19. ABSTRACT (Continue on reverse if necessary and identify by block number) The object of this study was to develop a method for forecasting the physical effects of the passage of commercial vessels through Great Lakes connecting waters during that period of time when traffic is normally at a minimum due to a more or less continuous ice cover. The physical impacts examined were sediment translocation, water quality effects, direct damage to existing structures, and changes in the gross hydraulic regime. Also associated with the User's Manual but bound separately are; Development of a Predictive Model to Assess the Effects of Extended Season Navigation on Great Lakes Connecting Waters, Final Report; Appendix A, Site and Soil Conditions; Appendix B, Observed Vessel Induced Water Level Drawdowns; and Appendix C, Observed Ice Thicknesses and Water Turbidities.

INTRODUCTION

The program "Prediction of Vessel Impacts in a Confined Waterway" was developed to allow the calculation of probable damage estimates involved with the passage of large commercial vessels through restricted waterways. During the development of the program, several subroutines were programmed to allow for use and storage of field data. All of these routines have been included in the package to make the program more useful. These subroutines include data input and storage, data file correction and update, and printout of data.

This manual has been designed to assist in the use of the accompanying PC program. Each of the routines included in the package is described in detail and each prompt that appears on the screen as the routines are used is included.

The components of the program have been broken into five separate subroutines that have been stored on the accompanying floppy disk. This disk also includes IBM DOS version 2.10, which was supplied by the sponsor. The program will load automatically by simply booting the system. This setup can be easily changed by taking the various routines off of the disk containing DOS 2.10 and loading them with other compatible versions of DOS.

The program is written in BASIC to allow for ease in performing any desired changes. The names of the five separately loadable programs are BEGIN, BEGIN.TWO, ONE.SUB, TWO.SUB and THREE.SUB. Flow diagram for each program is shown with each program listing.

When the system is booted, the PC will automatically load the small routine called BEGIN. The first screen to appear will be the program name. This monitor will clear itself after about 5 seconds and display the names of the authors and contracting officers. Press any key to move into the program. The following menu appears on the screen at this point:

MAIN PROGRAM OPTIONS

- 0 END PROGRAM EXECUTION - RETURN TO DOS
- 1 INPUT AND STORE FIELD DATA
 GOTO TO PRINTER AND/OR PLOTTER
- 2 PERFORM CALCULATIONS

INPUT OPTION?

The first user option shown on the menu, OPTION 0, will return the PC to the ready mode in DOS. If this option is desired, simply type "0" followed by the enter key and the "A>" prompt will appear on the screen. The PC is now ready to accept any DOS commands or to end the session.

The user can select Option 1, INPUT AND STORE FIELD DATA GOTO TO PRINTER AND/OR PLOTTER, by typing "1" followed by the enter key. The computer will read a subroutine off of the disk and load it into memory. The disk must be left in the drive when reading option routines from the disk. The program that is loaded at this point is TWO.SUB.

TWO.SUB contains all of the programs for field data input and printout. The first thing to appear on the screen is a menu containing options available to manipulate data. To select a path of interest, again type an option number and press the enter key. Each subroutine will have brief explanation of its use displayed on the screen before any prompts for information are displayed. (See page 6 for an explanation of the use of Option 1 of the main program menu).

The printing routines are designed for use on a Okidata 93 on 8 1/2 x 11 paper. The plotting is set up for a Hewlett Packard 7470A Plotter.

There are other printing and plotting options throughout the program, and they also use the same hardware. A full printout of each subroutine, including TWO. SUB can be found at the end of this manual in BASIC. This allows for hardware changes to be made easily.

Option 2 of the main program menu is the calculations mode of the package. It contains two subroutines called ONE.SUB and THREE.SUB. If Option 2 is selected, the PC automatically loads ONE.SUB. The program disk must again be left in the drive when the option is entered. A detailed explanation of Option 2 can be found on page 33. The printing and plotting routines included are set up for the same hardware as described under Option 1.

MAIN PROGRAM MENU: OPTION 1

If Option 1 of the main program menu is selected, the following menu appears on the screen:

OPTIONS

- 0 RETURN TO MAIN PROGRAM MENU
- 1 INPUT CROSS-SECTION DATA
- 2 CHANGE EXISTING CROSS-SECTION DATA FILE
- 3 PRINT CROSS-SECTION DATA
- 4 INPUT FIELD DRAWDOWN DATA

- 5 PRINT FIELD DRAWDOWN DATA
- 6 INPUT LIGHT METER DATA
- 7 PRINT LIGHT METER DATA
- 8 PRINT TURBIDITY DATA
- 9 PRINT ICE THICKNESS DATA

INPUT OPTION ?

This menu contains all of the routines programmed to store and print field data. They are set up to store data on a disk in the "B" drive, although this can be changed within the program. If it is changed to the "A" drive, or the drive that the program is loaded in, be sure to replace the program before selecting Option 0, RETURN TO MAIN PROGRAM MENU. All other options, 1-9, are stored in the computer's memory.

Option 0: Return to Main Program Menu

If Option 0 is selected, the computer returns to BEGIN. This allows the user to either end the session or move to the calculations mode.

Option 1: Input Cross-Section Data

Option 1 allows for input and storage of cross-section data. The parameters are distance to a point and elevation of the point. The distances are measured from a "0" point on the green side. It is best to

start the data at some point on shore to allow for possible changes in water surface elevation.

When Option 1 is selected, the following description appears on the screen:

THIS ROUTINE IS DESIGNED TO ALLOW INPUT
AND STORAGE OF CROSS-SECTION DATA.

ALL DISTANCES SHOULD BE INPUT FROM A BASE
ON THE GREEN SIDE WHICH IS THE LEFT SIDE
LOOKING UP RIVER.

INPUT DATA AS DISTANCE,ELEVATION
FOR EACH DATA POINT.

HIT SPACE BAR TO CONTINUE.

After pressing the space bar the prompt to enter data appears as follows:

ENTER DISTANCE FROM REFERENCE(X) AND ELEVATION(Y),
(enter (-1,0) to end data entry)

Enter all of the desired data points, one set at a time. Notice that each pair is separated by a comma and must be followed by return or enter key. When all of the data pairs have been entered, type "-1,0" to end entry as follows:

ENTER DISTANCE FROM REFERENCE(X) AND ELEVATION(Y),
(enter (-1,0) to end data entry) -1,0

After data entry has been finished, the following text appears on the screen:

CHECK DATA TO SEE IF YOU WANT TO MAKE ANY CHANGES

DATA WILL BE DISPLAYED 20 LINES AT A TIME.

HIT SPACE BAR TO CONTINUE.

At this point, the data can be checked to see if any points were entered improperly. For purposes of explanation in this manual, a small data file was entered. After pressing the space bar the file is displayed on the screen:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580
6	600	570
7	700	570
8	800	580
9	900	590
10	1000	595
11	1100	600

DO YOU WANT TO CHANGE ANY DATA POINTS (Yes/No)

Notice that at the bottom of the display, the user is prompted to change any points desired. If all of the data are correct, type "NO" and the computer will move to the data storage routine. To change a point or points type "YES" and the screen prompts:

ENTER DATA POINT 6

ENTER DISTANCE(X) AND ELEVATION(Y) 600,575

Here data point 6 was entered and changed to 600,575 as shown above. After the two prompts are answered the data are redisplayed as:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580
6	600	575
7	700	570
8	800	580
9	900	590
10	1000	595
11	1100	600

DO YOU WANT TO CHANGE ANY DATA POINTS (Yes/No)

Notice that point 6 has been changed. If it is desired to add a point to the file, enter the data point number that is next in the file along with the distance and elevation as shown:

ENTER DATA POINT 12

ENTER DISTANCE(X) AND ELEVATION(Y) 1200,600

After entering the changes the data are redisplayed as:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580

6	600	575
7	700	570
8	800	580
9	900	590
10	1000	595
11	1100	600
12	1200	600

DO YOU WANT TO CHANGE ANY DATA POINTS (Yes/No)

Data point 12 has been added. If the point that was added is in the middle of the file, it will still be displayed at the end. It will be put into the correct order in the file before being stored.

Once all desired data points have been changed or added, the computer sorts the values and puts them in order of distance from green side baseline. The following prompt then appears on the screen:

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

At this time, insert the data storage disk in drive B and press the space bar.

The following series of questions now comes up in order. Answer each question with a return or enter. The water surface elevation is the elevation at the time the sounding data were collected:

INPUT NAME OF NEW DATA FILE B:TEST

NAME OF SECTION ? TEST

DATE OF SOUNDING ? 1/1/85

WATER SURFACE ELEVATION = ? 600

After all of the prompts have been answered, the data is stored under the name entered and the screen reverts to the data input menu for a new option input.

Option 2: Change Existing Cross-Section Data File

After cross-section data have been stored on the data disk, they can be recalled and points changed or added using this routine.

If Option 2 is selected, the following description appears on the screen:

THIS ROUTINE IS DESIGNED TO ALLOW CHANGES
OF AN EXISTING CROSS-SECTION DATA FILE.
AFTER THE DATA HAS BEEN READ IT WILL BE
DISPLAYED 20 LINES AT A TIME TO DETERMINE
WHICH POINTS ARE TO BE CHANGED. THE NEW FILE
WILL THEN BE STORED ON THE DATA DISK. TO ADD
A POINT INPUT THE NEXT NUMBER AFTER THE LAST
DATA POINT IN THE FILE AND THE COMPUTER WILL
STORE IT IN ITS CORRECT PLACE IN THE FILE.

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

When the space bar is pressed, the user is prompted for the name of the data file and the information shown below is printed on the display:

INPUT NAME OF DATA FILE B:TEST

NAME OF SECTION TEST

DATE OF SOUNDING 1/1/85

WATER SURFACE ELEVATION AT DATE = 600

NUMBER OF DATA POINTS = 12

END OF DATA FILE B:TEST

HIT SPACE BAR TO CONTINUE.

This is the same file that was entered in the earlier section. The parameters are shown as they were read from the disk.

Press the space bar and the next screen shows:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580
6	600	575
7	700	570
8	800	580

9	900	590
10	1000	595
11	1100	600
12	1200	600

DO YOU WANT TO CHANGE ANY OF THESE DATA POINTS (Yes/No)

The procedure for changing points is the same, however, if there are more data points.

Assume that it is desired to change point 6 to 600,577. Enter the data as:

ENTER POINT YOU WANT TO CHANGE OR ADD,

DISTANCE(X),AND ELEVATION(Y)6,600,577

Notice that the three parameters are separated by two commas. After the change has been made and entered, the file is redisplayed as:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580
6	600	577
7	700	570
8	800	580
9	900	590

10	1000	595
11	1100	600
12	1200	600

DO YOU WANT TO CHANGE ANY OF THESE DATA POINTS (Yes/No)

Notice that data point 6 has the new values. To add a point within the file, enter the next number in line followed by the required distance and elevation as:

ENTER POINT YOU WANT TO CHANGE OR ADD,

DISTANCE(X), AND ELEVATION(Y) 13, 750, 575

This file is then reprinted on the screen as:

DATA POINT	DISTANCE(X)	ELEVATION(Y)
1	100	600
2	200	599
3	300	595
4	400	590
5	500	580
6	600	577
7	700	570
8	800	580
9	900	590
10	1000	595
11	1100	600
12	1200	600
13	750	575

DO YOU WANT TO CHANGE ANY OF THESE DATA POINTS (Yes/No)

Notice that the data are left as point number 13, although this is not the correct order. It will be put into the order by distance before it is stored on the data disk.

When all of the changes have been made, enter "NO" and the prompt is:

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

Insert the disk, press the space bar and answer these questions as in Option 1.

INPUT NAME OF NEW DATA FILE B:TEST1

NAME OF SECTION ? TEST

DATE OF SOUNDING ? 1/1/85

WATER SURFACE ELEVATION = ? 600

If it is desired to save the previous file unchanged, enter a different name than before. In this example, TEST1 is used as a new file name. Both files are now stored on the disk. After all parameters have been entered the PC returns to the data input menu.

Option 3: Print Cross-Section Data

This routine will print out a hard copy of the data stored on the disk. When Option 3 is selected this text appears:

PUT PRINTER ON LINE - PLACE PRINTER HEAD
AT THE TOP OF THE PAGE.

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

Place the printer head on the perforated line at the top of the page, put the data disk in the drive and press the space bar.

The user is then prompted for the data file name to be printed as:

INPUT NAME OF DATA FILE B:TEST1

NAME OF SECTION TEST

DATE OF SOUNDING 1/1/85

WATER SURFACE ELEVATION AT DATE = 600

NUMBER OF DATA POINTS = 13

END OF DATA FILE B:TEST1

HIT SPACE BAR TO CONTINUE.

After hitting the space bar, the data are sent to the printer and the table shown in Figure 1 is the result. If there are more data than will fit on one page, the routine will put the bottom margin on the sheet and move to a continued heading on the next page, along with the rest of the data.

Option 4: Input Field Drawdown Data

Option 4 uses basically the same format for entering data as Option 1. The first display to appear on the screen is:

THIS ROUTINE IS DESIGNED TO ALLOW INPUT
AND STORAGE OF DRAWDOWN DATA.

ALL DISTANCES SHOULD BE INPUT FROM A BASE
ON THE GREEN SIDE WHICH IS THE LEFT SIDE
LOOKING UP RIVER.

INPUT DATA AS TIME, GAUGE READING
FOR EACH DATA POINT.

HIT SPACE BAR TO CONTINUE.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
SOUNDING DATA

NAME OF SECTION TEST
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

DATE OF SOUNDING 1/1/85

WATER SURFACE ELEVATION in feet = 600

DATA POINT	DISTANCE(ft)	ELEVATION(ft)
1	100.0	600.0
2	200.0	599.0
3	300.0	595.0
4	400.0	590.0
5	500.0	580.0
6	600.0	577.0
7	700.0	570.0
8	750.0	575.0
9	800.0	580.0
10	900.0	590.0
11	1000.0	595.0
12	1100.0	600.0
13	1200.0	600.0

Figure 1 Test Sounding Data

After pressing the space bar, the user is prompted to enter data as:

TIME FROM '0' in sec. AND GAUGE READING
in inches-(enter (-1,0) to end data entry)

Time from "0" is the time that each staff gauge reading is made. "0" time is the start time before the vessel reaches the observation line. The gauge reads the water surface at a given time. Enter the data in pairs and again enter "-1,0" to end data entry. When all data are in, the following appears on the screen:

CHECK DATA TO SEE IF YOU WANT TO MAKE ANY CHANGES

DATA WILL BE DISPLAYED 20 LINES AT A TIME.

HIT SPACE BAR TO CONTINUE.

The data are again displayed 20 lines at a time as in Option 1. The file shown below was entered as an example.

DATA POINT	TIME(T)	READING(Y)
1	0	10
2	20	9
3	40	8
4	50	7
5	60	6
6	70	7
7	80	8
8	100	10
9	120	11
10	140	10
11	160	10

DO YOU WANT TO CHANGE ANY DATA POINTS (Yes/No)

If any changes need to be made they are entered in the same fashion as in Option 1. When the file is correct, the user is prompted to insert the data disk.

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

After pressing the space bar, the following series of questions appears on the screen in this order:

INPUT NAME OF NEW DATA FILE B:DRAW
NAME OF SECTION ? TEST
DATE OF OBSERVATION ? 1/1/85
VESSEL NAME ? DRAWTEST
UPBOUND or DOWNBOUND ? UPBOUND
VESSEL LENGTH (ft) = ? 730
VESSEL BEAM (ft) = ? 75

VESSEL DRAFT (ft) = ? 25
VESSEL SPEED (ft/sec) = ? 10
BOW ON TIME (sec) = ? 20
STERN ON TIME (sec) = ? 80
DISTANCE TO STAFF GAUGE from green side (ft) = ? 50
BACKGROUND READING (in) = ? 10

Answer all of the questions as appropriate. The "bow on time" and "stern on time" are the times that the bow and stern of the vessel cross the observation line. The background reading is the staff gauge reading before any effect of the oncoming vessel has occurred. When the last parameter has been entered, the data are stored on the disk and the screen returns to the data entry menu.

Option 5: Print Drawdown Data

Option 5 will print a hard copy of the drawdown data entered in Option 4 as Option 3 printed the cross-section data.

The first text to appear is:

PUT PRINTER ON LINE - PLACE PRINTER HEAD
AT THE TOP OF THE PAGE

PUT DATA DISK IN DRIVE 'B'

HIT SPACE BAR TO CONTINUE.

Again place the printer head at the top of the page, insert the data disk and press the space bar. The user is then prompted for the data file name as:

INPUT NAME OF NEW DATA FILE D:DRAW

NAME OF SECTION TEST
DATE OF OBSERVATION 1/1/85
VESSEL NAME DRAWTEST
UPBOUND or DOWNBOUND UPBOUND
VESSEL LENGTH (ft) = 730
VESSEL BEAM (ft) = 75
VESSEL DRAFT (ft) = 25
VESSEL SPEED (ft/sec) = 10
BOW ON TIME (sec) = 20
STERN ON TIME (sec) = 80
DISTANCE TO STAFF GAUGE from green side (ft) = 50
BACKGROUND READING (in) = 10

HIT SPACE BAR TO CONTINUE.

The parameters stored on the disk appear below the prompt as shown above. When the space bar is pressed the printout starts and the result is as is shown in Figure 2.

After the printout is complete, a prompt appears on the screen:

DO YOU WANT TO PRINT ANOTHER (Yes/No) ?

If "YES" is entered another printout is obtained. "NO" returns to the data entry menu.

[illegible]

DATE OF OBSERVATION 1/1/85

VESSEL NAME DRAWTEST

DIRECTION UPBOUND

VESSEL LENGTH in feet = 730

VESSEL BEAM in feet = 75

VESSEL DRAFT in feet = 25

VESSEL SPEED in feet/sec. = 10

BOW ON TIME in sec = 20

STERN ON TIME in sec = 80

DISTANCE TO STAFF GAUGE from green side in feet = 50

BACKGROUND READING in inches = 10

DATA POINT	TIME(sec)	GAUGE READING(in)	CHANGE FROM BG(in)
1	0.0	10.0	0.0
2	20.0	9.0	-1.0
3	40.0	8.0	-2.0
4	50.0	7.0	-3.0
5	60.0	6.0	-4.0
6	70.0	7.0	-3.0
7	80.0	8.0	-2.0
8	100.0	10.0	0.0
9	120.0	11.0	1.0
10	140.0	10.0	0.0
11	160.0	10.0	0.0

Figure 2 Test Drawdown Data

Option 6: Input Light Meter Data

This option is designed for the entry and storage of light meter data. The device and procedure used to collect the data can be found in the main report. When Option 6 is selected, the following routine description appears:

THIS ROUTINE ALLOWS FOR INPUT OF LIGHT
METER DATA. AFTER ALL VALUES HAVE BEEN
INPUT THEY WILL BE STORED ON THE DATA DISK.
INPUT DATA AS DEPTH,READING
FOR EACH POINT.

PUT DATA DISK IN DRIVE B
HIT ANY KEY TO CONTINUE

Put the data disk in the drive and hit the space bar. The list of questions shown below must then be answered.

FILE NAME? B:LIGHT
SITE NAME ? TEST
RDG LOCATION (dist off green side?)? 500
OVERHEAD READING ? 2000
ICE THICKNESS in. (0 for ice free conditions) ? 0
READING JUST UNDER SURFACE OR ICE SHEET ? 1800

The main report explains what each reading is when the light meter is used.
After these parameters are entered the data are put in as follows:

```
ENTER DATA POINT -- DEPTH of reading ft,METER READING
INPUT -9999,0 TO FINISH DATA INPUT
DATA PAIR NO. 1 =
? 2,1700
DATA PAIR NO. 2 =
? 5,1400
DATA PAIR NO. 3 =
? 10,1000
DATA PAIR NO. 4 =
? 15,700
DATA PAIR NO. 5 =
? 20,400
DATA PAIR NO. 6 =
? -9999,0
```

Enter each pair as depth of reading and reading separated by a comma.
When all of the data have been entered type "-9999,0" and the file will be
stored on the disk. The computer then returns to the data entry menu.

Option 7: Print Light Meter Data

When Option 7 is selected, the first display is:

```
PUT PRINTER ON LINE - PLACE PRINTER HEAD
AT THE TOP OF THE PAGE
```

PUT DATA DISK IN DRIVE B

HIT ANY KEY TO CONTINUE

Place the printer head as in Options 3 and 5 and put the light meter data disk in the drive. After pressing any key the user is prompted for the file name, and the following data appear on the screen from the stored file.

FILE NAME? B:LIGHT

TEST
DISTANCE = 500
OVERHEAD READING = 2000
ICE THICKNESS = 0 in.
READING UNDER SURFACE = 1800
1 . 2 1700
2 . 5 1400
3 . 10 1000
4 . 15 700
5 . 20 400

END OF DATA FILE B:LIGHT

HIT ANY KEY TO CONTINUE

Press any key and these questions are prompted in order.

DATE OF READINGS ? 1/1/85
TIME OF READINGS ? 1:00 PM

SKY WAS (CLEAR/CLOUDY)? CLEAR
ICE CONDITION (NO ICE/NO SNOW/SNOWCOVERED) ? NO ICE
TOTAL DEPTH AT LOCATION (ft) ? 34
WERE TURBIDITY SAMPLES TAKEN (Y/N)? Y

INPUT DEPTH OF SAMPLE(ft),TURBIDITY(JTU)? 10,1
MORE SAMPLES (Y/N) ? N

If "NO ICE" or "NO SNOW" is entered for the ice condition the above questions will be the result. If "SNOWCOVERED" is entered the parameters that follow are also included. The words "NO ICE", "NO SNOW" and "SNOWCOVERED" must be spelled correctly.

DATE OF READINGS ? 1/1/85
TIME OF READINGS ? 1:00 PM

SKY WAS (CLEAR/CLOUDY)? CLOUDY
ICE CONDITION (NO ICE/NO SNOW/SNOWCOVERED) ? SNOWCOVERED
PERCENTAGE SNOW ON ICE ? 20
DEPTH OF SNOW ON ICE (in)? 3
TOTAL DEPTH AT LOCATION (ft) ? 34
WERE TURBIDITY SAMPLES TAKEN (Y/N)? N

To enter turbidity readings taken at the same time, if there are any, answer the last question "yes" and the prompt that was shown two lists above will appear for each turbidity reading. Enter the depth of the reading and the turbidity separated by a comma.

When all data have been entered, they are sent to the printer and Figure 3 is the result. If no turbidities were measured, the printout looks like Figure 4. After printing is complete the computer returns to the data entry menu.

CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC

28

Option 8: Print Turbidity Data

Turbidity data can be printed using Option 8. The first prompt after the selection of 8 is:

PUT PRINTER ON LINE - PLACE PRINTER HEAD
AT THE TOP OF THE PAGE

HIT SPACE BAR TO CONTINUE.

Place the printer head as in earlier printout options and press the space bar. The next three questions result.

SITE NAME ? TEST
DATE OF READINGS ? 1/1/85
NUMBER OF SAMPLING LOCATIONS? 3

The number of sampling locations are the number of positions at different distances along the observation line or river cross-section. When these three prompts have been answered, the user is asked to enter the data for each sampling location. An example of this is as follows:

DISTANCE TO LOCATION 1 (from green side in feet)
? 500

TOTAL DEPTH AT LOCATION 1 (ft)
? 10
INPUT DEPTH OF SAMPLE, TURBIDITY(JTU)
? 5,1
INPUT MORE DATA FOR LOCATION 1 Y/N?
? N

DISTANCE TO LOCATION 2 (from green side in feet)
? 1000

TOTAL DEPTH AT LOCATION 2 (ft)
? 30
INPUT DEPTH OF SAMPLE, TURBIDITY(JTU)
? 10,1
INPUT MORE DATA FOR LOCATION 2 Y/N?
? Y
INPUT DEPTH OF SAMPLE, TURBIDITY(JTU)
? 20,1
INPUT MORE DATA FOR LOCATION 2 Y/N?
? N

DISTANCE TO LOCATION 3 (from green side in feet)
? 1500

TOTAL DEPTH AT LOCATION 3 (ft)
? 10
INPUT DEPTH OF SAMPLE, TURBIDITY(JTU)
? 5,1
INPUT MORE DATA FOR LOCATION 3 Y/N?
? N

Any number of samples can be entered at different depths for each location. After the last turbidity value has been entered for the final location, the data are sent to the printer and the result is as shown in Figure 5. When printing is completed, the data entry menu reappears on the screen.

Option 9: Print Ice Thickness Data

Option 9 will produce a hard copy of ice thickness at various locations along a cross-section line. The first display is:

TURBIDITY READINGS

SITE NAME TEST

DATE 1/1/85

TOTAL DEPTH AT LOCATION 1 (ft) 10
TOTAL DEPTH AT LOCATION 2 (ft) 30
TOTAL DEPTH AT LOCATION 3 (ft) 10

ALL DISTANCES ARE FROM THE GREEN SIDE BASELINE

	DIST. TO *** SAMPLE(ft) ***	DEPTH OF *** SAMPLE ***	TURBIDITY *** (JTU) ***
LOCATION 1	500.0	5.0	1.00
LOCATION 2	1000.0	10.0	1.00
		20.0	1.00
LOCATION 3	1500.0	5.0	1.00

Figure 5 Test Turbidity Readings

PUT PRINTER ON LINE - PLACE PRINTER HEAD
AT THE TOP OF THE PAGE

HIT SPACE BAR TO CONTINUE.

Place the printer head as before, press the space bar and answer the following questions.

SITE NAME ? TEST

DATE OF READINGS ? 1/1/85

Next enter the data as distance to location followed by the depth at the location and the ice thickness separated by a comma. An example of some data is:

DISTANCE TO LOCATION 1 (from green side in feet)
? 500
INPUT DEPTH AT LOC.(ft),ICE THICKNESS(in)
? 10,12
INPUT MORE DATA Y/N?
? Y

DISTANCE TO LOCATION 2 (from green side in feet)
? 1000
INPUT DEPTH AT LOC.(ft),ICE THICKNESS(in)
? 30,12
INPUT MORE DATA Y/N?
? Y

```
DISTANCE TO LOCATION 3 (from green side in feet)
? 1500
INPUT DEPTH AT LOC.(ft),ICE THICKNESS(in)
? 10,12
INPUT MORE DATA Y/N?
? N
```

Type "NO" for "input more data?" when all the sampling locations have been entered. The data are then sent to the printer as shown in Figure 6. After printing is complete the screen returns to the data entry menu.

This completes the description of the routines contained under Option 1 of the main program menu and TWO.SUB. The user should attempt the examples contained in this section of the manual to clarify its use.

MAIN PROGRAM MENU: OPTION 2

Option 2 of the main program menu, PERFORM CALCULATIONS, contains the various routines required to calculate areas of cross-sections, drawdowns and relative damage, and light extinction coefficients.

If Option 2 is selected at the beginning of the program, the subroutine BEGIN loads the subroutine ONE.SUB into memory.

The following menu is the first thing to appear on the screen:

OPTIONS

- 0 RETURN TO MAIN PROGRAM MENU
- 1 CALCULATE AREAS AND TOPWIDTHS OF CROSS-SECTIONS
- 2 CALCULATE DRAWDOWNS USING A SINGLE VESSEL SPEED
AND GIVE RELATIVE DAMAGE

- 3 CALCULATE DRAWDOWNS ITERATING VESSEL SPEED
 AND GIVE RELATIVE DAMAGE
- 4 FIT LIGHT METER DATA TO LINE AND GIVE RESULTS

INPUT OPTION ?

Options 1, 2 and 4 are all contained in ONE.SUB. If Option 3 is selected, the computer loads THREE.SUB, which contains the program to iterate vessel speeds. Each of these options is explained in detail in the following sections of this manual. The various calculation routines contain printout and plotting subroutines that can be used if prompted. All calculated answers will be displayed on the screen before the prompts to redirect to the printer and/or plotter appear. This allows the program to be used effectively without printing and/or plotting unnecessary output.

Option 0: Return to Main Program Menu

If Option 0 is selected, the computer reloads BEGIN and the main program menu comes back on the screen. This allows the user to return to DOS or to the data input mode.

Option 1: Calculate Areas and Topwidths of Cross-Section

Option 1 allows the user to calculate the area of a given cross-section using data stored by Option 1 of the data input menu. It will calculate the area of water given the water surface elevation. It also calculates the topwidth of the section at that water surface elevation. The topwidth is the distance between the two points on opposite river banks that the water surface touches as calculated using the cross-section of the nearshore regions.

The routine also calculates the areas on both sides of a vessel when the distance to the center of the vessel is entered.

When Option 1 is selected, the following description appears on the screen:

THIS ROUTINE ALLOWS FOR CALCULATION OF AREAS
AND TOPWIDTHS OF RIVER SECTIONS USING STORED
CROSS-SECTION DATA. IT WILL CALCULATE THE TOTAL
AREA AND TOP WIDTH PLUS THE AREAS ON THE RED AND
GREEN SIDES OF THE VESSEL.

PUT DATA DISK IN DRIVE 'B'.

HIT SPACE BAR TO CONTINUE.

Insert the data disk containing the cross-section data and press the space bar. The next prompt is for the name of the data file. For this description, a sample cross-section data file called EXAMPLE was entered using Option 1 of the data entry menu. After the data file name is entered the parameters at the beginning of the file are printed as follows:

INPUT NAME OF DATA FILE B:EXAMPLE

NAME OF SECTION EXAMPLE

DATE OF SOUNDING 1/1/85

WATER SURFACE ELEVATION AT DATE = 100

NUMBER OF DATA POINTS = 25

END OF DATA FILE B:EXAMPLE

HIT SPACE BAR TO CONTINUE.

Figure 7 is a printout obtained from Option 3 of the data entry menu of the sample file.

After pressing the space bar, these prompts must be answered in the order that they appear.

WATER SURFACE ELEVATION = WS = ? 100

ENTER DISTANCE TO UPBOUND VESSEL FROM GREEN SIDE in feet = ? 950

ENTER DISTANCE TO DOWNBOUND VESSEL FROM GREEN SIDE in feet = ? 1000

The water surface elevation that must be entered is the elevation at which the user wants the calculation to be made. In this case the water surface at the time that the sounding was made was used, although any reasonable water surface can be used.

The distance to the centers of upbound and downbound vessels allows for areas on both sides of the vessels to be calculated. Depth at the center of the vessel is just an average depth under the ship.

When all of the prompted parameters have been entered the computer asks the user to wait until the calculation is complete. After the computer has made the necessary calculations the first half of the results appears as:

SCOUNDING DATA

NAME OF SECTION EXAMPLE

DATE OF SOUNDING 1/1/85

WATER SURFACE ELEVATION in feet = 100

DATA POINT	DISTANCE(ft)	ELEVATION(ft)
1	0.0	102.0
2	25.0	100.0
3	50.0	98.0
4	100.0	95.0
5	150.0	97.0
6	200.0	95.0
7	300.0	90.0
8	400.0	92.0
9	500.0	88.0
10	600.0	75.0
11	700.0	66.0
12	800.0	63.0
13	900.0	68.0
14	1000.0	66.0
15	1100.0	67.0
16	1200.0	70.0
17	1300.0	76.0
18	1400.0	80.0
19	1500.0	82.0
20	1600.0	87.0
21	1700.0	90.0
22	1800.0	92.0
23	1900.0	95.0
24	1950.0	97.0
25	2000.0	101.0

Figure 7 Example Sounding Data

NAME OF SECTION

EXAMPLE

WATER SURFACE ELEVATION in feet = 100.00

DISTANCE TO UPBOUND VESSEL from green side in feet = 950

DEPTH AT CENTER OF UPBOUND VESSEL in feet = 33

DISTANCE TO DOWNBOUND VESSEL from green side in feet = 1000

DEPTH AT CENTER OF DOWNBOUND VESSEL in feet = 34

TOTAL AREA OF SECTION in sq. feet = 36156.

HIT SPACE BAR TO CONTINUE.

At this point the total area of the section should be recorded if the user cannot obtain a hard copy through a later prompt.

Press the space bar and the second half of the results is displayed as:

AREA ON GREEN SIDE OF UPBOUND VESSEL in sq. feet = 16700.

AREA ON RED SIDE OF UPBOUND VESSEL in sq. feet = 19456.

AREA ON GREEN SIDE OF DOWNBOUND VESSEL in sq. feet = 18350.

AREA ON RED SIDE OF DOWNBOUND VESSEL in sq. feet = 17806.

WIDTH OF WATER SURFACE in feet = 1962.5

DO YOU WANT A HARD COPY (Yes/No)?

Again if no hard copy will be made, the results should be recorded. If a printout is desired, answer the hard copy prompt with "Yes" and Figure 8 is the result. A "No" or the end of printing returns the user to the calculations menu.

Option 2: Calculate Drawdowns Using a Single Vessel Speed and Give Relative Damage

The program was written primarily for the outputs provided by Options 2 and 3. They are the routines that calculate vessel-induced drawdowns and associate a relative damage to them.

Option 2 calculates the drawdowns caused by a vessel passing at a given speed through a section upbound, downbound or in either direction. Drawdowns are calculated for each side of the vessel.

If Option 2 is selected, the following description appears on the screen:

THIS ROUTINE ALLOWS FOR CALCULATION OF DRAWDOWNS
AND DAMAGE FOR THE PASSAGE OF A VESSEL UPBOUND,
DOWNBOUND OR BOTH DIRECTIONS FOR A GIVEN SPEED.
IT WILL ALSO GIVE A PRINTOUT OF THE RESULTS
IF PROMPTED BY THE USER.

HIT SPACE BAR TO CONTINUE.

After pressing the space bar, the user is prompted to select the vessel direction:

CHOOSE ONE OF THE FOLLOWING OPTIONS

CALCULATE DRAWDOWNS FOR

- | | |
|---|----------------------------------|
| 1 | UPBOUND VESSEL ONLY |
| 2 | DOWNBOUND VESSEL ONLY |
| 3 | BOTH UPBOUND & DOWNBOUND VESSELS |

INPUT OPTION ? 3

The user selects one of the three options, and the following six questions are asked, one at a time:

NAME OF SECTION EXAMPLE

AREA ON GREEN SIDE OF UPBOUND VESSEL in sq. feet = ? 16700

AREA ON RED SIDE OF UPBOUND VESSEL in sq. feet = ? 19456

AREA ON GREEN SIDE OF DOWNBOUND VESSEL in sq. feet = ? 18350

AREA ON RED SIDE OF DOWNBOUND VESSEL in sq. feet = ? 17806

WIDTH OF WATER SURFACE in feet = ? 1962.5

Notice that the information prompted by these six questions can be obtained by Option 1 of the calculations menu. For purposes of this example, the results of the example for Option 1, calculation of area, will be used for the prompted parameters. To show how results are obtained for both upbound and downbound vessels, Option 3 for direction was chosen. If either of the other two options is selected, the same questions are asked, but only for the vessel direction desired.

After the six cross-section parameters have been entered, the following text and two prompts appear on the screen:

THE FOLLOWING TWO INPUT PARAMETERS ALLOW
EXAMINATION OF THE ICE COVERED CONDITION
ON THE SYSTEM. INPUT PERCENTAGE OF AREA
TAKEN UP BY ICE AS A DECIMAL MULTIPLIER
OF THE TOTAL AREA OF THE SECTION. INPUT
0 FOR ICE FREE CONDITIONS.

PERCENTAGE ICE on green side (decimal form) = ? .052

PERCENTAGE ICE on red side (decimal form) = ? .056

To determine what the parameter for percentage of ice is, calculate the submerged area of ice on the green and red sides of the vessel and divide that value by the area of water that would be present in the section at that water surface with no ice present. This is the percentage of ice in decimal form. If free water surface conditions are present, enter zeros for these two parameters.

After the ice condition parameters have been entered, the next option menu is printed on the screen.

INPUT THE NEARSHORE CONFIGURATION ON THE GREEN SIDE

CHOOSE ONE OF THE FOLLOWING OPTIONS

- 1 OPEN BLUFF OR ESCARPMENT
- 2 OPEN SLOPING BEACH
- 3 SUBMERGED WETLANDS
- 4 MANMADE PROTECTION

INPUT OPTION ? 2

Select the number of the configuration that best fits the shoreline area on the green side. A description of these four nearshore types can be found in the main report. Next select the soil type on the green side by the menu:

INPUT THE NEARSHORE SOIL TYPE ON THE GREEN SIDE

CHOOSE ONE OF THE FOLLOWING OPTIONS

- 1 BOULDERS AND/OR COBBLES
- 2 COARSE TO MEDIUM SAND
- 3 MEDIUM SAND TO SILT
- 4 CLAY

INPUT OPTION ? 3

These four major soil types are also described in the main report.

After this parameter has been selected, the same two menus appear for the nearshore area on the red side:

INPUT THE NEARSHORE CONFIGURATION ON THE RED SIDE

CHOOSE ONE OF THE FOLLOWING OPTIONS

- 1 OPEN BLUFF OR ESCARPMENT
- 2 OPEN SLOPING BEACH
- 3 SUBMERGED WETLANDS
- 4 MANMADE PROTECTION

INPUT OPTION ? 1

INPUT THE NEARSHORE SOIL TYPE ON THE RED SIDE

CHOOSE ONE OF THE FOLLOWING OPTIONS

- 1 BOULDERS AND/OR COBBLES
- 2 COARSE TO MEDIUM SAND
- 3 MEDIUM SAND TO SILT
- 4 CLAY

INPUT OPTION ? 4

Select the parameters for the red side in the same manner as above.

When the four parameters describing the nearshore areas on both sides of the section have been entered, the user is prompted to answer the next eight questions:

DISTANCE TO UPBOUND VESSEL from green side in feet = ? 950
DISTANCE TO DOWNBOUND VESSEL from green side in feet = ? 1000
VESSEL BEAM in feet = ? 75
VESSEL DRAFT in feet = ? 25
RIVER VELOCITY in feet per sec. = ? 1
UPBOUND VESSEL VELOCITY in feet per sec. = ? 10
DOWNBOUND VESSEL VELOCITY in feet per sec. = ? 10
DEPTH AT CENTER OF CHANNEL in feet = ? 33

The distances to the vessels are measured from the green shoreline to the center line of the vessel when it is located in the section. The vessel beam is the width of the vessel at its widest point. This value can be obtained from published data.

The vessel draft is the average depth of water that the vessel draws as it is moving. River velocity is the average river velocity across the section. It can be obtained by simply dividing the flow by the total cross-sectional area at the site. The vessel velocity is the speed that would be computed by a person standing on shore timing the ship as it passes "bow on" to "stern on" on the cross-section line. Finally the depth at the center of the channel is the average depth under the vessel.

After the depth has been entered, the user is requested to wait while the calculations are being made. When the calculations are complete, the results appear on the screen:

DRAWDOWN OF UPBOUND VESSEL on the green side (ft) = 0.34
DRAWDOWN OF UPBOUND VESSEL on the red side (ft) = 0.27

CRITICAL DRAWDOWN on the green side (ft) = 5.53
CRITICAL DRAWDOWN on the red side (ft) = 6.48

DAMAGE PROBABILITY GREEN IS NONE TO LIGHT

DAMAGE PROBABILITY RED IS NONE TO LIGHT

HIT SPACE BAR FOR DOWNBOUND RESULTS

Press the space bar and the rest of the results are printed:

DRAWDOWN OF DOWNBOUND VESSEL on the green side (ft) = 0.18
DRAWDOWN OF DOWNBOUND VESSEL on the red side (ft) = 0.18

CRITICAL DRAWDOWN on the green side (ft) = 7.33
CRITICAL DRAWDOWN on the red side (ft) = 7.34

DAMAGE PROBABILITY GREEN IS NONE TO LIGHT

DAMAGE PROBABILITY RED IS NONE TO LIGHT

DO YOU WANT A HARD COPY (Yes/No)?

Depending on the selection of vessel direction, one or the other of these sets of results may be omitted. The calculated values are given as the drawdowns on both sides of the vessel using the parameters entered. The critical drawdown is the drawdown at which critical conditions would exist for the given combination of inputs. The damage probability is the relative damage associated with that vessel passage.

The results are followed by the prompt "Do you want a hard copy?" If a "Yes" is entered the user is prompted to put the printer on line and Figure 9 is the result. All of the input values along with the calculated results are on the printout. If a single vessel direction was selected, only the appropriate values would be printed.

A "No" response to the hard copy prompt, or the end of printing, results in the next user option:

DO YOU WANT A ANOTHER COPY (Yes/No)? N

DO YOU WANT TO TRY OTHER DATA (Yes/No)?

At this point, any of the parameters can be changed, and the drawdowns recalculated using these new values. To try other parameters type "Yes". If "No" is entered, the user is returned to the calculation menu.

When it is desired to change one or more parameters by entering "Yes", the following description is printed:

THE FOLLOWING MENU ALLOWS FOR CHANGES IN THE DATA JUST RUN

INPUT OPTION # OF PARAMETER YOU WANT TO CHANGE.

THE OPTIONS ARE BROKEN INTO 2 LISTS

OPTION 'O' WILL RECALCULATE THE DRAWDOWNS WITH THE NUMBERS CHANGED

HIT SPACE BAR TO CONTINUE.

There are two menus included in this subroutine. There is an option in each to move back and forth between them. A "0" input will recalculate the drawdowns with the changed parameters.

After pressing the space bar at the end of the subroutine description, this option menu comes up on the monitor:

0	RECALCULATE DRAWDOWNS WITH DATA CHANGED
1	AREA ON GREEN SIDE OF UPBOUND VESSEL
2	AREA ON RED SIDE OF UPBOUND VESSEL
3	AREA ON GREEN SIDE OF DOWNBOUND VESSEL
4	AREA ON RED SIDE OF DOWNBOUND VESSEL
5	PERCENTAGE ICE ON GREEN SIDE
6	PERCENTAGE ICE ON RED SIDE
7	DISTANCE TO UPBOUND VESSEL
8	DISTANCE TO DOWNBOUND VESSEL
9	SECOND LIST OF INPUT DATA

OPTION # ?

If it is desired to change one of the values in this list, type the number of the parameter and the prompt to enter the new value is printed on the screen. If the parameter to be changed is not in the list, enter a "9" and the second list will be printed on the screen as:

0	RECALCULATE DRAWDOWNS WITH DATA CHANGED
1	WIDTH OF WATER SURFACE
2	VESSEL BEAM
3	VESSEL DRAFT
4	RIVER VELOCITY
5	UPBOUND VESSEL VELOCITY

- 6 DOWNBOUND VESSEL VELOCITY
- 7 DEPTH AT CENTER OF CHANNEL
- 8 FIRST LIST OF INPUT DATA

OPTION # ?

Again there is an option, "8", to return to the first menu. A "0" will recalculate with changed parameters. If one of the change parameter options is chosen the user is again prompted on the screen to enter the new value.

To give an example of changing values and also to show a result that could appear on the screen during calculation, Option 7 of the second list was chosen. The prompt on the screen is:

DEPTH AT CENTER OF CHANNEL in feet = ? 25.1

The depth at the center of the channel is entered as 25.1 ft. and the screen returns to the first list. After entering a "0" the computer goes back to recalculate the drawdowns with this one parameter changed.

During the process of the calculation, the following comes up on the monitor:

THE PARAMETERS INPUT FOR THE UPBOUND VESSEL
CREATE A DRAWDOWN LARGE ENOUGH
TO GROUND THE VESSEL. THE DRAWDOWN

ADDED TO THE DRAFT IS GREATER THAN
THE DEPTH IN THE CENTER OF THE CHANNEL.

DO YOU WANT TO CHANGE ANY PARAMETERS (Yes/No) ?

The draft of the vessel is 25 ft. With a depth under the vessel of 25.1 ft. the drawdown of the ship can only get to 0.1 ft. before it hits the bottom. Therefore, the combination of values input is not possible. If the prompt to change parameters is answered "Yes", the user is taken back to the change parameters menus. A "No" returns the program to calculations if a downbound vessel direction was entered, otherwise the results are printed on the screen as before. The printout on the monitor and also on the hard copy if desired will reflect on the fact that the vessel grounded itself before it got to the calculated drawdown.

To give an example of another possibility during the calculation, the vessel speed changed as follows:

UPBOUND VESSEL VELOCITY in feet per sec. = ? 17

After entering a "0" to recalculate, the screen shows:

THE PARAMETERS INPUT FOR THE UPBOUND VESSEL
HAVE FORCED THE FLOW TO GO CRITICAL
ON THE GREEN SIDE.
THE STEADY STATE MODEL DOES NOT APPLY
BEYOND THIS POINT.

THE PROBABILITY FOR DAMAGE IS SEVERE.

CRITICAL DRAWDOWN on the green side (ft) = 1.59

DO YOU WANT TO CHANGE ANY PARAMETERS (Yes/No) ?

When the calculation is attempted using an upbound vessel velocity of 17 ft. per second, the flow becomes critical in the section. When critical conditions are reached, the steady state equations within the program do not apply. Therefore, the calculation cannot go any further. The damage probability at this point has already become severe and there is no reason to continue. If the user wants to change parameters, a "Yes" will again return to the change menus. A "No" will continue into the downbound calculation or the results will be printed on the screen. The results will reflect the fact that the flow became critical if no changes are made.

The above example is intended to give a full explanation of the procedure to be followed to calculate the drawdowns and relative damages for vessel passages through a section at a single speed. If it is desired to iterate vessel speed to critical, Option 3 can be used.

Option 3: Calculate Drawdowns Iterating Vessel Speed and Give
Relative Damage

If Option 3 is selected, the computer automatically loads the subroutine THREE.SUB into memory. Before selecting 3 the disk must be in the drive. After the program is loaded, the following description appears on the screen:

THIS ROUTINE IS DESIGNED TO ITERATE UPBOUND
AND DOWNBOUND VESSEL VELOCITIES AND CALCULATE
THE CORRESPONDING DRAWDOWN. CALCULATIONS WILL
BE TERMINATED WHEN CRITICAL CONDITIONS ARE
REACHED ON ONE SIDE OF THE VESSEL OR THE OTHER.
BEGIN VELOCITY IS THE POINT THAT THE USER WANTS
ITERATION TO START.

HIT SPACE BAR TO CONTINUE.

The prompts for information to perform the calculations in this routine are the same as those for Option 2 except for the two vessel velocity questions. Under Option 3, these two questions are worded:

BEGIN UPBOUND VELOCITY in feet per sec. = ? 3

BEGIN DOWNBOUND VELOCITY in feet per sec. = ? 3

The "begin vessel velocity" is the speed at which the user wants the iteration to begin. The computer will calculate the drawdown for this speed. It then iterates the velocity by 0.5 ft. per second and calculates that drawdown until critical conditions are reached. At this point, the computer goes back to the last value for speed and advances by 0.05 from this point until critical conditions are reached again.

When the calculations for the desired vessel directions have been completed the results appear as:

THE CALCULATION REACHED CRITICAL CONDITIONS
ON THE GREEN SIDE OF THE UPBOUND VESSEL AT 15.45 ft/sec

DAMAGE PROBABILITY GREEN SIDE IS

NONE TO LIGHT FROM 0 ft/sec to 11.96 ft/sec

MODERATE from 11.96 ft/sec to 13.53 ft/sec

SEVERE above 13.53 ft/sec

DAMAGE PROBABILITY RED SIDE IS

NONE TO LIGHT FROM 0 ft/sec to 11.75 ft/sec

MODERATE from 11.75 ft/sec to 14.08 ft/sec

SEVERE above 14.08 ft/sec

HIT SPACE BAR TO CONTINUE.

THE CALCULATION REACHED CRITICAL CONDITIONS
ON THE RED SIDE OF THE DOWNBOUND VESSEL AT 18.05 ft/sec

DAMAGE PROBABILITY GREEN SIDE IS

NONE TO LIGHT FROM 0 ft/sec to 14.39 ft/sec

MODERATE from 14.39 ft/sec to 16.92 ft/sec

SEVERE above 16.92 ft/sec

DAMAGE PROBABILITY RED SIDE IS

NONE TO LIGHT FROM 0 ft/sec to 13.26 ft/sec

MODERATE from 13.26 ft/sec to 15.66 ft/sec

SEVERE above 15.66 ft/sec

HIT SPACE BAR TO CONTINUE.

This screen printout gives the side of the section where critical conditions were reached first. When the space bar is pressed, the results of vessel velocity and drawdown are printed on the monitor 15 lines at a time along with ranges of relative damage. They are shown by vessel direction as:

THE FOLLOWING IS A LIST OF THE RESULTS FOR
THE VELOCITY VS DRAWDOWN CALCULATIONS. THE
RESULTS WILL BE GIVEN 15 LINES AT A TIME

HIT SPACE BAR TO CONTINUE.

After pressing the space bar the screens show in order:

***** RESULTS FOR UPBOUND VESSEL *****

VESSEL VELOCITY (ft/sec)	GREEN SIDE DRAWDOWN (ft)	RED SIDE DRAWDOWN (ft)
3.00	0.03	0.03
3.50	0.04	0.04
4.00	0.05	0.04
4.50	0.07	0.05

18.00	2.00	2.31
CRITICAL		

HIT SPACE BAR TO CONTINUE.

After all of the lists of results have been run through by depressing the space bar, the user is prompted:

DO YOU WANT A HARD COPY (Yes,No)?

If a "Yes" is entered, the user is prompted to put the printer on line. After hitting the space bar, the printout is generated as in Figures 10, 11 and 12. Figure 10 contains the parameters entered along with the side at which critical conditions occurred. Note that the soil conditions have been changed from the previous example. Figures 11 and 12 are the vessel velocities, drawdowns and damage ranges for the calculation. The three figures will be paged automatically as they are here.

A "No" for the hard copy prompt, or the end of printing, results in the prompt:

DO YOU WANT TO PLOT RESULTS ON THE SCREEN (Yes,No)?

If "Yes" is entered here the results are plotted on the monitor as shown in Figures 13, 14, 15, and 16. To move through the four plots, press any key.

Figure 12 Velocity Iteration, Downbound

Figure 13 Screen Graphics for Green Side-Upbound Vessel

Figure 14 Screen Graphics for Red Side-Upbound Vessel

Figure 15 Screen Graphics for Green Side-Downbound Vessel

Figure 16 Screen Graphics for Red Side-Downbound Vessel

A "No" for the "plot on screen" question, or the end of the plots, results in the screen prompt:

DO YOU WANT TO PLOT RESULTS ON THE HP PLOTTER (Yes,No)?

If it is desired to plot the results on the HP plotter, a "Yes" will bring the following menu onto the screen:

CHOOSE ONE OF THE FOLLOWING OPTIONS

DRAW GRAPH OF

- | | |
|---|-------------------------------------|
| 1 | DRAWDOWNS ONLY |
| 2 | DAMAGE PROBABILITY ONLY |
| 3 | BOTH DRAWDOWNS & DAMAGE PROBABILITY |

INPUT OPTION ?

Choose one of the plotting options and the next menu is:

CHOOSE ONE OF THE FOLLOWING OPTIONS

DRAW GRAPH OF

- 1 GREEN SIDE ONLY
- 2 RED SIDE ONLY
- 3 BOTH SIDES ON SAME GRAPH

INPUT OPTION ?

Pick the option for the side or sides desired and the computer prompts the user to:

PUT PLOTTER ON LINE - REPLACE PAPER

INSERT THICK BLACK PEN FOR PEN #1

INSERT FINE BLACK PEN FOR PEN #2

HIT SPACE BAR TO CONTINUE.

Load the paper and insert the pens and the plotting will begin. In the middle of the plot the plotter stops and the screen prompts the user:

WHEN PLOTTER PAUSES -

INSERT GREEN PEN FOR PEN #1

INSERT RED PEN FOR PEN #2

HIT SPACE BAR TO CONTINUE.

Be sure that plotting has stopped before replacing the pens. After pressing the space bar, the plot is completed. The next prompt is:

DO YOU WANT TO DRAW MORE GRAPHS (Yes,No)?

If graphs for both upbound and downbound vessels were required, this prompt would appear after two graphs had been produced.

If it is desired to make another plot, the user is returned to the first plotting menu and the same procedure is followed.

Figures 17 through 28 show all possible combinations of graphs generated by the plotting options for both upbound and downbound vessels.

A "No" at this point or "No" for the first HP plotter prompt results in the following prompt:

DO YOU WANT TO CHANGE ANY PARAMETERS AND RERUN (Yes,No)?

At this point, the user is taken into the same routine for changing parameters as in Option 2 except for the vessel velocity questions. Parameters are changed in the same fashion.

Figure 28 Drawdown and Damage for Both Sides - Downbound Vessel

The calculations portion of this routine can take several minutes. The user is requested to wait as calculations are in progress. The vessel can also become grounded as in Option 2 and the screen printout is the same.

Option 4: Fit Light Meter Data to Line and Give Results

This routine will calculate the light extinction coefficients for data stored using Option 6 of the data entry menu. The results can then be plotted on the computer screen and/or on the HP plotter.

The first text to appear on the screen is:

```
THIS ROUTINE ALLOWS FOR CALCULATION OF THE  
COEFFICIENT OF EXTINCTION OF LIGHT WITH  
DEPTH FOR STORED LIGHT METER DATA. IT WILL  
ALSO PLOT THE RESULTS ON THE SCREEN OR ON  
THE PLOTTER IF PROMPTED.
```

```
PUT DATA DISK IN DRIVE 'B'.
```

```
HIT SPACE BAR TO CONTINUE.
```

Put the data disk containing the light meter data into the drive and press the space bar.

The next prompt is for the file name of the light meter data file. The file used for this example is the same as the one entered during the description of Option 6 of the data entry menu in an earlier section. The

following text shows what appears on the screen after the file name is entered.

```
FILE NAME?  B:LIGHT

TEST
DISTANCE =      500
OVERHEAD READING =      2000
ICE THICKNESS =      0 in.
READING UNDER SURFACE =      1800
  1 .   2      1700
  2 .   5      1400
  3 .  10      1000
  4 .  15       700
  5 .  20       400

END OF DATA FILE  B:LIGHT

ARE DATA CORRECT (Y/N)?
```

The prompt at the bottom, "are data correct?", is intended to allow the user to change data files if the one entered was not correct. If a "No" is entered the computer prompt is for another file name and the new file is displayed. If the data is correct and a "Yes" is entered the user is prompted to wait..while the calculation is performed. The result of the calculation as printed on the screen is as follows:

$K_e = 0.082 \pm 0.008$

NUMBER OF DATA = 4

END OF DATA ANALYSIS. HIT ANY KEY CONTINUE

"Ke" is the slope of the best fit line through the light data by linear regression. An explanation of its significance can be found in the main report. If no plots are to be made, this value should be recorded at this time, from the screen.

After pressing any key the prompt is:

DO YOU WANT RESULTS PLOTTED ON THE SCREEN (Y/N) ? Y

If a "Yes" is entered a representation similar to Figure 29 will show up on the screen. To clear the plot, press any key on the keyboard and the display will read:

DO YOU WANT RESULTS PLOTTED ON THE HP PLOTTER (Y/N) ?

If a "No" was entered for the computer screen plot prompt the question above would appear without the screen plot. When a plot is not desired from the HP plotter, type "No" at this time and the screen returns to the calculation menu.

If "Yes" is entered for a plot the next text is printed:

Figure 29 Screen Graphics of Light Extinction Analysis

PUT PLOTTER ON LINE

HIT SPACE BAR TO CONTINUE.

At this point, put the desired pen into the plotter, insert the 8 1/2 x 11 paper and press the space bar. Figure 30 is the result.

The last prompt is:

DO YOU WANT ANOTHER PLOT (Y/N) ?

If a "Yes" is entered the user is prompted to put the printer on line and another plot like Figure 30 results. A "No" returns the user to the calculations menu.

The previous sections are intended to familiarize the user with the various calculations subroutines. As in Option 1, MAIN PROGRAM MENU, the user can try the above examples to get an understanding of the program's use.

An explanation of the theoretical and empirical basis of this program and examples of its application can be found in the report accompanying this manual.

Listings of the various routines are found at the end of this manual.

LIGHT METER RESULTS

Figure 30 Light Extinction Analysis from Plotter

PROGRAM LISTING

The program is composed of five subroutines. They are BEGIN, BEGIN.TWO, TWO.SUB, ONE.SUB, and THREE.SUB. Flow diagrams are shown below and the subroutines are listed in the following sections.
