ABSTRACT

During January and February 1974 scientists aboard the R/V Thomas G. Thompson studied the thermohaline and density structures in the subtropical frontal zone of the central North Pacific. Additional hydrographic sections were made from the mouth of the Columbia River to the working area and from the working area to the Hawaiian Islands. Of the 261 CTD stations planned, 257 were completed and 4 were lost due to weather.

INTRODUCTION

a. Objectives

The primary objectives of the field study in the central North Pacific were:

1) to investigate the three dimensional thermohaline and density structure in the subtropical frontal zone by means of high resolution sections.

2) to determine the mesoscale baroclinic flow field in the subtropical frontal zone.

3) to study the mesoscale dynamic height perturbations and the mesoscale thermohaline structure along 1400 km long sections north and east of Hawaii.

4) to assess the mesoscale thermohaline and baroclinic flow variability in the vicinity of the Hawaiian ridge.

b. Cruise track

The overall cruise track and station positions are shown in Figs. 1 and 2. Station 1 was a test station off the Washington coast to check out the equipment. Stations 3-10 were off the mouth of the Columbia River. Stations 11-38 were on the way to the working area. Stations 39-67 and 100-217 were in the subtropical frontal zone and were taken at 15' latitude intervals (27 km). A detour was made from station 67 to Honolulu to put a sick seaman ashore. Stations 75-99 and 218-248 were in the tradewind region south of the subtropical frontal zone and were taken at 27 km intervals. Stations 70-79 and 249-261 were used to study the influence of the Hawaiian Ridge on the structure, the spacing varied between 5.6 km and 27 km.

c. Scope of the data report

This data report is based on the original measured variables. In order to make the data compatible with current oceanographic practices, the new international equation of state for sea water (EOS 80) was used in computing density and other derived variables. The report consists of three parts: (1) a listing of station positions, depths, and meteorological observations; (2) a tabulation of observed and derived thermohaline parameters at 15 db intervals and (3) plots of potential temperature, salinity, and potential density against pressure as well as plots of potential temperature against salinity. In the plots, all data points have been used.

PARTICIPANTS 1974

Ship's Captain

Clanton Clampitt	UW

Chief Scientist

Gunnar I. Roden	UW

Technical Personnel

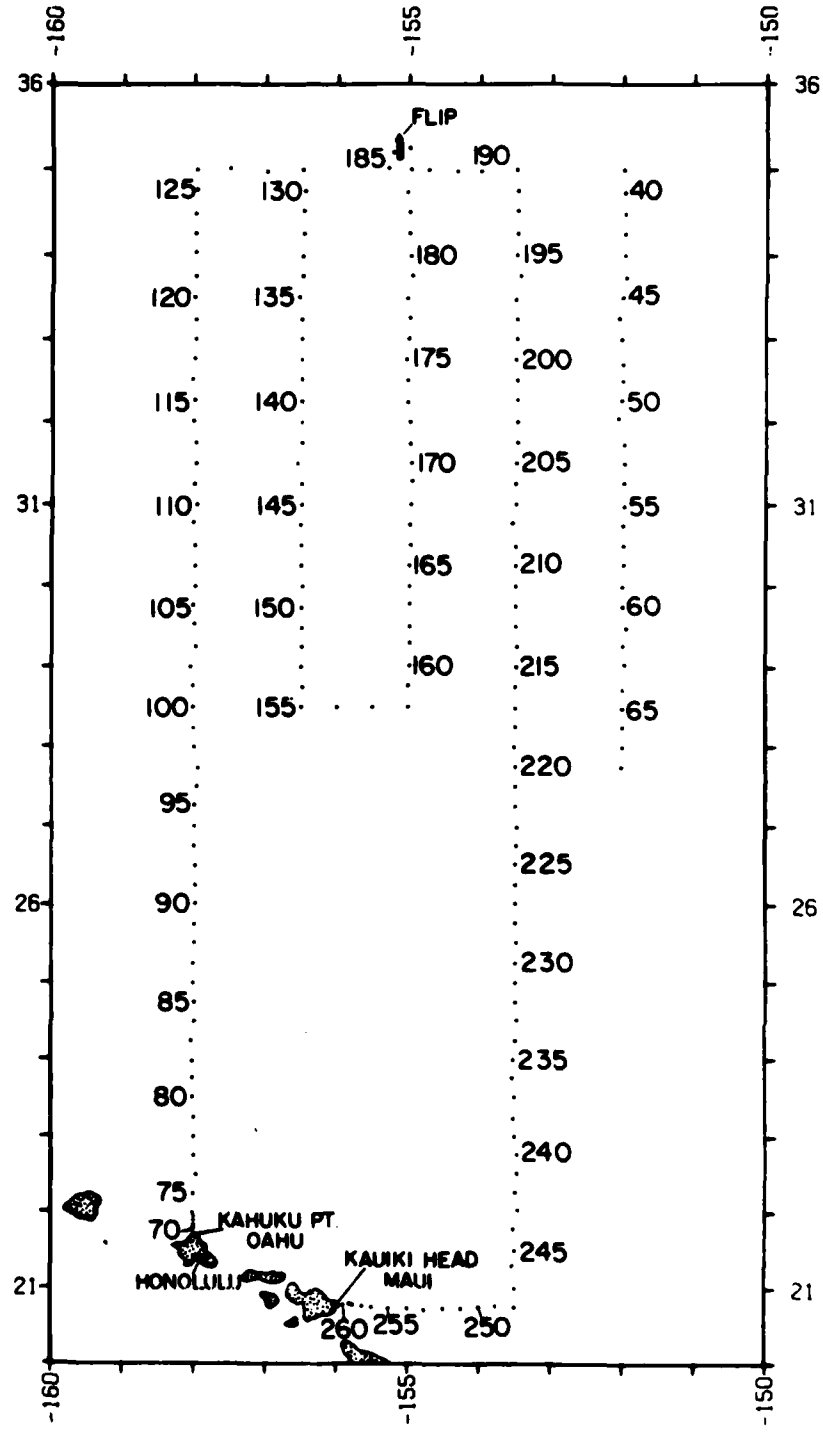

Edwin Baker	UW
Eugene Cade	UW
Flinn Curren	UW
David Hostetler	UW
Morris Johnson	UW
Randall McGeevy	UW
Philip Milholland	UW
Betty Ann Morse	UW
Joseph Stewart	UW

ACKNOWLEDGMENTS

Captain Clampitt and his officers and men are to be commended for outstanding performance under sometimes difficult weather conditions. The high professional competence of the seagoing personnel made this report possible.

This report was funded by the Office of Naval Research Contract N00014-75-C-0502. The original data tapes were rerun to comply with the new equation of state for sea water (EOS-80) under contract N00014-84-C-0111.

It is hoped that this data report will be useful in planning the World Ocean Circulation Experiment (WOCE).

R/V THOMAS G. THOMPSON, 7 JAN-10 FEB 1974

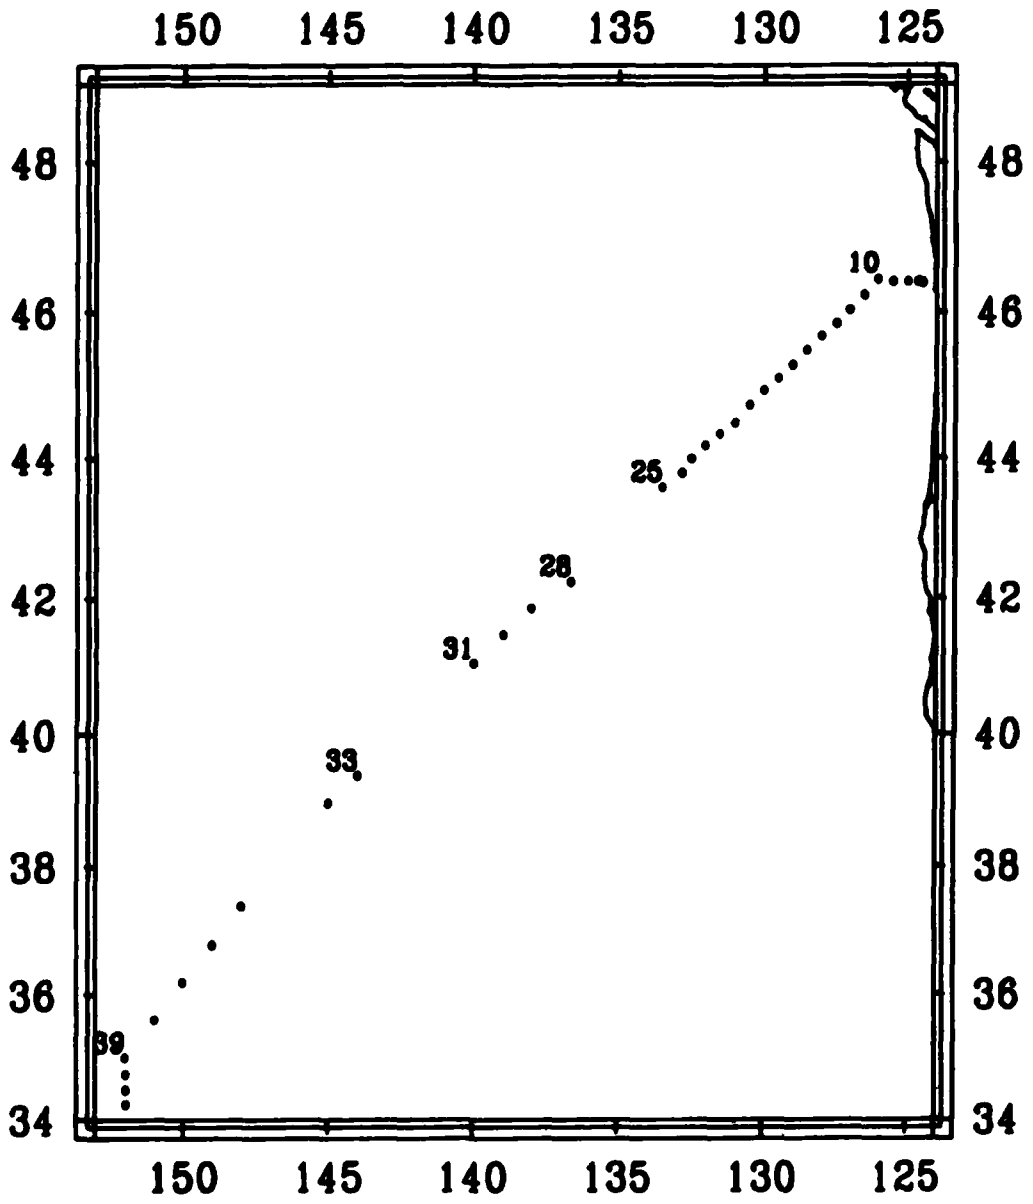

Figure 2

DATA ACQUISITION

The CTD casts were conducted using the University of Washington Plessey CTD, Model 9040. The CTD with a Rosette sampler attached was lowered from the surface to 1500 db. The in-situ CTD conductivity, temperature and pressure data were transmitted to the shipboard data acquisition system via coaxial cable and converted to salinity, temperature, and depth. The raw data were first error screened by a gradient filter to eliminate obviously bad data points and then initially digitized to yield interpolated data at 3 m Bissett-Berman depth increments. Because the Bissett-Berman depths are not true depths (due to an assumed constant pressure-depth relationship by the manufacturer), the latter were reconverted to pressure and redigitized at 3 db intervals. The CTD derived salinities were checked against Rosette bottle salinities determined by a shipboard salinometer and corrections were applied where the CTD and bottle salinities differed by more than 0.005 per mille (only a few cases). The edited and corrected data were plotted against pressure and inspected. It was found that on some stations the salinity plots contained low amplitude (less than $\pm$ 0.015 per mille) chatter of small vertical extent (less than 6 db). In order to eliminate this noise and reduce hydrostatic instabilities in the density profiles as much as possible, both the original temperature and salinity records were smoothed by a 21 point binomial filter. This filter has the property that it effectively eliminates perturbations less than 12 db thick. The filter was applied to all data points, except the margins, where the first and last ten data points were left unsmoothed. The data so worked up formed the basis of all subsequent calculations.

DATA PROCESSING

The calibrated T, S, and P data were used to calculate density using the international equation of state for sea water (EOS-80), as given in Gill (1982). Potential temperature was calculated from Bryden's polynomial (Bryden, 1973). Sound speed was computed from Wilson's equation (Tolstoy and Clay, 1966). The Väisälä frequency squared was computed from the vertical density gradient and the compressibilty term as given by Eckart (1960), with the gravity based on the international reference ellipsoid of 1980. A centered differences was used to calculate the vertical density gradient. A quadratic equation was used to calculate depth. The equation involved the integral of specific volume with respect to pressure and a gravity dependent upon latitude and pressure. The CTD data listings and units are as follows:

1. PRESSURE — pressure in decibars
2. DEPTH — depth in meters
3. TEMP — temperature in degrees C
4. TPOT — potential temperature in degrees C
5. SALINITY — salinity in parts per mille
6. POTDEN — potential density referenced to the sea surface; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
7. SIGMA-Z — density in situ; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
8. SIGMA-T — density referenced to the sea surface; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
9. SP-VOL.AN — specific volume anomaly in units of m**3/kg defined as the difference between specific volume at (S,T,P) and specific volume at (35,0,P)
10. DYN.HT — dynamic height in units of J/kg = m**2/sec**2 defined as the integral of specific volume anomaly with respect to pressure
11. TF — transport function in units of m**3/sec**2 defined as the integral of dynamic height with respect to depth
12. SV — sound velocity in units of m/sec
13. N**2 — Väisälä frequency squared in units of 1/sec**2 values have been multiplied by 10**6 to conserve space in the tabulations

STATION POSITIONS, DEPTHS, AND METEOROLOGICAL LOG

A listing of the station positions, depths, and meteorological observations are given in the table below:

1. dates are in Greenwich Mean Time.

2. depths are as obtained from the PDR depth recorder using a constant sound velocity and are given in meters.

3. atmospheric pressure was read from the ship barometer on the bridge of the R/V Thomas G. Thompson 10 m off the sea surface and is given in millibars and tenths.

4. wind speed and direction were obtained from a readout in the computer lab of the R/V Thomas G. Thompson and are given in knots and degrees true.

5. dry and wet bulb temperatures were read from thermometers mounted in a box on the ship's pilot house and are given in degrees Celsius.
