19. ABSTRACT (Continue on reverse if necessary and identify by block number) This report describes how to use a computer simulation to predict the performance of Army Tank-Automotive equipment. The simulation uses engineering data to predict the gradeability, acceleration and fuel consumption of vehicle propulsion systems. The engine, transmission and intermediate driveline components are simulated mathematically in order to provide an interactive capability. The simulation supports tektronix 4014 terminals and can produce plots of simulation output. The output is also provided in a file which can be sent to a printer.

1.0 INTRODUCTION

This document is a User's Guide which is to be used with the Propulsion System Performance Simulation (PS**2). This simulation is an automated method to evaluate the performance characteristics of different engines and transmissions that are proposed for use in Army tank-automotive equipment. This simulation has been developed by the Propulsion Systems Division of the Research, Development and Engineering Center of the U.S. Army Tank-Automotive Command. The simulation utilizes engineering performance data of vehicles, engines and transmissions to evaluate the performance of complete vehicle systems. The simulation produces text and graphic output to show the performance characteristics of Tractive Force vs Vehicle Speed, Sprocket Horsepower vs Vehicle Speed, Vehicle Speed vs Time, Vehicle Distance vs Time and Vehicle Fuel Consumption. The Tractive Force vs Vehicle Speed and Sprocket Horsepower vs Vehicle Speed listings and graphs are used to evaluate a vehicle's slope-climbing ability. Vehicle full power acceleration information is provided in the form of a listing of vehicle speed and distance and other data for every .1 second. Graphs of Vehicle Speed vs Time and Vehicle Distance vs Time are plotted from this data. The fuel consumption map consists of lines for sprocket horsepower vs speed for constant fuel consumption. There is one plot for each individual gear range.

The simulation is a computer-based, interactive system which runs on the RDE Center Prime time-sharing computer system; it has recently been updated to make it more user-friendly. No previous computer experience is required by the user. This manual provides the information required to use the PS**2. Actual simulation samples are used extensively in this manual; a sample terminal session is provided in Appendix D for reference.

1.1 SIMULATION PURPOSE

The purpose of the Engine Transmission Performance Evaluation Simulation is to provide engineers with a measuring device to evaluate different vehicle configurations quickly and easily, as well as to provide enough information to make decisions regarding selection of a particular system. The simulation provides access to Vehicle, Engine, and Transmission data that has been compiled by the Propulsion Systems Division.

1.2 BASIC SIMULATION COMPONENTS

There are three basic types of components in this simulation: Vehicles, Engines, and Transmissions. These components are also referred to as "entities." The user is allowed to create, or select from a catalog, each of these components individually to simulate alternative configurations.

The first type of component represents the vehicle characteristics.

These include physical attributes (e.g., weight, frontal area, rolling resistance, etc.) as well as names for an engine and transmission that are standard with the vehicle. Currently, there are approximately 20 vehicles in the AMSTA-RG CATALOG from which to choose.

The second type of simulation entity is the engine. This is the source of power for the simulated vehicle. There are approximately 30 parameters which describe the engine characteristics; many of the attributes are vectors and data arrays. There are now over three dozen engines in the AMSTA-RG CATALOG.

The last simulation component type is the transmission. In addition to the general characteristics, each transmission has an additional set of engine-dependent attributes; there is a separate set of values for each engine with which the transmission can be matched. In this respect, the variety of engines that can be simulated with any given transmission is limited. Presently, the AMSTA-RG CATALOG contains over one dozen transmissions.

1.3 SIMULATION PHILOSOPHY

The simulation has been developed so that an engineer will be able to exercise it and obtain meaningful/satisfactory results. It is written in SIMSCRIPT II.5, a simulation language. Considerable effort and testing have been devoted to making this simulation user-friendly but more suggestions are welcomed. Following are descriptions of features which facilitate ease of use.

1.3.1 SIMULATION PROMPTS. The simulation uses a system of "prompts" to communicate with the user. When the simulation requires information/inputs from you (the user), it will usually request the required information by printing a statement (prompt) at your terminal (e.g., ENTER TERMINAL TYPE) followed by the prompt character, a greater than sign (>). When this character is displayed the computer is waiting for an input from you.

The level of detail provided in the prompts can be specified by the user. There are two levels: full and brief. The prompt level is automatically set to "full" which provides the maximum prompt information. Until you become proficient in the use of this simulation, it may not be wise to change the prompt level.

1.3.2 USER RESPONSES. When entering your responses to the simulation prompts, they should always be in UPPERCASE. Terminals generally have a shift "lock" key. When it is depressed, it will only generate UPPERCASE responses.

If you make a mistake while entering your response, this can be easily corrected. If you have only mistyped a character or two, you can use a character delete to erase the incorrect characters (one for each character to be deleted). If you have typed an incorrect command, you

can use a line delete to erase your entire line. Check the appendix specific to the terminal type you are using to ascertain these deletion characters.

To streamline user responses, most simulation inputs have abbreviations. All recognized abbreviations are displayed next to the full length command; for example, SIMULATE(SIM). In addition, YES can be abbreviated as a Y and NO can be abbreviated as an N throughout the simulation.

Another point to remember is, if you are requested to enter a list of values as your response, these values should be separated by blanks. No other separator is acceptable; commas should NOT be used.

When you have successfully typed your response to the prompt, it must then be transmitted to the computer. This step is accomplished by entering/depressing the "RETURN" key; this is also known as entering a "carriage return."

The simulation may be terminated by pressing the "BREAK" key. This causes the computer to immediately stop execution of the simulation and returns to the computer operating system. Pressing the "BREAK" key causes a SIMSCRIPT error and a traceback can be obtained showing where the simulation was when it was stopped. Doing this may cause loss of the vehicle, engine and transmission data that were active in the simulation at that time, if they had not been saved. Normal termination is described in Section 2.4.4.

1.4 MANUAL LAYOUT

The remainder of this manual is organized into four sections. Section 2 presents instructions required to run the simulation. Section 3 stipulates the inputs the user provides; section 4 details the outputs of the simulation. Section 5 provides information regarding errors that can be encountered as well as potential solutions for the user.

Additionally, seven appendices are provided. They are listed below:

- Appendix A - TEKTRONIX Terminal Information
- Appendix B - TAB Terminal Information
- Appendix C - Decwriter (TTY) Terminal Information
- Appendix D - Sample Terminal Session
- Appendix E - Graftek Information
- Appendix F - Fuel Map Information
- Appendix G - Engine/Transmission Matching Information
- Appendix H - Blank Vehicle Data Sheet
- Appendix I - Blank Engine Data Sheet
- Appendix J - Blank Transmission Data Sheet

2.0 EXECUTING THE SIMULATION

This section explains how to execute the PS**2 simulation. The

following four subsections deal with 1) what is necessary before using the computer, 2) logging into the computer, 3) PS**2 initiation, and 4) PS**2 operations. Examples from actual terminal sessions are included.

2.1 BEFORE USING THE COMPUTER

The PS**2 simulation has been developed for the TACOM RDE Center. The TACOM RDE Center Computer consists of three CPU's (Central Processing Units) linked in a network, and housed together in Bldg. 215. Communication between remote computer terminals and the CPU's is via telephone lines. Stationed near each terminal is a modem (modulator/demodulator), which sends and receives computer signals in a form suited to the phone lines. The modem will be either telephone-style (Dataphone) or toggle-switch style (Gandalf).

Prior to running the simulation, you will need to obtain a computer userid and password on the TACOM RDE Center computer. When you are assigned a userid, your file storage area will be assigned to a disk storage unit controlled by either DRAS (Data Reduction Analysis System) or FEM (Finite Element Modeler), two of the three CPU's. Additionally, if you are going to use a dataphone (versus a Gandalf modem) to communicate with the computer, you will need the computer telephone number. All this information can be obtained from your Terminal Area Security Officer (TASO).

2.2 COMPUTER LOGIN

Now you are ready to use the computer. The simulation has been tailored to operate on remote terminals such as a Tektronix 4014, Tab 132-15G, or any (TTY) terminal. Locate one of these terminals. If it has an adjoining Gandalf modem, turn on both the modem and the terminal. If you are using a dataphone, do the following:

- 1) Turn on the terminal,
- 2) Dial the computer using the TALK line,
- 3) Wait for a loud, high-pitched tone (a carrier),
- 4) Depress the DATA button, then
- 5) Hang up the phone receiver.

In either case, depress the terminal "RETURN" key. You will be asked to login. Logins are of the form:

LOGIN userid password -ON curname

If you are successful, information will be printed regarding the computer, and an "OK," will appear. If you are unsuccessful, an error message will be printed. You should re-enter the LOGIN line.

2.3 SIMULATION INITIATION

Once you receive the "OK," message, enter SEG
<FEM03>JACOBSON>PERFORMANCE>PS**2; and the simulation will begin execution. First a greeting including time of day, date, and simulation consultant is printed, followed by information regarding user input.

2.3.1 INITIAL USER INPUTS. The following is a sample of the simulation initiation. All examples were generated on the TTY type terminal. The examples are printed in all upper case letters.

OK, SEG <FEMO3>JACOBSON>PERFORMANCE>PS**2

WELCOME TO THE PROPULSION SYSTEM PERFORMANCE SIMULATION.
SIMULATION EXECUTION WAS INITIATED AT 14.55.16 ON 11/21/83.
IF YOU HAVE ANY DIFFICULTIES USING THIS SIMULATION, CONTACT
RICH JACOBSON AT EXT. 45879/45999

IT IS NECESSARY FOR YOU, THE USER, TO PROVIDE SOME INFORMATION
SO THAT THE SIMULATION CAN TAILOR INPUTS AND OUTPUTS FOR YOU.
ENTER YOUR RESPONSES FOLLOWING THE ">", AND MAKE SURE THEY
ARE IN UPPERCASE. IT IS ALSO NECESSARY TO DEPRESS THE "RETURN" KEY
TO TRANSMIT YOUR RESPONSE TO THE COMPUTER.
ENTER THE BAUD RATE IN CHARACTERS PER SECOND (120 OR 960)

>

2.3.1.1 BAUD RATE. The baud rate is the speed which information can be transmitted to and from the computer. If you are accessing the computer through a dataphone, then the baud rate is 120. If the connection to the computer is through a Gandalf LDS 120 modem, then the baud rate is 960. The computer prompt is as follows:

ENTER THE BAUD RATE IN CHARACTERS PER SECOND (120 OR 960)

>960

ENTER ? TERMINAL TYPE

- 1 = TTY
- 2 = TEKTRONIX 4014
- 3 = RAMTEK 6211
- 4 = TAB 132/G

IF YOU ARE UNSURE OR YOUR TERMINAL TYPE IS NOT LISTED, ENTER 1
ENTER NUMBER

>

2.3.1.2 TERMINAL TYPE. The terminal type will determine if the simulation will be able to provide graphic output. The TTY option is the only option which will not allow graphics. The computer prompt is as follows:

ENTER TERMINAL TYPE

- 1 = TTY
- 2 = TEKTRONIX 4014
- 3 = RAMTEK 6211
- 4 = TAB 132/G

IF YOU ARE UNSURE OR YOUR TERMINAL TYPE IS NOT LISTED, ENTER 1

ENTER NUMBER

>1

FOR YOUR CONVENIENCE, THIS SIMULATION CONTAINS A SYSTEM OF "PROMPTS" WHICH PROVIDE/REQUEST INFORMATION. THE PROMPT LEVEL IS CURRENTLY SET TO PROVIDE THE MAXIMUM AMOUNT OF INFORMATION. UNTIL YOU BECOME PROFICIENT IN THE USE OF THIS SIMULATION, WE RECOMMEND NOT CHANGING THE LEVEL OF PROMPTING PROVIDED.

DO YOU WANT TO CHANGE THE PROMPT LEVEL? ENTER YES(Y) OR NO(N)

>

2.3.1.3 PROMPT LEVEL. The prompt level is the amount of information that is provided when a prompt is given. If the prompt level is changed, prompts will be very short; and it will be expected that the user will know all possible responses. The computer prompt is as follows:

DO YOU WANT TO CHANGE THE PROMPT LEVEL? ENTER YES(Y) OR NO(N)

>NO

THIS SIMULATION HAS THE CAPABILITY OF CALCULATING THE TRACTIVE FORCE VS VEHICLE SPEED OF AN ENGINE DRIVELINE SYSTEM AND EVALUATING THE FULL POWER ACCELERATION AND FUEL CONSUMPTION OF A VEHICLE SYSTEM. THE LIST THAT FOLLOWS THIS MESSAGE SHOWS THE AVAILABLE VEHICLES (WITH THEIR DEFAULT ENGINES AND TRANSMISSIONS)

AND OTHER AVAILABLE ENGINES AND TRANSMISSIONS. NOT ALL COMBINATIONS OF ENGINES AND TRANSMISSIONS ARE POSSIBLE. THE ENGINES THAT HAVE BEEN MATCHED WITH A PARTICULAR TRANSMISSION ARE INCLUDED IN THE TRANSMISSION DATA. THERE ARE TWO TYPES OF OUTPUT WITH THIS SIMULATION.

GRAPHS CAN BE GENERATED WITH THE GRAPH OPTION AND NUMERICAL DATA IS OUTPUT TO FILES. NUMERICAL OUTPUT FOR TRACTIVE FORCE VS SPEED IS WRITTEN TO THE FILE TRACTIVE.FORCE.DATA AND THE FULL POWER ACCELERATION DATA, AT 0.1 SEC INTERVALS, IS WRITTEN TO THE FILE ACCEL.DATA. FUEL CONSUMPTION DATA IN MILES PER GALLON IS WRITTEN ON THE FILE FUEL.DATA. A LIST OF VEHICLES, ENGINES AND TRANSMISSIONS WILL BE LISTED BY ENTERING A CARRIAGE RETURN.

Note that the letter Y can be used in place of YES and the letter N can be used for NO throughout the simulation.

At this point the user should respond by entering a carriage return. Now all initial inputs have been entered, and you are ready to utilize the data handling and evaluation capabilities of this simulation.

2.3.2 CATALOGS. At this point in the simulation, the option to view the AMSTA-RG CATALOG or the USER CATALOG of data is provided as well as the opportunity to recall data from them. The AMSTA-RG CATALOG contains data for Vehicles, Engines, and Transmissions that has been compiled by the Propulsion Systems Division. The USER CATALOG contains data that an individual user has created and stored under the user's UFD (User File Directory) where he executes the simulation. Data from the AMSTA-RG CATALOG can be recalled, but no user created data can be saved in the

AMSTA-RC CATALOG. User data can be saved in the USER CATALOG. These are files in the user's UFD where the user started the simulation. The file names are VEHICLE.DATA, ENGINE.DATA, and TRANS.DATA. The simulation will ask the user if he wants to see the AMSTA-RC CATALOG via the prompt which follows:

DO YOU WANT TO SEE THE AMSTA-RC CATALOG ? YES(Y) OR NO(N)
>YES

AMSTA-RC CATALOGED DATA

DO YOU WANT TO RECALL A VEHICLE, ENGINE OR TRANSMISSION AT THIS TIME
YES(Y) OR NO(N)

>

The simulation has been set up so that cataloged data can be recalled from a file at this time. If data is not recalled, the simulation goes to the top-level prompt, which follows:

DO YOU WANT TO RECALL A VEHICLE, ENGINE OR TRANSMISSION AT THIS TIME
YES(Y) OR NO(N)

>NO

TOP LEVEL CONTROLLER: ENTER ONE OF THE FOLLOWING COMMANDS (OR ABBREVIATIONS):
COMPONENT(CD) SIMULATE(SIM) GRAPH(G) OR STOP(S)

>

However, if the response was "YES", the simulation then enters the RECALL segment. See the section pertaining to the RECALL command for proper responses. After data is recalled the simulation returns to the top-level prompt.

2.4 SIMULATIONS OPERATIONS

The user is able to control the simulation operations via a hierarchy of commands. This structure is shown below:

USER COMMAND HIERARCHY

TOP LEVEL CONTROLLER COMMANDS:

- o COMPONENT(CD)
- o SIMULATE(SIM)
- o GRAPH(G)
- o STOP(S)

COMPONENT DATA MANAGEMENT COMMANDS:

- o QUERY(Q)
- o RECALL(R)
 - o VEHICLE(V)
 - o ENGINE(E)
 - o TRANS(T)
 - o RETURN(RET)
- o LIST(L)
Same options as RECALL above
- o CHANGE(CH)
Same options as RECALL above
- o SAVE(S)
Same options as RECALL above
- o DELETE(D)
Same options as RECALL above
- o CREATE(CR)
Same options as RECALL above

- o RETURN(RET)

SIMULATION FACILITY CHOICES

- o 1=FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- o 2=FULL POWER ACCELERATION PERFORMANCE
- o 3=FUEL CONSUMPTION
- o 4=RETURN

GRAPHING FACILITY CHOICES

- o 1=TRACTIVE FORCE VS VEHICLE SPEED
- o 2=ACCELERATION DISTANCE VS TIME
- o 3=ACCELERATION VEHICLE SPEED VS TIME
- o 4=SPROCKET HORSEPOWER VS VEHICLE SPEED
- o 5=FUEL CONSUMPTION IN CONSTANT MPG
- o 6=RETURN

There are three groups of commands: database commands, simulate commands, and graph commands. This section presents all available commands as well as a brief description of the resulting operations. Additionally, examples of command usage are provided.

After the initial user inputs (e.g., baud rate, terminal type) have been entered, the simulation will place the user at the "TOP LEVEL CONTROLLER" level. From this level, the user can invoke any of the three major command groups (database, simulate, or graph) or terminate simulation execution. The prompt which informs the user that he is at the TOP LEVEL CONTROLLER follows:

TOP LEVEL CONTROLLER: ENTER ONE OF THE FOLLOWING COMMANDS (OR ABBREVIATIONS):
 COMPONENT(CD) SIMULATE(SIM) GRAPH(G) OR STOP(S)

>

2.4.1 COMPONENT DATA COMMAND. The database section of the simulation allows the user to access all of the available data and perform various operations on it. The user is free to use the commands in any order desired, and he can re-enter them as well. Each operation is listed with an explanation of its use as well as examples of the computer interactions. The database segment prompt is as follows:

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
 CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
 RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)

>

2.4.1.1 QUERY. The QUERY command allows the user to display a list of the Vehicles, Engines, and Transmissions that are on the AMSTA-RG CATALOG or the USER CATALOG. The following example shows a query of the AMSTA-RG CATALOG:

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :

CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
RECALL(R) DELFTE(D) QUERY(Q) RETURN(RET)

>QUERY

DO YOU WANT TO SEE THE AMSTA-RG CATALOG ? YES(Y) OR NO(N)

>YES

(More Not Shown)

The next example shows a query of the user's local data files (USER CATALOG).

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :

CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)

>QUERY

DO YOU WANT TO SEE THE AMSTA-RG CATALOG ? YES(Y) OR NO(N)

>NO

USER CATALOGED DATA

VEHICLE WITH ENGINE AND TRANSMISSION			ENGINES	TRANSMISSIONS
M-60	AVDS-1790	CD-850-6A	AVDS-1790	CD-850-6A
M-1	ACT-1500	X-1100	ACT-1500	X-1100
RAM.1	318	NP435	318.1	NP435.1

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
 CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
 RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
 >

The query command automatically returns to the COMPONENT DATA HANDLER.

2.4.1.2 RECALL. The RECALL command allows the user to recall data from the AMSTA-RG CATALOG or previously saved data from his own USER CATALOG. Only one copy of each component type (Vehicle, Engine, and Transmission) can be available to the simulation at a time. Therefore, the existing data for a component must be deleted from the simulation before other data can be recalled.

The following example illustrates data being recalled from a file. First, the simulation asks if the AMSTA-RG CATALOG is to be used. The user responds "YES"; however, if the user would have responded "NO", his own USER CATALOG would have been used. The RECALL options are then printed. The user requests a vehicle be recalled and is prompted by the simulation for the vehicle name. Next an engine recall is requested. The simulation now asks the user if the default engine (AGT-1500) is to be recalled. This is responded to affirmatively by the user. Next, a transmission recall is requested by the user. Again, a default one (X-1100) is available; and the simulation asks if that one should be recalled. The user responds positively.

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
 CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
 RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
 >RECALL
 DO YOU WANT DATA FROM THE AMSTA-RG CATALOG YES(Y) OR NO(N)
 >YES
 RECALL ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >VEHICLE
 ENTER THE VEHICLE NAME
 >M-1
 THE VEHICLE M-1 WAS LOADED FROM THE FILE
 RECALL ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >ENGINE
 DO YOU WANT THE VEHICLE DEFAULT ENGINE LOADED YES(Y) OR NO(N)
 >YES
 THE ENGINE AGT-1500 WAS LOADED FROM THE FILE
 RECALL ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >TRANS
 DO YOU WANT THE VEHICLE DEFAULT TRANSMISSION LOADED YES(Y) OR NO(N)
 >YES
 THE TRANSMISSION X-1100 HAS BEEN LOADED

At this point, the desired recalls have been performed so a "RET" response is entered by the user to return to the COMPONENT DATA HANDLER level.

```

RECALL ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
  VEHICLE(V)  ENGINE(E)  TRANS(T)  RETURN(RET)
>RETURN
COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
  CREATE(CR)  LIST(L)  CHANGE(CH)  SAVE(S)
  RECALL(R)  DELETE(D)  QUERY(Q)  RETURN(RET)
>

```

2.4.1.3 LIST. The LIST option allows the user to list the Vehicle, Engine, or Transmission data that is presently available to the simulation. The following example shows a display of vehicle data.

```

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
  CREATE(CR)  LIST(L)  CHANGE(CH)  SAVE(S)
  RECALL(R)  DELETE(D)  QUERY(Q)  RETURN(RET)
>LIST
LIST ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)

At this point you are given an opportunity to continue listing components or to return to the COMPONENT DATA HANDLER. The example below illustrates a "RETURN" user response.

LIST ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
>RETURN
COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
>

2.4.1.4 CHANGE. The CHANGE command allows the user to change the values of the Vehicle, Engine, or Transmission data. Most, but not all, values are changeable. As with the other database commands, the user must specify which component he wants to change (i.e., Vehicle, Engine, or Transmission). A menu of changeable data values for the specified component is displayed at this point. The user is then prompted for the number which corresponds to the value to be changed. The current data value is furnished by the simulation; the simulation then prompts for the new data value, which is also displayed. The user will be allowed to change as many component data values as desired. When all changes for that component have been accomplished, the number which corresponds to the "RETURN" should be entered by the user. For a description of any data item see Section 3.

The following example depicts changing the vehicle's gross weight value:

CHANGE ROUTINE: ENTER THE ENTITY (OR ABBREVIATION)
 VEHICLE (V) ENGINE (E) TRANS (T) RETURN (RET)
 >VEHICLE
 FOLLOWING IS A LIST OF CHANGEABLE VEHICLE ATTRIBUTES:

- 1 - VEHICLE NAME
- 2 - DEFAULT ENGINE
- 3 - DEFAULT TRANSMISSION
- 4 - GROSS VEHICLE WEIGHT (LB)
- 5 - ACTIVE TRACK WEIGHT (LBM)
- 6 - PRIMARY ROAD ROLLING RESISTANCE (LBF/TON)
- 7 - SECONDARY ROAD ROLLING RESISTANCE (LBF/TON)
- 8 - CROSS COUNTRY ROLLING RESISTANCE (LBF/TON)
- 9 - FRONTAL AREA (FT**2)

- 14 - ALTITUDE LOSS FACTOR
- 15 - ENGINE FUEL CONSUMPTION MAP
- 16 - RETURN

ENTER THE NUMBER OF YOUR CHOICE

```

>3
PRESENT INSTALLATION LOSS FACTOR IS 0.97
ENTER NEW INSTALLATION LOSS FACTOR (REAL)
>.95
INSTALLATION LOSS FACTOR IS NOW 0.95
ENTER THE NUMBER OF YOUR CHOICE
>16

```

The final example illustrates several changes to the transmission data. First, the transmission gear shift time is changed. Next, the list of engines compatible with the transmission is requested by the user and printed by the simulation. The simulation then asks if a compatible engine is to be changed. The user responds affirmatively. After this a menu of changeable transmission engine-dependent values is printed; and the user is prompted for the number of the value to be changed. The user specifies a change to the sprocket pitch radius. This change is accomplished, and the user is prompted for the next transmission engine-dependent value change. There are none, so the user enters the number corresponding to the "RETURN" command (in this case 22), which returns him to the level where additional transmission values can be changed. No updates are desired; therefore, the number corresponding to the "RETURN" (in this case 6) is entered.

```

 6 - RETURN
 ENTER THE NUMBER OF YOUR CHOICE
 >6

At this point, the user can continue making component changes. No changes are desired by the user, so a "RETURN" response is entered.

CHANGE ROUTINE: ENTER THE ENTITY (OR ABBREVIATION)
 VEHICLE (V) ENGINE (E) TRANS (T) RETURN (RET)
 >RETURN
 COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
 CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
 RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
 >

2.4.1.5 SAVE. The SAVE command allows the user to save Vehicle, Engine and Transmission data that he has created or changed, on his local files (USER CATALOG). This data can then be recalled during subsequent simulation sessions. When saving Vehicle, Engine, or Transmission data, the name must be different than any name that is presently in the catalog. The simulation will check the name and tell the user if there is an item on the data files with the same name. If this happens, the CHANGE command should be used to enter a new, unique name. The data can then be saved. The following example shows a user invoking the save command. Next, the current vehicle is saved; then the engine is saved. Finally, the transmission is saved.

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
 CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
 RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
 >SAVE
 SAVE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >VEHICLE
 THE VEHICLE CALLED M-1 HAS BEEN SAVED ON FILE
 SAVE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >ENGINE
 THE ENGINE CALLED AGT-1500 HAS BEEN SAVED ON FILE
 SAVE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
 VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
 >TRANS
 THE TRANSMISSION CALLED X-1100 HAS BEEN SAVED ON FILE

When all desired data has been saved, a "RETURN" response should be entered by the user. This is illustrated below.

SAVE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)

```

    VEHICLE(V)   ENGINE(E)   TRANS(T)   RETURN(RET)
>RETURN
COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
    CREATE(CR)   LIST(L)     CHANGE(CH)   SAVE(S)
    RECALL(R)    DELETE(D)    QUERY(Q)    RETURN(RET)
>

```

2.4.1.6 DELETE. The DELETE command allows the user to delete the current Vehicle, Engine, or Transmission data that is available to the simulation so that other data can be recalled or new data can be created. No data can be permanently deleted once it is in the AMSTA-RG CATALOG or has been saved on your local files (USER CATALOG); it is only deleted as the current data available to the simulation. The following example shows all three PS**2 components being deleted:

```

DELETE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
    VEHICLE(V)   ENGINE(E)   TRANS(T)   RETURN(RET)
>VEHICLE
VEHICLE DELETED
DELETE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
    VEHICLE(V)   ENGINE(E)   TRANS(T)   RETURN(RET)
>ENGINE
ENGINE DELETED
DELETE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
    VEHICLE(V)   ENGINE(E)   TRANS(T)   RETURN(RET)
>TRANS
TRANS DELETED

```

At this point, all deletion requests were made by the user; therefore, the "RETURN" command is entered.

```

DELETE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
    VEHICLE(V)   ENGINE(E)   TRANS(T)   RETURN(RET)
>RETURN
COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
    CREATE(CR)   LIST(L)     CHANGE(CH)   SAVE(S)
    RECALL(R)    DELETE(D)    QUERY(Q)    RETURN(RET)
>

```

2.4.1.7 CREATE. The CREATE command allows the user to interactively enter the data which describes a new Vehicle, Engine, or Transmission. See Section 3 for a description of each of the data items. Following is an example of a vehicle being created:

```

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
    CREATE(CR)   LIST(L)     CHANGE(CH)   SAVE(S)
    RECALL(R)    DELETE(D)    QUERY(Q)    RETURN(RET)
>CREATE

The following three items are torque converter characteristics which
 in most cases cannot be described by only 1 curve. Therefore the data
 is divided into 2 parts and a curve is fitted to both parts. See
 Appendix E on the use of GRAFTEK, the curve fitting program. These
 curves are usually divided at a speed ratio of from .8 to .9. Several
 trials are usually needed to find the best point to divide this data.
 The first four data points represent the curve from 0 speed ratio to the
 change point.

ENTER SPEED RATIO WHERE INPUT CAPACITY FACTOR AND TORQUE RATIO

```

When you have completed creating the desired components, a "RETURN" or "RET" should be entered. This will return you to the COMPONENT DATA HANDLER level.

```

CREATE ROUTINE: ENTER THE ENTITY(OR ABBREVIATION)
VEHICLE(V) ENGINE(E) TRANS(T) RETURN(RET)
>RETURN
COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
>

```

2.4.1.8 RETURN. The RETURN command transfers simulation control to the next higher level. In other words, it causes the simulation to terminate the database operations. The following example demonstrates a "RETURN" response to the COMPONENT DATA HANDLER. This causes simulation control to be transferred to the TOP LEVEL CONTROLLER.

```

COMPONENT DATA HANDLER: ENTER A COMMAND (OR ABBREVIATION) :
CREATE(CR) LIST(L) CHANGE(CH) SAVE(S)
RECALL(R) DELETE(D) QUERY(Q) RETURN(RET)
>RETURN
TOP LEVEL CONTROLLER: ENTER ONE OF THE FOLLOWING COMMANDS (OR ABBREVIATIONS):
COMPONENT(CD) SIMULATE(SIM) GRAPH(G) OR STOP(S)
>

```

2.4.2 SIMULATE COMMAND. The SIMULATE command allows the user to perform different types of analysis on the Vehicle, Engine, and Transmission data. The user must make sure that the engine and transmission have been properly matched. (See APPENDIX C for further information). Following is an example of the SIMULATE command. The user is prompted for a concept title; it will be used by the simulation to label any graphs. Next a menu of available simulation options is presented, and the user is prompted to enter his choice.

```

TOP LEVEL CONTROLLER: ENTER ONE OF THE FOLLOWING COMMANDS (OR ABBREVIATIONS):
COMPONENT(CD) SIMULATE(SIM) GRAPH(G) OR STOP(S)
>SIMULATE
ENTER CONCEPT TITLE (WHICH WILL APPEAR ON GRAPHS)
(10 CHARACTERS OR LESS WITH NO BLANKS)

```

>TEST

SIMULATION FACILITY: THE FOLLOWING SIMULATIONS/OPERATIONS CAN BE PERFORMED

- 1 = FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- 2 = FULL POWER ACCELERATION PERFORMANCE
- 3 = FUEL CONSUMPTION
- 4 = RETURN TO TOP LEVEL CONTROLLER

ENTER THE NUMBER OF YOUR CHOICE

>

2.4.2.1 FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED. The Full Throttle Tractive Force vs Speed simulation calculates the amount of force available at the ground for selected vehicle speeds. This information is necessary to determine grade performance and is also necessary to run the Full Power Acceleration and Fuel Consumption simulations.

Following is an example of a user requesting a full throttle tractive force vs vehicle speed simulation. The simulation presents the default temperature and altitude which it will use and prompts the user for any changes. The simulation is performed, and the user menu is printed by the simulation.

SIMULATION FACILITY: THE FOLLOWING SIMULATIONS/OPERATIONS CAN BE PERFORMED

- 1 = FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- 2 = FULL POWER ACCELERATION PERFORMANCE
- 3 = FUEL CONSUMPTION
- 4 = RETURN TO TOP LEVEL CONTROLLER

ENTER THE NUMBER OF YOUR CHOICE

>

The following example is the same as the preceding example. The only difference is that the user had already requested a full throttle tractive force vs vehicle speed simulation during this terminal session. The prior request caused a TRACTIVE.FORCE.DATA file to be created, and its disposition must be addressed before another simulation can be

performed. This example demonstrates a user trying to continue; however, the simulation will not allow this. The file must either be saved, spooled (routed to a printer), or deleted.

SIMULATION FACILITY: THE FOLLOWING SIMULATIONS/OPERATIONS CAN BE PERFORMED

- 1 - FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- 2 - FULL POWER ACCELERATION PERFORMANCE

2.4.2.2 FULL POWER ACCELERATION PERFORMANCE. This simulation is used to predict the vehicle full power acceleration performance for Vehicle Speed vs Time (e.g., time from 0-10 MPH and 0-20 MPH) and Distance vs Time (e.g., time from 0-500 FT). The user can also make disposition of the ACCEL.DATA file here. Additionally, there are two items that the user can select that will affect the acceleration simulation. The first is the Rolling Resistance, which determines the type of terrain being traversed; and the second is the traction coefficient, which represents the capability of the surface to provide traction.

Following is an example of the dialog required to compute a full power acceleration performance simulation. As in the above example, a previous simulation of this type had been performed; therefore, the output file disposition must be addressed. At this point the user is prompted for the rolling resistance to be used; next the simulation presents the traction coefficient and prompts for any desired changes.

The requested simulation is performed, and the user is prompted for his next choice.

SIMULATION FACILITY: THE FOLLOWING SIMULATIONS/OPERATIONS CAN BE PERFORMED

- 1 - FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- 2 - FULL POWER ACCELERATION PERFORMANCE
- 3 - FUEL CONSUMPTION

2.4.2.3 FUEL CONSUMPTION. This simulation produces a vehicle fuel map showing lines of constant MPG. The map can be used to make fuel consumption predictions for various scenarios where the vehicle load conditions are known. The FUEL CONSUMPTION option has a large number of calculations and may take from 5 to 10 minutes depending on the number of gear conditions of the Transmission. The user can also make disposition of the FUEL.DATA file here.

Following is an example of a fuel consumption simulation. Again, a fuel consumption simulation had already been performed, so the user is prompted for the existing file disposition. The fuel consumption simulation is performed, and the user is prompted for his next simulation facility choice.

SIMULATION FACILITY: THE FOLLOWING SIMULATIONS/OPERATIONS CAN BE PERFORMED

- 1 = FULL THROTTLE TRACTIVE FORCE VS VEHICLE SPEED
- 2 = FULL POWER ACCELERATION PERFORMANCE
- 3 = FUEL CONSUMPTION
- 4 = RETURN TO TOP LEVEL CONTROLLER

ENTER THE NUMBER OF YOUR CHOICE

>

2.4.4 STOP COMMAND. The STOP command ends execution of the simulation and returns the user to PRIMOS Operating System level. At this time the user can look at the output files using the ED command in PRIMOS, use the SPOOL command and list the files at a printer, or logout from the computer.

TOP LEVEL CONTROLLER: ENTER ONE OF THE FOLLOWING COMMANDS (OR ABBREVIATIONS):
COMPONENT(CD) SIMULATE(SIM) GRAPH(G) OR STOP(S)

>STOP

IF SIMULATIONS HAVE BEEN RUN THE FOLLOWING FILES CONTAIN OUTPUT DATA:
TRACTIVE FORCE VS SPEED ON TRACTIVE.FORCE.DATA
FULL POWER ACCELERATION ON ACCEL.DATA
FUEL CONSUMPTION ON FUEL.DATA

OK,

2.5 TERMINATING THE TERMINAL SESSION (LOGOUT). After entering the STOP command, indicating that you have finished using the PS**2, the computer will respond with "OK,". The terminal session is completed by typing the PRIMOS "LOGOUT" command. The computer will print some summary information; you can then turn off the terminal (and the modem, if you were using one). If you were using a dataphone, pick up the receiver, depress the DATA button, and then hang up the phone. It is a good practice to check for a dial tone at this point.

3.0 SIMULATION INPUTS

This section gives a description of each of the input data items.

3.1 VEHICLE

3.1.1 VEHICLE DATA ITEM DESCRIPTIONS

VEHICLE NAME: (TEXT) 10 unique characters or less

DEFAULT ENGINE: (TEXT) 10 unique characters or less, must exist on ENGINE.DATA file

DEFAULT TRANSMISSION: (TEXT) 10 unique characters or less, must exist on TRANS.DATA file

GROSS VEHICLE WEIGHT: (LB INTEGER)

ACTIVE TRACK WEIGHT: (LB INTEGER) Weight of track not on the ground

PRIMARY ROAD ROLLING RESISTANCE: (LB/TON INTEGER) Resistance to motion on hard surface. Wheeled vehicles are approximately 30 LB/TON and tracked vehicles range from 70 to 100 LB/TON.

SECONDARY ROAD ROLLING RESISTANCE: (LB/TON INTEGER) Resistance to motion on loose surface. This resistance is approximately 10% greater than Primary Road Resistance.

CROSS COUNTRY ROLLING RESISTANCE: (LB/TON INTEGER) Resistance to motion off road. This resistance is approximately 100% greater than Primary Road Resistance.

FRONTAL AREA: (FT**2 INTEGER) Frontal cross-sectional area.

AIR DRAG COEFFICIENT: (REAL) Coefficient used to calculate wind resistance, trucks and tanks have a coefficient of from .8 to 1.5.

3.1.2 VEHICLE DATA SHEET

The next page shows a filled-in VEHICLE DATA SHEET.

VEHICLE DATA SHEET

VEHICLE NAME	= M-1	
DEFAULT ENGINE	= AGT-1500	
DEFAULT TRANSMISSION	= X-1100	
GROSS VEHICLE WEIGHT	= 120000	LB

This is the weight of the track that is not on the ground.

ACTIVE TRACK WEIGHT	= 8944	LB
---------------------	--------	----

Rolling resistance for wheeled vehicles on hard surface is around 30 lb/ton. Army tracked vehicles are generally 3 times this amount. Secondary road rolling resistance is approximately 10% greater and cross country rolling resistance is about 100% greater.

PRIMARY ROAD ROLLING RESISTANCE	= 90	LB/TON
SECONDARY ROAD ROLLING RESISTANCE	= 100	LB/TON
CROSS COUNTRY ROLLING RESISTANCE	= 180	LB/TON
FRONTAL AREA	= 80	FT**2

Air drag coefficients of different vehicles are as follows:

Trucks	.8 to 1.5
Van body	.5 to .7
Car	.3 to .5

AIR DRAG COEFFICIENT	= 1.3
----------------------	-------

3.2 ENGINE

3.2.1 ENGINE DATA ITEM DESCRIPTION

ENGINE NAME: 10 unique characters or less (TEXT)

ENGINE MAXIMUM HORSEPOWER: Maximum rated gross horsepower (HP INTEGER)

INSTALLATION LOSS FACTOR: Fraction of gross power available due to installation losses (REAL)

STANDARD TEMPERATURE: Ambient temperature for net power calculations (DEG F INTEGER)

STANDARD ALTITUDE: Altitude for net power calculations (FT INTEGER)

RATED ENGINE RPM: Maximum manufacturer rpm rating (RPM INTEGER)

ENGINE IDLE RPM: Engine idle rpm (RPM INTEGER)

ENGINE SPEED FOR SHIFT: Engine speed for transmission shifting (RPM INTEGER)

ENGINE RPM VS GROSS TORQUE: Gross torque vs rpm data (FT-LB INTEGER RPM INTEGER)

COEFFICIENTS TO ENGINE ACCESSORY TORQUE LOSS CURVE: These are coefficients to a third order polynomial equation that fit the accessory torque loss vs rpm data. (REAL)

COEFFICIENTS TO ENGINE ALTERNATOR TORQUE LOSS CURVE: These are coefficients to a third order polynomial equation that fit the alternator torque loss vs rpm data. (REAL)

COEFFICIENTS TO ENGINE FAN TORQUE LOSS CURVE: These are coefficients to a third order polynomial equation that fit the engine fan torque loss vs rpm data. (REAL)

COEFFICIENTS TO AMBIENT TEMPERATURE VS PERFORMANCE LOSS DATA: These are coefficients to a third order polynomial equation that fit the ambient temperature vs power reduction data. (REAL)

COEFFICIENTS TO ENGINE TORQUE LOSS DUE TO ALTITUDE DATA: These are coefficients to a third order polynomial equation that fit the altitude vs power reduction data. (REAL)

FUEL CONSUMPTION HORSEPOWER STEP SIZE: This is the horsepower step used for engine fuel map data. (HP INTEGER)

FUEL CONSUMPTION ENGINE SPEED STEP SIZE: This is the engine rpm step used for engine fuel map data. (RPM INTEGER)

NUMBER OF ENGINE RPM POINTS INCLUDING ZERO: This is the number of steps starting with 0 and ending with rated engine speed. (INTEGER)

NUMBER OF HORSEPOWER POINTS INCLUDING ZERO: This is the number of steps starting with 0 and ending with rated engine horsepower. (INTEGER)

ENGINE FUEL CONSUMPTION: The engine fuel map data is in BSFC in LB/HP-HR; there is a value for each combination of speed and horsepower. This is necessary in order for the simulation to make interpolations near the full power line. (LB/HP-HR REAL)

3.2.2 ENGINE DATA SHEET

The next 2 pages show a filled-in ENGINE DATA SHEET.

ENGINE DATA SHEET
(PAGE 1)

ENGINE NAME	= AGT-1500

ENGINE DATA SHEET
(PAGE 2)

The data in the engine fuel consumption map must be filled out completely in order for the simulation to operate properly. Data values are in BSFC (lb/hp-hr). Data outside the full power curve and at the zero points on the axis is developed by straight line extrapolation. There is a program available to digitize an engine fuel map and put that data into the correct format for this simulation, Appendix F describes the use of this program and the required inputs.

FUEL CONSUMPTION ENGINE SPEED STEP SIZE = 300
FUEL CONSUMPTION HORSEPOWER STEP SIZE = 100
NUMBER OF ENGINE RPM POINTS INCLUDING ZERO = 11
NUMBER OF HORSEPOWER POINTS INCLUDING ZERO = 16

3.3 TRANSMISSION

3.3.1 TRANSMISSION DATA ITEM DESCRIPTIONS

TRANSMISSION NAME: 10 unique characters or less (TEXT)

TRANSMISSION TYPE: There are presently 2 types of transmissions that can be simulated; they are (1) Hydrokinetic and (2) Mechanical (INTEGER)

TRANSMISSION GEAR SHIFT TIME: The time delay between gear shifts (SEC REAL), usually less than 1 second.

TRANSMISSION MOMENT OF INERTIA: Polar moment of inertia of the rotating components (FT-LB-SEC**2 REAL)

NAME OF ENGINE MATCHED TO THIS TRANSMISSION: 10 characters or less, must exist on ENGINE.DATA file (TEXT)

IF TRANS TYPE=HYDROKINETIC, CONVERTER NAME: 10 characters or less (TEXT)

ENGINE TO TRANSMISSION GEAR RATIO: (REAL)

ENGINE TO TRANSMISSION GEAR EFFICIENCY: (REAL)

TRANSFER CASE GEAR RATIO: (REAL)

TRANSFER CASE GEAR EFFICIENCY: (REAL)

FINAL DRIVE GEAR RATIO: (REAL)

FINAL DRIVE GEAR EFFICIENCY: (REAL)

SPROCKET PITCH RADIUS: FT (REAL)

NUMBER OF GEARS: (INTEGER) Maximum of 6

NORMAL STARTING GEAR: (INTEGER)

The following items are curves of data which have been fitted with third order polynomial equations. The first three items, which deal with the operational characteristics of the torque converter of a Hydrokinetic type of transmission, have been fitted with 2 curves.

SPEED RATIO AT WHICH THE CURVES CHANGE: (REAL)

COEFFICIENTS TO THE TWO SPEED RATIO VS TORQUE RATIO CURVES: 8 VALUES (REAL)

COEFFICIENTS TO THE TWO SPEED RATIO VS INPUT CAPACITY FACTOR CURVES: 8

VALUES (REAL)

COEFFICIENTS TO THE TWO OUTPUT CAPACITY FACTOR VS SPEED RATIO CURVES: 8
VALUES (REAL)

The next items deal with transmission losses and are fitted with only 1
curve.

COEFFICIENTS FOR TRANS INPUT TORQUE LOSS CURVE CONVERTER: 4 VALUES
(REAL)

COEFFICIENTS FOR TRANS INPUT TORQUE LOSS CURVE LOCKUP: 4 VALUES (REAL)

COEFFICIENTS FOR TRANS OUTPUT TORQUE LOSS CURVE: 4 VALUES For each gear
(REAL)

TRANSMISSION GEAR MODE: This indicates for the hydrokinetic type of
transmission if the particular gear operates in (1) converter only, (2)
lockup only, or (3) both converter and lockup. One for each gear
(INTEGER)

CONVERTER SPEED RATIO FOR LOCKUP: One for each gear (REAL)

TRANSMISSION GEAR RATIO: One for each gear (REAL)

TRANSMISSION GEAR EFFICIENCY: One for each gear (REAL)

TRANSMISSION GEAR MOMENT OF INERTIA: One for each gear (REAL)

TRANSMISSION SHIFT SCENARIO: This indicates if a gear condition occurs
in normal acceleration. A 1 means that the gear condition occurs, a 0
means that it does not. Two for each gear (INTEGER)

TRANSMISSION GEAR SHIFT VALUES: Four pairs are required for every gear
condition (both Converter and Lockup) in the shift scenario.

3.3.2 TRANSMISSION DATA SHEET

The next 4 page show a filld in TRANSMISSION DATA SHEET.

TRANSMISSION DATA SHEET
(PAGE 1)

TRANSMISSION NAME	= X-1100	
TRANSMISSION TYPE	= HYDROKINETIC MECHANICAL	X

TRANSMISSION DATA SHEET
(PAGE 2)

The next three items are the torque converter characteristics of a hydrokinetic type transmission. This data is fitted with third order polynomial equations. In order to find the coefficients the program GRAFTEK can be used. See Appendix E on the use of this program.

The data can be fitted to either 1 or 2 curves. If one curve is used then the speed ratio at which the curves change must be 1.0 and the coefficients for curve 2 are set to zero. If 2 curves are used then all three data items must change at the same speed ratio.

SPEED RATIO AT WHICH THE CURVES CHANGE = .870

COEFFICIENTS TO THE TWO SPEED RATIO VS TORQUE RATIO CURVES

TRANSMISSION DATA SHEET
(PAGE 3)

The following data items require 1 entry for each gear ratio. The simulation can accept transmissions with up to 6(six) gear ratios.

The transmission GEAR MODE represents the capability of a hydrokinetic type transmission. The modes are:

- TRANSMISSION GEAR MODE = 1 (CONVERTER ONLY)
- = 2 (LOCKUP ONLY)
- = 3 (BOTH CONVERTER AND LOCKUP)

When the transmission type is MECHANICAL then the TRANSMISSION GEAR MODE must be 2 for every gear.

TRANSMISSION GEAR MODE	1 = 1
	2 = 3
	3 = 3
	4 = 3
	5 = _____
	6 = _____

CONVERTER SPEED RATIO FOR LOCKUP	1 = .86

	2 = 25.
	3 = 13.
	4 = 10.
	5 = _____
	6 = _____

TRANSMISSION DATA SHEET
(PAGE 4)

The following data is used in the fuel consumption simulation. The TRANSMISSION SHIFT SCENARIO is the normal gear shifting sequence when the vehicle is accelerating or decelerating. The TRANSMISSION GEAR SHIFT VALUES represent a shift line for a particular gear condition; these are sets of horsepower and vehicle speed values, across which the transmission will shift to the next gear in the TRANSMISSION SHIFT SCENARIO. There will only be TRANSMISSION GEAR SHIFT VALUES for the conditions which have a 1 in the TRANSMISSION SHIFT SCENARIO.

TRANSMISSION SHIFT SCENARIO

4.0 SIMULATION OUTPUTS

4.1 GRAPHICAL

Currently, the PS**2 provides five types of graphical output. These are as follows:

- o Tractive Force vs Speed
- o Distance vs Time
- o Speed vs Time
- o Sprocket Horsepower vs Speed
- o Lines of Constant Miles per Gallon on Sprocket Horsepower vs Speed

See Section 2.4.3 for a description and example of each graph.

4.2 TABULAR

Currently, PS**2 provides three types of tabular output. Each is explained in more detail in the following three sections.

4.2.1 TRACTIVE.FORCE.DATA FILE. The TRACTIVE.FORCE.DATA file lists the concept information and all input data for the engine and transmission. The output consists of data for all the engine losses and a list of the tractive force, sprocket horsepower and speed for each gear range for converter mode and for lockup mode. The transmission heat rejection for first gear range is also listed.

4.2.2 ACCEL.DATA FILE. The ACCEL.DATA file contains some identifying information about the Vehicle, Engine, and Transmission, a list of the tractive force vs speed data used to calculate the acceleration, and a list of acceleration data at .01 sec intervals. The information in this list consists of the time, gear, equivalent weight used to calculate acceleration, total resistance at the present speed, total tractive force available, acceleration at the present speed (MPH), distance (FT), sprocket horsepower, mass factor, and change in acceleration. The mass factor represents the gross vehicle weight plus the effect of the inertia of rotating components divided by the gross vehicle weight.

4.2.3 FUEL.DATA FILE

The fuel.data file contains a list of the input data for the vehicle, engine, and transmission. The output consists of a list of the fuel consumption in MPG for every gear condition, sprocket horsepower step, and vehicle speed step. There is also a list of speed and sprocket horsepower data for the constant mileage lines for each gear condition.

5.0 ERROR HANDLING

5.1 ERRORS THAT ARE EASILY REMEDIED

Mode/Data errors are the most common type of error that will be encountered. The error will appear when the wrong type/mode of data has been entered or commas have been used to separate a list of numbers. When this happens the following message will appear:

```
SIMSCRIPT-W-ERROR 2084, invalid character in "I" format during input  
Do you want traceback?(YES, NO or PRINT)
```

The answer to this should be "NO," after which the following will appear:

```
"Input rest of line starting from the erroneous field:"
```

Now the correct data can be entered, and the simulation will continue executing.

5.2 ERRORS THAT CAUSE SIMULATION EXECUTION TO TERMINATE

When an error is encountered that causes the simulation to terminate the following message will appear:

```
SIMSCRIPT-F-ERROR XXXX, (a comment of what kind of error was  
encountered.) Do you want traceback?(YES, NO or PRINT)
```

A "YES" will cause the traceback to print immediately at the terminal; a "NO" will give no traceback. "PRINT" will put the traceback on the file SIMU06.LIST. The traceback will show where the error occurred and list other information about the simulation. The most common problem that may cause the simulation to terminate is a mismatch between the engine and the transmission.

Any time you encounter a SIMSCRIPT error, which causes simulation execution to terminate, it is important to obtain a hardcopy of the traceback. This can be accomplished by responding to the traceback prompt with "PRINT" and spooling the SIMU06.LIST file to a printer, or responding "YES" and copying the contents of the screen with a copying device. Either way, take the traceback to the Time Share Computer Branch (AMSTA-RYT) when assistance is needed in determining the cause of simulation termination.

APPENDIX A
TEKTRONIX TERMINAL INFORMATION

The important keys on this terminal are: 1) the TTY LOCK, located at the lower left of the keyboard, which will make the terminal type in all caps, 2) the BACKSPACE, located at the upper right of the keyboard, which is the character delete, 3) and the RUBOUT key, located just to the right of the CARRIAGE RETURN, which is the line delete key. If the need arises to stop the terminal from printing, pressing the CONTROL(CTRL) key and the "S" simultaneously will halt the terminal; to continue press "CONTROL Q".

APPENDIX B
TAB TERMINAL INFORMATION

The important keys on this terminal are: 1) the LOCK, located at the lower left of the keyboard, which will make the terminal type in all caps when the red light is on, 2) the BACKSPACE, located at the upper right of the keyboard, which is the character delete, 3) and the DELETE, located just to the right of the RETURN, which is the line delete key. On the TAB terminal the listing may be stopped by pressing the HOLD key on the lower left hand of the keyboard; to continue press the key a second time.

APPENDIX C
DECWRITER (TTY) TERMINAL INFORMATION

The important keys on this terminal are: 1) the CAPS LOCK, located at the lower left of the keyboard, which will make the terminal type in all caps, 2) the BACK SPACE, located at the upper right of the keyboard, which is the character delete, and 3) the DELETE key, located just to the right of the RETURN, which is the line delete key.

APPENDIX D
SAMPLE TERMINAL SESSION

The following is a sample of a terminal session using the Engine Transmission Performance Evaluation Program.

OK, SEG JACOBSON>PERFORMANCE>PS**2

WELCOME TO THE PROPULSION SYSTEM PERFORMANCE SIMULATION.
SIMULATION EXECUTION WAS INITIATED AT 09.57.14 ON 12/20/83 .
IF YOU HAVE ANY DIFFICULTIES USING THIS SIMULATION, CONTACT
RICHARD JACOBSON AT EXT. 45879/45999

IT IS NECESSARY FOR YOU, THE USER, TO PROVIDE SOME INFORMATION
SO THAT THE SIMULATION CAN TAILOR INPUTS AND OUTPUTS FOR YOU.
ENTER YOUR RESPONSES FOLLOWING THE ">", AND MAKE SURE THEY
ARE IN UPPERCASE. IT IS ALSO NECESSARY TO DEPRESS THE "RETURN" KEY
TO TRANSMIT YOUR RESPONSES TO THE COMPUTER.
ENTER THE BAUD RATE IN CHARACTERS PER SECOND (120 OR 960)

>960

ENTER TERMINAL TYPE

- 1 - TTY
- 2 - TEKTRONIX 4014
- 3 - RAMTEK 6211
- 4 - TAB 132/C

IF YOU ARE UNSURE OR YOUR TERMINAL TYPE IS NOT LISTED, ENTER 1
ENTER NUMBER

>1

FOR YOUR CONVENIENCE, THIS SIMULATION CONTAINS A SYSTEM OF
"PROMPTS" WHICH PROVIDE/REQUEST INFORMATION. THE PROMPT LEVEL IS
CURRENTLY SET TO PROVIDE THE MAXIMUM AMOUNT OF INFORMATION. UNTIL
YOU BECOME PROFICIENT IN THE USE OF THIS SIMULATION, WE RECOMMEND NOT
CHANGING THE LEVEL OF PROMPTING PROVIDED.

DO YOU WANT TO CHANGE THE PROMPT LEVEL? ENTER YES(Y) OR NO(N)

>NO

ENTER USER ID

>XXYYZZ

THIS SIMULATION HAS THE CAPABILITY OF CALCULATING THE TRACTIVE
FORCE VS VEHICLE SPEED OF AN ENGINE DRIVELINE SYSTEM AND EVALUATING
THE FULL POWER ACCELERATION AND FUEL CONSUMPTION OF A VEHICLE SYSTEM.
THE LIST THAT FOLLOWS THIS MESSAGE SHOWS THE AVAILABLE VEHICLES
(WITH THEIR DEFAULT ENGINES AND TRANSMISSIONS)
AND OTHER AVAILABLE ENGINES AND TRANSMISSIONS. NOT ALL COMBINATIONS
OF ENGINES AND TRANSMISSIONS ARE POSSIBLE. THE ENGINES THAT HAVE
BEEN MATCHED WITH A PARTICULAR TRANSMISSION ARE INCLUDED IN THE
TRANSMISSION DATA. THERE ARE TWO TYPES OF OUTPUT WITH THIS SIMULATION.
GRAPHS CAN BE GENERATED WITH THE GRAPH OPTION AND NUMERICAL DATA
IS OUTPUT TO FILES. NUMERICAL OUTPUT FOR TRACTIVE FORCE VS SPEED
IS WRITTEN TO THE FILE TRACTIVE.FORCE.DATA AND THE FULL POWER ACCELERATION
DATA, AT 0.1 SEC INTERVALS, IS WRITTEN TO THE FILE ACCEL.DATA.
FUEL CONSUMPTION DATA IN MILES PER GALLON IS WRITTEN ON THE FILE FUEL.DATA.

A LIST OF VEHICLES, ENGINES AND TRANSMISSIONS WILL BE LISTED
BY ENTERING A CARRIAGE RETURN.

DO YOU WANT TO SEE THE AMSTA-RG CATALOG ? YES(Y) OR NO(N)
>YES

APPENDIX E
INFORMATION TO USE GRAFTEK

GRAFTEK is a separate program which can be used to fit curves to data. It can be used to obtain the coefficients for all third order polynomial curve fits (e.g., Speed Ratio vs Torque Ratio and Transmission Input and Output Losses). The program contains an explanation of the different options and can be initiated with the following command: SEG <DRAS02>JACOBSON>GRAFTEK>#GTEK. The program produces several files. The file names are as follows:

F#005: File of actual input data
F#006: Formatted list of input data (Original Data)
F#007: Unknown
F#008: Output listing of curve fit
F#010: Unknown

The following pages show the GRAFTEK screens which provide information on the use of the options and the graph screen. The following steps are required to fit a curve to data points: 1) Select "READ IN NEW DATA" with the cursor. 2) Enter the data at the bottom of the screen in X,Y pairs separated by commas, making sure not to go past the short verticle line. Each line of data points must end with a comma. When all data has been entered and "END OF DATA" has been selected the data points will then be plotted on the graph. 3) When all data points have been entered and plotted select "DISPLAY A CURVE" with the cursor and then select the type of curve shown on the lefthand side of the screen. For a 3rd order polynomial select "3RD" under "POLYNOMIAL". The program will then fit the type of curve selected to the data points and then plot the curve.

Each time a curve is plotted the coefficients are printed to the file F#008 along with the actual X,Y data and the calculated Y data.

DO YOU WISH TO SEE A DESCRIPTION OF THE OPTIONS. PICK

YES NO

-NOTE TO CHAPTER USER:-

IT IS THE NATURE OF CHAPTER TO ALLOW THE USER TO SELECT, FROM AMONGST ALL THE POLYNOMIAL AND EMPIRICAL EQUATIONS OFFERED, THE EQUATION (CURVE) WHICH BEST FITS THE DATA SET. TO MAKE IT REASONABLE AND CORRECT TO COMPARE ONE CURVE TO ANOTHER FOR BEST FIT, THE STANDARD ERROR OF ESTIMATE (Σ SQUARED ONLY IS USED. THE COEFFICIENT OF DETERMINATION (R^2 SQUARED) WILL NOT BE USED, SINCE FOR MOST OF THE CURVES THE RESULT CAN NOT BE PROPERLY DETERMINED UNLESS A TRANSFORMATION TO A LINEAR EQUATION (AND ASSOCIATED NEW TRANSFORMED DATA) IS MADE. THESE TRANSFORMATIONS THEM ONLY LEAD THEMSELVES TO THE RESULTANT NEW DATA SET AND NOT TO EACH CURVE.

READ IN NEW DATA (READ)

CAUSES THE CURRENT SCREEN CONTENTS TO ERASE AND THE NEW DATA SET TO BE READ. SUBSEQUENTLY, THE NEW DATA POINTS WILL APPEAR SCALED TO FIT NICELY WITHIN THE PROGRAM SUPPLIED AXES.

IF THE DATA SETS HAVE BEEN EXHAUSTED, THERE ARE THREE CHOICES.

- 1- TYPE IN A NEW DATA SET VIA THE ALPHANUMERIC KEYBOARD. OR
- 2- REREAD THE OLD DATA SET. OR
- 3- END GRAP-TEX.

RESCALE AXES (RESC)

SELECTS A SCALE SUCH THAT ALL THE DATA POINTS WILL FIT NICELY WITHIN THE PROGRAM SUPPLIED AXES. THE SCREEN WILL CLEAR AND THE NEW RESCALED AXES WILL APPEAR.

S-L FORM (S-L)

CHANGES THE SCREEN PHRASES TO A SHORT, MORE CRYPTIC DISPLAY. THIS SHORTENS DISPLAY REGENERATION TIME AND TAKES EFFECT THE NEXT TIME THE SCREEN IS ERASED. SELECT AGAIN TO RETURN TO THE LONG FORM. IT IS SUGGESTED THAT A COPY BE MADE OF THE LONG FORM DISPLAY AND USED AS A REMINDER WHEN THE SHORT FORM OPTION IS IN EFFECT.

DELETE ALL CURVES (D CV)

CLEAR THE SCREEN AND RETURNS A DISPLAY THAT REFLECTS THE CURRENT DATA SET STATUS WITH ALL CURVES ELIMINATED.

DELETE POINT(S) (S PT)

ENABLES THE DELETION OF A POINT OR COMBINATION OF POINTS FROM THE DATA SET SO THAT MODIFIED CURVE FITTINGS MAY BE OBTAINED - PERHAPS GIVING A BETTER FIT. IN ORDER TO DELETE A POINT, LOCATE THE CROSS-HAIRS OVER THE DESIRED POINT REPRESENTED BY AN X OR * AND TYPE ANY ARBITRARY CHARACTER. AN O WILL APPEAR OVER THE X OR * INDICATING THAT FUTURE CALCULATIONS ON THE CURRENT DATA SET WILL NOT INCLUDE THE DELETED POINT(S).

ADD NEW POINT(S) (ADD)

ALLOWS THE ADDITION OF NEW DATA POINTS TO THE CURRENT DATA SET VIA THE ALPHANUMERIC KEYBOARD. THE DATA IS ENTERED IN PAIRS OF X AND Y COORDINATES WITH EACH ELEMENT FOLLOWED BY A COMMA. THE DATA IS ENTERED IN FREE FORMAT, WITH OR WITHOUT A DECIMAL POINT, OR CAN BE ENTERED IN E FORMAT NOTATION. MORE THAN ONE LINE OF DATA CAN BE ENTERED. THE ADDED DATA POINTS WILL APPEAR AS AN **.

ORIGINAL POINTS (ORIG)

CLEARs THE SCREEN AND REDISPLAYS THE ORIGINAL SET OF DATA POINTS.

NEW P.T.S. NOW ORG (NEW)

CLEARs THE SCREEN AND CLEARs UP THE CURRENT DATA SET. ALL DELETED POINTS ARE PERMANENTLY ELIMINATED AND ALL ADDED POINTS ARE PERMANENTLY RETAINED. NOW SELECTING "ORIGINAL POINTS" WILL RETURN THIS CLEANED UP DATA SET.

DISPLAY A CURVE (DISP)

ALLOWS FOR THE SELECTION OF ANY OF THE NINE EMPIRICAL OR ELEVEN NTH DEGREE POLYNOMIAL EQUATIONS AT THE LEFT OF THE GRAPH AREA. A MAXIMUM OF THREE CURVES MAY BE DISPLAYED AT ONE TIME. TO DISPLAY ADDITIONAL CURVES THE PHRASE "DELETE ALL CURVES" MUST FIRST BE CHOSEN. ONCE "DISPLAY A CURVE" HAS BEEN SELECTED, EACH OF THE THREE CURVES MAY BE PICKED CONSECUTIVELY WITHOUT RE-SELECTING "DISPLAY A CURVE".

RESTORE DELETED POINTS (REST)

ALLOWS ANY PREVIOUSLY DELETED POINT TO BE RESTORED AND INCLUDED AGAIN IN THE CURRENT DATA SET. PLACE THE CROSS-HAIRS OVER THE DESIRED POINT AND TYPE ANY ARBITRARY CHARACTER. THE X OF THE DELETED POINT WILL BE WRITTEN OVER WITH A P.

REVERSE X AND Y (REVE)

CLEAR THE SCREEN AND REDISPLAYS THE DATA SET WITH THE X VALUES AND Y VALUES INTERCHANGED.

HARD COPY (HARD)

STORES ALL NECESSARY INFORMATION ABOUT THE LAST DISPLAYED CURVE ON TO A DISK STORAGE FILE WITH LOCAL FILE NAME PLOT. CATALOGING PLOT AT THE CONCLUSION OF GRAP-TEX WILL SAVE THE FILE SO THAT A CAL-COMP DRUM PLOT CAN BE PREPARED AT A LATER TIME BY RUNNING THE GRAP-TEX PLOT PROGRAM.

NEXT PAGE

FINISHED

CONNECT POINTS (CONN)

WHEN CALLED ONCE, THIS OPTION WILL CONNECT EACH CURRENT POINT WITH
A STRAIGHT LINE. WHEN CALLED AGAIN, THIS OPTION WILL BE TURNED OFF.

LOOK (LOOK)

ALLOWS A FULL SCREEN DISPLAY OF THE LAST SELECTED CURVE WITHOUT THE
LIST OF EQUATIONS, THE LIST OF OPTIONS, OR ANY OTHER RESULT INFORMATION.
WHEN LOOK IS COMPLETE, THE CROSSHAIRS APPEAR. TYPING ANY CHARACTER
RETURNS TO GRAPHIC WITH ALL CURVES DELETED.

SPECIFY CONSTANTS (SPEC)

ALLOWS EXPERIMENTATION ON ANY EMPIRICAL EQUATION SELECTED TO FIT THE DATA. A CURVE IS SELECTED IN THE NORMAL FASHION AND ITS RESULTS DISPLAYED. THEN ANY OF THE CALCULATED CONSTANTS CAN BE MODIFIED TO SEE THEIR EFFECT. SELECTING THE PHRASE "DISPLAY" WILL CAUSE THE MODIFIED EQUATION TO BE PLOTTED AND ITS RESULTS TO APPEAR. TO CHANGE MORE THAN ONE CONSTANT, SELECT THE PHRASE "ENTER". ONLY ONE EMPIRICAL EQUATION CAN BE WORKED ON AT A TIME. THERE ARE ONLY TWO PHRASES THAT CAN BE SELECTED TO GET OUT OF THIS OPTION, AND THEY ARE "DONE" AND "END OF PROGRAM" (END).

CHANGE TITLE (CHAN)

ALLOWS THE CURRENT TITLE TO BE CHANGED TO A NEW TITLE. UP TO 18 CHARACTERS ARE ALLOWED AND IT WILL REAPPEAR IN ITS NORMAL POSITION THE NEXT TIME THE SCREEN CLEARS.

PUNCH DECK (PUNC)

GIVES PUNCH DECK OUTPUT WHICH CONTAINS ANY ADDED AND ALL NON-DELETED POINTS REPRESENTING THE CURRENT DATA SET.

END OF PROGRAM (END)

TERMINATES GRAP-TRE AND CLEARS THE SCREEN.

APPENDIX F
INFORMATION TO USE FUEL MAP PROGRAM

This program has the capability of digitizing an engine fuel map and producing a datafile that can be read into the simulation. Contact Richard Jacobson (Ext. 45879/45999) for information on using this program.

APPENDIX G
MATCHING AN ENGINE WITH A TRANSMISSION

In order to obtain good performance from the simulation, the Hydrokinetic transmissions must be properly matched to the engine. This matching is difficult.

It encompasses such things as:

- o Proper Engine Power
- o Proper Converter Characteristics

When a converter and engine are mismatched the engine may reach maximum speed at a low speed ratio or the engine may operate at a low speed and not reach peak torque over the range of speed ratios. To obtain information on matching a non-standard combination of engine and transmission contact Richard W. Jacobson AMSTA-RY 45879/45999.

If simulation results appear incorrect or the simulation abnormally terminates, contact Richard Jacobson. In the case where the simulation abnormally terminates, obtain a copy of the traceback and any partial output files to assist in locating the problem.

APPENDIX H
BLANK VEHICLE DATA SHEET

The following page is a blank Vehicle Data Sheet.

VEHICLE DATA SHEET

VEHICLE NAME * _____
 DEFAULT ENGINE * _____
 DEFAULT TRANSMISSION * _____
 GROSS VEHICLE WEIGHT * _____ LB

This is the weight of the track that is not on the ground.

ACTIVE TRACK WEIGHT * _____ LB

Rolling resistance for wheeled vehicles on hard surface is around 30 lb/ton. Army tracked vehicles are generally 3 times this amount. Secondary road rolling resistance is approximately 10% greater and cross country rolling resistance is about 100% greater.

PRIMARY ROAD ROLLING RESISTANCE * _____ LB/TON
 SECONDARY ROAD ROLLING RESISTANCE * _____ LB/TON
 CROSS COUNTRY ROLLING RESISTANCE * _____ LB/TON
 FRONTAL AREA * _____ FT**2

Air drag coefficients of different vehicles are as follows:

Trucks	.8 to 1.5
Van body	.5 to .7
Car	.3 to .5

AIR DRAG COEFFICIENT * _____

APPENDIX I
BLANK ENGINE DATA SHEET

The following 2 pages are the blank Engine Data Sheet.

ENGINE DATA SHEET (PAGE 1)

ENGINE NAME _____

ENGINE MAXIMUM HORSEPOWER _____ HP

INSTALLATION LOSS FACTOR _____
LESS THAN OR EQUAL TO 1.000

STANDARD TEMPERATURE _____ DEG F

STANDARD ALTITUDE _____ FT

RATED ENGINE RPM _____ RPM

ENGINE IDLE RPM _____ RPM

ENGINE SPEED FOR SHIFT _____ RPM

ENGINE MOMENT OF INERTIA _____ FT-LB-SEC**2

ENGINE RPM VS GROSS TORQUE							
RPM	FT-LBF	RPM	FT-LBF	RPM	FT-LBF	RPM	FT-LBF
_____	_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____	_____

The following engine data is fitted to third order polynomial equations. In order to find the coefficients the program GRAFTEK can be used. See Appendix E on the use of this program.

COEFFICIENTS TO ENGINE TORQUE LOSS CURVES

	CONSTANT	X	X**2	X**3
ACCESSORY	_____	_____	_____	_____
ALTERNATOR	_____	_____	_____	_____
ENGINE FAN	_____	_____	_____	_____

COEFFICIENTS TO TEMPERATURE AND ALTITUDE CORRECTION FACTOR CURVES

TEMPERATURE	_____	_____	_____	_____
ALTITUDE	_____	_____	_____	_____

ENGINE DATA SHEET

(PAGE 2)

The data in the engine fuel consumption map must be filled out completely in order for the simulation to operate properly. Data values are in BSFC (lb/hp-hr). Data outside the full power curve and at the zero points on the axis is developed by straight line extrapolation. There is a program available to digitize an engine fuel map and put that data into the correct format for this simulation, Appendix F describes the use of this program and the required inputs. Contact Richard Jacobson 45879 on the use of this program.

FUEL CONSUMPTION ENGINE SPEED STEP SIZE = _____

NUMBER OF ENGINE RPM POINTS INCLUDING ZERO = _____

NUMBER OF HORSEPOWER POINTS INCLUDING ZERO = _____

SAMPLE ENGINE FUEL CONSUMPTION MAP

The graph is a blank coordinate system with the following features:

- Vertical Axis (Y-axis):** Labeled "SPROCKET HORSEPOWER" on the left side. It has 11 major tick marks, with the bottom-most tick mark labeled "0".
- Horizontal Axis (X-axis):** Labeled "ENGINE RPM" at the bottom center. It has 11 major tick marks, with the left-most tick mark labeled "0".
- Grid:** A grid of 10 horizontal and 10 vertical lines, creating 10x10 rectangular cells for plotting data.

APPENDIX J
BLANK TRANSMISSION DATA SHEET

The following 4 pages are the blank Transmission Data Sheet.

TRANSMISSION DATA SHEET
(PAGE 1)

TRANSMISSION NAME = _____

TRANSMISSION TYPE = HYDROKINETIC _____
MECHANICAL _____

TRANSMISSION GEAR SHIFT TIME = _____ SEC

TRANSMISSION INPUT MOMENT OF INERTIA = _____ FT-LB-SEC**2

NAME OF ENGINE MATCHED TO THIS TRANSMISSION = _____

IF TYPE-HYDROKINETIC, CONVERTER NAME = _____

ENGINE TO TRANSMISSION GEAR RATIO = _____

ENGINE TO TRANSMISSION GEAR EFFICIENCY = _____

TRANSFER CASE GEAR RATIO = _____

TRANSFER CASE GEAR EFFICIENCY = _____

FINAL DRIVE GEAR RATIO = _____

FINAL DRIVE GEAR EFFICIENCY = _____

FINAL DRIVE MOMENT OF INERTIA = _____ FT-LB-SEC**2

SPROCKET PITCH RADIUS = _____ FT

NUMBER OF GEARS = _____

NORMAL STARTING GEAR = _____

The next three items are the torque converter characteristics of a hydrokinetic type transmission. This data is fitted with third order polynomial equations. In order to find the coefficients the program GRAFTEK can be used. See Appendix E on the use of this program.

The data can be fitted to either 1 or 2 curves. If one curve is used then the speed ratio at which the curves change must be 1.0 and the coefficients for curve 2 are set to zero. If 2 curves are used then all three data items must change at the same speed ratio.

SPEED RATIO AT WHICH THE CURVES CHANGE = _____

COEFFICIENTS TO THE TWO SPEED RATIO VS TORQUE RATIO CURVES

	CONSTANT	X	X**2	X**3
CURVE 1	_____	_____	_____	_____
CURVE 2	_____	_____	_____	_____

COEFFICIENTS TO THE TWO SPEED RATIO VS INPUT CAPACITY FACTOR CURVES

CURVE 1	_____	_____	_____	_____
CURVE 2	_____	_____	_____	_____

COEFFICIENTS TO THE TWO OUTPUT CAPACITY FACTOR VS SPEED RATIO CURVES

CURVE 1	_____	_____	_____	_____
CURVE 2	_____	_____	_____	_____

TRANSMISSION FAN TORQUE LOSS COEFFICIENTS

_____	_____	_____	_____
-------	-------	-------	-------

COEFFICIENTS FOR TRANS INPUT TORQUE LOSS CURVE

CONVERTER	_____	_____	_____	_____
LOCKUP	_____	_____	_____	_____

COEFFICIENTS FOR TRANS OUTPUT TORQUE LOSS CURVE

1	_____	_____	_____	_____
2	_____	_____	_____	_____
3	_____	_____	_____	_____
4	_____	_____	_____	_____
5	_____	_____	_____	_____
6	_____	_____	_____	_____

The following data items require 1 entry for each gear ratio. The simulation can accept transmissions with up to 6(six) gear ratios.

The transmission GEAR MODE represents the capability of a hydrokinetic type transmission the modes are:

- TRANSMISSION GEAR MODE = 1 (CONVERTER ONLY)
- = 2 (LOCKUP ONLY)
- = 3 (BOTH CONVERTER AND LOCKUP)

When the transmission type is MECHANICAL then the TRANSMISSION GEAR MODE must be 2 for every gear.

TRANSMISSION GEAR MODE

1 = _____
 2 = _____
 3 = _____
 4 = _____
 5 = _____
 6 = _____

CONVERTER SPEED RATIO FOR LOCKUP

1 = _____
 2 = _____
 3 = _____
 4 = _____
 5 = _____
 6 = _____

TRANSMISSION GEAR RATIO

1 = _____
 2 = _____
 3 = _____
 4 = _____
 5 = _____
 6 = _____

TRANSMISSION GEAR EFFICIENCY

1 = _____
 2 = _____
 3 = _____
 4 = _____
 5 = _____
 6 = _____

TRANS GEAR OUTPUT MOMENT OF INERTIA

1 = _____
 2 = _____
 3 = _____
 4 = _____
 5 = _____
 6 = _____

TRANSMISSION DATA SHEET

(PAGE 4)

The following data is used in the fuel consumption simulation. The TRANSMISSION SHIFT SCENARIO is the normal gear shifting sequence when the vehicle is accelerating or decelerating. The TRANSMISSION GEAR SHIFT VALUES represent a shift line for the particular gear condition; these are sets of horsepower and vehicle speed values, across which the transmission will shift to the next gear in the TRANSMISSION SHIFT SCENARIO. There will only be TRANSMISSION GEAR SHIFT VALUES for the conditions which have a 1 in the TRANSMISSION SHIFT SCENARIO.

TRANSMISSION SHIFT SCENARIO

GEAR	CONVERTER	LOCKUP
1	_____	_____
2	_____	_____
3	_____	_____
4	_____	_____
