APPROVED FOR PUBLIC RELEASE; DISTRIBUTION IS UNLIMITED

FOREWORD

This directory lists research publications produced by the Naval Environmental Prediction Research Facility (NEPRF) since the command was established in 1971. Abstracts of the last calendar year's publications also are provided.

The following identification information is given:

- (1) Report number assigned by NEPRF;
- (2) Government accession (AD) number where assigned;
- (3) Date of publication;
- (4) The publication's title, author(s), and number of pages

Publications are listed in sequence by type (see key to letter prefixes on first page of listings), report number, and year published.

Requests for copies of individual publications for official use may be directed to:

Commanding Officer
Attn: Technical Library
Naval Environmental Prediction Research Facility
Monterey, CA 93943-5006

While in print, copies of publications will be supplied from stocks on hand. An asterisk (*) by a report's number indicates the publication is out of print and no longer available for distribution from NEPRF.

Registered, qualified users may request copies from:

Director
Defense Technical Information Center (DTIC)
Cameron Station
Alexandria, VA 22314

Others may purchase copies (paper or microfiche) from:

National Technical Information Service (NTIS)
U.S. Department of Commerce
Springfield, VA 22151

Prices are available upon request from NTIS.

(Note: When ordering copies from DTIC or NTIS, cite the Government accession (AD) number where assigned.)

TR 87-01, July 1987: Meteorological Radar and Its Usage in the Navy -- Dr. L. Hembree, Jr. -- 67 pp.

The basic principles of radar meteorology are presented along with the current capabilities of meteorological radars. Factors that need to be examined when evaluating a radar for meteorological applications are also discussed. The current use of radars for meteorological measurements within the Navy is presented along with possible future applications. It is concluded that Doppler meteorological radar data could have a significant impact on Naval operations. It is recommended that the replacement for the FPS-106 have Doppler capability with at least intensity and velocity displays. It is further recommended that the radar have the capacity to apply various application algorithms to the data. The ability to process weather information should be added to suitable afloat tactical radars.

TR 87-04, December 1987: Temperature Profile Construction Methods: An Evaluation -- W. Thompson -- 66 pp.

A method for obtaining atmospheric temperature profiles in data sparse areas is to extract temperature from numerical weather prediction model analysis fields at mandatory levels. An important component of this technique is the near surface air temperature, which can be obtained either from the numerical model's extrapolated mean planetary boundary layer temperature or from an analysis of the observations. In an effort to determine which of these two values gives the most representative profile, comparisons were made between profiles constructed from Fleet Numerical Oceanography Center (FNOC) fields and ship soundings from weather station ships in the North Atlantic. Although both profiles compared favorably to the soundings in many cases, the analysis field provided more representative estimates of atmospheric stability than the model-derived near surface air temperature.

TR 87-05, December 1987: The Surface Evaporative Duct Height Product:
An Evaluation -- W. Thompson -- 55 pp.

The global surface evaporative duct (SED) height field is produced operationally at the Fleet Numerical Oceanography Center (FNOC) by the global surface contact layer interface (GSCLI) model. An evaluation of the quality of the product and an analysis of the GSCLI SED algorithm were conducted. Results indicate that there is a considerable geographical bias in the quality of the product. The expression used to compute duct height contains several simplifications and produces unrealistic values for duct height under certain conditions. It is recommended that a different expression be adopted for duct height determination when the surface layer is stable.

Common Abstract:

This handbook for the port of ((name of port)), one in a series of severe weather guides for Mediterranean ports, provides decision-making guidance for ship captains whose vessels are threatened by actual or forecast strong winds, high seas, restricted visibility or thunderstorms in the vicinity. Causes and effects of such hazardous conditions are discussed. Precautionary or evasive actions are suggested for various vessel situations. The handbook is organized in four sections for ready reference: general guidance on handbook content and use; a quick-look captain's summary; a more detailed review of general information on environmental conditions; and an appendix that provides oceanographic information.

CR 87-07, April 1987: Determining Large Scale Tendency Terms for the Navy Over-Water Local Atmospheric Prediction System (NOWLAPS) -- P. Ardanuy, L. Penn -- 69 pp.

A manual method for calculating large scale tendency (LST) terms for the Navy Over-Water Local Atmospheric Prediction system (NOWLAPS) is adapted from an automated, central-site method utilizing forecast fields from the Navy Operational Global Atmospheric Prediction System (NOGAPS). This report describes the design and use of the LST terms, and compares NOWLAPS predictions for an oceanic weather station ship to those of the Navy Operational Local Atmospheric Prediction System (NOLAPS) and persistence. NOWLAPS, a one-dimensional planetary boundary layer (PBL) model, is designed primarily for shipboard use and was adapted to the Hewlett-Packard 9845 computer under a previous contract. Although it can be run as a single-station PBL forecast model, NOWLAPS can not be a competitive forecast tool until horizontal advection is included or parameterized.

CR 87-08, April 1987: Determining Large Scale Tendency Terms for NOWLAPS: Users Guide -- P. Ardanuy, L. Penn -- 25 pp.

Procedures are described for manually computing the large scale tendency (LST) terms for NOWLAPS, a one-dimensional planetary boundary layer model designed for shipboard use. A description of the design and testing of the LST method is provided in NAVENVPREDRSCHFAC Contractor Report CR 87-07, Determining Large Scale Tendency Terms for the Navy Over-Water Local Atmospheric Prediction System (NOWLAPS).

CR 87-09, April 1987: Tropical Cyclone Readiness Conditions Setting Aids -- J. Jarrell -- 62 pp.

A procedure to set tropical cyclone readiness conditions with a high degree of reliability is described. Where possible, threshold values for 90% and/or 95% confidence are given for 50 kt tropical cyclone and typhoon (hurricane) readiness conditions. The methodology used a large number of computer-simulated forecasts for actual typhoons (hurricanes) that passed near Yokosuka, Buckner Bay, Apra Harbor, Cubi Point, or Pearl Harbor. Wind probabilities were computed from these forecasts assuming present-day forecast error characteristics, and were compared to estimates of actual winds. These data were used to establish tropical cyclone condition thresholds at desired levels of confidence as related to wind probability.

CR 87-10, June 1987: Recent Colorado State University Tropical Cyclone Research of Interest to Forecasters -- W. Gray -- 116 pp.

This report discusses new tropical cyclone research being conducted at Colorado State University, research which may be used as background information by tropical cyclone forecasters. Observational findings and speculations from a recent research project are presented, addressing: (1) various climatological characteristics of tropical cyclones; (2) tropical cyclone formation; (3) tropical cyclone structural variability; (4) tropical cyclone intensity change; and (5) tropical cyclone outer radius wind distribution.

CR 87-12 (printing delayed to 1988): Forecasters Handbook for Japan and Adjacent Sea Areas -- R. Englebreton, R. Gilmore -- 571 pp.

Weather conditions for the Sea of Japan, East China Sea, Yellow Sea, Sea of Okhotsk, Philippine Sea and western North Pacific Ocean (W of 160 deg E) are examined. Each of these regions is addressed separately with information directed toward operational forecasters. A general overview chapter provides seasonal climatology charts for the entire area. In most cases, satellite imagery examples are included in discussions of particular weather conditions. These examples provide references for various seasonal atmospheric and oceanic synoptic scale features. Also included are numerous forecast rules that have direct application to naval operational planning. Appendices provide information on local geographic terminology, tropical cyclones, and superstructure icing.
