ABSTRACT

During September and October 1972, scientists aboard the R/V Thomas G. Thompson studied the thermohaline and density structures in the tradewind region east of the Hawaiian Islands. An additional hydrographic section was made from the working area to San Diego, California. A total of 300 stations were taken.

INTRODUCTION

a. Objectives

The primary objectives of the field study in the tradewind region east of Hawaii were:

1) to investigate the mesoscale thermohaline and density structures in 2700 km long high resolution sections across the tradewind region.

2) to determine the subtropical and doldrum fronts occuring at the boundaries of this region.

3) to study the mesoscale dynamic height and baroclinic flow perturbations in the tradewind region.

4) to assess the mesoscale and baroclinic flow structures across the California current between the subtropical gyre and the coast.

b. Cruise track

The overall cruise track is shown in Figure 1. The station spacing was at intervals of 20 n.m. (37 km) along most of the cruise, except at the zonal northern sections, where it was at 31 km intervals west of longitude 120 W and at 27 km intervals to the east of it. Station 1 was a test station south of Oahu to check the equipment. Stations 2-10 were west of Kauiki Point, Maui. Stations 11-48 crossed the subtropical front. Stations 78-150 and 180-250 crossed both the subtropical and doldrum fronts. Stations 49-77 were located mostly north of the subtropical front, stations 150-180 crossed a meandering doldrum front. Stations 251-300 crossed the California current region.

c. Scope of the data report

This data report is based on the original measured variables. In order to make the data compatible with current oceanographic practices, the new international equation of state for sea water (EOS 80) was used in computing density and other derived variables. The report consists of three parts: (1) a listing of station positions, depths, and meteorological observations; (2) a tabulation of observed and derived thermohaline parameters at 15 db intervals and (3) plots of potential temperature, salinity, and potential density against pressure as well as plots of potential temperature against salinity. In the plots, all data points have been used.

ACKNOWLEGMENTS

Captain Clampitt and his officers and men are to be commended for outstanding performance. The high professional competence of the seagoing personnel made this report possible.

This report was funded by the Office of Naval Research Contract N00014-67A-0103. The original tapes were rerun to comply with the new equation of state for sea water (EOS-80) under contract N00014-84C-0111.

It is hoped that this data report will be useful in planning the World Ocean Circulation Experiment (WOCE).

DATA ACQUISITION

The STD casts were conducted using the University of Washington Bissett-Berman STD, model 9006. The STD with a Nansen bottle attached was lowered from the surface to 1500 m. The in-situ STD salinity, temperature, and depth measurements were transmitted via coaxial cable to the shipboard data acquisition system and were digitized and punched on paper tape. The paper tape was then processed on the shipboard IBM 1130 computer. The raw data were first error screened by a gradient filter to eliminate obviously bad data points, and then interpolated to give values at 3 m Bissett-Berman depth increments. Because the Bissett-Berman depths are not true depths (because of an assumed constant pressure-depth relationship by the manufacturer), the latter were reconverted to pressure. The output from the STD salinity sensor was checked against Nansen bottle salinities determined by a shipboard salinometer. Corrections were applied to the STD salinities where the difference between the STD and bottle salinities exceeded 0.01 per mille. The edited and corrected data were plotted against pressure and inspected. It was found that some salinity plots contained low amplitude (less than $\pm$0.015 per mille) noise of small vertical extent (less than 6 db). In order to eliminate the noise and reduce hydrostatic instabilities in the density profile as much as possible, both the original temperature and salinity records were smoothed by a 21-point binomial filter. This filter was applied to all data points, except the margins, where the first and last ten data points were left unsmoothed. The filter has the property that it effectively eliminates perturbations less than 12 db thick. The data so worked up formed the basis of all subsequent calculations.

DATA PROCESSING

The calibrated T, S, and P data were used to calculate density using the international equation of state for sea water (EOS-80), as given in Gill (1982). Potential temperature was calculated from Bryden's polynomial (Bryden, 1973). Sound speed was computed from Wilson's equation (Tolstoy and Clay, 1966). The Väisälä frequency squared was computed from the vertical density gradient and the compressibilty term as given by Eckart (1960), with the gravity based on the international reference ellipsoid of 1980. A centered differences was used to calculate the vertical density gradient. A quadratic equation was used to calculate depth. The equation involved the integral of specific volume with respect to pressure and a gravity dependent upon latitude and pressure. The STD data listings and units are as follows:

1. PRESSURE — pressure in decibars
2. DEPTH — depth in meters
3. TEMP — temperature in degrees C
4. TPOT — potential temperature in degrees C
5. SALINITY — salinity in parts per mille
6. POTDEN — potential density referenced to the sea surface; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
7. SIGMA-Z — density in-situ; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
8. SIGMA-T — density referenced to the sea surface; a value of 1000 kg/m**3 has been subtracted from the density to conserve space
9. SP-VOL.AN — specific volume anomaly in units of m**3/kg defined as the difference between specific volume at (S,T,P) and specific volume at (35,0,P)
10. DYN.HT — dynamic height in units of J/kg = m**2/sec**2 defined as the integral of specific volume anomaly with respect to pressure
11. TF — transport function in units of m**3/sec**2 defined as the integral of dynamic height with respect to depth
12. SV — sound velocity in units of m/sec
13. N**2 — Väisälä frequency squared in units of 1/sec**2 values have been multiplied by 10**6 to conserve space in the tabulations

STATION POSITIONS, DEPTHS, AND METEOROLOGICAL LOG

A listing of the station positions, depths, and meteorological observations are given in the table below:

1. dates are in Greenwich Mean Time.

2. depths are as obtained from the PDR depth recorder using a constant sound velocity and are given in meters.

3. atmospheric pressure was read from the ship barometer on the bridge of the R/V Thomas G. Thompson 10 m off the sea surface and is given in millibars and tenths.

4. wind speed and direction were obtained from a readout in the computer lab of the R/V Thomas G. Thompson and are given in knots and degrees true.

5. dry and wet bulb temperatures were read from thermometers mounted in a box on the ship's pilot house and are given in degrees Celsius.
