19. ABSTRACT (Continue on reverse if necessary and identify by block number)

In order to provide an understanding of covariance analyses for split plot designs, analyses are first conducted on a data set without the covariate. Then an analysis with the covariate is performed. The third example has a different experiment design for the whole plots and the covariate is constant for all split plots within a whole plot. Computer packages may only give portions of the analysis correctly. Some packages require two procedural calls to obtain a portion of the correct results. GENSTAT requires only one procedural call.

ANNOTATED COMPUTER OUPUT FOR SPLIT PLOT DESIGN: GENSTAT ANOVA

by

W.T. Federer, Z.D. Feng, and N.J. Miles-McDermott

Mathematical Sciences Institute, Cornell University, Ithaca, NY

ABSTRACT

In order to provide an understanding of covariance analyses for split plot designs, analyses are first conducted on a data set without the covariate. Then an analysis with the covariate is performed. The third example has a different experiment design for the whole plots and the covariate is constant for all split plots within a whole plot. Computer packages may only give portions of the analysis correctly. Some packages require two procedural calls to obtain a portion of the correct results. GENSTAT requires only one procedural call.

INTRODUCTION

This is part of a continuing project that produces annotated computer output for the analysis of balanced split plot experiments with covariates. The complete project will involve processing three examples on SAS/GLM, BMDP/2V, SPSS-X/MANOVA, GENSTAT/ANOVA, and SYSTAT/MGLH. Only univariate results are considered. We show here the results from GENSTAT ANOVA.

For Example 1, the data are artificial and were constructed for ease of computation; the experiment design for the whole plots is a randomized complete block and the split plot treatments are randomly allocated to the split plot experimental units within each whole plot. Example 2 is the same as Example 1 except that a covariate varies from split plot to split plot. The data for Example 3 come from an experiment wherein the whole plot treatments were laid out in a completely randomized design and the split plot treatments were randomly allotted to the split plot experimental units within <u>each</u> whole plot. The value of the covariate varies from whole plot to whole plot but is constant for all split plots within a whole plot treatment.

We present the elementary computational steps. Simple hypothetical data are used for the first two examples so that it is easy to provide all detailed computations to illustrate how each number is obtained. Some readers may wish to skip the detailed computations. The third example comes from Winer (1971). The detailed computations are given in his book (p. 803).

Data SP-1

Split plot data with whole plots arranged in
randomized complete block design

Grand Mean		7						

$$\text{Model:} \quad Y_{ijk} = \mu + \rho_j + \tau_i + \delta_{ij} + \alpha_k + (\alpha\tau)_{ik} + \epsilon_{ijk}$$

μ = mean

ρ_j = effect of block j

δ_{ij} = error (a)

ϵ_{ijk} = error (b)

τ_i = effect of whole plot i

α_k = effect of split plot k

$(\alpha\tau)_{ik}$ = effect of interaction of whole plot i and split plot k

Analysis of Variance

Source	(*)	df	SS
B (Blocks)	$= R(\rho \mid \mu,\tau,\alpha,\alpha\tau)$	2	48
W (whole plot treatments)	$= R(\tau \mid \mu,\rho,\alpha,\alpha\tau)$	1	24
B×W (error (a))	$= R(\delta \mid \mu,\rho,\tau,\alpha,\alpha\tau)$	2	16
S (split plot treatments)	$= R(\alpha \mid \mu,\rho,\tau,\alpha\tau)$	3	156
S×W (interaction of S and W)	$= R(\alpha\tau \mid \mu,\alpha,\tau,\rho)$	3	84
(**) S×B:W (error (b))	$= R(\epsilon \mid \mu,\alpha,\tau,\alpha\tau,\rho)$	12	112
Total (Corrected for mean)	$= R(\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon \mid \mu)$	23	440
Mean	$= R(\mu)$	1	1176
Total (Uncorrected for mean)	$= R(\mu,\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon)$	24	1616

(*)Notation follows that of Searle(1971); since the design is balanced, $R(\rho \mid \mu,\tau,\alpha,\alpha\tau) = R(\rho \mid \mu)$, etc. The simpler notation is used later.
(**) S×B:W means S×B within W.

Calculations of sums of squares:

$N = 2 \cdot 3 \cdot 4 = 24 \quad , \quad \bar{Y} = 7$

$$R(\mu,\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon) = \sum_{i=1}^{2} \sum_{j=1}^{3} \sum_{k=1}^{4} Y_{ijk}^2 = (3^2 + 6^2 + 6^2 + \cdots + 18^2 + 13^2) = 1616$$

$$R(\mu) = N\bar{Y}^2 = 24 \cdot (7)^2 = 1176$$

$$R(\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon \mid \mu) = 1616 - 1176 = 440$$

$$R(\rho|\mu) = R(\mu,\rho) - R(\mu) = \frac{(40^2+64^2+64^2)}{8} - 1176 = 1224 - 1176 = 48$$

$$R(\tau|\mu) = R(\mu,\tau) - R(\mu) = \frac{(72^2+96^2)}{12} - 1176 = 1200 - 1176 = 24$$

$$R(\delta|\mu,\rho,\tau) = R(\delta,\mu,\rho,\tau) - R(\mu,\rho) - R(\tau,\mu) + R(\mu)$$

$$= \frac{(20^2+28^2+24^2+20^2+36^2+40^2)}{4} - 1224 - 1200 + 1176$$

$$= 1264 - 1224 - 1200 + 1176 = 16$$

$$R(\alpha|\mu) = R(\alpha,\mu) - R(\mu) = \frac{(36^2+42^2+24^2+66^2)}{6} - 1176 = 1332 - 1176 = 156$$

$$R(\alpha\tau|\mu,\alpha,\tau) = R(\alpha\tau,\mu,\alpha,\tau) - R(\mu,\alpha) - R(\mu,\tau) + R(\mu)$$

$$= \frac{(15^2+24^2+12^2+21^2+21^2+18^2+12^2+45^2)}{3} - 1332 - 1200 + 1176$$

$$= 1440 - 1332 - 1200 + 1176 = 84$$

$$R(\epsilon|\mu,\rho,\delta,\alpha,\tau,\alpha\tau) = R(\epsilon,\mu,\alpha,\rho,\delta,\tau,\alpha\tau) - R(\mu,\rho,\tau,\delta) - R(\mu,\alpha,\tau,\alpha\tau) + R(\tau,\mu)$$

$$= 1616 - 1264 - 1440 + 1200 = 112$$

Data SP-2

Data SP-2: Data SP-1 with the following covariate Z which varies with split plot

Covariate (Z)

Mean	1	1176	420	150
Total	24	1616	537	216

YY column is the same as in SP-1, ZZ column is computed in the same fashion. Thus, only computations for YZ column are illustrated.

$$\text{Total}_{YZ} = \sum_{i=1}^{2}\sum_{j=1}^{3}\sum_{k=1}^{4} Y_{ijk}\cdot Z_{ijk}$$
$$= 3(1)+ 6(2)+\cdots+ 14(4)+ 18(4)+ 13(7) = 537$$

$$\text{Mean}_{YZ} = N\bar{Y}_{...}\bar{Z}_{...} = \frac{168\cdot 60}{24} = 420$$

$$B_{YZ} = \frac{\sum_{j=1}^{3}\left(\sum_{i=1}^{2}\sum_{k=1}^{4} Y_{ijk}\right)\left(\sum_{i=1}^{2}\sum_{k=1}^{4} Z_{ijk}\right)}{2\cdot 4} -420 = \frac{40(14)+64(20)+64(26)}{8} - 420$$
$$= 438 - 420 = 18$$

$$W_{YZ} = \frac{\sum_{i=1}^{2}\left(\sum_{j=1}^{3}\sum_{k=1}^{4} Y_{ijk}\right)\left(\sum_{j=1}^{3}\sum_{k=1}^{4} Z_{ijk}\right)}{3(4)} - 420 = 432 - 420 = 12$$

$$B\times W_{YZ} = \frac{\sum_{i=1}^{2}\sum_{j=1}^{3}(\sum_{k=1}^{4} Y_{ijk})(\sum_{k=1}^{4} Z_{ijk})}{4} - 438 - 432 + 420$$

$$= 454 - 438 - 432 + 420 = 4$$

$$S_{YZ}: \sum_{k=1}^{4} \frac{(\sum_{i=1}^{2}\sum_{j=1}^{3} Y_{ijk})(\sum_{i=1}^{2}\sum_{j=1}^{3} Z_{ijk})}{2(3)} - 420 = 453 - 420 = 33$$

$$S\times W_{YZ}: \frac{\sum_{i=1}^{2}\sum_{k=1}^{4}(\sum_{j=1}^{3} Y_{ijk})(\sum_{j=1}^{3} Z_{ijk})}{3} - 453 - 432 + 420$$

$$= 498 - 453 - 432 + 420 = 33$$

$S\times B{:}W_{YZ}$:

$$\sum_{i=1}^{2}\sum_{j=1}^{3}\sum_{k=1}^{4} Y_{ijk}Z_{ijk} - 454 - 498 + 432$$

$$= 537 - 454 - 498 + 432 = 17$$

Analysis of Variance and Covariance

Source		df	SS
B (block)	$= R(\rho \mid \mu,\tau)$	2	48
W (whole plot treatment)	$= R(\tau \mid \mu,\rho,\beta_1)$	1	3.4286
Regression (a)	$= R(\beta_1 \mid \mu,\rho,\tau)$	1	16.0
B×W (error (a))	$= R(\delta \mid \mu,\rho,\tau,\beta_1)$	1	0.0
S (split plot treatment)	$= R(\alpha \mid \mu,\rho,\tau,\alpha\tau,\beta_2)$	3	84.243
S×W (interaction of S and W)	$= R(\alpha\tau \mid \mu,\rho,\tau,\alpha,\beta_2)$	3	37.474
Regression (b)	$= R(\beta_2 \mid \mu,\rho,\tau,\alpha,\alpha\tau)$	1	14.450
S×B: W (error (b))	$= R(\epsilon \mid \mu,\rho,\alpha,\tau,\alpha\tau,\beta_2)$	11	97.550

$$\hat{\beta}_1 = B\times W_{YZ} \;/\; B\times W_{ZZ} = 4/1 = 4$$

$$\hat{\beta}_2 = S\times B{:}W_{YZ} \;/\; S\times B{:}W_{ZZ} = 17/20 = 0.85$$

The SS's adjusted by regression on Z are illustrated below:

$R(\rho|\mu) = 48$, remains same since it is not of interest to adjust for Z on the blocks.

$$R(\tau,\delta|\mu,\rho,\beta_1) = (W_{YY} + B\times W_{YY}) - \frac{(W_{YZ} + B\times W_{YZ})^2}{W_{ZZ} + B\times W_{ZZ}}$$

$$= (24 + 16) - \frac{(12 + 4)^2}{6 + 1} = 40 - \frac{256}{7} = 3.4286$$

$$R(\delta|\mu,\rho,\tau,\beta_1) = B\times W_{YY} - \frac{(B\times W_{YZ})^2}{B\times W_{ZZ}} = 16 - \frac{4^2}{1} = 0$$

$$R(\tau|\mu,\rho,\beta_1) = R(\tau,\delta|\mu,\rho,\beta_1) - R(\delta|\mu,\rho,\tau,\beta_1)$$

$$= 40 - \frac{256}{7} - 0 = 3.4286$$

$$R(\beta_1|\mu,\tau,\rho) = \frac{(B\times W_{YZ})^2}{B\times W_{ZZ}} = \frac{4^2}{1} = 16$$

$$R(\alpha,\epsilon|\mu,\rho,\tau,\alpha\tau,\beta_2) = (S_{YY} + S\times B:W_{YY}) - \frac{(S_{YZ} + S\times B:W_{YZ})^2}{S_{ZZ} + S\times B:W_{ZZ}}$$

$$= (156 + 112) - \frac{(33+17)^2}{9+20}$$

$$= 268 - 86.207 = 181.793$$

$$R(\alpha\tau,\epsilon|\mu,\rho,\alpha,\tau,\beta_2) = (S\times W_{YY} + S\times B:W_{YY}) - \frac{(S\times W_{YZ} + S\times B:W_{YZ})^2}{S\times W_{ZZ} + S\times B:W_{ZZ}}$$

$$= 84 + 112 - \frac{(33+17)^2}{21+20} = 196 - 60.976 = 135.024$$

Note: $R(\alpha,\epsilon|\mu,\beta_2)$ and $R(\alpha\tau,\epsilon|\mu,\alpha,\tau,\beta_2)$ are intermediate steps for later use.

$$R(\beta_2|\mu,\rho,\alpha,\tau,\alpha\tau) = \frac{(S\times B:W_{YZ})^2}{S\times B:W_{ZZ}} = \frac{17^2}{20} = 14.450$$

$$R(\epsilon|\mu,\rho,\alpha,\tau,\alpha\tau,\beta_2) = S\times B:W_{YY} - \frac{(S\times B:W_{YZ})^2}{S\times B:W_{ZZ}} = 112 - \frac{17^2}{20} = 112 - 14.45 = 97.55$$

$$R(\alpha|\mu,\rho,\tau,\alpha\tau,\beta_2) = R(\alpha,\epsilon|\mu,\rho,\tau,\alpha\tau,\beta_2) - \text{SS error b} = 181.793 - 97.55 = 84.243$$

$$R(\alpha\tau|\mu,\rho,\alpha,\tau,\beta_2) = R(\alpha\tau,\epsilon|\mu,\rho,\alpha,\tau,\beta_2) - R(\epsilon|\mu,\rho,\alpha,\tau,\alpha\tau,\beta_2)$$

$$= 135.024 - 97.55 = 37.474$$

Data SP-3

Split plot data with plots arranged in a completely randomized design and a covariate Z that is constant within the whole plot. (Winer, 1971, p. 803)

(*) Block is just a nuisance factor; hence only $R(\rho|\mu,\tau) = 48$ is used in Analysis of variance

NOTE: low value of COV EF (usually close to unity) indicates high correlation between treatment and covariate e.g. COV EF for plots is .143; indicating correlation between $\bar{W}_i$ and $\bar{Z}_i$ ($\bar{W}_1 = 6$, $\bar{W}_2 = 8$, $\bar{Z}_1 = 2$, $\bar{Z}_2 = 3$)

***** COVARIANCE REGRESSIONS *****
