CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

INTRODUCTION

- . To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- . To attempt to identify any unsupported language constructs required by the Ada Standard
- . To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by SofTech, Inc., under the direction of the AVF according to policies and procedures established by the Ada Validation Organization (AVO). On-site testing was conducted from 14 December 1987 through 16 December 1987 at Lyngby, Denmark.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

1.4 DEFINITION OF TERMS

ACVC	The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.
Ada Commentary	An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.
Ada Standard	ANSI/MIL-STD-1815A, February 1983.
Applicant	The agency requesting validation.
AVF	The Ada Validation Facility. In the context of this report, the AVF is responsible for conducting compiler validations according to established procedures.
AVO	The Ada Validation Organization. In the context of this report, the AVO is responsible for establishing procedures for compiler validations.
Compiler	A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.

INTRODUCTION

Failed test	An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.
Host	The computer on which the compiler resides.
Inapplicable test	An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.
Language Maintenance Panel	The Language Maintenance Panel (LMP) is a committee established by the Ada Board to recommend interpretations and possible changes to the ANSI/MIL-STD for Ada.
Passed test	An ACVC test for which a compiler generates the expected result.
Target	The computer for which a compiler generates code.
Test	An Ada program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.
Withdrawn test	An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. However, no checks are performed during execution to see if the test objective has been met. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or

semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters--for example, the number of identifiers permitted in a compilation or the number of units in a library--a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time--that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of these units is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values--for example, an

INTRODUCTION

illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of validation are given in Appendix D.

CHAPTER 2
CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: DDC-I Ada Compiler System, Version 4.1.1

ACVC Version: 1.9

Certificate Number: 871214W1.09013

Host Computer:

Machine: DEC VAX-11 Model 8530

Operating System: VMS, Release 4.5

Memory Size: 20 Megabytes

Target Computer:

Machine: DEC VAX-11 Model 8530

Operating System: VMS, Release 4.5

Memory Size: 20 Megabytes

CONFIGURATION INFORMATION

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

- . Capacities.

The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See tests D55A03A..H (8 tests), D56001B, D64005E..G (3 tests), and D29002K.)

- . Universal integer calculations.

An implementation is allowed to reject universal integer calculations having values that exceed `SYSTEM.MAX_INT`. This implementation processes 64-bit integer calculations. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

- . Predefined types.

This implementation supports the additional predefined types `SHORT_INTEGER`, `LONG_INTEGER`, and `LONG_FLOAT` in the package `STANDARD`. (See tests B86001C and B86001D.)

- . Based literals.

An implementation is allowed to reject a based literal with a value exceeding `SYSTEM.MAX_INT` during compilation, or it may raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` during execution. This implementation raises `CONSTRAINT_ERROR` during execution. (See test E24101A.)

- . Expression evaluation.

Apparently no default initialization expressions for record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with the same precision as the base type. (See test C35712B.)

CONFIGURATION INFORMATION

This implementation uses no extra bits for extra precision and uses all extra bits for extra range. (See test C35903A.)

Apparently `NUMERIC_ERROR` is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

Apparently `NUMERIC_ERROR` is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is not gradual. (See tests C45524A..Z.)

. Rounding.

The method used for rounding to integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round away from zero. (See test C4A014A.)

. Array types.

An implementation is allowed to raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` for an array having a `'LENGTH` that exceeds `STANDARD.INTEGER'LAST` and/or `SYSTEM.MAX_INT`. For this implementation:

Declaration of an array type or subtype declaration with more than `SYSTEM.MAX_INT` components raises `CONSTRAINT_ERROR`. (See test C36003A.)

`NUMERIC_ERROR` is raised when `'LENGTH` is applied to an array type with `INTEGER'LAST + 2` components. (See test C36202A.)

`NUMERIC_ERROR` is raised when `'LENGTH` is applied to an array type with `SYSTEM.MAX_INT + 2` components. (See test C36202B.)

A packed `BOOLEAN` array having a `'LENGTH` exceeding `INTEGER'LAST` raises `NUMERIC_ERROR` when the array objects are sliced. (See test C52103X.)

A packed two-dimensional `BOOLEAN` array with more than `INTEGER'LAST` components raises `NUMERIC_ERROR` when the array type is declared. (See test C52104Y.)

CONFIGURATION INFORMATION

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a non-null range of a non-null aggregate does not belong to an index subtype. (See test E43211B.)

- Representation clauses.

The Ada Standard does not require an implementation to support representation clauses. If a representation clause is not supported, then the implementation must reject it.

CONFIGURATION INFORMATION

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are not supported. (See tests C35508I..J and C35508M..N.)

Length clauses with SIZE specifications for enumeration types are not supported. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are not supported. (See tests A39005E and C87B62C.)

Record representation clauses are not supported. (See test A39005G.)

Length clauses with SIZE specifications for derived integer types are not supported. (See test C87B62A.)

. Pragas.

The pragma `INLINE` is supported for procedures and functions. (See tests LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

. Input/output.

The package `SEQUENTIAL_IO` can be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package `DIRECT_IO` can be instantiated with unconstrained array types and with unconstrained record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

There are no strings which are illegal external file names for `SEQUENTIAL_IO` and `DIRECT_IO`. (See tests CE2102C and CE2102H.)

Modes `IN_FILE` and `OUT_FILE` are supported for `SEQUENTIAL_IO`. (See tests CE2102D and CE2102E.)

CONFIGURATION INFORMATION

Modes `IN_FILE`, `OUT_FILE`, and `INOUT_FILE` are supported for `DIRECT_IO`. (See tests CE2102F, CE2102I, and CE2102J.)

`RESET` and `DELETE` are supported for `SEQUENTIAL_IO` and `DIRECT_IO`. (See tests CE2102G and CE2102K.)

Dynamic creation and deletion of files are supported for `SEQUENTIAL_IO` and `DIRECT_IO`. (See tests CE2106A and CE2106B.)

Overwriting to a sequential file truncates the file to last element written. (See test CE2208B.)

An existing text file can be opened in `OUT_FILE` mode, can be created in `OUT_FILE` mode, and can be created in `IN_FILE` mode. (See test EE3102C.)

More than one internal file can be associated with each external file for text I/O for reading only. (See tests CE2110B, CE2111D, CE3111A..E (5 tests), CE3114B, and CE3115A.)

More than one internal file can be associated with each external file for sequential I/O for reading only. (See tests CE2107A..D (4 tests) and CE2111D.)

More than one internal file can be associated with each external file for direct I/O for reading only. (See tests CE2107E..I (5 tests) and CE2111H.)

An external file associated with more than one internal file cannot be deleted for `SEQUENTIAL_IO`, `DIRECT_IO`, and `TEXT_IO`. (See test CE2110B.)

Temporary sequential and direct files are not given names. (See tests CE2108A and CE2108C.)

. Generics.

Generic declarations and bodies can be compiled in separate compilations only when the instantiation occurs after the body. (See tests CA1012A, CA2009C, CA2009F, BC3204C, and BC3205D.)

Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)

CHAPTER 3
TEST INFORMATION

3.1 TEST RESULTS

At the time of testing, version 1.9 of the ACVC comprised 3122 tests of which 24 had been withdrawn. Of the remaining tests, 254 were determined to be inapplicable to this implementation. Not all of the inapplicable tests were processed during testing; 201 executable tests that use floating-point precision exceeding that supported by the implementation were not processed. Modifications to the code, processing, or grading for 12 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.2 SUMMARY OF TEST RESULTS BY CLASS

RESULT	TEST CLASS						TOTAL
	A	B	C	D	E	L	
Passed	107	1048	1609	17	17	46	2844
Failed	0	0	0	0	0	0	0
Inapplicable	3	3	247	0	1	0	254
Withdrawn	3	2	18	0	1	0	24
TOTAL	113	1053	1874	17	19	46	3122

TEST INFORMATION

3.3 SUMMARY OF TEST RESULTS BY CHAPTER

RESULT	CHAPTER														TOTAL
	2	3	4	5	6	7	8	9	10	11	12	13	14		
Passed	187	494	549	248	166	98	140	326	135	36	232	3	230	2844	
Failed	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Inapplicable	17	79	126	0	0	0	3	1	2	0	2	0	24	254	
Withdrawn	2	13	2	0	0	1	2	0	0	0	2	1	1	24

3.4 WITHDRAWN TESTS

The following 24 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

B28003A	C35904A	C37215C	C41402A	CC1311B
E28005C	C35A03E	C37315E	C45614C	BC3105A
C34004A	C35A03R	C37215G	A74106C	AD1A01A
C35502P	C37213H	C37215H	C85018B	CE2401H
A35902C	C37213J	C38102C	C87B04B	

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 254 tests were inapplicable for the reasons indicated:

- . C24113I..K (3 tests) are inapplicable because they have line lengths that exceed this implementation's maximum line length.
- . C35508I..J (2 tests) and C35508M..N (2 tests) use enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1). These

clauses are not supported by this compiler.

- . C35702A uses `SHORT_FLOAT` which is not supported by this implementation.
- . A39005B and C87B62A use length clauses with `SIZE` specifications for derived integer types or for enumeration types which are not supported by this compiler.
- . A39005E and C87B62C use length clauses with `SMALL` specifications which are not supported by this implementation.
- . A39005G uses a record representation clause which is not supported by this compiler.
- . C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this compiler.
- . C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed-point base types which are not supported by this compiler.
- . C4A013B uses a static value that is outside the range of the most accurate floating-point base type. The declaration was rejected at compile time.
- . B86001D and C45231D requires a predefined numeric type other than those defined by the Ada language in package `STANDARD`. There is no such type for this implementation.
- . C96005B requires the range of type `DURATION` to be different from those of its base type; in this implementation they are the same.
- . CA2009C, CA2009F, BC3204C, BC3205D compile the bodies of generic units separately and follow with a compilation that contains instantiations of those units. This compiler requires that a generic unit's body be compiled prior to instantiation, so the unit containing the instantiations is rejected.
- . EE2401D raises `USE_ERROR` when attempting to create a file with unconstrained array types.
- . CE2105B attempts to create a `DIRECT_IO` file of mode `IN_FILE`, which is not allowed by this compiler. Such an attempt raises `USE_ERROR`.
- . CE2111H attempts to reset a `DIRECT_IO` file of mode `IN_FILE`, which is not allowed by this compiler. Such an attempt raises `USE_ERROR`.

TEST INFORMATION

- . CE2107B..E (4 tests), CE2107G..I (3 tests), CE2110B, CE2111D, CE2407A, CE3111B..E (4 tests), and CE3114B are inapplicable because multiple internal files can be associated with the same external file for reading only. The proper exception is raised when multiple access is attempted.
- . CE2108A..D (4 tests), CE3112A..B (2 tests) are inapplicable because temporary files do not have a name.
- . The following 201 tests require a floating-point accuracy that exceeds the maximum of 15 digits supported by this implementation:

C24113L..Y (14 tests)	C45321L..Y (14 tests)
C35706L..Y (14 tests)	C45421L..Y (14 tests)
C35705L..Y (14 tests)	C45521L..Z (15 tests)
C35707L..Y (14 tests)	C45524L..Z (15 tests)
C35708L..Y (14 tests)	C45621L..Z (15 tests)
C35802L..Z (15 tests)	C45641L..Y (14 tests)
C45241L..Y (14 tests)	C46012L..Z (15 tests)

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made with the approval of the AVO, and are made in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).

Modifications were required for nine Class B tests and two Class C tests.

The following Class B tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B33301A	B67001A	B67001D	BC1109A	BC1109D
B55A01A	B67001C	B97102A	BC1109C	

The following executable tests were split because the resulting programs were too large to be executed:

C35A06N	CC1221A
---------	---------

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the DDC-I Ada Compiler System was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and that the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the DDC-I Ada Compiler System using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a DEC VAX-11 Model 8530 host operating under VMS, Release 4.5, and a DEC VAX-11 Model 8530 target operating under VMS, Release 4.5.

A magnetic tape containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were included in their modified form on the magnetic tape.

Due to periodic backups, the contents of the magnetic tape were loaded onto a VAX-11 Model 785, and then transported to the host computer. After the test files were loaded to disk, the full set of tests was compiled and linked on the DEC VAX-11 Model 8530, and all executable tests were run on the DEC VAX-11 Model 8530. Object files were linked and executed on the host. Results were printed from the host computer.

The compiler was tested using command scripts provided by DDC International A/S, and reviewed by the validation team. The compiler was tested using all default option settings.

Tests were compiled, linked, and executed (as appropriate) using a single computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

The validation team arrived at Lyngby, Denmark on 14 December 1987, and departed after testing was completed on 16 December 1987.

APPENDIX A
CONFORMANCE STATEMENT

DDC International A/S has submitted the following conformance statement concerning the DDC-I Ada Compiler System.

DECLARATION OF CONFORMANCE

Compiler Implementor: DDC International A/S
Ada®Validation Facility: ASD/SCOL, Wright-Patterson AFB, OH 45433-6503
Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name: DDC-I Ada Compiler System Version: 4.1.1
Host Architecture ISA: DEC VAX-11 Model 8530 OS&VER #: VMS, Release 4.5
Target Architecture ISA: DEC VAX-11 Model 8530 OS&VER #: VMS, Release 4.5

Implementor's Declaration

I, the undersigned, representing DDC International A/S, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler(s) listed in this declaration. I declare that DDC International A/S is the owner of record of the Ada language compiler(s) listed above and, as such, is responsible for maintaining said compiler(s) in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada language compiler(s) listed in this declaration shall be made only in the owner's corporate name.

DDC International A/S
Carston Bjernaa, Product Leader

Date: _____

Owner's Declaration

I, the undersigned, representing DDC International A/S, take full responsibility for implementation and maintenance of the Ada compiler(s) listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada language compilers listed, and their host/target performance, are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

DDC International A/S
Carston Bjernaa, Product Leader

Date: _____

®Ada is a registered trademark of the United States Government
(Ada Joint Program Office).

APPENDIX B

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of MIL-STD-1815A, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the DDC-I Ada Compiler System, Version 4.1.1, are described in the following sections which discuss topics in Appendix F of the Ada Language Reference Manual (ANSI/MIL-STD-1815A). Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is

...

```
type INTEGER is range -32768 .. 32767;
type SHORT_INTEGER is range -128 .. 127;
type LONG_INTEGER is range -2_147_483_648 .. 2_147_483_647;

type FLOAT is digits 6 range -1.70141E+38 .. 1.70141E+38;
type LONG_FLOAT is digits 15 range -8.98846567431158E+307 ..
                                     8.98846567431158E+307;
```

...

end STANDARD;

Appendix

User's Guide

F Appendix F of the Ada Reference Manual

F.0 Introduction

This appendix describes the implementation-dependent characteristics of the DDC-I VAX/VMS Ada Compiler, as required in the Appendix F frame of the Ada Reference Manual (ANSI/MIL-STD-1815A).

F.1 Implementation-Dependent Pragmas

There is one implementation defined pragma: pragma interface_spelling. See the description in Section 5.6.2.2.

F.2 Implementation-Dependent Attributes

No implementation-dependent attributes are defined for the VAX/VMS version.

F.3 Package SYSTEM

The specification of the package SYSTEM:

package SYSTEM is

type ADDRESS	is access INTEGER;
subtype PRIORITY	is INTEGER range 0..15;
type NAME	is (VAX11);
SYSTEM_NAME:	constant NAME := VAX11;
STORAGE_UNIT:	constant := 16;
MEMORY_SIZE:	constant := 2048 * 1024;
MIN_INT:	constant := -2_147_483_647-1;
MAX_INT:	constant := 2_147_483_647;
MAX_DIGITS:	constant := 15;
MAX_MANTISSA:	constant := 31;
FINE_DELTA:	constant := 2#1.0#E-31;
TICK:	constant := 0.000_001;

type interface_language is (VMS);

end SYSTEM;

F.4 Representation Clauses

In general, no representation clauses may be given for a derived type. The representation clauses that are accepted for non-derived types are described in the following:

Appendix

User's Guide

Length Clause

The compiler accepts two kinds of length clauses, specifying either the number of storage units to be reserved for a collection, or the number of storage units to be reserved for an activation of a task.

Enumeration Representation Clause

Enumeration representation clauses may specify representations only in the range of the predefined type INTEGER.

Record Representation Clause

A component clause is allowed if and only if

- the component type is a discrete type different from LONG_INTEGER
- the component type is an array type with a discrete element type different from LONG_INTEGER
- the size of a record component, that is not an array, is 8 or 16 bits (Special for VAX/VMS version)
- it is an alignment clause

No component clause is allowed if the component type is not covered by the above four inclusions. If the record type contains components not covered by a component clause, they are allocated consecutively after the component with the value. Allocation of a record component without a component clause is always aligned on a storage unit boundary. Holes created because of component clauses are not otherwise utilized by the compiler.

F.5 Implementation-Dependent Names for Implementation-Dependent Components

None defined by the compiler.

F.6 Address Clauses

Not supported by the compiler.

Appendix
User's Guide

F.7 Unchecked Conversion

Unchecked conversion is only allowed between objects of the same "size". In this context the "size" of an array is equal to that of two access values and the "size" of a packed array is equal to two access values and an integer. This is the only restriction imposed on unchecked conversion.

F.8 Input-Output Packages

The implementation supports all requirements of the Ada language. It is an effective interface to the VAX/VMS file system, and in case of text input-output also an effective interface to the VAX/VMS terminal driver.

This section describes the functional aspects of the interface to the VAX/VMS file system and terminal driver. Certain portions of this section is of special interest to the system programmer who needs to control VAX/VMS specific Input-Output characteristics via Ada programs.

The section is organised as follows.

Subsection numbers refer to the equivalent subsections in Chapter 14 of the ARM. Only subsections of interest to this section are included.

The Ada Input-Output concept as defined in Chapter 14 of the ARM does not constitute a complete functional specifications of the Input-Output packages. Some aspects are not discussed at all, while others are deliberately left open to an implementation.

These gaps are filled in the appropriate subsections and summarized in subsection F.8.a.

The reader should be familiar with

[DoD 83] - The Ada language definition

and certain sections require that the reader is familiar with

[DEC 84a] - Guide to VAX/VMS File Applications

[DEC 84b] - Record Management Services

[DEC 85] - VAX/VMS I/O Users Reference Manual

Appendix

User's Guide

F.8.1 External Files and File Objects

An external file is either any VAX/VMS file residing on a file-structured device (disk, tape), a record structured device (terminal, lineprinter), or a virtual software device (mailbox). ARM 14.1(1).

Identification of an external file by a string (the NAME parameter) is described in subsection F.8.2.1.

System-dependent characteristics (the FORM parameter) is described in subsection F.8.2.1

An external file created on a file-structured device will exist after program termination, and may be accessed later from an Ada program, except if the file is a temporary file created by using an empty name parameter. If files corresponding to the external file have not been closed, the external file will also exist upon program completion, and the contents will be the same as if the files had been closed prior to program completion. See further F.8.3. ARM 14.1(7).

Input-Output of access types will cause input-output of the access value [Dod 83] 14.1(7).

Sharing of an external file is, when using the default system-dependent characteristics, handled as described in the following.

When a file is associated with an external file using the Record Management Services (RMS), and the file is opened with mode `IN_FILE`, the implementation will allow the current process and other processes to open files associated with the same external file (e.g. as `IN_FILE` in an Ada program).

When a file is opened with mode `INOUT_FILE` or `OUT_FILE` no file sharing is allowed when using RMS. In particular, trying to gain write access to an external file shared by other files, by `OPEN` or `RESET` to mode `INOUT_FILE` or `OUT_FILE` will raise `USE_ERROR`.

When a text file is associated with a terminal device, using the Queue I/O System Services (QIO), there are no restrictions on file sharing.

F.8.2 Sequential and Direct Files

When dealing with sequential and direct input-output only RMS files are used.

Appendix

User's Guide

In this section, a description of the basic file-mapping is given.

Basic file-mapping concerns the relation between Ada files and (formats of) external RMS files, and the strategy for accessing the external files. When creating new files (with the CREATE procedure), there is a unique mapping onto a RMS file format, the preferred file format. When opening an existing external file (with the OPEN procedure), the mapping is not unique; i.e. several external file formats other than preferred for CREATE may be acceptable. In subsection F.8.2.1 the preferred and acceptable formats are described for sequential and direct input-output. In subsection F.8.3.1 the preferred and acceptable formats are described for text input-output.

F.8.2.1 File Management

This subsection contains information regarding file management:

- Description of preferred and acceptable formats for sequential and direct input-output.
- The NAME parameter.
- The FORM parameter.
- File access.

Preferred and Acceptable Formats

The preferred and acceptable formats for sequential and direct input-output, are described using RMS notation and abbreviations [DEC 84b]. ES is used to denote the element size, i.e. the number of bytes occupied by the element type, or, in case of a varying size type, the maximum size (which must be determinable at the point of instantiation from the value of the SIZE attribute for the element type).

It should be noted that the latter means a type definition like:

```
type large_type is array( integer <> ) of integer;
```

would be mapped onto an element size greater than the maximum allowed size (32 k byte).

Appendix

User's Guide

SEQUENTIAL_IO:

An element is mapped into a single record of the external file, or if block-io is used, a number of consecutive virtual blocks of 512 bytes. ES must not be greater than 32767, otherwise USE_ERROR is raised.

CREATE - preferred file format

- ORG=SEQ, RFM=FIX, MRS=ES
(note: read and write operations will be done by BLOCK IO if element size is a multiple of 512 bytes)

OPEN - acceptable formats

- ORG=REL, RFM=FIX, MRS=ES
- ORG=SEQ, RFM=FIX, MRS=ES
- ORG=SEQ, RFM=VAR
- ORG=SEQ, RFM=UDF
(note: BLOCK IO will be used)

(note: a RESET operation to OUT_FILE mode will give a USE_ERROR exception, as it is not possible to empty a file of this format).

The detailed setting of the control blocks for sequential_IO is given below. Note that the user-provided form parameter will override the default specified settings, when used with OPEN or CREATE.

Also note that, when an Ada program contains tasks, asynchronous I/O will be used (ROP = <ASY>).

The following shows the initial setting for OPEN and CREATE (unspecified fields in the control blocks will be cleared to zero).

Appendix
User's Guide

FAB:

ALQ = 12
DEQ = 6
DNM = <.DAT>
FAC = for block-io, IN_FILE: <BRO,GET>
for block-io, OUT_FILE: <BRO,PUT,UPD,DEL,TRN>
otherwise, IN_FILE: <GET>
otherwise, OUT_FILE: <PUT,UPD,DEL,TRN>
FNM = name parameter
FOP = non-empty name parameter: <MXV,SQO>
empty name parameter to CREATE: <MXV,SQO,TMP>
MRS = element size (in bytes)
NAM = address of name-block
ORG = SEQ
RAT = <CR>
RFM = FIX
SHR = for IN_FILE: <GET>
for OUT_FILE: <NIL>
XAB = address of XABFHC block

RAB:

FAB = address of FAB block
KBF = address of internal longword
KSZ = 4
RAC = SEQ
ROP = for block-io: <BIO>
otherwise: <UIF>

NAM:

RSA = address of internal 255 byte buffer
RSS = 255

XABFHC:

NXT = 0

DIRECT_IO:

An element is mapped into a single record of the external file, or if block io is used, the smallest possible number of consecutive virtual blocks of 512 bytes. ES must not be greater than 32767, otherwise USE_ERROR will be raised.

CREATE - preferred file format

- if element size is not a multiple of 512:
ORG=REL, RFM=FIX, MRS=ES
- if element size is a multiple of 512: ORG=SEQ, RFM=FIX,
MRS=ES
(note: read and write operations will be done by BLOCK
IO)

Appendix
User's Guide

OPEN - acceptable formats

- ORG=REL, RFM=FIX, MRS=ES
- ORG=SEQ, RFM=FIX, MRS=ES
(note: if element size is a multiple of 512, BLOCK IO will be used)
- ORG=SEQ, RFM=UDF
(note: BLOCK IO will be used)

The detailed setting of the control blocks for direct_IO is given below. Note that the user-provided form parameter will override the default specified settings, when used with OPEN or CREATE.

Also note that, when an Ada program contains tasks, asynchronous I/O will be used (ROP = <ASY>).

The initial setting for OPEN and CREATE (unspecified fields in the control blocks will be cleared to zero) follows:

FAB:

ALQ = 12
DEQ = 6
DNM = <.DAT>
FAC = for IN_FILE: <GET>
 for OUT_FILE: <GET,PUT,UPD,DEL,TRN>
FNM = name parameter

FOP = non-empty name parameter: <MXV,SQO>
 empty name parameter to CREATE: <MXV,SQO,TMP>
MRS = 512
NAM = address of name-block
ORG = SEQ
RAT = <CR>
RFM = VAR
SHR = for IN_FILE: <GET>
 for OUT_FILE: <NIL>
XAB = address of XABFHC block

RAB:

FAB = address of FAB block
KBF = address of internal longword
KSZ = 4
RAC = SEQ
ROP = <>
UBF = address of internal 512 byte buffer
USZ = 512

Appendix
User's Guide

NAM:

RSA = address of internal 255 byte buffer
RSS = 255

XABFHC:

NXT = 0

Name Parameter

The name parameter, when non null, must be a valid VAX/VMS file specification referring to a file-structured device: a file with that name will then be created.

For a null name parameter, the process' current directory and device must designate a directory on a disk device; a temporary, unnamed file marked for deletion will then be created in that directory. The file will be deleted after closing it, or, if not closed when the program terminates. ARM 14.2.1(3).

Form Parameter

The FORM string parameter that can be supplied to any OPEN or CREATE procedure is for controlling the external file properties, such as physical organization, allocation etc. In the present implementation this has been achieved by accepting form parameters that specify setting of fields in the RMS control blocks FAB and RAB, used for all open files. This scheme is rather general in that it accepts all settings of the FAB and RAB fields. It opens for modifications of the behaviour required by the Arm, such as being able to open a file for appending data to it. Furthermore, a form parameter for accessing mailboxes is provided.

The following fields can currently not be set explicitly:

FAB:

FNA, FNS..(are set by the NAME parameter of OPEN or
CREATE)
DNA, DNS (can be set by DNM=/.../)

The syntax of the form parameter is as follows:

form_parameter ::= [param { , param }]

param ::= number_param
 string_param
 quotation_param
 mask_param

Appendix

User's Guide

```

number_param ::= keyword = number
number       ::= digit { digit }
digit        ::= 0 | 1 | ... | 9
string_param ::= keyword = string
string       ::= / {any character other than slash} /

quotation_param ::= keyword = specifier

mask_param      ::= clear_bits
                  | set_bits
                  | define_whole_field

clear_bits      ::= keyword - mask
set_bits        ::= keyword + mask
define_whole_field
                ::= keyword = mask
mask            ::= < [ specifier { , specifier } ] >

keyword         ::= letter letter letter
specifier       ::= letter letter letter [ letter letter ]

letter          ::= A | B | ... | Z | a | b | ... | z

```

Notes:

- . all space characters are ignored.
- . string parameters are converted to uppercase.
- . all keywords and specifiers are 3- or 5-letter words, like the RMS assembly level interface symbolic names. The only exceptions are the RAT=<CR> specifier, which in this implementation must be specified as CAR rather than CR, and the RAB CTX field keyword, which must be specified as CON. There are only 2 5-letter words: the specifiers STMCR and STMLF.

The semantics of the form parameter is (except for the mailbox parameter) to modify the specified FAB and RAB fields just prior to actually calling RMS to open or create a file, i.e. the form parameter overrides the default conventions provided by this implementation (ARM section F.5.4). The form parameter is interpreted left to right, and it is legal to respecify fields; in particular a mask field may be manipulated in several turns.

Note that there is no way of modifying fields after an RMS open or create service, in particular it is not possible to set RAB fields on a per record operation basis.

Appendix

User's Guide

The modifications made are those to be expected from the textually corresponding RMS macro specifications. However, the `clear_bits` and `set_bits` are particular to this implementation: They serve to either clear individual mask specifiers set by the implementation default, or to set mask specifiers in addition to those specified by the implementation default, respectively.

The mailbox parameter can be either

```
        MBX=TMP
or
        MBX=PRM
```

It applies to `CREATE` only, and causes either a temporary or a permanent mailbox to be created. The `NAME` parameter will be used to establish a logical name for the mailbox, unless an empty string is specified (in this case, no logical name will be established).

Note that the implementation does in no way check that the form parameter supplied is at all reasonable. The attitude is "you asked for it, you got it". It is discouraged, if other procedures than `OPEN`, `CREATE`, and `CLOSE` will be called, to set `ORG`, `RAC`, `MRS`, `NAM`, `FOP`=<NAM>. It is generally discouraged to set `XAB`.

Examples:

```
-- create a text file
create(file, out_file, "DATA.TXT");

-- create a temporary text file which will be deleted
  after completion of the main program
create(file, out_file);

-- create an empty stream format text file
create(file, out_file, "DATA.DAT", "ORG=SEQ, RFM=STMLF");

-- create a very big file:
create(file, out_file, "DATA.DAT", "ALQ=2048, DEQ=256");

-- create a temporary mailbox:
create(file, out_file, "HELLO", "MBX=TMP");

-- open a mailbox; at reading, do not wait for
  messages:
open(file, in_file, "HELLO", "ROP+<TMO>, TMO=0");
```

Appendix

User's Guide

File Access

The OPEN and CREATE procedures utilize the normal RMS defaulting mechanism to determine the exact file to open or create.

Device and directory (when not specified) defaults to the process' current device (SYSSDISK) and directory.

The version number (when not specified), defaults for OPEN to highest existing, or for CREATE, one higher than the highest existing, or 1 when no version exists.

The implementation provides .DAT as the default file type.

External files, which are not to be accessed via block-io (as described in formats), will be accessed via standard RMS access methods. For SEQUENTIAL_IO, sequential record access mode will be used. For DIRECT_IO, random access by record number will be used.

Creation of a file with mode IN_FILE will raise USE_ERROR, when referring to an RMS file.

For sequential and direct io, files created by SEQUENTIAL_IO for a given type T, may be opened (and processed) by DIRECT_IO for the same type and vice-versa. In the latter case, however, the function END_OF_FILE (14.2.2(8)) may fail to produce TRUE in case where the file has been written at random, leaving "holes" in the file. See ARM 14.2.1(7).

For a sequential or text file associated with an RMS file, a RESET operation to OUT_FILE mode will cause deletion of any elements in the file, i.e. the file is emptied. Likewise, a sequential file or text file opened (by OPEN) with mode OUT_FILE, will be emptied. For any other RESET operation, the contents of the file is not affected.

For a text file, any RESET operation will cause USE_ERROR to be raised, when QIO services are used.

F.8.2.2 Sequential Input-Output

The implementation omits type checking for DATA_ERROR, in case the element type is of an unconstrained type, ARM 14.2.2(4), i.e.:

```
... f : FILE_TYPE
type et is 1..100;
type eat is array( et range <> ) of integer;
```

Appendix
User's Guide

```
X : eat( 1..2 );
Y : eat( 1..4 );
...
-- write X, Y:

write( f, X); write( f, Y); reset( f, IN_FILE);

-- read X into Y and Y into X:

read( f, Y); read( f, X);
```

This should have given DATA_ERROR, but will instead give undefined values in the last 2 elements of Y.

F.8.2.3 Specification of the Package Sequential IO

```
with BASIC_IO_TYPES;

with IO_EXCEPTIONS;

generic

    type ELEMENT_TYPE is private;

package SEQUENTIAL_IO is

    type FILE_TYPE is limited private;

    type FILE_MODE is (IN_FILE, OUT_FILE);

    -- File management

    procedure CREATE(FILE : in out FILE_TYPE;
                     MODE : in      FILE_MODE := OUT_FILE;
                     NAME : in      STRING  := "";
                     FORM : in      STRING  := "");

    procedure OPEN  (FILE : in out FILE_TYPE;
                     MODE : in      FILE_MODE;
                     NAME : in      STRING;
                     FORM : in      STRING := "");

    procedure CLOSE (FILE : in out FILE_TYPE);

    procedure DELETE(FILE : in out FILE_TYPE);

    procedure RESET (FILE : in out FILE_TYPE;
                     MODE : in      FILE_MODE);
```

Appendix
User's Guide

```
procedure RESET (FILE : in out FILE_TYPE);

function MODE    (FILE : in FILE_TYPE) return FILE_MODE;

function NAME    (FILE : in FILE_TYPE) return STRING;

function FORM    (FILE : in FILE_TYPE) return STRING;

function IS_OPEN(FILE : in FILE_TYPE) return BOOLEAN;

-- input and output operations

procedure READ  (FILE : in      FILE_TYPE;
                 ITEM : out ELEMENT_TYPE);

procedure WRITE (FILE : in FILE_TYPE;
                 ITEM : in ELEMENT_TYPE);

function END_OF_FILE(FILE : in FILE_TYPE) return BOOLEAN;

-- exceptions

STATUS_ERROR : exception renames IO_EXCEPTIONS.STATUS_ERROR;
MODE_ERROR   : exception renames IO_EXCEPTIONS.MODE_ERROR;
NAME_ERROR   : exception renames IO_EXCEPTIONS.NAME_ERROR;

F.8.3 Text Input-Output

When utilizing text input-output, RMS is used when an external file is residing on a file-structured device, or is a virtual software device. When an external file that is a terminal device is opened or created, the queue I/O services (QIO) are used by default.

If a text file of mode `OUT_FILE` corresponds to an external RMS file, the external file will also exist upon program completion, and a pending linebuffer will be flushed before the text file is closed.

Appendix
User's Guide

F.8.3.1 File management

This subsection contains information regarding file management, where it differs from the file management described in F.8.2.1.

- Description of preferred and acceptable formats for text input-output.
- The FORM parameter.
- File access.

Preferred and Acceptable Formats

Lines of text are mapped into records of external files.

For output, the following rules apply.

The Ada line terminators and file terminators are never explicitly stored (however, for stream format files, RMS forces line terminators to trail each record). Page terminators, except the last, are mapped into a form feed character trailing the last line of the page. (In particular, an empty page (except the last) is mapped into a single record containing only a form feed character). The last page terminator in a file is never represented in the external file. It is not possible to write records containing more than 512 characters. That is, the maximum line length is 511 or 512, depending on whether a page terminator (form feed character) must be written or not. If output is more than 512 characters, USE_ERROR will be raised.

On input, a FF trailing a record indicates that the record contains the last line of a page and that at least one more page exists. The physical end of file indicates the end of the last page.

CREATE - preferred file format

- ORG=SEQ, RFM=VAR, MRS=512

OPEN - acceptable file formats

- all formats except
 - ORG=IDX
 - RFM=UDF

(Note: for stream files (RFM=STM...) any sequence of the LF, CR, and VT control characters at the end of a line will be stripped off at input. At output, line terminators will be provided by RMS defaults).

Appendix

User's Guide

(Note: input of any record containing more than 512 characters will raise a `USE_ERROR` exception).

The detailed setting of the control blocks for `TEXT_IO` is given below. Note that the user-provided form parameter will override the default specified settings, when used with `OPEN` or `CREATE`.

Also note that, when an Ada program contains tasks, asynchronous I/O will be used. When RMS files `ROP = <ASY>`, or asynchronous QIO when terminal devices.

The following shows the initial setting for `OPEN` and `CREATE` (unspecified fields in the control blocks will be cleared to zero):

FAB:

ALQ = 12
DEQ = 6
DNM = <.DAT>
FAC = for IN_FILE: <GET>
for OUT_FILE: <GET,PUT,UPD,DEL,TRN>
FNM = name parameter
FOP = non-empty name parameter <MXV,SQO>
empty name parameter to CREATE: <MXV,SQO,TMP>
MRS = 512
NAM = address of name-block
ORG = SEQ
RAT = <CR>
RFM = VAR
SHR = for IN_FILE: <GET>
for OUT_FILE: <NIL>
XAB = address of XABFHC block

RAB:

FAB = address of FAB block
KBF = address of internal longword
KSZ = 4
RAC = SEQ
ROP = <>
UBF = address of internal 512 byte buffer
USZ = 512

NAM:

RSA = address of internal 255 byte buffer
USZ = 255

XABFHC:

NXT = 0

Appendix

User's Guide

Form parameter

If any form parameter, except for the empty string or a string containing only blanks, is supplied to OPEN or CREATE, RMS services will always be used. In this case, the file operations on external files as terminal-devices will use buffered input- output.

File access

External RMS files are accessed via sequential record access methods.

Files associated with terminal devices, using QIO services, do not contain page terminators. This means that calling SKIP_PAGE will raise USE_ERROR. Furthermore, trying to RESET a file in this category will cause USE_ERROR.

Files associated with the same external file, using QIO services, share the standard values (page-, line, and column-number), e.g. standard values for STANDARD_OUTPUT are implicitly updated after reading from STANDARD_INPUT.

F.8.3.10 Specification of the Package Text IO

with BASIC_IO_TYPES;
with IO_EXCEPTIONS;
package TEXT_IO is

F.8.6 Low Level Input-Output

The package LOW_LEVEL_IO is empty.

F.8.a Clarifications of Ada Input-Output Requirements Summary

The Ada Input-Output concepts as presented in Chapter 14 of ARM do not constitute a complete functional specification of the Input-Output packages. Some aspects are not discussed at all, while others are deliberately left open to an implementation. These gaps are filled in below, with reference to sections of the ARM.

Appendix
User's Guide

F.8.b Assumptions

- 14.2.1(15): For a sequential or text file, a RESET operation to OUT_FILE mode deletes any elements in the file, i.e. the file is emptied. Likewise, a sequential or text file opened (by OPEN) as an OUT_FILE, will be emptied. For any other RESET operation, the contents of the file is not affected.
- 14.2.1(7) : For sequential and direct io, files created by SEQUENTIAL_IO for a given type T, may be opened (and processed) by DIRECT_IO for the same type and vice-versa. In the latter case, however, the function END_OF_FILE (14.2.2(8)) may fail to produce TRUE in the case where the file has been written at random, leaving "holes" in the file.

F.8.c Implementation Choices

- 14.1(1) : An external file is either any VAX/VMS file residing on a file-structured device (disk,tape), a record structured device (terminal, lineprinter), or a virtual software device (mailbox).
- 14.1(7) : An external file created on a file-structured device will exist after program termination, and may later be accessed from an Ada program.
- 14.1(13) : See Section F.8.2.1 File Management.
- 14.2.1(3) : The name parameter, when non-null, must be a valid VAX/VMS file specification referring to a file-structured device; a file with that name will then be created. For a null name parameter, the process' current directory and device must designate a directory on a disk device; a temporary, unnamed file marked for deletion will then be created in that directory.

The form and effect of the form parameter is discussed in Sections F.8.2.1 and F.8.3.1.

Creation of a file with mode IN_FILE will raise USE_ERROR.

- 14.2.1(13): Deletion of a file is only supported for files on a disk device, and requires deletion access right to the file.

Appendix
User's Guide

14.2.2(4): No check for DATA_ERROR is performed in case the element type is of an unconstrained type.

Pragma PRIORITY

As in ARM.

Pragma SHARED

Not allowed for variables of type LONG_FLOAT or subtypes or derived types thereof.

Pragma STORAGE UNIT

Has no effect.

Pragma SUPPRESS

The implementation only supports the following form of the pragma:

```
pragma SUPPRESS (identifier);
```

where identifier is one of the identifiers defined in ARM, Section 11.7, i.e. it is not possible to restrict the omission of a certain check to a specified name.

Pragma SYSTEM NAME

Not supported. The only meaningful SYSTEM_NAME is VAX11 when using the VAX version of the DDC-I Ada Compiler.

5.6.2.2 Implementation defined Pragmas

Currently there is one implementation defined pragma:

Pragma INTERFACE SPELLING

The pragma has the form:

```
pragma Interface_spelling (routine_name, string);
```

It is used to establish the connection between a subprogram name mentioned in a pragma interface (routine_name) and an external name (given by the string). The external name is the name the linker will look for when linking the program. This is useful when the external name does not conform with the lexical rules for identifiers in Ada (e.g the VAX/VMS library routines called LIBS*).

APPENDIX C

TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

<u>Name and Meaning</u>	<u>Value</u>
\$BIG_ID1 Identifier the size of the maximum input line length with varying last character.	(1..125 =>'A', 126 =>'1')
\$BIG_ID2 Identifier the size of the maximum input line length with varying last character.	(1..125 =>'A', 126 =>'2')
\$BIG_ID3 Identifier the size of the maximum input line length with varying middle character.	(1..63 65..126 =>'A', 64 =>'3')
\$BIG_ID4 Identifier the size of the maximum input line length with varying middle character.	(1..63 65..126 =>'A', 64 =>'4')
\$BIG_INT_LIT An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.	(1..123 =>'0', 124..126 =>'298')

TEST PARAMETERS

<u>Name and Meaning</u>	<u>Value</u>
\$BIG_REAL_LIT A universal real literal of value 690.0 with enough leading zeroes to be the size of the maximum line length.	(1..120 =>'0', 121..126 =>'69.0E1')
\$BIG_STRING1 A string literal which when catenated with BIG_STRING2 yields the image of BIG_ID1.	(1..63 =>'A')
\$BIG_STRING2 A string literal which when catenated to the end of BIG_STRING1 yields the image of BIG_ID1.	(1..62 =>'A', 63 =>'1')
\$BLANKS A sequence of blanks twenty characters less than the size of the maximum line length.	(1..106 =>' ')
\$COUNT_LAST A universal integer literal whose value is TEXT_IO.COUNT'LAST.	2147483647
\$FIELD_LAST A universal integer literal whose value is TEXT_IO.FIELD'LAST.	35
\$FILE_NAME_WITH_BAD_CHARS An external file name that either contains invalid characters or is too long.	X}}!@#~&-Y
\$FILE_NAME_WITH_WILD_CARD_CHAR An external file name that either contains a wild card character or is too long.	XYZ*
\$GREATER_THAN_DURATION A universal real literal that lies between DURATION'BASE'LAST and DURATION'LAST or any value in the range of DURATION.	100000.0

Name and Meaning	Value
\$GREATER_THAN_DURATION_BASE_LAST A universal real literal that is greater than DURATION'BASE'LAST.	200000.0
\$ILLEGAL_EXTERNAL_FILE_NAME1 An external file name which contains invalid characters.	ILLEGAL!@#%^^
\$ILLEGAL_EXTERNAL_FILE_NAME2 An external file name which is too long.	ILLEGAL&()_+=
\$INTEGER_FIRST A universal integer literal whose value is INTEGER'FIRST.	-32768
\$INTEGER_LAST A universal integer literal whose value is INTEGER'LAST.	32767
\$INTEGER_LAST_PLUS_1 A universal integer literal whose value is INTEGER'LAST + 1.	32_768
\$LESS_THAN_DURATION A universal real literal that lies between DURATION'BASE'FIRST and DURATION'FIRST or any value in the range of DURATION.	-100000.0
\$LESS_THAN_DURATION_BASE_FIRST A universal real literal that is less than DURATION'BASE'FIRST.	-200000.0
\$MAX_DIGITS Maximum digits supported for floating-point types.	15
\$MAX_IN_LEN Maximum input line length permitted by the implementation.	126
\$MAX_INT A universal integer literal whose value is SYSTEM.MAX_INT.	2147483647
\$MAX_INT_PLUS_1 A universal integer literal whose value is SYSTEM.MAX_INT+1.	2_147_483_648

TEST PARAMETERS

<u>Name and Meaning</u>	<u>Value</u>
\$MAX_LEN_INT_BASED_LITERAL A universal integer based literal whose value is 2#11# with enough leading zeroes in the mantissa to be MAX_IN_LEN long.	(1 =>"2", 2..122 =>"0", 123..125 =>"11:"
\$MAX_LEN_REAL_BASED_LITERAL A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX_IN_LEN long.	(1..3 =>"16:", 4..122 =>'0', 123..126 = "F.E:")
\$MAX_STRING_LITERAL A string literal of size MAX_IN_LEN, including the quote characters.	"1..124 =>"A""
\$MIN_INT A universal integer literal whose value is SYSTEM.MIN_INT.	-2_147_483_548
\$NAME A name of a predefined numeric type other than FLOAT, INTEGER, SHORT_FLOAT, SHORT_INTEGER, LONG_FLOAT, or LONG_INTEGER.	NO_SUCH_TYPE
\$NEG_BASED_INT A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX_INT.	16#FFFFFFFF#

APPENDIX D

WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 24 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

- . B28003A: A basic declaration (line 36) incorrectly follows a later declaration.
- . E28005C: This test requires that "PRAGMA LIST (ON);" not appear in a listing that has been suspended by a previous "PRAGMA LIST (OFF);". The Ada Standard is not clear on this point, and the matter will be reviewed by the AJPO.
- . C34004A: The expression in line 168 yields a value outside the range of the target type T, but there is no handler for `CONSTRAINT_ERROR`.
- . C35502P: The equality operators in lines 62 and 69 should be inequality operators.
- . A35902C: The assignment in line 17 of the nominal upper bound of a fixed-point type to an object raises `CONSTRAINT_ERROR`, for that value lies outside of the actual range of the type.
- . C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises `CONSTRAINT_ERROR`, because its upper bound exceeds that of the type.
- . C35A03E and C35A03R: These tests assume that attribute 'MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard does not support this assumption.
- . C37213H: The subtype declaration of `SCONS` in line 100 is incorrectly expected to raise an exception when elaborated.

WITHDRAWN TESTS

- . C37213J: The aggregate in line 451 incorrectly raises CONSTRAINT_ERROR.
- . C37215C, C37215E, C37215G, and C37215H: Various discriminant constraints are incorrectly expected to be incompatible with type CONS.
- . C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.
- . C41402A: The attribute 'STORAGE_SIZE is incorrectly applied to an object of an access type.
- . C45614C: The function call of IDENT_INT in line 15 uses an argument of the wrong type.
- . A74106C, C85018B, C87B04B, and CC1311B: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur at lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively.
- . BC3105A: Lines 159 through 168 expect error messages, but these lines are correct Ada.
- . AD1A01A: The declaration of subtype SINT3 raises CONSTRAINT_ERROR for implementations which select INT'SIZE to be 16 or greater.
- . CE2401H: The record aggregates in lines 105 and 117 contain the wrong values.
