EXECUTIVE SUMMARY

This Validation Summary Report (VSR) summarizes the results and conclusions of validation testing performed on the Harris Ada Compiler, Version 1.0, using Version 1.8 of the Ada® Compiler Validation Capability (ACVC). The Harris Ada Compiler is hosted on a Harris H1200 operating under VOS, Version 6.1. Programs processed by this compiler may be executed on a Tektronix 8540A-1750A, having no operating system. Keywords: Ada programming language.

On-site testing was performed 30 May 1987 through 3 June 1987 at Fort Lauderdale, FL, under the direction of the Ada Validation Facility (AVF), according to Ada Validation Organization (AVO) policies and procedures. The AVF identified 1974 of the 2399 tests in ACVC Version 1.8 to be processed during on-site testing of the compiler. The 19 tests withdrawn at the time of validation testing were not processed; the 242 executable tests that make use of floating-point precision exceeding that supported by the implementation were not processed; and the 164 executable tests that require creation of external files were not processed. After the 1974 tests were processed, results for Class A, C, D, and E tests were examined for correct execution. Compilation listings for Class B tests were analyzed for correct diagnosis of syntax and semantic errors. Compilation and link results of Class L tests were analyzed for correct detection of errors. There were 15 of the processed tests determined to be inapplicable. The remaining 1959 tests were passed.

The results of validation are summarized in the following table:

RESULT	CHAPTER												TOTAL
	2	3	4	5	6	7	8	9	10	11	12	14	
Passed	96	221	298	241	161	97	135	261	130	32	218	69	1959
Failed	0	0	0	0	0	0	0	0	0	0	0	0	0
Inapplicable	20	104	122	6	0	0	4	1	0	0	0	164	421
Withdrawn	0	5	5	0	0	1	1	2	4	0	1	0	19
TOTAL	116	330	425	247	161	98	140	264	134	32	219	233	2399

The AVF concludes that these results demonstrate acceptable conformity to ANSI/MIL-STD-1815A Ada.

EXECUTIVE SUMMARY

This Validation Summary Report (VSR) summarizes the results and conclusions of validation testing performed on the Harris Ada Compiler, Version 1.0, using Version 1.8 of the Ada® Compiler Validation Capability (ACVC). The Harris Ada Compiler is hosted on a Harris H1200 operating under VOS, Version 6.1. Programs processed by this compiler may be executed on a Tektronix 8540A-1750A, having no operating system.

On-site testing was performed 30 May 1987 through 3 June 1987 at Fort Lauderdale, FL, under the direction of the Ada Validation Facility (AVF), according to Ada Validation Organization (AVO) policies and procedures. The AVF identified 1974 of the 2399 tests in ACVC Version 1.8 to be processed during on-site testing of the compiler. The 19 tests withdrawn at the time of validation testing were not processed; the 242 executable tests that make use of floating-point precision exceeding that supported by the implementation were not processed; and the 164 executable tests that require creation of external files were not processed. After the 1974 tests were processed, results for Class A, C, D, and E tests were examined for correct execution. Compilation listings for Class B tests were analyzed for correct diagnosis of syntax and semantic errors. Compilation and link results of Class L tests were analyzed for correct detection of errors. There were 15 of the processed tests determined to be inapplicable. The remaining 1959 tests were passed.

The results of validation are summarized in the following table:

RESULT	CHAPTER												TOTAL
	2	3	4	5	6	7	8	9	10	11	12	14	
Passed	96	221	298	241	161	97	135	261	130	32	218	69	1959
Failed	0	0	0	0	0	0	0	0	0	0	0	0	0
Inapplicable	20	104	122	6	0	0	4	1	0	0	0	164	421
Withdrawn	0	5	5	0	0	1	1	2	4	0	1	0	19
TOTAL	116	330	425	247	161	98	140	264	134	32	219	233	2399

The AVF concludes that these results demonstrate acceptable conformity to ANSI/MIL-STD-1815A Ada.

TABLE OF CONTENTS

CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from characteristics of particular operating systems, hardware, or implementation strategies. All of the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.

INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- To attempt to identify any unsupported language constructs required by the Ada Standard
- To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by SofTech, Inc., under the direction of the AVF according to policies and procedures established by the Ada Validation Organization (AVO). On-site testing was conducted from 30 May 1987 through 3 June 1987 at Fort Lauderdale, FL.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse

1.4 DEFINITION OF TERMS

ACVC	The Ada Compiler Validation Capability. A set of programs that evaluates the conformity of a compiler to the Ada language specification, ANSI/MIL-STD-1815A.
Ada Standard	ANSI/MIL-STD-1815A, February 1983.
Applicant	The agency requesting validation.
AVF	The Ada Validation Facility. In the context of this report, the AVF is responsible for conducting compiler validations according to established policies and procedures.
AVO	The Ada Validation Organization. In the context of this report, the AVO is responsible for setting procedures for compiler validations.
Compiler	A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.
Failed test	A test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.
Host	The computer on which the compiler resides.

Inapplicable test	A test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.
Passed test	A test for which a compiler generates the expected result.
Target	The computer for which a compiler generates code.
Test	A program that checks a compiler's conformity regarding a particular feature or features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.
Withdrawn test	A test found to be incorrect and not used to check conformity to the Ada language specification. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. However, no checks are performed during execution to see if the test objective has been met. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters--for example, the number of identifiers

permitted in a compilation or the number of units in a library--a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time--that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of these units is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values--for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of validation are given in Appendix D.

CHAPTER 2

CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: Harris Ada Compiler, Version 1.0

ACVC Version: 1.8

Certificate Number: 870601W1.08069

Host Computer:

Machine:	Harris H1200
Operating System:	VOS, Version 6.1
Memory Size:	12 megabytes

Target Computer:

Machine:	Tektronix 8540A-1750A
Operating System:	No operating system
Memory Size:	64K words

Communications Network: RS232

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. This compiler is characterized by the following interpretations of the Ada Standard:

- Capacities.

  The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See tests D55A03A..H (8 tests), D56001B, D64005E..G (3 tests), and D29002K.)

- Universal integer calculations.

  An implementation is allowed to reject universal integer calculations having values that exceed SYSTEM.MAX_INT. This implementation does not reject such calculations and processes them correctly. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

- Predefined types.

  This implementation supports the additional predefined type LONG_FLOAT in the package STANDARD. (See tests B86001C and B86001D.)

- Based literals.

  An implementation is allowed to reject a based literal with a value exceeding SYSTEM.MAX_INT during compilation, or it may raise NUMERIC_ERROR or CONSTRAINT_ERROR during execution. This implementation raises NUMERIC_ERROR during execution. (See test E24101A.)

- Array types.

  An implementation is allowed to raise NUMERIC_ERROR or CONSTRAINT_ERROR for an array having a 'LENGTH that exceeds STANDARD.INTEGER'LAST and/or SYSTEM.MAX_INT.

A packed BOOLEAN array having a 'LENGTH exceeding INTEGER'LAST raises NUMERIC_ERROR when the array type is declared. (See test C52103X.)

A packed two-dimensional BOOLEAN array with more than INTEGER'LAST components raises NUMERIC_ERROR when the array subtype is declared. (See test C52104Y.)

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Discriminated types.

  During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

  In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Aggregates.

  In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

  In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

  All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

- Functions.

  An implementation may allow the declaration of a parameterless function and an enumeration literal having the same profile in the same immediate scope, or it may reject the function declaration. If it accepts the function declaration, the use of the enumeration literal's identifier denotes the function. This implementation rejects the declaration. (See test E66001D.)

- Representation clauses.

  The Ada Standard does not require an implementation to support representation clauses. If a representation clause is not supported, then the implementation must reject it. While the operation of representation clauses is not checked by Version 1.8 of the ACVC, they are used in testing other language features. This implementation accepts 'STORAGE_SIZE for tasks, and 'STORAGE_SIZE for collections; it rejects 'SIZE and 'SMALL clauses. Enumeration representation clauses, including those that specify noncontiguous values, appear to be supported. (See tests C55B16A, C87B62A, C87B62B, C87B62C, and BC1002A.)

- Pragmas.

  The pragma INLINE is supported for procedures and functions. (See tests CA3004E and CA3004F.)

- Input/output.

  This implementation supports only the packages TEXT_IO for file operations on STANDARD_INPUT and STANDARD_OUTPUT.

  The package SEQUENTIAL_IO can be instantiated with unconstrained array types and record types with discriminants. The package DIRECT_IO can be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, AE2101H, CE2201D, CE2201E, and CE2401D.)

- Generics.

  Generic subprogram declarations and bodies can be compiled in separate compilations. (See test CA2009F.)

  Generic package declarations and bodies can be compiled in separate compilations. (See tests CA2009C and BC3205D.)

CHAPTER 3

TEST INFORMATION

3.1 TEST RESULTS

Version 1.8 of the ACVC contains 2399 tests. When validation testing of the Harris Ada Compiler was performed, 19 tests had been withdrawn. The remaining 2380 tests were potentially applicable to this validation. The AVF determined that 421 tests were inapplicable to this implementation, and that the 1959 applicable tests were passed by the implementation.

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.2 SUMMARY OF TEST RESULTS BY CLASS

RESULT	TEST CLASS						TOTAL
	A	B	C	D	E	L	
Passed	68	862	954	17	12	46	1959
Failed	0	0	0	0	0	0	0
Inapplicable	1	5	414	0	1	0	421
Withdrawn	0	7	12	0	0	0	19
TOTAL	69	874	1380	17	13	46	2399

3.3 SUMMARY OF TEST RESULTS BY CHAPTER

RESULT	CHAPTER												TOTAL
	2	3	4	5	6	7	8	9	10	11	12	14	
Passed	96	221	298	241	161	97	135	261	130	32	218	69	1959
Failed	0	0	0	0	0	0	0	0	0	0	0	0	0
Inapplicable	20	104	122	6	0	0	4	1	0	0	0	164	421
Withdrawn	0	5	5	0	0	1	1	2	4	0	1	0	19
TOTAL	116	330	425	247	161	98	140	264	134	32	219	233	2399

3.4 WITHDRAWN TESTS

The following 19 tests were withdrawn from ACVC Version 1.8 at the time of this validation:

C32114A	C41404A	B74101B
B33203C	B45116A	C87B50A
C34018A	C48008A	C92005A
C35904A	B49006A	C940ACA
B37401A	B4A010C	CA3005A..D (4 tests)
		BC3204C

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. For this validation attempt, 421 tests were inapplicable for the reasons indicated:

- C34001D, B52004E, B55B09D, and C55B07B use SHORT_INTEGER which is not supported by this compiler.
- C34001E, B52004D, B55B09C, and C55B07A use LONG_INTEGER which is not supported by this compiler.
- C34001F and C35702A use SHORT_FLOAT which is not supported by this compiler.

- B86001D requires a predefined numeric type other than those defined by the Ada language in package STANDARD. There is no such type for this implementation.

- C86001F redefines package SYSTEM, but TEXT_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT_IO.

- C87B62A and C87B62C use length clauses which are not supported by this compiler. The length clauses are rejected during compilation.

- C96005B checks implementations for which the smallest and largest values in type DURATION are different from the smallest and largest values in DURATION's base type. This is not the case for this implementation.

- The following 164 tests require the use of external files. This implementation supports only the files STANDARD_INPUT and STANDARD_OUTPUT:

CE2102C	CE3104A	CE3411A
CE2102G	CE3107A	CE3412A
CE2104A..D (4 tests)	CE3108A..B (2 tests)	CE3413A
CE2105A	CE3109A	CE3413C
CE2106A	CE3110A	CE3602A..D (4 tests)
CE2107A..F (6 tests)	CE3111A..E (5 tests)	CE3603A
CE2108A..D (4 tests)	CE3112A..B (2 tests)	CE3604A
CE2109A	CE3114A..B (2 tests)	CE3605A..E (5 tests)
CE2110A..C (3 tests)	CE3115A	CE3606A..B (2 tests)
CE2111A..E (5 tests)	CE3203A	CE3704A..B (2 tests)
CE2111G..H (2 tests)	CE3208A	CE3704D..F (3 tests)
CE2201A..F (6 tests)	CE3301A..C (3 tests)	CE3704M..O (3 tests)
CE2204A..B (2 tests)	CE3302A	CE3706D
CE2210A	CE3305A	CE3706F
CE2401A..F (6 tests)	CE3402A..D (4 tests)	CE3804A..E (5 tests)
CE2404A	CE3403A..C (3 tests)	CE3804G
CE2405B	CE3403E..F (2 tests)	CE3804I
CE2406A	CE3404A..C (3 tests)	CE3804K
CE2407A	CE3405A..D (4 tests)	CE3804M
CE2408A	CE3406A..D (4 tests)	CE3805A..B (2 tests)
CE2409A	CE3407A..C (3 tests)	CE3806A
CE2410A	CE3408A..C (3 tests)	CE3806D..E (2 tests)
AE3101A	CE3409A	CE3905A..C (3 tests)
CE3102B	CE3409C..F (4 tests)	CE3905L
EE3102C	CE3410A	CE3906A..C (3 tests)
CE3103A	CE3410C..F (4 tests)	CE3906E..F (2 tests)

- The following 242 tests require a floating-point accuracy that exceeds the maximum of nine supported by the implementation:

C24113F..Y (20 tests)	C35705F..Y (20 tests)
C35706F..Y (20 tests)	C35707F..Y (20 tests)
C35708F..Y (20 tests)	C35802F..Y (20 tests)
C45241F..Y (20 tests)	C45321F..Y (20 tests)
C45421F..Y (20 tests)	C45424F..Y (20 tests)
C45521F..Z (21 tests)	C45621F..Z (21 tests)

3.6 SPLIT TESTS

If one or more errors do not appear to have been detected in a Class B test because of compiler error recovery, then the test is split into a set of smaller tests that contain the undetected errors. These splits are then compiled and examined. The splitting process continues until all errors are detected by the compiler or until there is exactly one error per split. Any Class A, Class C, or Class E test that cannot be compiled and executed because of its size is split into a set of smaller subtests that can be processed.

Splits were required for 18 Class B tests:

B24204A	B33301A	B67001A
B24204B	B37201A	B67001B
B24204C	B38008A	B67001C
B2A003A	B41202A	B67001D
B2A003B	B44001A	B91003B
B2A003C	B64001A	B95001A

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.8 produced by the Harris Ada Compiler was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and that the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the Harris Ada Compiler using ACVC Version 1.8 was conducted on-site by a validation team from the AVF. The configuration consisted of a Harris H1200 host operating under VOS, Version 6.1 and Tektronix 8540A-1750A target having no operating system. The host and target were linked via RS232.

A magnetic tape, containing all tests except for 19 withdrawn tests, 242 tests requiring unsupported floating-point precision, and 164 tests requiring the creation or opening of external files, was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring splits during the prevalidation testing were included in their split form on the magnetic tape.

The contents of the magnetic tape were loaded directly onto the host computer.

After the test files were loaded to disk, the full set of tests was compiled and linked on the Harris H1200, and all executable tests were run on Tektronix 8540A-1750A. The results of this validation were compared to the results of the validation for the H1200 host and target computer. The differences were transferred using FTP to a Harris HCX-7 and printed.

The 1750A target is connected to the host machine via 2 RS232 cables to 9600 baud ports; one port is used for communication between the host and the 1750A emulator for downloading and execute commands, and the other is used for character I/O.

Each Ada program is compiled and linked on the host by a single or multiple invocation of the Ada tool. The executable image produced is then loaded and executed on the 1750A emulator invocation of a communications program. The program sends commands across the communications port which accomplish the following:

- Inform the emulator of upcoming requests.
- Transfer the executable image into 1750A program memory.
- Begin execution.
- Wait for notification from the emulator of program completion.

The communication program then exits.

The results of the executable tests are captured by an I/O daemon program that runs on the host. This program captures the I/O generated from the REPORT packages and all other I/O calls from the executing test. The daemon appends all such I/O to a file that resides on the host system.

The compiler was tested using command scripts provided by Harris Corporation and reviewed by the validation team. The following options were in effect for testing:

Option	Effect
-w	warnings suppressed (all but b tests)
-el	long error listing (for compile-error tests)
-Bf front-end	specify fe
-Bc code-generator	specify cg
-Bl linker	specify a.ld
-o executable name	specify executable

Tests were compiled, linked, and executed (as appropriate) using one computer. Test output and compilation listings were captured on magnetic tape and archived at the AVF. The listing and job logs examined on-site by the validation team were also archived.

3.7.3 Test Site

The validation team arrived at Fort Lauderdale, FL on 30 May 1987, and departed after testing was completed on 3 June 1987.

APPENDIX A

DECLARATION OF CONFORMANCE

Harris Corporation has submitted the following declaration of conformance concerning the Harris Ada Compiler.

DECLARATION OF CONFORMANCE

Compiler Implementor: Harris Corporation
Ada® Validation Facility: ASD/SCOL, Wright-Patterson AFB, OH
Ada Compiler Validation Capability (ACVC) Version: 1.8

Base Configuration

Base Compiler Name: Harris Ada Compiler Version: 1.0
Host Architecture ISA: Harris H1200 OS&VER #: VOS, Version 6.1
Target Architecture ISA: Tektronix 8540A-1750A OS&VER #: (bare machine)

Implementor's Declaration

I, the undersigned, representing Harris Corporation, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler listed in this declaration. I declare that Harris Corporation is the owner of record of the Ada language compiler listed above and, as such, is responsible for maintaining said compiler in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for the Ada language compiler listed in this declaration shall be made only in the owner's corporate name.

Wendell Norton Date: 6-2-87
Harris Corporation
Wendell E. Norton, Director of Contracts

Owner's Declaration

I, the undersigned, representing Harris Corporation, take full responsibility for implementation and maintenance of the Ada compiler listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that the Ada language compiler listed, and its host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A. I have reviewed the Validation Summary Report for the compiler and concur with the contents.

Wendell Norton Date: 6-2-87
Harris Corporation
Wendell E. Norton, Director of Contracts

®Ada is a registered trademark of the United States Government (Ada Joint Program Office).

APPENDIX B

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of MIL-STD-1815A, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the Harris Ada Compiler, Version 1.0, are described in the following sections which discuss topics in Appendix F of the Ada Language Reference Manual (ANSI/MIL-STD-1815A). Implementation-specific portions of the package STANDARD are also included in this appendix.

```
package STANDARD is

     ...

     type INTEGER is range -32768 .. 32767;

     type FLOAT is digits 6 range
          -2#0.1111111111_1111111111_111#E127 ..
           2#0.1111111111_1111111111_111#E127;

     type LONG_FLOAT is digits 9 range
          -2#0.1111111111_1111111111_1111111111_1#E127 ..
           2#0.1111111111_1111111111_1111111111_1#E127;

     type DURATION is delta 2.0**(-8) range
          -2#10000000000000000000000.0# ..
           2#11111111111111111111111.11111111#;

          -- DURATION_DELTA is constant 2#1.0#E-8;

     ...

end STANDARD;
```

Appendix F of the Reference Manual for the Ada® Programming Language

Software Development

Harris Corporation Computer Systems Division

This document serves as appendix F of the Reference Manual for the Ada Programming Language. It describes the implementation-dependencies for HAPSE 6024/1750A.

1. Program Structure and Compilation

A 'main' program must be a parameterless non-generic library level procedure. It may not be an instantiation of a generic procedure.

2. Data Types

2.1 Character Types

HAPSE 6024/1750A provides one CHARACTER type which occupies one STORAGE_UNIT, which is 16 bits. Additionally, the predefined type STRING is a packed array of CHARACTERS. Packing has no effect and each element of the string consists of one STORAGE_UNIT.

2.2 Integer Types

HAPSE 6024/1750A provides one integer type in addition to *universal_integer*.

INTEGER ::= 16 bits, range -32_768 .. 32_767

2.3 Floating Point Types

HAPSE 6024/1750A provides two floating types in addition to *universal_real*.

FLOAT ::= 32 bits, 8 bit signed exponent, 24 bit signed mantissa

LONG_FLOAT ::= 48 bits, 8 bit signed exponent, 40 bit signed mantissa

---

• Ada is a registered trademark of the U.S. Government (Ada Joint Program Office (AJPO))

attribute	FLOAT Value	LONG_FLOAT Value
size	32	48
first	-1.70141E+38	-1.70141163E+38
last	1.70141E+38	1.70141163E+38
digits	6	9
mantissa	21	31
epsilon	9.53674E-7	9.31322575E-10
emax	84	124
small	2.58494E-26	2.35098870E-38
large	1.93428E+25	2.12676454E+37
safe_emax	127	127
safe_small	2.93874E-39	2.93873587E-39
safe_large	1.70141E+38	1.70141163E+38
machine_radix	2	2
machine_mantissa	24	40
machine_emax	127	127
machine_emin	-127	-127
machine_rounds	TRUE	TRUE
machine_overflows	FALSE	FALSE

2.4 Fixed Point Types

HAPSE 6024/1750A provides for four anonymous fixed point types. The type chosen as a base type for a specified fixed point declaration is determined by the following sequence: The default is tried, then if the range or delta is insufficient, the remaining three types are tried in order of decreasing precision. In the following table, *default*, *high* , *middle*, and *low* refer to the relative precisions of the four anonymous fixed point types.

Fixed Type	Size	Mantissa	Integer Size	Fraction Size
default	32	32	14	17
high	32	32	8	23
middle	32	32	9	22
low	32	32	23	8

3. Implementation-Dependent Pragmas

pragma controlled is recognized by the implementation but has no effect in this release.

pragma inline is implementation as described by the RM.

pragma interface is recognized by the implementation but has no effect.

pragma memory_size is recognized by the implementation, but has no effect. The implementation does not allow the package SYSTEM to be modified by means of pragmas; however, the same effect can be achieved by recompiling SYSTEM with altered values.

pragma optimise is recognized by the implementation but has no effect in this release.

pragma pack is recognized by the implementation but has no effect in this release.

pragma shared is recognized by the implementation but has no effect in this release.

pragma storage_unit is recognized by the implementation but has no effect. The implementation does not allow the package SYSTEM to be modified by means of pragmas; however, the same effect can be achieved by recompiling SYSTEM with altered values.

pragma suppress is recognized by the implementation and applies from the point of occurrence to the end of the innermost enclosing block. The double parameter form of the

pragma, with a name of an object, type, or subtype is recognized, but has no effect.

pragma system_name is recognized by the implementation but has no effect. The implementation does not allow the package SYSTEM to be modified by means of pragmas; however, the same effect can be achieved by recompiling SYSTEM with altered values.

4. Implementation-Defined Pragmas

pragma share_body is used to indicate a desire to share or not share an instantiation. The pragma may reference the generic unit or the instantiated unit. When it references a generic unit, it sets sharing on/off for all instantiations of that generic, unless overridden by specific SHARE_BODY pragmas for individual instantiations. When it references an instantiated unit, sharing is on/off only for that unit. The default is to share all generics that can be shared, unless the unit uses PRAGMA IN_LINE.

pragma share_body is only allowed in the following places: immediately within a declarative part, immediately within a package specification, or after a library unit in a compilation, but before any subsequent compilation unit. The form of this pragma is:

pragma SHARE_BODY (generic_name, boolean_literal)

Note that a parent instantiation is independent of any individual instantiation, therefore recompilation of a generic with different parameters has no effect on other compilations that reference it. The unit that caused compilation of a parent instantiation need not be referenced in any way by subsequent units that share the parent instantiation.

Sharing generics causes a slight execution time penalty because all type attributes must be indirectly referenced (as if an extra calling argument were added). However, it substantially reduces compilation time in most circumstances and reduces program size.

5. Implementation-Dependent Attributes

There are no implementation-dependent attributes in HAPSE 6024/1750A.

6. Implementation-Defined Attributes

The **'ref** attribute is used to obtain the address of an Ada program variable, label or subprogram. This attribute is only valid in the context of machine code insertion as defined in section 13.8 of the RM.

7. Package SYSTEM

Specification of the package SYSTEM

```
package SYSTEM is

   type ADDRESS is private  ;
   type NAME is ( Harris_6024_to_1750A ) ;

   SYSTEM_NAME      : constant NAME := Harris_6024_to_1750A ;

   -- System-Dependent Constraints

   STORAGE_UNIT     : constant := 16 ;
   MEMORY_SIZE      : constant := 1_048_576 ; -- Non-extended; 64K words

   -- System-Dependent Named Numbers

   MIN_INT          : constant := - 32_768 ;
   MAX_INT          : constant := 32_767 ;
   MAX_DIGITS       : constant := 9 ;
   MAX_MANTISSA     : constant := 31 ;
   FINE_DELTA       : constant := 2.0**(-23) ;
   TICK             : constant := 0.01 ; -- Unknown

   -- Other System-dependent Declarations

   subtype PRIORITY is INTEGER range 0 .. 15 ;

   MAX_REC_SIZE : integer := 32_767 ; ;

private

   type ADDRESS is new INTEGER;

end SYSTEM ;
```

8. Restrictions on Representation Clauses

8.1 Length Clauses

- The specification T'SIZE is not supported.
- The specification T'SMALL is not supported.

8.2 Record Representation Clauses

Component clauses must specify alignment on multiples of STORAGE_UNIT boundaries.

8.3 Address Clauses

Address clauses are supported as described in RM section 13.5. Variables which are not renames of other objects may be assigned a physical address with an address clause.

8.4 Interrupt Clauses

Interrupt clauses are supported as described in RM section 13.5.1.

8.5 Interpretation of Expressions in Address Clauses

The expression given in an address clause for an object denotes the actual physical memory address assigned to that object. Since SYSTEM.ADDRESS is an integer type the expression

must be of type UNIVERSAL_INTEGER.

8.6 Interpretation of Expressions in Interrupt Clauses

The expresion given in an interrupt clause for an object denotes the bit position in the 1750A Pending Interrupt Register of the actual interrupt. The UNIVERSAL_INTEGER expression given must be in the range 0 .. 15. Only the values in the set (2, 8, 10, 11, 13, 15) are valid. The rest of the interrupts are reserved for use by the RTS.

8.7 Other Representation Implementation-Dependencies

- Change of representation is not supported for record types.
- The ADDRESS attribute is not supported for the following entities: static constants; packages; tasks; and entries.
- There are no implementation generated names.

8.8 Restrictions on Unchecked Conversions

The predefined generic function UNCHECKED_CONVERSION cannot be instantiated with a target type that is an unconstrained array type or an unconstrained record type with discriminants.

9. Implementation Characteristics of I/O Packages

9.1 Interpretation of Strings as Applied to External Files

The present implementation does not support any external files.

9.2 Interpretation of Strings as Applied to Form Parameters

The present implementation does not support any external files. Form parameters are ignored since all opens of external files result in the exception USE_ERROR being raised.

9.3 Implementation-Dependent Chacteristics of DIRECT_IO

The present implementation does not support any external files. DIRECT_IO can be instantiated but all opens of external files raise the exception USE_ERROR.

9.4 Implementation-Dependent Characteristics of SEQUENTIAL_IO

The present implementation does not support any external files. SEQUENTIAL_IO can be instantiated but all opens of external files raise the exception USE_ERROR.

APPENDIX C

TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

Name and Meaning	Value
$BIG_ID1 Identifier the size of the maximum input line length with varying last character.	(1..498 =>'A', 499 =>'1')
$BIG_ID2 Identifier the size of the maximum input line length with varying last character.	(1..498 =>'A', 499 =>'2')
$BIG_ID3 Identifier the size of the maximum input line length with varying middle character.	(1..249 | 251..499 =>'A', 250 =>'3')
$BIG_ID4 Identifier the size of the maximum input line length with varying middle character.	(1..249 | 251..499 =>'A', 250 =>'4')
$BIG_INT_LIT An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.	(1..496 =>'0', 497..499 =>"298")

TEST PARAMETERS

Name and Meaning	Value
$BIG_REAL_LIT A real literal that can be either of floating- or fixed-point type, has value 690.0, and has enough leading zeroes to be the size of the maximum line length.	(1..493 =>'0', 494..499 =>"69.0E1"
$BLANKS A sequence of blanks twenty characters fewer than the size of the maximum line length.	(1..479 =>' ')
$COUNT_LAST A universal integer literal whose value is TEXT_IO.COUNT'LAST.	32767
$EXTENDED_ASCII_CHARS A string literal containing all the ASCII characters with printable graphics that are not in the basic 55 Ada character set.	"abcdefghijklmnopqrstuvwxyz!$%?@[\]^`{}~"
$FIELD_LAST A universal integer literal whose value is TEXT_IO.FIELD'LAST.	32767
$FILE_NAME_WITH_BAD_CHARS An illegal external file name that either contains invalid characters, or is too long if no invalid characters exist.	./^BAD-CHARACTER
$FILE_NAME_WITH_WILD_CARD_CHAR An external file name that either contains a wild card character, or is too long if no wild card character exists.	./CE2102{254 C's}
$GREATER_THAN_DURATION A universal real value that lies between DURATION'BASE'LAST and DURATION'LAST if any, otherwise any value in the range of DURATION.	100_000.0
$GREATER_THAN_DURATION_BASE_LAST The universal real value that is greater than DURATION'BASE'LAST, if such a value exists.	10_000_000_000.0

Name and Meaning	Value
$ILLEGAL_EXTERNAL_FILE_NAME1 An illegal external file name.	./^ILLEGAL_EXTERNAL_FILE_NAME1
$ILLEGAL_EXTERNAL_FILE_NAME2 An illegal external file name that is different from $ILLEGAL_EXTERNAL_FILE_NAME1.	/no/such/directory/ILLEGAL_EXT_FILE_NAME2
$INTEGER_FIRST The universal integer literal expression whose value is INTEGER'FIRST.	-32768
$INTEGER_LAST The universal integer literal expression whose value is INTEGER'LAST.	32767
$LESS_THAN_DURATION A universal real value that lies between DURATION'BASE'FIRST and DURATION'FIRST if any, otherwise any value in the range of DURATION.	-100_000.0
$LESS_THAN_DURATION_BASE_FIRST The universal real value that is less than DURATION'BASE'FIRST, if such a value exists.	-10_000_000_000.0
$MAX_DIGITS The universal integer literal whose value is the maximum digits supported for floating-point types.	9
$MAX_IN_LEN The universal integer literal whose value is the maximum input line length permitted by the implementation.	499
$MAX_INT The universal integer literal whose value is SYSTEM.MAX_INT.	32767

TEST PARAMETERS

Name and Meaning	Value
$NAME A name of a predefined numeric type other than FLOAT, INTEGER, SHORT_FLOAT, SHORT_INTEGER, LONG_FLOAT, or LONG_INTEGER if one exists, otherwise any undefined name.	LONG_LONG_INTEGER
$NEG_BASED_INT A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX_INT.	16#FFFFFFFD#
$NON_ASCII_CHAR_TYPE An enumerated type definition for a character type whose literals are the identifier NON_NULL and all non-ASCII characters with printable graphics.	(NON_NULL)

APPENDIX D

WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 19 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

- C32114A: An unterminated string literal occurs at line 62.
- B33203C: The reserved word "IS" is misspelled at line 45.
- C34018A: The call of function G at line 114 is ambiguous in the presence of implicit conversions.
- C35904A: The elaboration of subtype declarations SFX3 and SFX4 may raise NUMERIC_ERROR instead of CONSTRAINT_ERROR as expected in the test.
- B37401A: The object declarations at lines 126 through 135 follow subprogram bodies declared in the same declarative part.
- C41404A: The values of 'LAST and 'LENGTH are incorrect in the if statements from line 74 to the end of the test.
- B45116A: ARRPRIBL1 and ARRPRIBL2 are initialized with a value of the wrong type--PRIBOOL_TYPE instead of ARRPRIBOOL_TYPE--at line 41.
- C48008A: The assumption that evaluation of default initial values occurs when an exception is raised by an allocator is incorrect according to AI-00397.
- B49006A: Object declarations at lines 41 and 50 are terminated incorrectly with colons, and end case; is missing from line 42.
- B4A010C: The object declaration in line 18 follows a subprogram body of the same declarative part.

WITHDRAWN TESTS

- B74101B: The begin at line 9 causes a declarative part to be treated as a sequence of statements.

- C87B50A: The call of "/=" at line 31 requires a use clause for package A.

- C92005A: The "/=" for type PACK.BIG_INT at line 40 is not visible without a use clause for the package PACK.

- C940ACA: The assumption that allocated task TT1 will run prior to the main program, and thus assign SPYNUMB the value checked for by the main program, is erroneous.

- CA3005A..D (4 tests): No valid elaboration order exists for these tests.

- BC3204C: The body of BC3204C0 is missing.
