FOREWORD

The Leadership and Management Technical Area of the U.S. Army Research Institute (ARI) conducts programmatic research to improve leader effectiveness, with a focus on the sequential, progressive development of leaders. To support this and other research, ARI is developing an Officer Longitudinal Research Data Base (OLRDB) along with an on-line User's Manual and Data Dictionary. The data base will enable researchers to produce data-based information on officer training, professional development, and utilization.

This report describes the procedures used to incorporate personnel and advanced camp performance data on cadets enrolled in the Reserve Officers' Training Corps (ROTC). Inclusion of these data expands the precommissioning coverage of the OLRDB. The utility of this expansion is also demonstrated by a comparison of the active duty retention rates of ROTC scholarship recipients with the retention rates of nonscholarship cadets.

The development of the OLRDB has been briefed to the research sponsor, the Center for Army Leadership (29 April 1987), which recognizes its role as a research tool to generate information necessary for systematic enhancement of leader training and effectiveness.

DEVELOPMENT OF ROTC DATA SETS AND EVALUATION OF
THEIR USEFULNESS FOR OFFICER LONGITUDINAL
RESEARCH DATA BASE

BACKGROUND

The U.S. Army Research Institute (ARI) established the Officer Longitudinal Research Data Base (OLRDB) to provide a longitudinal record of officer history for research purposes. The OLRDB contains a record for all officers on active duty between 1970 and 1986. The record of separated officers contains the separation program designator (SPD) that describes the reason for separation.

The Department of the Army maintains computerized yearly records of cadets enrolled in Reserve Officer Training Corps (ROTC). Each record reflects a cadet's status and progress in the training program for an academic school year.

The objective of matching ROTC precommission data with officer history from the OLRDB was to determine whether a relationship exists between documented characteristics of ROTC cadets and retention of these cadets as officers.

The scope of this effort was to create two ROTC data sets which were free of detectable errors, linked with the existing OLRDB core data set and documented for research use with the Statistical Analysis System (SAS). The data sets are the ROTC Advanced Camp Data Set and the ROTC Commission Data Set.

Retention analysis of the commissioned cadets, as documented on the OLRDB core data set, was also included within the scope of effort. Scholarship recipients were specifically evaluated in the retention report. The separation program designator was examined for those officers who had separated.

PROCEDURE

Source Data Used in the Project

ARI supplied two sets of ROTC data to be organized, verified for accuracy, and linked with the OLRDB.

1. ROTC Advanced Camp Cadet annual files from 1982 through 1985.
2. ROTC Cadet Master (Commission) annual files from 1982 through 1985.

Documentation for the Advanced Camp data consisted of record specifications and element descriptions. The Commission file was documented by tape layouts and TRADOC Regulation 145-15 that describes the entry of cadet data into the ROTC Management Information System (ROTCMIS). Examples of these documentation vehicles are included in Appendix A for Camp data and Appendix B for Commission data.

The ROTC data sets were linked to the OLRDB core data set. The core data set contains essential or core data elements from the Officer Master File that give a concise overview of an officer's status and promotion history while on active duty. A brief description of the data elements maintained on this data set is included in Appendix C.

Data Resolution

The location of data elements, valid values for data elements, and the data elements themselves are not consistent from year to year on the ROTC files. The tasks that were necessary to resolve the inconsistency in the data are described below.

1. Match the acronyms and abbreviations that appear on the tape layout forms to the data element descriptions.
2. Develop a set of data element names that were unique to the data set involved, descriptive of the data element, consistent within the OLRDP, and appropriate for use by the Statistical Analysis System.
3. Create a SAS program to extract each data element by name from each yearly file.
4. Create frequency tables for each data element from each year. Match the actual data values to the documented values for specific years to ensure the thoroughness of the documentation.
5. Create specifications and programs to change inconsistent data values to match current values for some data elements. Document new data values if no modification was possible.

ROTC Advanced Camp File. The data resolution of the ROTC Advanced Camp file was straightforward. Although some additional data values were present on the files for a few data variables, the title and placement of each data element was clearly documented.

The Contracting Officer's Representative (COR) reviewed the changes required to bring the early data up-to-date with current coding practices and the conversion was accomplished. Appendix D contains a description of the changes performed on the Advanced Camp data.

ROTC Commission File. The only identification of data elements on the ROTC Commission files was that specified on the tape layouts. They were denoted with acronyms and abbreviations that were extremely small in size and of poor copy quality that made the document difficult to decipher in some cases.

The data element names that were legible were matched to descriptions of data elements in TRADOC Regulation 145-15. The organization of this document has no relationship to the tape layouts in terms of placement of data elements. This regulation specifies data entry procedures for an input form, and data descriptions were arranged in reference to that form. It also contains data elements not present on the tape file and contains no information on some of the elements that do exist on the tape file.

The length of each of the data elements was clearly defined on the tape layouts so frequency tables for each element were used to verify a match between the tape layout and the TRADOC Regulation. Through this step of the data resolution process, it was discovered that the tape layout for fiscal year 1983 was incorrect. In actuality, the 1983 data matched the layout for fiscal year 1984.

After all possible resolutions were made, some data elements remain unidentified (10 out of 120) and some data values are not fully documented. These data elements were described on the data dictionary with whatever information was available such as position on the input file. Additional documentation for the ROTC Commission file could lead to proper identification of these data elements.

Each of the identified data elements was examined in the context of the current coding specifications. Some data elements on the older files required updating earlier coding standards to those used in 1985. A description of the conversion specifications for each input file is included in Appendix D.

ROTC Data Consolidation

After the data from each year of the ROTC files were made consistent with current coding requirements, the yearly files were consolidated to create two ROTC data sets, an Advanced Camp Data Set and a Commission Data Set.

The consolidation of each data set was performed by encoding the data year on the cadet's record and merging by social security number. If multiple entries for one social security number existed, the most recent record was saved. There were cases of multiple entries but they all appeared to be exact duplications of another record.

Encryption of Personal Identification Number

Each cadet record was identified by social security number. Privacy regulations prohibit the use of social security number in research files. Therefore, a special procedure was performed to transform the social security numbers into unique but meaningless identification numbers. This procedure was developed for the core data set of the OLRDB. The identification numbers generated for the ROTC data sets were consistent with those on the OLRDB.

Each record from the ROTC data sets was matched to the OLRDB core data set. A match means that the cadet was commissioned and began serving active duty as indicated in the OLRDB. The ROTC data set was marked with a special data element which indicates whether or not an OLRDB match was found.

RESULTS AND PRODUCTS

Data Set Description

Two ROTC/OLRDB data sets result from this effort. They reside at the National Institutes of Health (NIH) computer facility. They were both built and organized with the use of the Statistical Analysis System. SAS is a completely functional data processing programming language and contains a wide variety of statistical and reporting procedures commonly used in research. All data elements were assigned names conforming to SAS naming conventions with a length of eight or less. Missing values are represented on the SAS data sets by a period which is the SAS standard.

The ROTC/OLRDB Advanced Camp Data Set consists of 34,776 observations. Each observation (or record) describes an individual cadet present on the ROTC Advanced Camp files between 1982 and 1985. All ROTC data elements that were present on the annual files were carried over to the new data set. When this data set was matched to the OLRDB core data set, 14,661 cadets were present as active duty officers by 1986. The data element that indicates an OLRDB match, COLRDB, has a value of 'Y' for these cadets.

Each cadet was identified by a unique 9-digit match code that links the cadet to other data sets within the OLRDB. This data set contain some personal data such as date of birth, sex, and race, as well as background academia and military experience. The majority of the data elements, however, describe the cadet's status and training results from ROTC advanced camp work.

The ROTC/OLRDB Commission Data Set consists of 31,967 observations. All records contain the complete set of data elements present on the ROTC Commission annual files. When the match to the OLRDB core data set was performed, 18,617 cadets were present as active duty officers by 1986. For each of these officers, the OLRDB match indicator was set to 'Y'.

As in the Advanced Camp Data Set, the records were identified by the OLRDB matchcode. Similarly, some data elements described the cadet's status, personal data, and military background. The majority of data elements describe the cadet's academic performance, test results, and commissioning information. Scores were recorded for the Scholastic Aptitude Test, the American College Test, the General Screening Test, and others. Language performance was ranked. Grade point averages for both academic and ROTC Military Science classes were reported. Scholarship terms and status, commission dates, and branch information were also described.

A full list and description of all data elements can be found in Appendix E, which contains the data dictionary descriptions.

Data Dictionary Descriptions

ARI maintains a dictionary of all data elements contained in the OLRDB. The ROTC data set elements are documented in the data dictionary. Each entry consists of the element name, title (if known), description (if known), data values, and documentation for each data value (if known).

Both ROTC data sets contain some data elements for which no description was available in the documentation. The meaning of specific data values was frequently missing. Therefore, some data values lack descriptions. A complete listing of the data dictionary entries can be found in Appendix E.

Computer Procedures

The annual ROTC Advanced Camp and Commission files required the same processing steps to achieve the final research product. The objective of each computer procedure that can be used to update the ROTC data sets was the same for all files. However, the detailed program specifications such as data element input position, length, and name were unique for each file.

Each computer procedure is described below by its objective, input, output, and processing considerations if relevant. The Statistical Analysis System was the programming language used for each procedure. SAS is a high-level language that performs standard data processing functions well and lends itself to statistical analysis commonly used in research. Program listings of each procedure are included in Appendix F.

Procedure #1: Read Annual Files for Field Identification

OBJECTIVE

After manual review of the documentation for each file, it was necessary to verify that each field in the file contains data that matches the documentation. Rather than naming each element at this time, each data element was identified by its location in the record. For example, elements starting at positions 1 and 5 were identified as A1 and A5, with the appropriate lengths. Frequency counts of each element can be used to match the documented values for each data variable with what exists on the file.

INPUT

Input raw data files from ROTC.

OUTPUT

Program listing and frequency counts for each data element.

PROCESSING CONSIDERATIONS

The number of pages of output depends on the number of values found in each data element. Elements such as name and social security number will cause a separate line to be printed for each observation because these elements are unique for each record.

This step may need to be repeated again if elements do not appear as expected. Length or position of the variables may need to be corrected, and the frequencies rerun.

Procedure #2: Scramble Personal Identification Number

OBJECTIVE

Each cadet on the ROTC files is identified by social security number. The scramble procedure encrypts the social security number. This scrambled number can be used to uniquely identify each cadet for matching purposes within the OLRDB. In this manner, the privacy of each cadet as identified by social security number was maintained.

Due to the sensitive nature of this step, the Contracting Officer's Representative is the only person to receive a copy of the program listing for the scramble procedure.

INPUT

Input raw data files from ROTC.

OUTPUT

Working file #1 with all data unchanged except that social security number was replaced with the scrambled matchcode.

Procedure #3: Read and Recode Annual Files

OBJECTIVE

This procedure associates a unique and meaningful name with each data element. The ROTC Advanced Camp variables begin with 'C'. The ROTC Commission variables begin with 'M'. If possible, the descriptive names are the same for like elements. For example, the data variable 'RACE' is identified as 'CRACE' and 'MRACE' on the appropriate data set.

It was necessary to change the value of some data elements to conform to 1985 coding requirements. Conversion specifications for each data set are described in Appendix D.

Additional data variables were created as needed. For example, 1982 test scores were maintained in their component parts of math and language. The following years reported only the total score. The total score was created for 1982 by adding together the math and language scores. The component scores for 1982 were also stored on the data set. The fiscal year of the ROTC file associated with each record was also added as well.

Data variables that were not to be included on the final data set were deleted in this procedure. File maintenance element 'DELETE' and filler elements were of no use for research purposes. 'NAME' was removed for privacy purposes.

INPUT

Working file #1.

OUTPUT

Working file #2.

Procedure #4: Examine Duplicate Records

OBJECTIVE

Each final data set contains one record for each cadet. This procedure identifies duplicate records, if they exist, and prints them for manual review.

INPUT

Working file #2.

OUTPUT

Printout of records for each cadet with multiple records.

Procedure #5: Concatenate Years and Match to OLRDB

OBJECTIVE

This procedure produces the final ROTC data sets. The recoded files for each year were merged together in order by the scrambled matchcode. The combined data set was sorted by year in descending order within matchcode. The duplicate records for a single cadet were dropped from the file, leaving the most recent year if multiple years exist. There were 47 duplicate records for cadets on the Advanced Camp files and 20 duplicate records for cadets on the Commission files.

The resulting data set was then matched to the OLRDB core data set. New data elements, COLRDB (Camp) and MOLRDB (Commission), were added to the ROTC data sets to identify those records for which an OLRDB match was found.

Finally, a listing of the contents of the newly created data set was created using the PROC CONTENTS procedure. This listing identifies the SAS name of each element, the element type, length, and position in the SAS file.

INPUT

Working file #2.

OUTPUT

SAS ROTC/OLRDB Data Set.
Contents listing of the SAS ROTC/OLRDB Data Set.

PROCESSING CONSIDERATIONS

The program listing must be examined carefully to ensure that each step was completed correctly. The SAS notes and comments identify the number of observations in each step of the program as well as denote error conditions encountered and actions taken.

Procedure #6: Count Frequency of ROTC Data Variable Values

OBJECTIVE

Frequency counts of each data variable value identify the range of values present on the data set as well as the percentage of observations that contain each value. These counts were created for all ROTC data elements.

INPUT

SAS ROTC/OLRDB Data Set.

OUTPUT

Listing of frequency counts for each ROTC data variable.

PROCESSING CONSIDERATIONS

Each data value is reported on the frequency listing. Those observations that had no value recorded for a particular data element were counted as 'missing' values. SAS represents missing values by a period. Cases with missing values were not counted into the column and cumulative frequency totals.

Procedure #7: Analyze Retention

OBJECTIVE

This procedure consists of as many analyses as desired to analyze retention of ROTC cadets as officers. Retention in this case is not to be confused with reenlistment analysis based on obligation. It simply reflects the number of officers who stay or separate in a given year.

Analysis of the OLRDB match data elements on the ROTC data sets showed that 42% of the Camp cadets and 58% of the Commission cadets were present as active duty officers on the OLRDB core data set. Retention analysis was performed with SAS on these officers and was presented in a variety of ways. Retention was analyzed by scholarship status alone, by separation program designator alone, and by both scholarship status and separation program designator together.

INPUT

SAS ROTC/OLRDB Data Set.

OUTPUT

Reports of retention analysis for officers who were present on the ROTC Advanced Camp and Commission files in 1982 through 1985.

Retention Analysis

ROTC cadets who had become active duty officers were examined by a retention analysis. The officers present on a given year of the Officer Master File (OMF) as represented on the OLRDB were examined for presence or absence in the following year. Thus a retention rate was calculated for each 2-year period for which the officers were present on the OLRDB. The retention rates were further distinguished by a scholarship element. Table 1 describes the retention analysis.

Table 1

1984 to 1985	4598	4571	99.4
1985 to 1986	6646	6579	98.9

Over the few years to which retention analyses could be applied, a slightly greater percentage of officers who received ROTC scholarships were retained longer than those without scholarships.

For those officers who were not retained, examination of the separation program designator (SPD) revealed a wide range of reasons for separation. However, two reasons dominated the separation of these officers.

1. Failure to meet course performance or selection standards.

Scholarship Recipients	36% of 152 Separations 1982-1986
Nonscholarship Recipients	33% of 790 Separations 1982-1986

2. Expiration of term of service.

Scholarship Recipients	3% of 152 Separations 1982-1986
Nonscholarship Recipients	32% of 790 Separations 1982-1986

A much higher percentage of nonscholarship recipients had separated due to expiration of their terms. There were no data available in the data sets used in this study that identified obligation. Scholarship recipients have longer periods of obligation. Comparisons of retention rates by scholarship status cannot yet be evaluated with the small number of years present on the OLRDB for the officers in the study. More comprehensive retention analysis will be feasible when periods of obligation and other pertinent information are incorporated into the OLRDB.

SUMMARY AND CONCLUSIONS

The ROTC Advanced Camp and Commission Data Sets linked with the OLRDB would be useful for evaluating retention of the ROTC cadets as officers. Specific characteristics of the ROTC cadet or the training program can be utilized to better understand the characteristics of officers who choose to remain in the Army as well as the reasons for separation.

For the ROTC cadet records available in the OLRDB at this time, there was not enough history on the OLRDB to provide a complete analysis of retention. However, various subgroups of officers can be evaluated in a year-by-year retention analysis.

The ROTC Advanced Camp Data Set contains 156 data elements. The number of cadets from each year of camp data and whether or not they were matched to a record on the OLRDB is described below.

Table 2

ROTC Advanced Camp/OLRDB

Year	Number Cadets	Number Matched OLRDB	Percent Matched OLRDB
1982	8,111	4,421	(54%)
1983	9,451	4,694	(49%)
1984	8,904	3,579	(40%)
1985	<u>8,310</u>	<u>1,967</u>	<u>(24%)</u>
Total	34,776	14,661	(42%)

The ROTC Commission data set contains 123 data elements. The number of cadets from each year of commission data and whether or not they were matched to a record on the OLRDB is described below.

Table 3

ROTC Commissioned/OLRDB

Year	Number Cadets	Number Matched OLRDB	Percent Matched OLRDB
1982	7,118	4,654	(65%)
1983	8,250	5,274	(64%)
1984	8,273	4,853	(59%)
1985	<u>8,326</u>	<u>3,836</u>	<u>(46%)</u>
Total	31,967	18,617	(58%)

Research use of these data sets would benefit from further documentation for some data which are poorly described. This documentation is likely to accompany additional years of ROTC Advanced Camp and Commission data.

These new years of data could also be added to the existing files by using the procedures described in Appendix F. For example, if 1986 data were to be added to the files, the tape layout would need to be examined for changes in data element placement and length. The input format in Procedure #3 would need to be changed to reflect the new layout. If data values for some data elements changed between 1985 and 1986, the SAS statements which would perform this conversion would replace the existing conversion code in

Procedure #3. Finally, the new file would be matched to the OLRDB. Whether or not new ROTC data are added to the existing files, there would appear to be significant benefit from the inclusion of additional years of OLRDB data with the newly formed ROTC/OLRDB data sets.

APPENDIX D
CONVERSION SPECIFICATIONS FOR ROTC DATA

CONVERSION SPECIFICATIONS FOR ROTC ADVANCED CAMP DATA

The following criteria ensure that all values on the ROTC Advanced Camp data set are consistent and conform to 1985 coding specifications.

<u>Data Variable</u>	<u>Conversion Specifications</u>
CYEAR	Create for each record from fiscal year of the input file
CMSCLASS	Change 'C' to blank
CWAIVER	Change values less than 'A' to blank
CSMP	Change 'N' to 'G' Change 'R' to 'V'
C25MSWIM	Change 'Y' to "G"
CTLT	Change 'Y' to 'S'

CJPDINIT	Change '&' to blank
CDELETE	Drop from file
CNAME	Drop from file
Fillers	Drop from file

The following conversion is performed on dates for 1982 and 1983. During those years, the rating scale for the affected data elements was 1 through 7. In 1984 and 1985 the rating scale was 1 through 5. Basically, the two extremes of the 1-7 scale are collapsed. The next six conversion specifications apply to the first nine data elements at the left.

The following criteria properly identify two divergent types
of data stored in the same data field.

Data VariableConversion Specification

MCHGTIME

If the value is 2400 then:
1. Create MCONTRYY by
dividing by 10 and using
the integer which results.
2. Create MCONTRMM by multi-
plying MCONTRYY by 100 and
subtracting the result
from MCHGTIME.
3. Set MCHGTIME to missing
values.
