^{*}This material is based on work supported in part by the Office of Naval Research under contract N00014-86-K-0092 and the National Science Foundation under Grant No. CCR-8701103. Any opinions, findings, and conclusions or recommendations expressed in this publication are those of the author and do not reflect the views of the Office of Naval Research or National Science Foundation.

1. Introduction

Two classes of properties are of particular interest when considering programs: safety properties and liveness properties. Informally, a *safety property* stipulates that "bad things" do not happen during execution of a program and a *liveness property* stipulates that "good things" do happen (eventually) [2]. Distinguishing between safety and liveness properties is useful because knowing whether a property is safety or liveness helps when deciding how to prove that the property holds for a program.

In [1], formal definitions of safety and liveness are given and it is proved that every property can be expressed as the conjunction of a safety property and a liveness property. The formal definitions of safety and liveness are given in terms of first-order predicate logic, but the proof that every property can be decomposed into safety and liveness is not—it uses topology. The purpose of this paper is to give a proof of this theorem using only first-order predicate logic.

2. Specifying Properties

A *program state* is a mapping from variables to values. An execution of a concurrent program can be viewed as an infinite sequence of program states

$$\sigma = s_0 s_1 \dots,$$

which we call a *history*. In a history, s_0 is an initial state of the program and each subsequent state results from executing a single atomic action in the preceding state. (For a terminating execution, an infinite sequence is obtained by repeating the final state.) A *property* is a set of such sequences.

One way to specify a property is by using first-order predicate logic. For a state s , define $s.v$ to be the value of variable v in that state. A formula of first-order predicate logic where s is the only free variable defines a set of states. For example,

$$(\forall i: 1 \leq i < N: s.a[i] \leq s.a[i+1])$$

specifies the set of states in which the elements of array $a[1:N]$ are sorted. Usually " s ." is implicit and therefore left out of such a formula, resulting in the more familiar use of first-order predicate logic as an assertion language.

A set of sequences of states—a property—can also be defined using first-order predicate logic. To facilitate such specifications, for any sequence $\sigma = s_0 s_1 \dots$ define for $0 \leq i$:

$$\sigma[i] \equiv s_i.$$

$$\sigma[..i] \equiv s_0 s_1 \dots s_{i-1}. \text{ The empty sequence if } i=0.$$

$$|\sigma| \equiv \text{the length of } \sigma \text{ (}\omega \text{ if } \sigma \text{ is infinite).}$$

A formula of first-order predicate logic in which σ is the only free variable defines the set of sequences that satisfy the formula and therefore specifies a property. For example,

$$(\forall i: 0 \leq i: \sigma[i].v = 0)$$

specifies the property in which the value of v remains 0 throughout execution.

We write $\alpha \models P$ if $\alpha \in S^\omega$ is in the property specified by P . Thus,

$$\begin{aligned}\alpha \models P &= P_\alpha^\sigma. \\ \alpha \not\models P &= \neg P_\alpha^\sigma.\end{aligned}$$

3. Safety and Liveness

According to [1], a property P is a safety property provided

$$\text{Safety: } (\forall \sigma: \sigma \in S^\omega: \sigma \not\models P \Rightarrow (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P))), \quad (3.1)$$

where S is the set of program states, S^* the set of finite sequences of states, S^ω the set of infinite sequences of states, and juxtaposition is used to denote catenation of sequences. A property P is a liveness property provided

$$\text{Liveness: } (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha\beta \models P)). \quad (3.2)$$

Given a property P , we are interested in defining properties $\text{Safe}(P)$ and $\text{Live}(P)$ such that

- $\text{Safe}(P)$ is a safety property,
- $\text{Live}(P)$ is a liveness property, and
- $P = \text{Safe}(P) \wedge \text{Live}(P)$.

Observe that if

$$\begin{aligned}\text{Safe}(P) &= P \vee M_P \\ \text{Live}(P) &= P \vee \neg M_P\end{aligned}$$

then

$$\begin{aligned}\text{Safe}(P) \wedge \text{Live}(P) &= (P \vee M_P) \wedge (P \vee \neg M_P) \\ &= (P \wedge P) \vee (P \wedge \neg M_P) \vee (M_P \wedge P) \vee (M_P \wedge \neg M_P) \\ &= P\end{aligned}$$

Hence, we have only to look for an M_P that makes $P \vee M_P$ (i.e. $\text{Safe}(P)$) a safety property and $P \vee \neg M_P$ (i.e. $\text{Live}(P)$) a liveness property.

It turns out that using

$$M_P: (\forall i: 0 \leq i: (\exists \beta: \beta \in S^\omega: \sigma[..i]\beta \models P))$$

suffices. First, we show formally that $\text{Safe}(P)$ satisfies definition (3.1) of safety. The proof that follows is a sequence of first-order predicate logic formulas with explanations interspersed (and delimited by « and ») of how each formula is derived from its predecessor.

Choose any $\sigma \in S^\omega$:

$$\sigma \not\models \text{Safe}(P)$$

$$\begin{aligned}
& \text{«by definition of Safe}(P)\text{»} \\
= & \sigma \# (P \vee (\forall i: 0 \leq i: (\exists \beta: \beta \in S^\omega: \sigma[..i]\beta \models P))) \\
& \text{«by definition of } \# \text{»} \\
= & \neg(P \vee (\forall i: 0 \leq i: (\exists \beta: \beta \in S^\omega: \sigma[..i]\beta \models P)))^G \\
& \text{«by substitution»} \\
= & \neg(P \vee (\forall i: 0 \leq i: (\exists \beta: \beta \in S^\omega: \sigma[..i]\beta \models P))) \\
& \text{«by De Morgan's Laws»} \\
= & \neg P \wedge (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P)) \\
& \text{«} A \wedge B \Rightarrow B \text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P)) \\
& \text{«because } (\forall x:: A) = (\forall x:: A \wedge (\forall y:: A_y^x))\text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge (\forall \gamma: \gamma \in S^\omega: \sigma[..i]\gamma \not\models P))) \\
& \text{«because } true \wedge P = P \text{ and } (\sigma[..i]\beta)[..i] = \sigma[..i]\text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge (i=i) \wedge (\forall \gamma: \gamma \in S^\omega: (\sigma[..i]\beta)[..i]\gamma \not\models P))) \\
& \text{«by substitution»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge (k=i)_i^k \wedge (\forall \gamma: \gamma \in S^\omega: (\sigma[..i]\beta)[..k]\gamma \not\models P)_i^k)) \\
& \text{«by } \exists\text{-Generalization»} \\
\Rightarrow & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge (\exists k: k=i: (\forall \gamma: \gamma \in S^\omega: (\sigma[..i]\beta)[..k]\gamma \not\models P)))) \\
& \text{«by Range Widening»} \\
\Rightarrow & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge (\exists k: 0 \leq k: (\forall \gamma: \gamma \in S^\omega: (\sigma[..i]\beta)[..k]\gamma \not\models P)))) \\
& \text{«by De Morgan's Law»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge \neg(\forall k: 0 \leq k: (\exists \gamma: \gamma \in S^\omega: (\sigma[..i]\beta)[..k]\gamma \models P)))) \\
& \text{«by definition of } \# \text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P \wedge \sigma[..i]\beta \not\models (\forall k: 0 \leq k: (\exists \gamma: \gamma \in S^\omega: \sigma[..k]\gamma \models P)))) \\
& \text{«because } \alpha \# A \wedge \alpha \# B = \alpha \# (A \vee B)\text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models (P \vee (\forall k: 0 \leq k: (\exists \gamma: \gamma \in S^\omega: \sigma[..k]\gamma \models P)))) \\
& \text{«by definition of Safe}(P)\text{»} \\
= & (\exists i: 0 \leq i: (\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models Safe(P)))
\end{aligned}$$

It is not surprising that $Safe(P)$ is a safety property. If $\sigma \# Safe(P)$ then, by definition, $\sigma \# M_P$. However, this means there exists an i such that

$$(\forall \beta: \beta \in S^\omega: \sigma[..i]\beta \not\models P).$$

We could consider prefix $\sigma[..i]$ to be a "bad thing". Thus, σ violates a safety property whenever $\sigma \# Safe(P)$.

We now show formally that $Live(P)$ satisfies definition (3.2) of liveness.

$$\begin{aligned}
& (\forall \alpha: \alpha \in S^*: true) \\
& \text{«since } true = A \vee \neg A \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha\beta \models P) \vee \neg(\exists \beta: \beta \in S^\omega: \alpha\beta \models P)) \\
& \text{«renaming bound variable } \beta \text{ to } \gamma \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha\beta \models P) \vee \neg(\exists \gamma: \gamma \in S^\omega: \alpha\gamma \models P)) \\
& \text{«since } \beta \text{ is not free in } (\exists \gamma: \gamma \in S^\omega: \alpha\gamma \models P)\text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha\beta \models P \vee \neg(\exists \gamma: \gamma \in S^\omega: \alpha\gamma \models P))) \\
& \text{«by De Morgan's Law»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha\beta \models P \vee (\forall \gamma: \gamma \in S^\omega: \alpha\gamma \not\models P)))
\end{aligned}$$

$$\begin{aligned}
& \text{«since } true \wedge A = A \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee (|\alpha| = |\alpha| \wedge (\forall \gamma: \gamma \in S^\omega: \alpha \gamma \neq P)))) \\
& \text{«by substitution, since } (\alpha \beta)[..|\alpha|] = \alpha \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee ((i = |\alpha|)_{|\alpha|} \wedge (\forall \gamma: \gamma \in S^\omega: (\alpha \beta)[..i] \gamma \neq P)_{|\alpha|}))) \\
& \text{«by } \exists\text{-Generalization»} \\
\Rightarrow & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee (\exists i: i = |\alpha|: (\forall \gamma: \gamma \in S^\omega: (\alpha \beta)[..i] \gamma \neq P)))) \\
& \text{«by Range Widening»} \\
\Rightarrow & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee (\exists i: 0 \leq i: (\forall \gamma: \gamma \in S^\omega: (\alpha \beta)[..i] \gamma \neq P)))) \\
& \text{«by De Morgan's Law»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee \neg(\forall i: 0 \leq i: (\exists \gamma: \gamma \in S^\omega: (\alpha \beta)[..i] \gamma = P)))) \\
& \text{«by definition of } \alpha \beta = A \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = P \vee \alpha \beta = \neg(\forall i: 0 \leq i: (\exists \gamma: \gamma \in S^\omega: \sigma[..i] \gamma = P)))) \\
& \text{«because } \alpha \beta = A \vee \alpha \beta = B = \alpha \beta = (A \vee B) \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = (P \vee \neg(\forall i: 0 \leq i: (\exists \gamma: \gamma \in S^\omega: \sigma[..i] \gamma = P)))) \\
& \text{«by definition of } Live(P) \text{»} \\
= & (\forall \alpha: \alpha \in S^*: (\exists \beta: \beta \in S^\omega: \alpha \beta = Live(P))) \\
& \text{«by Liveness definition (3.2)»} \\
= & Live(P) \text{ is liveness.}
\end{aligned}$$

An informal justification that $Live(P)$ is liveness is the following. If $\sigma \neq Live(P)$ then, by definition, $\sigma \models M_P$. From, $\sigma \models M_P$, we conclude that it always remains possible for some "good thing" (i.e. β in M_P) to happen. This is the defining characteristic of liveness, so σ violates a liveness property whenever $\sigma \neq Live(P)$.

Acknowledgment

David Gries made numerous suggestions—some of which I even adopted—about presenting the proofs.
