19 ABSTRACT (Continue on reverse if necessary and identify by block number) This unit test plan establishes the methodology and procedures used to adequately test the capabilities of the computer program identified as the Form Processor (FP). The FP consists of a set of callable execution time routines that allows an application program to send receive formatted screen to from various terminals and to perform terminal control functions independent of the terminal type. It also has a User Interface Monitor (UIM) that handles translating messages sent across the NTH into the appropriate FP calls. The UIM also handles the log on to IISS, processing the IISS Function Screen and processing the window management form.

PREFACE

This unit test plan covers the work performed under Air Force Contract F33615-80-C-5155 (ICAM Project 6201). This contract is sponsored by the Materials Laboratory, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio. It was administered under the technical direction of Mr. Gerald C. Shumaker, ICAM Program Manager, Manufacturing Technology Division, through Project Manager, Mr. David Judson. The Prime Contractor was Production Resources Consulting of the General Electric Company, Schenectady, New York, under the direction of Mr. Alan Rubenstein. The General Electric Project Manager was Mr. Myron Hurlbut of Industrial Automation Systems Department, Albany, New York.

Certain work aimed at improving Test Bed Technology has been performed by other contracts with Project 6201 performing integrating functions. This work consisted of enhancements to Test Bed software and establishment and operation of Test Bed hardware and communications for developers and other users. Documentation relating to the Test Bed from all of these contractors and projects have been integrated under Project 6201 for publication and treatment as an integrated set of documents. The particular contributors to each document are noted on the Report Documentation Page (DD1473). A listing and description of the entire project documentation system and how they are related is contained in document FTR620100001, Project Overview.

The subcontractors and their contributing activities were as follows:

TASK 4.2

<u>Subcontractors</u>	<u>Role</u>
Boeing Military Aircraft Company (BMAC)	Reviewer.
D. Appleton Company (DACOM)	Responsible for IDEF support, state-of-the-art literature search.
General Dynamics/ Ft. Worth	Responsible for factory view function and information models.

UTP620144200
1 November 1985

Subcontractors

Role

Illinois Institute of
Technology

Responsible for factory view
function research (IITRI)
and information models of
small and medium-size business.

North American Rockwell

Reviewer.

Northrop Corporation

Responsible for factory view
function and information
models.

Pritsker and Associates

Responsible for IDEF2 support.

SofTech

Responsible for IDEF0 support.

TASKS 4.3 - 4.9 (TEST BED)

Subcontractors

Role

Boeing Military Aircraft
Company (BMAC)

Responsible for consultation on
applications of the technology
and on IBM computer technology.

Computer Technology
Associates (CTA)

Assisted in the areas of
communications systems, system
design and integration
methodology, and design of the
Network Transaction Manager.

Control Data Corporation
(CDC)

Responsible for the Common Data
Model (CDM) implementation and
part of the CDM design (shared
with DACOM).

D Appleton Company
(DACOM)

Responsible for the overall CDM
Subsystem design integration
and test plan, as well as part
of the design of the CDM
(shared with CDC) DACOM also
developed the Integration
Methodology and did the schema
mappings for the Application
Subsystems.

UTP620144200
1 November 1985

Subcontractors

Role

Digital Equipment
Corporation (DEC)

Consulting and support of the
performance testing and on DEC
software and computer systems
operation.

McDonnell Douglas
Automation Company
(McAuto)

Responsible for the support and
enhancements to the Network
Transaction Manager Subsystem
during 1984/1985 period.

On-Line Software
International (OSI)

Responsible for programming the
Communications Subsystem on the
IBM and for consulting on the
IBM.

Rath and Strong Systems
Products (RSSP) (In 1985
became McCormack & Dodge)

Responsible for assistance in
the implementation and use of
the MRP II package (PIOS) that
they supplied.

SofTech, Inc.

Responsible for the design and
implementation of the Network
Transaction Manager (NTM) in
1981/1984 period.

Software Performance
Engineering (SPE)

Responsible for directing the
work on performance evaluation
and analysis.

Structural Dynamics
Research Corporation
(SDRC)

Responsible for the User
Interface and Virtual Terminal
Interface Subsystems.

Other prime contractors under other projects who have
contributed to Test Bed Technology, their contributing
activities and responsible projects are as follows:

Contractors

ICAM Project

Contributing Activities

Boeing Military
Aircraft Company
(BMAC)

1701, 2201,
2202

Enhancements for IBM
node use. Technology

SECTION 1

GENERAL

1.1 Purpose

This unit test plan establishes the methodology and procedures used to adequately test the capabilities of the computer program identified as the Form Processor, known in this document as the FP. The FP is one configuration item of the Integrated Information Support System (IISS) User Interface (UI). It consists of Form Processor callable routines and the User Interface Monitor which is the main controller of the Form Processor.

1.3 Terms and Abbreviations

American Standard Code for Information Interchange: (ASCII), the character set defined by ANSI X3.4 and used by most computer vendors.

Application Interface: (AI), subset of the IISS User Interface that consists of the callable routines that are linked with applications that use the Form Processor or Virtual Terminal. The AI enables applications to be hosted on computers other than the host of the User Interface.

Application Process: (AP), a cohesive unit of software that can be initiated as a unit to perform some function or functions.

Attribute: field characteristic such as blinking, highlighted, black, etc. and various other combinations. Background attributes are defined for forms or windows only. Foreground attributes are defined for items. Attributes may be permanent, i.e., they remain the same unless changed by the application program, or they may be temporary, i.e., they remain in effect until the window is redisplayed.

Common Data Model: (CDM), IISS subsystem that describes common data application process formats, form definitions, etc. of the IISS and includes conceptual schema, external schemas, internal schemas, and schema transformation operators.

Computer Program Configuration Item: (CPCI), an aggregation of computer programs or any of their discrete portions, which satisfies an end-use function.

Conceptual Schema: (CS), the standard definition used for all data in the CDM. It is based on IDEF1 information

modelling.

Current Cursor Position: the position of the cursor before an edit command or function is issued in the text editor.

Cursor Position: the position of the cursor after any command is issued.

Device Drivers: (DD), software modules written to handle I/O for a specific kind of terminal. The modules map terminal specific commands and data to a neutral format. Device Drivers are part of the UI Virtual Terminal.

Display List: is similar to the open list, except that it contains only those forms that have been added to the screen and are currently displayed on the screen.

Display Size: the number of lines used in the edit area.

Extended Binary Coded Decimal Interchange Code: (EBCDIC), the character set used by a few computer vendors (notably IBM) instead of ASCII.

External Schema: (ES), an application's view of the CDM's conceptual schema.

Field: two-dimensional space on a terminal screen.

Field Pointer: indicates the ITEM which contains the current cursor position.

Form: structured view which may be imposed on windows or other forms. A form is composed of fields. These fields may be defined as forms, items, and windows.

Form Definition: (FD), forms definition language after compilation. It is read at runtime by the Form Processor.

Forms Definition Language: (FDL), the language in which electronic forms are defined.

Forms Driven Form Editor: (FD FE), subset of the FE which consists of a forms driven application used to create Form Definition files interactively.

Form Editor: (FE), subset of the IISS User Interface that is used to create definitions of forms. The FE consists of the

Forms Driven Form Editor and the Forms Language Compiler.

Form Hierarchy: a graphic representation of the way in which forms, items and windows are related to their parent form.

Forms Language Compiler: (FLAN), subset of the FE that consists of a batch process that accepts a series of forms definition language statements and produces form definition files as output.

Form Processor: (FP), subset of the IISS User Interface that consists of a set of callable execution time routines available to an application program for form processing

Form Processor Text Editor: (FPTE), subset of the Form Processor that consists of software modules that provide text editing capabilities to all users of applications that use the Form Processor.

Integrated Information Support System (IISS), a test computing environment used to investigate, demonstrate and test the concepts of information management and information integration in the context of Aerospace Manufacturing. The IISS addresses the problems of integration of data resident on heterogeneous data bases supported by heterogeneous computers interconnected via a Local Area Network

Item: non-decomposable area of a form in which hard-coded descriptive text may be placed and the only defined areas where user data may be input/output

Logical Device: a conceptual device which to an application is indistinguishable from a physical device and is then mapped to part or all of a physical device.

Message: descriptive text which may be returned in the standard message line on the terminal screen. They are used to warn of errors or provide other user information

Message Line: a line on the terminal screen that is used to display messages.

Network Transaction Manager: (NTM) IISS subsystem that performs the coordination, communication and housekeeping functions required to integrate the Application Processes and System Services resident on the various hosts into a cohesive system.

Open List: a list of all the forms that have been and are currently open for an application process.

Operating System: (OS), software supplied with a computer which allows it to supervise its own operations and manage access to hardware facilities such as memory and peripherals.

Page: instance of forms in windows that are created whenever a form is added to a window.

Paging and Scrolling: a method which allows a form to contain more data than can be displayed with provisions for viewing any portion of the data buffer.

Physical Device: a hardware terminal

Presentation Schema: (PS), may be equivalent to a form. It is the view presented to the user of the application.

Previous Cursor Position: the position of the cursor when the previous edit command was issued.

Qualified Name: the name of a form, item or window preceded by the hierarchy path so that it is uniquely identified.

Report Definition Language: an extension of the Forms Definition Language that includes retrieval and calculation of database information and is used to define reports.

Subform: a form that is used within another form.

User Data: data which is either input by the user or output by the application programs to items

User Interface (UI), IISS subsystem that controls the user's terminal and interfaces with the rest of the system. The UI consists of two major subsystems: the User Interface Development System (UIDS) and the User Interface Management System (UIMS).

User Interface Development System (UIDS), collection of IISS User Interface subsystems that are used by applications programmers as they develop IISS applications. The UIDS includes the Form Editor and the Application Generator.

User Interface Management System (UIMS), the runtime UI. It consists of the Form Processor, Virtual Terminal, Application Interface, the User Interface Services and the Text Editor.

User Interface Monitor (UIM), part of the Form Processor that handles messaging between the NTM and the UI. It also provides authorization checks and initiates applications.

User Interface Virtual Terminal Interface (UI/VTI), another name for the User Interface

Virtual Terminal (VT), subset of the IISS User Interface that performs the interfacing between different terminals and the UI. This is done by defining a specific set of terminal features and protocols which must be supported by the UI software which constitutes the virtual terminal definition. Specific terminals are then mapped against the virtual terminal software by specific software modules written for each type of real terminal supported.

Virtual Terminal Interface (VTI), the callable interface to the VT

Window, dynamic area of a terminal screen on which predefined forms may be placed at run time

Window Manager, a facility which allows the following to be manipulated: size and location of windows, the device on which an application is running, the position of a form within a window. It is part of the Form Processor

SECTION 2

DEVELOPMENT ACTIVITY

2.1 Statement of Pretest Activity

During system development, the computer programs were tested progressively. Functionality was incrementally tested, and as bugs were discovered by this testing, the software was corrected.

Each Form Processor callable routine was tested individually through Form Processor development. A test program, ARTEST, was developed as an easy means of testing changes to the Form Processor. This test program allows a developer to type in commands that are translated into the appropriate Form Processor calls. With this test program all Form Processor callable routines may be executed.

Testing of the User Interface Monitor (UIM) of the Form Processor began with the integration of the Form Processor and the NTM. The UIM's main task is to receive messages sent to the Form Processor. A test mini-NTM was developed also so that the Window Management processing capability of the Form Processor could be tested before integration with the NTM.

All pretesting activity was conducted by the individual program developer in a manual mode. The developer would manually enter data onto the screen and observe the results. Any errors were noted by the developer, and corrections to the Form Processor software were then made after a testing session.

2.2 Pretest Activity Results

The pretest activity was very successful in the elimination of programming bugs so that at release time only a few bugs were found in the Form Processor. The development of the test program, ARTEST, has proved very beneficial since as new functionality was added to the Form Processor, ARTEST was also updated to test this functionality. ARTEST is the major test tool for the Unit Test Plan of the Form Processor.

The mini-NTM was useful in testing the window management

UTP620144200
1 November 1985

processing; however, it postponed our integration with the real NTM since it was easier to run and test standalone. This integration was a difficult process. The only significant bug found in the window management processing through the NTM integration was incorrect use of the Source as the application name in an Application End message.

The pretesting activity was successful in eliminating programming errors and helped pinpoint difficulties in integration with the NTM.

SECTION 3

SYSTEM DESCRIPTION

3.1 System Description

The Form Processor consists of a set of callable execution time routines that allows an application program to send/receive formatted screens to/from various terminals and to perform terminal control functions independent of the terminal type. It also has a User Interface Monitor (UIM) that handles translating messages sent across the NTM into the appropriate FP calls. The UIM also handles the log on to IISS, processing the IISS Function Screen and processing the window management form.

The following block diagram illustrates the Form Processor Test Configuration used in the Unit Test Plan.

Figure 3-1 Interface Block Diagram

The required input and the resulting output of these tests are documented in detail in Section 5.3. The general testing method is the entry of commands on the ARTEST form Command Line item and the translation of this command by the ARTEST program into a call to the appropriate Form Processor routine. Each Form Processor routine as found in Section 3.2 of the Form Processor Development Specification is to be exercised. The resulting output is observed on the ARTEST form. Appendix A

outlines the ARTEST command format and the various types of commands and function keys.

The following keys are used to move within forms (using the VT100 terminal as an example): the ENTER key is used to activate all commands; the TAB key is used to move from field to field within the form; and the arrow keys are used to move within fields. In addition, ESC TAB is a reverse TAB.

3.2 Testing Schedule

The execution of the Form Processor is dependent upon the NTM subsystem of IISS when it is not configured stand-alone. Testing of the Form Processor must be done only after the NTM has been successfully tested. In this unit test, the Form Processor is dependent on the Application Interface (AI) and on the Virtual Terminal (VT).

3.3 First Location Testing

These tests of the Form Processor require the following:

Equipment: Air Force VAX, terminals supported by the Virtual Terminal as listed in the UI Terminal Operator's Guide.

Support Software: Release 2.0 of the Integrated Information Support System, the Relational Software Incorporated Oracle database management system.

Personnel: One integrator familiar with the IISS.

Training: The FP User Manual has been previously provided with the current release.

Deliverables: The User Interface Management Subsystem Release 2.0.

Test Materials: This test may be run interactively by inputting the appropriate data and observing the output as outlined in this test plan. A script file has been created to run this unit test plan and save the resulting output.

UTP620144200
1 November 1985

Security considerations: None.

3.4 Subsequent Location Testing

The requirements as listed above need to be met; however, in subsequent testing it is advantageous to create a script file of the outlined tests and run this saving the output of the test for future comparisons.

SECTION 4

SPECIFICATIONS AND EVALUATIONS

4.1 Test Specification

The Unit Test Plan is based on covering specific functionality as outlined in the Form Processor DS. The test uses the test program ARTEST. The division of the test is as follows:

- 1) Form Processor callable routines,
- 2) Form Processor paging and scrolling,
- 3) Window management callable routines,
- 4) Window management function keys,
- 5) Window Management Form processing.

The following chart has the functional requirements as outlined in Section 3.2 of the Form Processor Development Specification listed vertically and the test activities in the Unit Test Plan that demonstrate each functional requirement's testing listed horizontally. As can be seen in the figures in Section 5.3, the command line of the form used by ARTEST, has the actual Form Processor routine name specified or is annotated with what function key was pressed.

4.2 Testing Methods and Constraints

The tests as outlined in Section 5 must be followed. The required input is stated for each test. This testing uses the normal mode of operation of these functions and does not completely exercise all the error combinations that a user of the Form Processor might create by faulty entry of form field information. Much of this testing has been done, however, through the normal testing done by the developer of these functions. No data recording is required. It is suggested that on further running of this test, scripting of the test may be done and the output from running the script be saved for future testing. No additional constraints are placed on this unit test besides those listed in Section 3.3 of this unit test plan.

4.3 Test Progression

The progression of testing of the Form Processor is fully outlined in Section 5 of this unit test plan. This progression should be followed exactly to insure the successful testing of this IISS configuration item.

4.4 Test Evaluation

The test results are evaluated by comparing the information returned on the various output screens to that specified as successful for the given test. As outlined in Section 5, each test of Form Processor functionality provides an input screen with the required data entry specified and the resulting output for a successful test. To speed up this testing and provide more accurate measurement of the test's success, scripting has been used. The resulting output of these test is saved in a file FPUTP.SAV. The corresponding test script file is FPUTP.SCP. Both these files are under IISS Configuration Management. If scripting is used, these files should be copied over to the test directory. The .SAV file may be used for future comparison against subsequent running of this unit test using scripting. To compare the results use the command file DIFFILE.COM which was released as part of the acceptance testing done on the Air Force VAX and is under Configuration Management. The only differences should be the date/time stamps on the IISS function screen and the type of device on the window manager screen. The device type is given to the UIS by the NTM at run time.

SECTION 5

TEST PROCEDURES

5.1 Test Description

A general description of this unit test was provided in Section 3.

5.2 Test Control

As outlined, this unit test may be done manually or run automatically using a supplied script file. To manually perform this unit test would require the tester to be logged into the IISS system and enter SDARTESTZZ on the IISS Function Screen. In section 5.3 the required input data is specified for each function being tested and the resulting successful output is also specified. The order of the testing is also completely specified. The test control information is completely described by the sequence of the input and output screens presented in this section. The successfulness of the test may be determined by doing a comparison on the SAV files produced against the ones provided under IISS Configuration Management.

5.3 Test Procedures

To run the unit test plan as outlined in this section on a VAX, one must be logged on to an IISS account. The NTM must be up and running and the UI group logical names IISSFLIB and IISSMLIB must be set properly. IISSFLIB points to the directory containing production form definitions (FD files). IISSMLIB points to the directory containing error messages (MSG files).

This unit test uses the program ARTEST and its associated forms ffl through ff9. The fdl source file for these forms is presented in Appendix B. The executable for ARTEST should exist in the NTM environment directory and the NTM dirtbl.dat should have its SD entry pointing to this directory. The NTM tables APITBL, APTTBL, and ACTTBL should have ARTEST set up as a normal IISS application program.

Assuming the NTM is up and running, an IISS user may start up this unit test plan as follows:

UTP620144200
1 November 1985

```
$ SET DEF .to directory containing your NTM environment  
$ VT100 -RFPUTP.SCP -SFPTST.SAV
```

This starts up the VT100 device driver with a source script as input and specifies a save file for output. If the User Interface system has been installed at your site with a different device driver, then this step is amended as appropriate. The test begins executing on the terminal. The results of this test are saved in the current directory in the file FPTST.SAV. The Before and After Figures show not only the form input and output but also the sequencing of the test.

The screenshot shows a terminal window with a title bar. Inside, there's a 'Command Line' at the top left. Below it are two empty rectangular boxes. To the right of the command line is a large rectangular area containing several smaller rectangular forms, some of which are labeled 'form #1' through 'form #17'. At the bottom of the terminal, there's a 'Display:' label followed by a series of dots, and a 'Msg:' label followed by a series of dots. The overall appearance is that of a text-based graphical user interface from the early 1990s.

The diagram illustrates a computer terminal screen with the following elements:

- Top Left:** A box labeled "Command Line" containing the text "addrn w3 ff1".
- Top Center:** A large box containing the handwritten text "(Press PF12 UNSELECT WINDOW)".
- Top Right:** A box labeled "Command Line" containing the text "form ff1".
- Middle Left:** A box labeled "Command Line" containing the text "chg.d. 6".
- Middle Right:** A box labeled "form ff2" containing a table with two columns, A and E, and three rows of data: "1", "E 5", and "1 2".
- Bottom Left:** A box labeled "form ff4" containing a table with two columns, A and E, and three rows of data: "1", "E 5", and "1 2".
- Bottom Center:** A box labeled "Display:" followed by a series of dots.
- Bottom Right:** A box labeled "Msg:" followed by a box containing the number "0".

The diagram shows a graphical user interface with several windows and command lines. At the top left, a window labeled "Command Line" contains the text "addrw w3 ffl". To its right is a window labeled "form ffl". Below the top-left window is another window, and below that is a window labeled "form ffl2" containing a small diagram. In the center, a window labeled "Command Line" contains the text "chglav e". To its right is a window labeled "Command L" containing a small diagram. Below the center window is a window labeled "form ffl4" containing a small diagram. To the right of the center window is a window labeled "form ffl4" containing a small diagram. At the bottom left, there are two windows labeled "form ffl4" containing small diagrams. At the bottom center, there is a window labeled "Display:" containing three lines of dotted text. At the bottom left, there is a window labeled "Msg:" containing the text "Window is unselected". At the bottom right, there is a window labeled "window mu".

APPENDIX A

Commands for ARTEST

Commands are of the form:

command arg1 arg2 ... argn

Where command is the form processor procedure implementing the command and arg1, etc. are the input arguments. Arguments are separated by blank(s) and arguments which contain blanks are enclosed in double quotes.

Window/Form Manipulation

add form to a window	addfrm window_path form_name
delete pages from window	rmvpag window_path page_number
replace page in window	rplfrm window_path page_number form_name
close form	clsfrm form_name

Window/Form Information

get name of form on page n	gpage window_path page_number
get number of pages in window	gwindo window_path

Attributes

change attributes	putatt path dur attribute
get attributes	getatt path dur
put and get temp attributes	tmpatt path dur attribute
change background attributes	putbak path dur attribute
get background attributes	getbak path dur
put and get background	tmpbak path dur attribute

dur is 0) permanent
1) temporary

attributes are:
INPUT, OUTPUT, TEXT, HIDDEN, ERROR

background attributes are:
WHITE, BLACK, XPARNT

Data Manipulation

put data to form item array pdata path data
get data from form item array gdata instance path
instance is 0=previous, 1=current

Miscellaneous

put cursor to field putcur path
window set(term within term) oiscr window_path
parse fully qualified name parfqn level
 with level: 1=first, 2=second, ...
 0=last, -1=next to last, ...
 Must use pfl6(0) first!!!

Function Keys

pf0(enter) - do command on command line
pfl6(0) - display path name of cursor position
pfl1 - go to next form processor mode
pfl2 - help
pfl3 - display message screen
pfl4 - quit

for scrolling, press pfl until the mode is scrll/page,
then:

pfl5(7) - horizontal scroll forward
pfl6(8) - horizontal scroll backward
pfl7(9) - vertical scroll forward
pfl8(-) - vertical scroll backward
pfl9(4) - horizontal page forward
pfl10(5) - horizontal page backward
pfl11(6) - vertical page forward
pfl12(0) - vertical page backward
