CHAPTER 1

Introduction

This document is volume II of an M. Phil. thesis representing a text generation system. This portion contains detailed system software listings for the interested implementor. All code is clean and simple to understand. Mnemonic variables and function names pervade the software.

1.1 Software Methodology

The software methodology adopted follows from the top-down refinement approach to structured programming. System modularity together with localisation of procedures combine to provide efficiency and consistency. Furthermore, global variables are minimised, iterative constructs are replaced with elegant tail recursion, and goto statements are forbidden. This good programming practise, consistent throughout the generation system, should make the code very accessible and, hopefully, reusable with minimal effort. Where primitive functions were repeated frequently, macros were developed for rapid execution.

1.2 System Organisation

The software is listed according to the flow of information in the system. First, the main module, which loads in all the sub-modules, is presented. Following this are the mechanisms which interface the linguistic representations with the underlying knowledge representation. Then text strategies are illustrated followed by software for semantic, relational and syntactic analysis. A significant investigation was performed on the development of a successful focus selection algorithm, which is also presented.

The generation module has a feature dictionary system together with unification routines for the comparison of syntactic features and generation of well formed grammatical constituents. Finally, the realisation routines are presented (including linearisation, morphological synthesis and orthographic formatting). The knowledge sources for testing are presented followed by some system output.

All software is well documented and includes a title, purpose, copywrite, and often a linguistic theory or principle behind the code. Each function is described in English so that even hacker's who speak dialects other than LISP can understand.

1.1 Software Methodology

The software methodology adopted follows from the top-down refinement approach to structured programming. System modularity together with localisation of procedures combine to provide efficiency and consistency. Furthermore, global variables are minimised, iterative constructs are replaced with elegant tail recursion, and goto statements are forbidden. This good programming practise, consistent throughout the generation system, should make the code very accessible and, hopefully, reusable with minimal effort. Where primitive functions were repeated frequently, macros were developed for rapid execution.

1.2 System Organisation

The software is listed according to the flow of information in the system. First, the main module, which loads in all the sub-modules, is presented. Following this are the mechanisms which interface the linguistic representations with the underlying knowledge representation. Then text strategies are illustrated followed by software for semantic, relational and syntactic analysis. A significant investigation was performed on the development of a successful focus selection algorithm, which is also presented.

The generation module has a feature dictionary system together with unification routines for the comparison of syntactic features and generation of well formed grammatical constituents. Finally, the realisation routines are presented (including linearisation, morphological synthesis and orthographic forming). The knowledge sources for testing are presented followed by some system output.

All software is well documented and includes a title, purpose, copywrite, and often a linguistic theory or principle behind the code. Each function is described in English so that even hacker's who speak dialects other than LISP can understand.

GENNY'S KNOWLEDGE AND PROCESSES

FUNCTIONAL LINGUISTIC FRAMEWORK

GENNY -- Generation Process

Select Text Structure

Determine Discourse Goal

Focus Globally on Relevant Knowledge

Create a Knowledge Vista

Instantiate Rhetorical Predicates using KB

Focus Locally on Connected Knowledge

Select Rhetorical Predicates

**Transform Rhetorical Proposition
to Deep Case Structure**

Make Surface Decisions constrained by Pragmatics

Universal Language Representation for Portability

Sentential Realization

lexical translation of knowledge base predicates

unification with grammar

linearization

morphological generation

orthographic synthesis

SECTION 2

MAIN MODULE

```

////////////////////////////////////
;
; MODULE: TEXT GENERATOR -- MAIN MODULE
; PURPOSE: To generate text from a frame based expert system for
; diagnosis of brain disorders.
; The system employs text structures and focus mechanisms
; to synthesize well focused and coherent text.
; The system can be viewed as consisting of a strategic and
; tactical component.
;
; STRATEGIC: KB query --> Text Structures --> Rhetorical Predicates
;
; TACTICAL: Messages
; --> Deep Case
; --> Relational Grammar
; --> GPSG Unification Grammar with Features & Function
; --> Linearizer
; --> Morphology and Orthography
;
; LINGUISTIC
; PRINCIPLES: Analysis of human produced text suggests that individuals
; utilise common strategies of discourse to achieve a
; particular discourse goal. They are constrained in realising
; this discourse plan by choosing knowledge salient to the
; discourse topic as well as uttering acts which are connected
; via their focus of attention as well as their role in the
; text (as suggested by content, verb choice, and lexical
; connectives). GENNY addressed three discourse goals:
; DEFINE, EXPLAIN, and COMPARE. Furthermore, the generator
; suggests a representation which holds promise to be
; independent of text-type, domain, knowledge formalism and
; (possibly) language.
;
; OWNER: copywrite Mark T. Maybury, May, 1987.

MODULE: IO -- LISP INPUT/OUTPUT TOOLBOX
PURPOSE: To facilitate the development of user interfaces.
```

TERMINAL PRINTING FUNCTIONS

```
(print-list list &optional punctuation)
(print-sentence sentence &optional punctuation)
(blank number-of-lines)
(space number-of-spaces)
(tell-user message &optional numblanksbefore numblanksafter spacesbefore)
(print-list list-of-items)
(writein list-of-strings-atoms-lists-or-numbers)
(print-list-commas-and list-of-items)
```

```
FUNCTION: all-but-last
PURPOSE: To return all but the last item in a given list.
INPUT: list
OUTPUT: list minus the last element
```

```
(define (all-but-last list)
  (cond ((null (tail list)) nil) ; tail empty --> nil
        (t (append (list (head list)) ; attach head of list to
                     (all-but-last (tail list)) ; all but last of tail
                  )
        )
  )
)
```

```
FUNCTION: length-characters
PURPOSE: To return the length of the characters (plus 1 space between)
in a given list.
```

```
(define (length-characters lyst)
  (cond ((null lyst) 0)
        (t (+ (length (explode (head lyst))) ; length of first
               (length-characters (tail lyst)) ; length of rest
               1 ; space between words
              )
        )
  )
)
```

```
FUNCTION: print-list
PURPOSE: To print out a list of atoms with a space between each
followed by proper punctuation if requested.
INPUT: list of words
OUTPUT: Words separated by one space, with no spaces at end.
AIDED BY: my-patom == prints the given atom
          last == returns the last item in a list.
```

```
(define (my-patom atom) (patom atom) (princ " "))
```

```
(define (print-list lyst &optional punctuation)
  (mapc 'my-patom (all-but-last lyst) ; space after all but last
        (patom (car (last lyst))) ; print the last one
        )
  (cond ((eq punctuation 'space) (princ " ")) ; punctuate properly
        ((eq punctuation 'period) (princ ".")) ; - put a space at the end
        ((eq punctuation '?') (princ "?")) ; - period if selected
        )
  )
)
```

```

((eq punctuation '!') (princ "!"))      ; - exclamation
)

;
;
; *****
; FUNCTION: writeln and writeout
; PURPOSE: To output a list of atoms, numbers, lists and strings with
;          proper spacing and punctuation, as requested.
; INPUT:   A list of output and optional punctuation.
; OUTPUT:  Nice Pascal like output.
;
; *****

(defun writeln fexpr (outputlist)
; *****
; (writeout outputlist)      ; call writeout fexpr

```
*****
;
; PROGRAM: STACK
; AUTHOR: Mark Thomas Maybury
; DATE: November 17 1986
; PURPOSE: To keep track of stack operations.
;
; NB: stack is considered to be a global variable!
;
*****
```

```
*****
;
; FUNCTION: initialise-stack
; PURPOSE: To initialise a stack so that it can be used with my-push and
; my-pop routines. Note that unless you initialize a stack, you
; may get unwanted errors. For example, if you try to pop an
; uninitialized stack before pushing anything on it, you will
; get a lisp level error.
; INPUT: A symbol representing a stack.
; OUTPUT: Nothing, but side effect is setting stack to nil.
;
*****
```

```
(defmacro initialise-stack (stack)
;*****
; '(setq ,stack nil) ; set to nil
;)
```

```
*****
;
; FUNCTION: my-push
; PURPOSE: To push a given element onto a given stack.
; If the stack is empty, make it the list of give item.
; Otherwise add the element to the current stack by using cons.
; INPUT: Item and stack
; OUTPUT: Rebinds global variable.
;
*****
```

```
(defmacro my-push (item stack)
;*****
; '(setq ,stack (cons ,item ,stack)))
```

```
*****
;
; FUNCTION: my-pop
; PURPOSE: To pop an item off a stack.
; INPUT: stack
; OUTPUT: First element on list or nil if none.
;
*****
```

```
(defmacro my-pop (stack)
;*****
; '(progn
;   (car ,stack)
;   (setq ,stack (cdr ,stack))
; )
```

```
(defmacro my-pop2 (stack) ; does same thing somewhat less elegantly

////////////////////////////////////
//
// MODULE: TRACK
// PURPOSE: To provide special tracing capabilities for the programmer.
//
////////////////////////////////////

:*****
:
: FUNCTION: TRACK
: PURPOSE:
:         TRACK is a built-in debugging and trace mechanism which
:         allows the program developer and user to trace the functional
:         workings of the software. This offers more flexibility and
:         greater ease of use (and more control) than the built-in
:         lisp TRACE function. The level of tracking can be altered
:         with each run, dynamically allowing multiple levels of tracking.
:         If level-desired is greater than threshold required for a
:         message to print out, then print it. A blanking routine is
:         also provided.
:
:         FUTURE --> let message be a body or executable code. (macro or fexpr?)
:*****

(define (track level-desired threshold message &optional blanks spaces-before)
  (cond
    ((>= level-desired threshold) ; above threshold?
     (cond (spaces-before (space spaces-before)); spaces? spaces-before
           (print-list message) ; print message
           (cond (blanks (blank blanks)) ; blank blanks, if selected
                 (t (blank 1)) ; default to 1
                )
            )
    )
  )

(define (track-blank level-desired threshold number-of-blanks)
  (cond
    ((>= level-desired threshold) ; if above threshold
     (blank number-of-blanks) ; blank number of lines
    )
  )

(define (track-space level-desired threshold number-of-spaces)
  (cond

TEXT MODULE

```

////////////////////////////////////
MODULE: DISCOURSE SCHEMA
PURPOSE: To make discourse decisions on what to say next constrained
         by available knowledge (from global focus constraints), the
         discourse goal, and local focus constraints.
         To instantiate rhetorical predicates and send them to tactical
         component.
OWNER:  copywrite Mark T. Maybury, June, 1987.
        $Header: text.1,v 1.1 87/08/25 01:11:59 mtm Exp $
////////////////////////////////////

```

```

-----
FUNCTION: MAIN
PURPOSE: to begin GENNY after initialization by determining the
         discourse goal which is characterized by what we are going to
         talk about (discourse focus) and how we are going to talk about
         it (discourse structure).

```

```

LINGUISTIC
PRINCIPLES: This module exploits knowledge of common discourse strategies
            together with global and local focus constraints to generate
            and then realize text for a provided discourse goal (e.g.
            define, explain, compare) and discourse focus (e.g. frame).

            First a theme-scheme is generated, built up by sub-scheme
            and their corresponding rhetorical predicates. Next, a
            vista of salient knowledge is selected from the knowledge
            base, guided by the discourse topic. Then, globally
            constrained by this knowledge vista, a pool of relevant
            propositions is generated. GENNY then steps through the
            theme-scheme, selecting propositions from the available pool
            guided by a local focus model. These are realized by a
            tactical component which makes use of focus and context
            to determine sentence structure and referring expressions,
            and word choice (e.g. voice, anaphora, and articles).
            The propositions are realized by a threefold process
            including semantic interpretation, generation of relational
            constituents, and building of a syntactic tree. The final
            surface form is determined by morphological and orthographic
            procedures. GENNY does not give up (or crash) if she fails
            at any one of these stages. Instead, she degrades gracefully
            by attempting to say anything that she can within the
            boundaries of the global and local constraints.)

SECTION 6

RHETORICAL PREDICATE SEMANTICS

```

////////////////////////////////////
;
; MODULE: PREDICATE SEMANTICS
; PURPOSE: To associate the individual rhetorical predicates with the
; frame based knowledge representation.
; NOTE: While these semantics are domain-independent, easily ported
; to any domain represented in a frame network, they are
; knowledge representation specific. Porting the generator
; to another KR scheme (logic, for example) would require a new
; semantic link into that representation. Hence, this module
; would be replaced.
; OWNER: copywrite Mark T. Maybury, June, 1987.
;
; LINGUISTIC
; MOTIVATION: It seems that discourse can be elegantly described in
; terms of rhetorical acts or predicates which serve as
; text-type independent building blocks of larger discourse.
; This stems from work by early grammarians (c.f. Williams,
; 1893), more recently investigated by Grimes (1975), with
; related speech-act work by Searle (1969, 1975). McKeown's
; (1985) work, a major contribution to text structure
; definition, motivates these predicates, although the
; discourse goals in GENNY include explanations in addition
; to definitions and comparisons. More importantly, the
; predicates presented below -- definition, attributive,
; constituent, evidence, illustration, cause-effect,
; compare-contrast, and inference -- are interfaced to a
; frame knowledge formalism, as defined by the following
; predicate semantics.
;
////////////////////////////////////

```

```

;;; RHETORICAL PREDICATE + SEMANTICS + KNOWLEDGE BASE ==> PROPOSITION

-----
FUNCTION: mark-as-used
PURPOSE: to mark one or a number of frames as used for a particular rhetorical purpose. This device acts as a discourse context which records past utterances. This can aid in resolving focus selection when such a choice is ambiguous.
THEORETICAL
MOTIVATION People don't normally repeat themselves in discourse unless they wish to achieve a peculiar effect (eg emphasis, conversational implicature, etc). Thus, record past usages of a particular knowledge chunk so that it is not repeated later in the discourse.
MECHANISM: The frame slot called "discourse-context" is marked with the symbol representing the rhetorical predicate type (eg illustrative or constituent). When the pool of knowledge is being constructed, this field is tested and no proposition is generated for a particular rhetorical predicate if that utterance has already occurred in the discourse.
-----

SECTION 7

FOCUS AND ANAPHOR ALGORITHMS

```

////////////////////////////////////
;
; MODULE: FOCUS
; PURPOSE: To determine and utilize both global and local focus
;          constraints to enhance relevancy of knowledge and
;          connectivity of discourse.
; OWNER:  copywrite Mark T. Maybury, June, 1987.
;          $Header: focus.1,v 1.1 87/08/25 01:09:59 atm Exp $
;
////////////////////////////////////

```

GLOBAL FOCUS THEORY

```

; Motivated by Barbara Gross's theory of global focus, declare a knowledge
; vista which encompasses the given frame, its parent, and children. A
; more sophisticated mechanism (beyond the scope of this dissertation)
; could incorporate user modelling to select relevant knowledge with
; regard to the level of sophistication of the audience. Furthermore, a
; discourse model could suppress or encourage certain pieces of information
; with regard to previously generated text.

```

```

; The use of the diction "knowledge vista" illustrates the connection with
; the FRL approach to knowledge representation. In this paradigm,
; knowledge is most perpicuous when viewed from some relevant vista.
; Here, knowledge in global focus is the relevant vista.
;

```

```

; FUNCTION: select-knowledge-vista
; PURPOSE: to select a vista within the knowledge base which reflects the
;          knowledge relevant to the global-focus(i).
; METHOD:   utilize the frame hierarchy to place the superordinate and
;          subordinate classes of the frames into the knowledge vista.
;          Also, siblings of frames are placed in implicit vista or focus.
; LINGUISTIC
; THEORY:  Humans place not only individual entities but also multiple
;          entities in focus simultaneously. This is the case, for
;          example, when conversants discuss two items in parallel, as in
;          comparison.
;

```

```

(define (select-knowledge-vista frames)
  (let
    ((frames-vista
      (append
        frames ; frames vista consists of
        (apply 'append (mapcar 'children frames)) ; frames in focus
        (apply 'append (mapcar 'parents frames)) ; their children
        (apply 'append (mapcar 'parents frames)) ; their parents
      )
    )
    (mapcar 'place-in-vista frames-vista) ; mark knowledge vista
    (mapcar 'implicit-vista
      (apply 'append (mapcar 'siblings frames))) ; mark implicit knowledge vista
      ; (could mark two levels away)
    (cond
      ((listp frames) (cons frames frames-vista)) ; multiple global foci? add to kvista
      (t frames-vista) ; return kvista
    )
  )
)

```

```

; FUNCTION: in-vista?
; PURPOSE: to determine if a given frame is in global focus (in K vista).
;

```

```

(define (in-vista? frame)
  (cond ((eq (relevance frame) 'in-vista))))

```

```

; FUNCTION: implicit-vista?
; PURPOSE: to determine if a given frame is implicitly in focus.
;

```

```

(define (implicit-vista? frame)

```

```

;-----
; (cond ((eq (relevance frame) 'implicit-vista))))
;-----

;-----
; LOCAL FOCUS THEORY
;-----

; PF == past foci list
; CF == current focus
; FF == potential future foci list

; Attentional shift algorithm (motivated by Candace Sidner's work).
; if choice between PF or CF, prefer CF (to continue present topic)
; if choice between CF or FF, prefer FF (to introduce new topics)

; INSIGHT
; if possible, stick to topic unless future role is illustration, then PF
; otherwise, allow digression from topic for one level,
; then return to topic.
;-----

; FUNCTION: select-proposition
; PURPOSE: to select a proposition based on local focus constraints.
; METHOD: Sidner's algorithm modified for generation purposes.
; Furthermore, the proposition that is used is marked in the
; as a discourse context so it won't be repeated.
;-----

(define (select-proposition choices PF CF FF)

SECTION 8

TRANSLATE MODULE

```

////////////////////////////////////
;
;
; MODULE: TRANSLATE
; PURPOSE: To translate a rhetorical predicate into a case structure which
; is transformed into a syntax tree by unifying with GPSG
; + features
; OWNER: copywrite Mark T. Maybury, June, 1987.
;
; REPRESENTATION:
; Predicate -> Focus -> Case -> Relations -> GPSG -> Orthographic
;
; FUNCTIONAL ANALYSIS:
; Discourse -> Pragmatic -> Semantic -> Relational -> Syntactic -> Surface
;
; LINGUISTIC
; PRINCIPLES: The following code implements the translation of the
; message formalism -- rhetorical predicates -- onto surface
; form. This mapping is motivated by recent insights in
; discourse analysis (c.f. Perlmutter, 1980 and Fillmore,
; 1977) which suggest the need for a distinct level of
; grammatical representation in terms of relational
; constituents (e.g. subject, object, predicate). This theory
; is supported by the success of interpreters exploiting
; relational knowledge (e.g. GUS (Bobrow, 1977)) and the
; insufficiency of some tactical generators (e.g. Mckeown,
; 1985) which do not take sufficient account of relational
; ideas. With this in mind, GENNY first semantically
; interprets a rhetorical predicate into a case formalism
; (c.f. Fillmore, 1977, Sparck-Jones and Boguraev, 1987),
;
; the builds relational constituents (Perlmutter, 1980), and
; finally constructs a syntax tree with GPSG (Gazdar, 1982).
; Trees are linearized, and final utterances are produced
; by morphological and orthographic routines.
;
;
;
////////////////////////////////////
;
; FUNCTION: translate
; PURPOSE: to decide on syntactic, semantic, and pragmatic function.
;
;

-----
; FUNCTION: assign-syntax-function
; PURPOSE: To unify a lexical list with the given grammar and produce a
;          consistent and well-featured syntax tree.
; METHOD: Utilizes a chart data structure which acts as a well-formed
;         substring table containing all the possible structures.
;         First the routine generate-tree generates the chart.
;         At the end of the unification process, the tree generation
;         procedure returns a list of possible edges which represent
;         all the possible ways to realize the given input. The
;         procedure output-parses-features retrieves the successful
;         realizations from the chart by consistently percolating
;         features up the edges which constitute the tree.
;         As in interpretation, there may be more than one possible way
;         to realize a given structure.
-----

RELATIONAL GRAMMAR MODULE

```

////////////////////////////////////
;
; MODULE: RELATIONAL GRAMMAR
; PURPOSE: To make decisions on the relations and determining of
; constituents given semantic (ie role) information as well
; as pragmatic information.
; OWNER: copywrite Mark T. Maybury, June, 1987.
;
; LINGUISTIC
; PRINCIPLES: This code is motivated by relational grammar (Perlmutter,
; 1980), which suggests interpretation and generation requires
; a distinct level of representation between syntax and
; semantics. Furthermore, this theory shows some promise
; in language portability. The syntactic experts which
; build relational constituents are constrained by pragmatic
; (e.g. given/new context and focus) as well as syntactic
; knowledge. While these syntactic experts are language
; dependent, and would therefore need to be rebuilt for a new
; target language, the relational constituents which they
; represent have shown promise in universality (c.f. Cole
; and Sadock, 1977).
;
////////////////////////////////////

```

```

-----
; FUNCTION: make-np
; PURPOSE: to generate a noun phrase based on the agent(s) given
; METHOD: Select lexical entry
; Generate NP
; INCOMING: ((brain)) -> (the brain)
; ((lobe lfrontal) (test language)) -> the lfrontal lobe & the
; ((lobe) (test)) -> the lobe and the test
; ((value test indef 1)) -> a damage value of one
; ((hemisphere two)) -> two hemispheres
-----

```

GENERATE MODULE

```

////////////////////////////////////
:
: MODULE: GENERATE COMPILE
: PURPOSE: To compile routines which perform syntactic generation.
: OWNER:  copywrite Mark T. Maybury, June, 1987.
: LINGUISTIC
: PRINCIPLE: This code loads the syntactic modules which use a unification
:            feature grammar together with lexical entries to generate
:            a well-formed syntactic tree. This eventually will be
:            linearised, and the syntactic categories will guide
:            selection of morphology.
:
:
:////////////////////////////////////

```

```

***** TREEPRINTER *****
;; prints a labelled bracketing out as a tree. If no second argument
;; is given, output is assumed to be the standard (i.e. terminal).
;; A second argument must evaluate to an output port:
;; (treeprint <tree> <port>)
;; Syntax of input is:

;; <tree> ::= (<node-label> <daughter*>)
;; <daughter> ::= <tree>
;;
;; terminals are the case where the node label is the only member of the tree
;; e.g.
;;
;; (treeprint '(s (np (n (joe))) (vp (v (likes)) (np (n (mary))
;;
;; Where node-labels are not atoms, the fn 'node-label' will need changing.
;;
;; NB maximum width governed by Franz defaults
;;; *****MAIN FNS*****

;; treeprint is a lexpr:

(defun treeprint (s optional (port nil))

  (setq s (make-tree-level s (find-max-depth s 0)))
  (setq s (replace-all-nodes s nil))
  (annotate-nodes-with-width-info s 0 nil)
  (treeprint-aux (list s) port nil)

  ; first the tree is adjusted so that all the terminals are at the same
  ; depth from the root. Dummy nodes are used to make the tree a uniform
  ; object. Both they and the actual nodes are replaced by gensyms, and attached
  ; to the gensym as a property by replace-all-nodes.
  ; 'annotate-nodes-with-width-info' goes down the tree
  ; recursively attaching to each node as a property its width:
  ; the number of characters in the widest symbol from it to the terminal
  ; it dominates (or sum of such if a branching node). This is used by the
  ; actual printing functions to centre each node properly.
  ;

  (def treeprint-aux
    (lambda (s port next)
      (if (setq next (print-nodes s nil port))
          then (print-downstrokes s port)

:-----
:  BRAIN KB contains a model of the brain which is organized as a hierarchy.
:  It is broken down into left and right hemispheres which are further
:  subdivided into local lobes. Each lobe has associated conditions (the
:  children frame) which are present when there is damage in that
:  particular lobe. The sibling frames of each of these conditions,
:  furthermore, are demons which calculate a probability from |1 to +1.
:  These demons are test results or professional observations which
:  indicate the presence or absence of the parent condition.

;*****
; BRAIN_KB.LSP contains a model of the brain which is organized as a
; hierarchy. It
; is broken down into left and right hemispheres which are further sub-
; divided into local lobes. Each lobe has associated conditions (the
; children frame) which are present when there is damage in that
; particular lobe. The sibling frames of each of these conditions,
; furthermore, are demons which calculate a probability from -1 to +1.
; These demons are test results or professional observations which
; indicate the presence or absence of the parent condition.

Welcome to the GENNY text generation system for expert systems.
GENNY was designed to answer questions of the form:

-- What is an X?
-- Why did you diagnose Y? or Why does Y have a problem?
-- What is the difference between X and Y?

where X and Y are entities within the provided knowledge base.

These three types of questions are indicated by the keywords:
DEFINE, EXPLAIN, and COMPARE, respectively.

Please enter the domain dictionary file name? neuropsychology.dict

SURFACE FORM

A brain is a region for understanding located in the human skull.
It has a relative importance value of ten.
It contains two regions: a left-hemisphere region and a right-hemisphere region.
The left-hemisphere region has a relative importance value of ten.
The right-hemisphere region has a relative importance value of ten.
The right-hemisphere region, for example, is a region for gestalt-understanding located in the right brain.

SURFACE FORM
```

```
A personality observation is an observation for stability-detection located in a patient.
It has a likelihood value of four.
A sex-activity observation is an observation for intrapersonal-behavior.
It has a likelihood value of four.
Personality and it have a different class, a similar type and a similar importance.
It and the sex-activity observation, therefore, are similar entities.

SURFACE FORM

A left-hemisphere is a region for feature-recognition located in the left brain.
It has a relative importance value of ten.
It contains five lobes: the left-frontal lobe, the left-parietal lobe,
the left-subcortex lobe, the left-temporal lobe and the left-occipital lobe.
The left-frontal lobe has a relative importance value of five.
The left-parietal lobe has a relative importance value of three.
The left-subcortex lobe has a relative importance value of five.
The left-temporal lobe has a relative importance value of eight.
The left-occipital lobe has a relative importance value of three.
It, for example, is a lobe for vision located in the human skull.

SURFACE FORM

An equipment fault is a fault with a physical function located in a camera. It has a relative importance value of three.

It contains three instruments: a camera instrument, a lighting instrument and a tripod instrument.

The camera instrument has a relative importance value of nine.

The lighting instrument has a relative importance value of ten.

The tripod instrument has a relative importance value of three.

It, for example, is an instrument with alluminum legs for camera support.

SURFACE FORM

Photography is an art-form for recording images on film.
It has a relative importance value of ten.
It contains three faults: an equipment fault, a technique fault and a style fault.
The equipment fault has a relative importance value of three.
The technique fault has a relative importance value of four.
The style fault has a relative importance value of nine.
It, for example, is a fault with personal expression.
