cr>

"Enter new filename..."

1. Commands to perform:
 - a. Type: <FILENAME> <cr>

RETURN FROM JOIN FILES OPTION:

Following entry of the desired filenames, the program will join the desired files and return to the JOIN FILE menu.

3.3.3 JOIN TO FORM SPECS:

The JOIN TO FORM SPECS option is called from the JOIN FILES MENU and allows the user to view and print a specifications structure of the existing database files.

When this option is selected the monitor will query the user:

"Direct this output to the printer? (Y/N)"

If printed copy is desired:

1. Command to perform:
 - a. Type: Y<cr>

If printed copy is not desired:

1. Command to perform:
 - a. Type: N<cr>

After selecting Y/N the requested specifications chart will scroll on the screen.

RETURN FROM JOIN TO FORM SPECS OPTION:

To return from viewing a specifications chart, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.4 MODIFY RECORDS:

When the user selects this option four selections are available:

1. ADD AIRCRAFT MODEL
2. EDIT RECORDS
3. DELETE RECORDS
0. EXIT (to the TIGER MAIN MENU)

3.4.1 ADD AIRCRAFT MODEL:

This program assists the user in adding a new model aircraft to all of the nine basic files concurrently. This also does an automatic sort to place the new aircraft in alpha-numeric order.

When this option is selected the monitor will query the user to input the new model:

1. Command to perform:
 - a. Type: Model<cr>

RETURN FROM ADD AIRCRAFT MODEL OPTION:

To return from adding a new aircraft, the user may type <CTRL - End> which will return the screen to the previous menu.

3.4.2 EDIT RECORDS:

This program assists the user in editing records in the nine basic files. The user must be cautioned: in this selection you will be editing only the file you have selected, you will not edit all the structures simultaneously. In addition, if you edit the model, it will only be edited in the structure selected. In order to ensure continuity among all structures you will have to individually modify the model attribute in the remaining structures. The selections are:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the MODIFY RECORDS MENU)

Select an option from the BROWSE BASIC FILES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, 8, 9 or 0 <cr>

RETURN FROM EDIT RECORDS OPTION:

To return from editing a record, the user may type <esc> which will save the changes and return the screen to the previous menu.

3.4.3 DELETE RECORDS:

This program assists the user in deleting records from the nine basic files concurrently. It does an automatic pack to ensure the remaining models are maintained in alpha-numeric order. In addition, it displays the following selections:

1. YOU ARE ABOUT TO PERMANENTLY DELETE SELECTED RECORDS FROM FILES
0. EXIT (to the MODIFY RECORDS MENU)

RETURN FROM DELETE RECORDS OPTION:

To return from deleting a record, the user may type <esc> which will return the screen to the previous menu.

3.5 CREATE REPORT:

The CREATE REPORT menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to create an ad hoc report or view a listing of existing report files with the following selections:

1. CREATE NEW REPORT
2. LIST EXISTING REPORT FILES
0. EXIT (to the TIGER MAIN MENU)

SELECTING CREATE REPORT OPTIONS:

Select an option from the CREATE REPORT menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2 or 0 <cr>

3.5.1 CREATE NEW REPORT:

The CREATE NEW REPORT option is called from the CREATE REPORT menu and allows the user to create an ad hoc report utilizing the dBASE III+ ASSIST function.

1. Commands to perform:
 - a. Type: 1

*** a. User is directed to the dBASE III+ ASSIST function.

RETURN FROM CREATE NEW REPORT OPTION:

To return from creating an ad hoc report, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.5.2 LIST EXISTING REPORT FILES:

The LIST EXISTING REPORT FILES option is called from the CREATE REPORT menu and allows the user to view a directory listing of existing report files.

RETURN FROM EXISTING REPORT FILES LISTING OPTION:

To return from viewing an existing report files listing, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.6 CREATE QUERIES:

The CREATE QUERIES menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to create ad hoc query relationships with the following selectaons:

1. CREATE NEW QUERY
2. LIST QUERY FILES
0. EXIT (to the TIGER MAIN MENU)

SELECTING CREATE QUERIES OPTIONS:

Select an option from the CREATE QUERIES menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2 or 0 <cr>

3.6.1 CREATE NEW QUERY:

The CREATE NEW QUERY option is displayed when called as an option from the CREATE QUERY menu. This option allows the user to create an ad hoc query using the dBASE III+ ASSIST function.

1. Commands to perform:
 - a. Type: 1

a. User is directed to the dBASE III+ ASSIST function.

3.6.2 LIST QUERY FILES:

The LIST QUERY FILES option is called from the CREATE QUERY menu and allows the user to view all query files.

RETURN FROM LIST QUERY FILES OPTION:

To return from viewing a query file listing, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.7 PRINT REPORTS:

The PRINT REPORTS menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to send to the printer the following selections:

1. PRINT BASIC REPORTS
2. PRINT ANY REPORT
0. EXIT (to the TIGER MAIN MENU)

SELECTING SUB-MENUS:

Select an option from the PRINT REPORTS menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, or 0 <cr>

3.7.1 PRINT BASIC REPORTS:

The PRINT BASIC REPORTS menu is displayed when called as an option from the TIGER MAIN MENU. This menu provides the user the opportunity to send to the printer nine standard reports with the following selections:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the PRINT REPORTS MENU)

SELECTING SUB-MENUS:

Select an option from the PRINT BASIC REPORTS menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, 8, 9, or 0 <cr>

RETURN FROM PRINT BASIC REPORTS OPTION:

To return from printing a basic report, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.7.2 PRINT ANY REPORT:

Allows the user to print a report based on the primary data files. The selections are:

1. PRINT ANY REPORT
2. LIST REPORTS
0. EXIT (to the PRINT REPORTS MENU)

3.7.2.1 PRINT ANY REPORT:

Allows the user to print a report based on the following selections:

1. AIRCRAFT
2. CHARACTERISTICS
3. PERFORMANCE
4. RATIOS/FACTORS
5. WEIGHT
6. FATIGUE TEST
7. FLIGHT TEST
8. STATIC TEST
9. WIND TUNNEL TEST
0. EXIT (to the PRINT REPORTS MENU)

SELECTING SUB-MENUS:

Select an option from the PRINT ANY REPORTS menu by typing the number of the corresponding option desired.

1. Commands to perform:
 - a. Type: 1, 2, 3, 4, 5, 6, 7, 8, 9, or 0 <cr>

RETURN FROM PRINT ANY REPORTS OPTION:

To return from printing a report, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>

3.7.2.2 LIST REPORTS:

Allows the user to view and print the reports that are available.

RETURN FROM LIST REPORTS OPTION:

To return from viewing or printing the available reports, the user may type <esc> which will return the screen to the previous menu.

1. Commands to perform:
 - a. Type: <esc>
