19. ABSTRACT (Continue on reverse if necessary and identify by block number)					
Volume I of the COPRS Study is the basic study report. It describes the COHORT Replacement Model (C-REM) and sample COHORT replacement packages for select infantry, field artillery and armor units. C-REM is a BASIC model. It has the capability to simulate an MOS in a unit and determine COHORT package replacement sizes, NCO strength, total monthly strength by grade, and COHORT replacements at the battalion level. Volume II of the COPRS Study is the COHORT Replacement Model (C-REM) User's Guide. This volume describes the C-REM Model, how to use it, and the code for each module of the model. The model, as coded, must be compiled on the IBM BASIC Compiler to run properly.

APPENDIX D

COHORT REPLACEMENT MODEL (C-REM) USER'S MANUAL

D-1. **PREFACE.** The primary objective of C-REM is to determine average sizes of Cohesion, Operational Readiness, and Training (COHORT) replacement packages for first-term soldiers assigned to companies/batteries in either the FORSCOM or European theaters. The user has the option to control the length of the time intervals between COHORT package replacements. The model is capable of playing 3, 4, or 5 companies per battalion. To allow for computation of battalion COHORT replacement packages, either 3-, 4-, or 6-month time intervals must be used. The model will play any other interval; however, the battalion package output is forfeited. The user also has the capability of determining NCO replacements over various replacement intervals. The user can have the model create the initial force or supply the model with a current company personnel profile.

D-2. **THE MODEL.** C-REM is a BASIC program designed to run on an IBM PC-AT or compatible machine (DOS 3.10). The model consists of four main modules: C-REM, BUILD, FORSCOM, and EUROPE. The code for these modules is in Annexes I-IV, respectively. *Keywords: manuals, computer program*

a. **C-REM.** The sole purpose of the C-REM module is to link the user with either the BUILD, FORSCOM, or EUROPE module. By calling C-REM, the screen will appear as shown in Figure D-1, giving a brief description of the overall C-REM model. Pressing any key then displays the screen, Figure D-2, which prompts the user to determine how the model is to be executed. The user has the option of creating a company personnel profile (option "C"), or modeling a FORSCOM (option "F") or a European (option "E") company/battery or battalion. The reason for having both the FORSCOM module and the EUROPE module is that the personnel policies for FORSCOM and EUROPE are different.

```

THE PURPOSE OF THIS PROGRAM IS TO DETERMINE THE SIZES OF COHORT
REPLACEMENT PACKAGES OVER VARIOUS REPLACEMENT INTERVALS FOR
FIRST TERM SOLDIERS ASSIGNED TO COMPANIES/BATTERYS IN EITHER FORSCOM
OR EUROPE  IN ADDITION TO FIRST TERM SOLDIERS, YOU HAVE THE OPTION
TO DETERMINE NCO REPLACEMENTS OVER VARIOUS REPLACEMENT INTERVALS
YOU CAN ALSO INPUT A CURRENT UNIT'S PERSONNEL PROFILE IF YOU DESIRE

THIS PROGRAM CAN PRODUCE FOUR DIFFERENT PRINTOUTS

1  CO/BTRY COHORT PKG SIZES
2  BATTALION COHORT PKG SIZES (OPTIONAL)
3  NCO STRENGTH (OPTIONAL)
4  MONTHLY STRENGTH BY GRADE (OPTIONAL)

PRESS ANY KEY TO CONTINUE

```

Figure D-1. C-REM Sample 1

DO YOU WANT TO INPUT DATA FOR A FORSCOM OR EUROPEAN TYPE UNIT
OR DO YOU WANT TO INPUT A CURRENT UNIT'S PROFILE ?

ENTER *F* FOR FORSCOM , *E* FOR EUROPE OR *C* TO INPUT A PROFILE.

Figure D-2. C-REM Sample 2

b. **Build.** The BUILD module is called by the C-REM module when the user chooses Option "C" from the main menu. The purpose of this module is to allow the user to create a file of a current company/battery personnel profile, which can then be used again and again. BUILD prompts the user as to whether a FORSCOM or EUROPEAN company/battery profile is going to be entered.

(1) **FORSCOM Unit.** BUILD will allow a FORSCOM company/battery to be input by choosing the "F" option. For first-term soldiers in FORSCOM, the length of the soldier's initial enlistment contract and the soldier's time remaining in the service (both in months) are the only two inputs required by C-REM. For NCOs, the only input required by C-REM is the NCO's time remaining in the company/battery to which the NCO is assigned. The BUILD module prompts the user for all these inputs.

(2) **EUROPEAN Unit.** BUILD will allow a EUROPEAN company/battery to be input by choosing the "E" option. For first-term soldiers in a EUROPEAN company, the length of the soldier's initial enlistment contract and the soldier's time remaining in the service (both in months) are two of the three inputs required. The third input required is the soldier's time remaining in the company/battery to which the soldier is assigned. This third input is required to determine whether or not a soldier is eligible to return back to CONUS as well as for promotions. For NCOs, the only input required is the NCO's time remaining in the company/battery to which the NCO is assigned. The BUILD module prompts the user for all of these inputs.

(3) **Other Inputs.** Figure D-3 shows the only other inputs required by the BUILD module. These inputs are required when inputting data for either a FORSCOM or a EUROPEAN unit. The user inputs this data immediately after choosing to input a FORSCOM or EUROPEAN unit and is then prompted for the individual first-term and NCO data. All of the inputs will then be saved on the disk in a file named by the user.

```

ENTER THE TOTAL FIRST TERMERS, E1 - E4
ENTER THE TOTAL NUMBER OF    E5s
ENTER THE TOTAL NUMBER OF    E6s
ENTER THE TOTAL NUMBER OF    E7s
ENTER THE DATA FILE NAME

```

Figure D-3. BUILD Sample

(4) **Outputs.** Upon completion of the company/battery personnel profile, the user then has the option of getting a hard copy of the company/battery profile just created. The user can then create another company/battery personnel profile or return to the C-REM module to use either the FORSCOM or EUROPE module with the company/battery personnel profile or newly created profiles.

c. **FORSCOM.** The FORSCOM module is called by the C-REM module when the "F" option is chosen from the main menu. The purpose of this module is to simulate a CONUS company/battery life span under a fixed station concept. The module takes into consideration unprogramed attritions, promotions, normal losses, reassignments, and reenlistments. All of these transactions are controlled by rates that are input by the user. The inputs required for the FORSCOM module are discussed below. The outputs of the FORSCOM module are identical to the outputs of the EUROPE module and will be discussed in paragraph D-3.

(1) **FORSCOM Inputs.** The FORSCOM module is extremely flexible because all variables are input by the user. However, to achieve this flexibility, the user is prompted for a large number of inputs. The user is initially prompted for a filename to which these inputs will be saved on disk. Once an input file is created, the user can then have the module load this data without having to type individual inputs. If this is done, the user has the option to change any or all of the inputs and to save the changes under a new filename or the same file name. Since many of the inputs are relatively stable, it is recommended that if only a few changes are desired, the user should load an existing file into memory, make the desired changes, and then save the data in a new file. This also enables the user to play the "what if" game by making minor changes to the inputs, executing the simulation, and then repeating the process to analyze the affect of the changes. Among the inputs are authorized strengths for first-termers and NCOs. The user has the option of having either an initial force as 100 percent of the authorized strength or the user can supply an initial force based on a current company personnel profile created in the BUILD module. With either choice, the force is initially loaded. At the first time period specified by the input for the number of the month

for first-term replacements and NCO replacements, the company/battery is filled to 100 percent of authorized strength. The company/battery continues receiving replacements in equally spaced intervals based on these inputs. The user is prompted for all of these inputs and is expected to be familiar with current FORSCOM personnel policies and the structure of FORSCOM companies/batteries. If the user is familiar with these, all of the inputs will be self-explanatory.

(2) Control. To control the execution of this module and the life span of a company/battery, the user must also input the number of months to be simulated and the number of repetitions to be executed. It is recommended that the number of months to be simulated be at least 72. Also, the number of repetitions should be at least 30 for the results to be statistically significant. For example, if the number of months simulated is 72 and the number of repetitions is 30, then the module will execute the simulation 30 times with a company life span of 72 months and will be statistically significant. Output data from simulations that are less than 30 repetitions should not be considered since statistically they may be in error.

d. EUROPE. The EUROPE module is called by the C-REM module when the "E" option is chosen from the main menu. The purpose of this module is to simulate an OCONUS company/battery life span under a fixed station concept. The module takes into consideration unprogramed attritions, promotions, normal losses, reassignments, and reenlistments. All of these transactions are controlled by rates that are input by the user. The inputs that are required for the EUROPE module are discussed below. The outputs of the EUROPE module will be discussed in conjunction with the output of the FORSCOM module in paragraph D-3. The EUROPE module is very similar to the FORSCOM module with the exception of reassignments, which must be treated differently due to differing personnel policies. The EUROPE module also considers 3-year and 4-year enlistments, variable enlistments, and marital status, where as the FORSCOM module does not consider marital status.

(1) EUROPE Inputs. The EUROPE module is also extremely flexible, and the user is prompted for a large number of inputs. As with the FORSCOM module, the user is initially prompted for a filename to which these inputs will be saved. The user then has the same options as the FORSCOM module as discussed in paragraph D-2c(1). For example, the user can play the "what if..." game as in the FORSCOM module. The primary distinction between EUROPE inputs and FORSCOM inputs is that the EUROPE module requires more variables to be input. The first additional input is the percentage of initial fill a company/battery will have. The reason for this input is that initially the user may want to overfill the company since replacements for first-termers and NCOs do not arrive until month 12. The remaining additional inputs are concerned with marital status and all-others tours for NCOs. The user is prompted for all of these inputs and is expected to be familiar with current EUROPEAN personnel policies and the structure of EUROPEAN companies/batteries. If the user is familiar with these, all of the inputs will be self-explanatory.

(2) **Control.** The same control variables, as discussed in paragraph D-2c(2) for the FORSCOM module, are input to control the simulation of the EUROPE module. Also, the same recommendations for the number of months to simulate and the number of repetitions to ensure statistical significance are identical for the EUROPE module.

D-3. MODEL OUTPUTS. The same outputs are available when running either the FORSCOM module or the EUROPE module. There are five output reports available, the last three of which are optional. The three optional reports are a listing of battalion COHORT package sizes, NCO strengths, and monthly strengths by grade. The input variables and the company/battery COHORT package sizes report are generated automatically. The user is prompted regarding the three optional reports.

a. The first report is a listing of the input variables which drive the simulation. Figure D-4 is a sample report of the inputs supplied to the EUROPE module when simulating life cycles of an OCONUS 13B battery. Figure D-5 is a sample report of the inputs supplied to the FORSCOM module when simulating life cycles for a 13B battery in CONUS. The differences are due to the differing personnel policies in the FORSCOM and EUROPE modules.

b. The next report is also generated automatically. This report lists, in 4-month intervals, the average company/battery package size, a 90 percent confidence interval, the standard deviation, and the percent of the company/battery strength based on the number of repetitions supplied by the user. Figure D-6 is a sample report of the company first-termers COHORT replacement packages for a 13B OCONUS battery.

c. The first optional report available is a report of the battalion first-termers COHORT replacement packages. This report lists the average package sizes for each company/battery in the battalion, a 90 percent confidence interval, the standard deviation, and the average percent of company/battery strength every 4 months. The averages, confidence interval, and the standard deviation are all based on the number of repetitions input by the user. This output report is only available when the user is simulating a battalion consisting of 3, 4, or 5 companies/batteries. Figure D-7 is a sample report of a 13B OCONUS battalion.

d. The second optional report is the listing in 4-month intervals of the minimum NCO strengths by grade before replacements. Figure D-8 is a sample minimum NCO strength before replacements report for a 13B OCONUS battery.

e. The third optional output report is a monthly listing of the company/battery strength by grade. This report also lists the percentage of strength for the total company/battalion and for NCO strength. Figure D-9 is a sample monthly report for a 13B OCONUS battery.

GLOSSARY**1. ABBREVIATIONS, ACRONYMS, AND SHORT TERMS**

C-REM	COHORT Replacement Model
ETS	expiration term of service
IET	initial entry training
IRS	Individual Replacement System
JET	Junior Enlistment Trainee
MILPERCEN	Military Personnel Center
NMS	New Manning System
PCS	permanent change of station
PDA	present duty assignment
PFAM	Personnel Flow Assessment Model
PRI	personnel readiness indicator(s)
TOS	time on station
UMS	Unit Manning System
URSA	Unit Replacement System Analysis
VEL	variable enlistment length

2. DEFINITIONS

all-others tour	For purposes of this study, an OCONUS long-tour assignment served by SM with dependents who chose not to be accompanied by his/her dependents. The all-others tour length is 24 months.
careerist	An enlisted soldier who has continuous service beyond his initial enlistment period resulting from one or more reenlistments.
COHORT	An acronym for cohesion, operational readiness, and training. Describes a management concept in which soldiers and leaders are assigned to, and stabilized within, battalion or company-sized combat arms units for fixed periods of time.

COHORT package	A group of first-termers trained together in IET and assigned to a COHORT unit.
COHORT unit	A combat arms unit (company/battery or battalion) composed of COHORT packages and careerists who will be stabilized for a fixed life cycle of the unit. The unit trains together and usually will deploy overseas at a fixed time in the unit life cycle.
COHORT unit life cycle	The duration of time a COHORT unit exists for stabilization and retention of its personnel; usually consists of a CONUS and an OCONUS phase.
first-termers	Those soldiers who have not yet completed their first enlistment period. In PFAM, an enlisted soldier serving in grade E3 or E4.
Individual Replacement System (IRS)	The personnel management system currently used to fill Army-wide requirements, defined at the grade and MOS level of detail, by individually selecting soldiers from the Army at large to fill personnel vacancies on a singular basis, i.e., one soldier leaves an assignment and is replaced by another soldier.
long tour	For purposes of this study, an assignment to an OCONUS theater for which the standard tour length is 36 months for SM accompanied by their dependents and for single SM. The tour length is 24 months for all others.
regiment	A grouping of like-type CONUS and OCONUS battalions with the same regimental designation formed for the purpose of allowing recurring assignments over the length of a soldier's career.
regimental system	An Army-wide system under which the battalions of each combat arms branch are organized into regiments.
short tour	For purposes of this study, an assignment to an OCONUS theater for which the standard tour length is 12 months for all SM.
steady state	The eventual condition which occurs, and can be sustained, after the start-up or transition phase is complete.
turnover rate	As defined in AR 220-1, the sum of a unit's last 3 months' losses divided by its current operating strength.
