INTRODUCTION

→ The US Army Human Engineering Laboratory (USAHEL) has been designated as the US Army Materiel Command (AMC) lead Laboratory for robotics. One of the functions of this assignment is to monitor all of the robotic activities within AMC and to identify areas of overlap and voids in the robotics research and development program. The Director of USAHEL also serves as the Chairman of the Army, Navy, and Air Force Laboratory Directors' Joint Technology Panel on Robotics (JTPR). There is a requirement for the chairman to report periodically on the status of all robotic studies and projects throughout the three Services, exclusive of the Artificial Intelligence (AI) aspects which are being handled as a separate effort.

BACKGROUND

→ The US Navy has been assigned responsibility for the design and maintenance of a Tri-Service robotics data base. This data base is known as the Robotics/Artificial Intelligence Data Base (RAID). The primary source of input to RAID is the DoD Form 1498, "Research and Technology Work Unit Summary". A spot check revealed that many of the current and programmed robotic projects had not been reported on the DoD Form 1498. It was, therefore, determined that a one-time robotic survey of all DoD agencies and activities should be performed. The results of this survey would serve as the primary input for the Director, USAHEL's presentation to the JTPR and would also be used to update the RAID. Since the in-house USAHEL resources were fully committed on other priority tasks that could not be deferred, Armament Systems, Inc. (ASI) was tasked to conduct the survey and to develop a number of statistical summaries that would provide an overview of the entire DoD robotics effort to the JTPR.

OBJECTIVE

The objective of the task was to gather information on all of the research and development projects for the Army, Navy and Air Force, as related to robotics, and to develop an overview of the entire DoD robotics program, as well as some insights into any voids or duplications of effort. (KR) ←

DEFINITIONS/EXPLANATIONS

Because of the rapidity with which the robotic technology is expanding, new terms and applications are appearing in the literature almost on a daily basis. One can find any number of different versions of the basic definition of robotics, depending on whether it is being defined in terms of a manufacturing process, a general functional application or a military systems

application. Therefore, for a better understanding of the information contained in this report, the following definitions and program explanations are provided.

Robot. A system incorporating a computer controller to provide autonomy and reprogrammability which incorporates an end effector of some type (manipulator arm or mobile platform) which exhibits flexibility in the roles which it can perform or the equipment with which it interfaces, and which performs tasks of a complexity level which previously required human control.

Artificial Intelligence. The part of computer science that is concerned with symbol manipulation processes that produce intelligent action. By "intelligent action" is meant an act or decision that is goal oriented, arrived at by an understandable chain or symbolic analysis and reasoning steps and is one in which knowledge of the world informs and guides the reasoning.

Robotic Component Technologies. The application of scientific study and experimentation to specific parts, assemblages and interfaces of a robotic system which performs the basic robotic functions of intelligence, movement and control. Component technology areas can be subdivided into the following categories:

- **Manipulators.** Multi-degree of freedom structures designed to move materials, tools, or sensors through space and includes kinematic optimization techniques, selection of optimum materials and efficient actuators.

- **End Effectors.** Provide the means of interacting with work pieces--flexible, multifunctional. "SMART", i.e., sensor equipped grippers will provide most utility. The end effector is that end of arm tooling that the robot manipulates.

- **Sensors.** The devices such as photoelectric cells that receive and respond to the voice, touch or vision stimuli of a robotic system. Emphasis on means of reducing dependence on a structured working environment (includes acoustic ranging, touch, and force-torque).

- **Mobility/Navigation.** Concerned with the means of locomotion such as wheels, tracks, legs, which can include navigation systems, which incorporate sensor-based information to enable route planning or adhere to previously planned routes.

- **Control.** Controls are micro electronics based which provide means of autonomous action directly interfaced with actuators, servos, i.e., capacity for pre-programming provides means of interface with operator or higher echelons of control. They incorporate the capacity to accommodate to environmental change through processing of sensor-based information. The key

feature is the control of manipulator structural dynamics.

- Soldier/Machine Interface. Optimization of operator interface includes task allocation between operator and robot. It includes implementation of teleoperation, supervisory control (remote management) or fully autonomous, strategies information display. Maintainability and self diagnostics are critical features.

- Power Sources. Concerned with efficient sources of electrical or hydraulic power for extended duty cycles. Optimum interface with existing battlefield power sources and impact on logistics system are important considerations.

- Survivability. Survivability considerations include a wide range of ECM-ECCM-EMP resistant techniques and operational considerations. Robotic systems will require new survivability initiatives to maximize potential combat effectiveness gains from systems with very significant on-board computational capability and (with AI) decision making. Materials handling systems entail initiatives on hydraulics and servo control.

Robotic Technology Applications. The end use to which the technology is put. Within the Army, robotic technology is subdivided into the following major requirements categories.

- Autonomous Vehicles. Vehicles with an autonomous vision and navigation capability. This application requires significant developments in vision technology, as well as artificial intelligence for route planning and the accommodation of unexpected contingencies. These capabilities are significantly beyond the current state of the art. This is one of the reasons why the Defense Advanced Research Projects Agency (DARPA) selected autonomous vehicles as a test bedding area. Once developed, these systems will have a wide range of potential applications, but their dependence on technology, which is well beyond the present state of the art, removes them from serious consideration as near-term transition from tech base candidates. In the near term, teleoperation (remote control) has been proposed as an accessible alternative; however, the viability of the C³ link to the vehicle is highly tentative, and, in the case of tethered systems range, is severely limited. In any event, opportunities for systems of the teleoperated type more clearly appear in the Battlefield Systems category and will be addressed there.

- Materials Handling Systems - Field Oriented. Tech base requirements for robotic materials handling systems exist in areas such as sensor systems which will permit accommodation to environmental uncertainties, e.g., part positioning orientation, object recognition, etc. These requirements, though substantially more severe than the parallel requirements in the industry, are

made less risky due to the opportunities to constrain problem areas, e.g., one can program a vision system to recognize a relatively limited set of ammunition pallets in all stable configurations. Similar requirements for structural optimization of robot manipulators and grippers, as well as system computer controllers, exist. Technology to support most application requirements is either currently available (may still present system integration challenges) or could be developed at low to moderate risks through a focused tech base effort. These systems share a virtually common ground within the group tech base, i.e., the tech base to support an ammunition handling system would also be directly supportive of NBC decontamination applications and robotic vehicle refueling systems. Additional tech base issues include multifunctional end effectors (grippers), manipulator designs optimized kinematically and dynamically (incorporating advanced composite materials for improved payload to weight ratios), and integrated actuators to increase system efficiency, and reduce weight and vulnerability.

Battlefield Systems. Interest in the Battlefield Systems category should focus on systems without requirements for autonomous platforms. The high risk tech base required for autonomous vehicles properly places these systems in a separate category. A variety of non-autonomous vehicle based systems have been proposed and found to have substantial bases of interest, if not funding, in the Navy and Air Force. Army interest in these systems has focused on applications which involve teleoperation of heavy combat engineer vehicles for mine clearing operations (of which the ROBAT vehicle is a prime example) or much smaller systems, fixed or mobile, with a light weapon and/or sensor payload. The tech base for these systems is more diverse than that required for either of the above categories and is low to moderate risk in nature, depending on the specific application. Some of the key technical issues involved include low cost all weather vision, compact energy sources, fire control and discipline and moving target indicators. Many of the intermediate milestone tech products which are produced through the programs associated with the Autonomous Vehicle program will find application in the Battlefield Systems, e.g., advanced teleoperators and path planning navigation assistance. The Battlefield Systems application category provides more appropriate test-bed opportunities for these stepping stone technologies than the Autonomous Vehicle category since, if proven on a well chosen system with end item transition potential, transition into system acquisition can be expedited. This is in contrast to proposed autonomous vehicle technology demonstrations on systems which are developed as test-bed end items.

A key technical consideration which spans all three application categories is the assessment of man-machine task/function allocation. The appropriate apportioning of tasks to autonomous subsystems and system operators will ensure the

earliest possible transition from the tech base. The systems with requirements for the highest level of autonomy require the most tech base work and require substantially greater research and development resources and development times than those which, when feasible, utilize human operator involvement. Supervisory control (whereby an operator exerts direct control over a system only in the event of nonprogrammed contingencies) is a critical feature of optimum resolution which is a prerequisite for the most efficient pooling of operator and machine capabilities. Trade-off analyses based on these parameters will govern fielding costs and development times for the foreseeable future.

Industrial Applications. The current robotics technology effort within the US Air Force is oriented entirely towards the industrial applications, particularly the maintenance and repair of aircraft. The US Navy program is also focused primarily on manufacturing and includes several major robotic projects oriented towards the cleaning, repair and maintenance of ships and submarine hulls and operating equipment. Within the AMC, the industrial application of robotics is managed within the Manufacturing Methods and Technology (MAN TECH) program and is oriented primarily towards the depot maintenance and repair activities. It represents approximately 13% of the AMC 5-Year Robotics Program. Table 1 shows the industrial applications funding by Service by fiscal year.

TABLE 1

Industrial Applications Funding By Service
By Fiscal Year (Dollars In Thousands)

Service	FY84	FY85	FY86	FY87	FY88	FY89
Army	206	405	317	550	0	0
Navy	5,325	4,500	40,551	800	0	0
Air Force	12,741	9,648	8,776	4,068	2,000	2,000

METHODOLOGY

The Statement of Work called for a query of the Navy RAID, Defense Technical Information Center (DTIC) and NASA Technical Information Analysis Centers to obtain DoD Form 1498 and related information from such sources relative to the Army, Navy, and Air Force Research and Development efforts in robotics, including past, current and planned projects. These data were to be filtered to weed out that information pertaining purely to AI which was to be excluded from the effort. The data were then to be reviewed and clarified through personal visits and/or telephone discussions

with the data sources concerned.

Because of the results of the sampling of the RAID data base and based on a review of the information provided through a query of DTIC, it was determined that a onetime survey of the Services would be required to obtain a current and complete status of all robotic surveys. A survey form was developed, coordinated with USAHEL and forwarded to the Services for completion. The data resulting from this survey was used as the primary source for information which is contained in this report. The information was entered into a computer data base developed by ASI and the output of this program was used to develop the management displays and briefing charts which follow.

SCOPE OF SURVEY

Within the US Army, survey forms were forwarded to the four AMC corporate laboratories, the Army Research Office, the 27 separate major subordinate command laboratories, the Test and Evaluation Command, the Medical R&D Command, the Engineer Topographic Laboratory, the Development and Deployment Agency, and the Defense Advanced Research Projects Agency for a total of 39 requests for completion of survey forms. Responses were received from 37 organizations which represents a 95% response. Replies were not received from the Atmospheric Sciences Laboratory, White Sands Missile Range, NM, or the Electronics Technology and Devices Laboratory, Ft. Monmouth, NJ.

Survey forms were also forwarded to central points of contact for the US Navy, the US Marine Corps, and the US Air Force.

Appendix A contains a copy of the survey form and instructions for its preparation. Appendix B contains a copy of each of the Army, Navy, and Air Force individual computer printouts. TAB B-1 contains a summary printout of total Army financial data followed by individual summaries of projects and tasks by designated technology areas and technology application areas. Inasmuch as the Army portion of the survey results was also planned for use by the USAHEL as input for a briefing to the Deputy Commanding General for Research, Development and Acquisition, AMC, separate printouts were also provided for each performing AMC organization to include the major AMC subordinate commands and the separate corporate laboratories. A listing of each robotic project/task by each AMC organization was also provided and is included as part of TAB B-1.

TAB B-2 contains a summary printout of the total US Navy portion of the survey, including a financial summary followed by individual summaries of projects and tasks by designated technology and technology applications and TAB B-3 contains similar information for all US Air Force robotics projects.

RESULTS AND DISCUSSION

As shown in Table 2, a total of 32 separate organizations, excluding DARPA, are presently working on 95 separate projects. DARPA funded projects are shown as part of the respective military Services' submissions.

TABLE 2

Scope of Survey

Table 4 is a project title listing of Joint-Service projects with lead and supporting Service(s) as shown.

TABLE 4

Joint Service Projects

Reference Number	Project Title
A-85-20	Multimission Robotics - Light Mobile Robotic System (LMRS). Lead: US Army, Supporting: US Navy.
N-84-12	Robotic Microwave Hybrid Substrate Assembly. Lead: US Navy, Supporting: US Air Force.
N-84-17	Laser Paint Stripper. Lead: US Navy, Supporting: US Air Force and US Army.
N-84-18	Automated Aircraft Paint System. Lead: US Navy, Supporting: US Air Force.
N-85-26	Advanced Teleoperators. Lead: US Marine Corps, Supporting: US Navy and US Army.
F-85-13	General Purpose Robotic System. Lead: US Air Force, Supporting: US Army.

One of the questions on the survey form asked whether or not a DoD Form 1498 had been completed for each robotic project. It was interesting to note that out of the 52 project submissions by the US Army, only 24 or 46% reported that the required DoD Form 1498 had been completed. Of the 27 projects reported by the Navy, DoD Form 1498 had been completed on only 5 or 19%. None of the 16 projects reported by the US Air Force had the required DoD Form 1498 submitted.

SUMMARY OF SURVEY FINDINGS

Although the referenced task did not include a requirement for reporting any survey conclusions or recommendations, it was interesting to note that:

- Of the Army's 52 robotics projects, only two are funded in FY85 at a level in excess of one million dollars and only four in FY86.

- There is an apparent wide interest in autonomous-teleoperated vehicles in that there are 14 separate AMC projects in FY85 for a total funding of \$7.1 million which are concerned with autonomous-teleoperated vehicles.

- Of the 52 projects reported by the Army as active during the period 1984-1989, only nine projects show transition funding into 6.3B Advanced Hardware Development by FY89 and only three show 6.4 Engineering Development funds, which total only \$1.3 million, or less than 1% of the \$133.9 million total AMC robotics program FY84 - FY89.

- Based on a cursory review of the individual robotic survey submissions, there is an apparent overlapping of test bed efforts.

LESSONS LEARNED

- Based on the small number of projects (29 out of 95) wherein it was reported that DoD Form 1498 had been completed, as required by DoD Directive 7720.13, it is a very unreliable and misleading indicator of the robotics projects being performed by the military Services.

- Based on the extensive delays experienced in the completion of the survey forms by all three Services, notwithstanding the extensive follow-up effort put forth, it is apparent that future surveys to update the robotics data base will be ineffective and inefficient. Since the DoD Form 1498 is also ineffective as a source of information for updating a robotic data base, an alternative would be to establish a recurring report to obtain the specific data input requirements needed for the continued effective management and control of the DoD robotics program.

- Inasmuch as many technology base projects provide support to several basic technology areas, as well as having multitechnology applications, an improved taxonomy methodology is required to properly catalogue the projects so that they will be more supportive of robotic literature searches for related robotics work.

- Although the originally designed computer software program outputs were responsive in terms of satisfying the basic management display requirements, it has been determined that with minor modifications, significant improvements in providing timely ancillary information in support of management needs can be provided. These software modifications, when interfaced with a computer graphics program will make possible the timely publication of periodic technical progress and resource information report to enhance the robotics program decision making process at all levels of management. Armament Systems, Inc. (ASI) has started to make these software modifications and should have

them completed in the near future.

FUTURE CONSIDERATIONS

A. If the Director, USAHEL is to serve for another year as Chairman of the JTPR, immediate action is required to obtain approval for a recurring report to provide timely information required by the JTPR to fulfill the requirements of its charter, i.e., identification of program duplications and overlaps, identification of program voids, and the identification of programs of questionable value in terms of satisfying high priority weapons and system requirements.

B. Whether or not the HEL Robotic Integration Center (ROBIC) data base is to include information for other Services in support of any suggested actions taken, stated in the previous paragraph, or be limited to AMC projects, there is a need to incorporate TRADOC requirements information in support of the AMC RDT&E robotics projects. Only then can the proper management control be maintained.

C. If future ROBIC activities are to include information in support of JTPR chartered functions, recommend immediate action be taken to establish a procedure (recurring report or similar requirement) for obtaining timely information on all of the Services' robotics activities, as well as an awareness of current and planned robotics projects of other federal departments.

D. If future ROBIC activities are to be limited to the AMC robotics projects, future contractor support should be accomplished as a task under the existing contract.

E. If, as a result of ongoing robotic briefings, it is determined that future management briefings will be required on a continuing basis, a requirement should be identified for a set of standard briefing charts so that the data input requirements can be developed and a computer graphics program refined to provide timely information with minimum expenditure of time and effort.

F. Inasmuch as several agency and activity letters which transmitted robotic survey data requested feedback, in terms of overall program status be provided, recommend this be accomplished as a priority effort as a means of encouraging improvements in support of future robotic program efforts.
