NOTICE

This data summary has been prepared for the United States Air Force for the purpose of aiding in the implementation of a final remedial action plan under the Air Force Installation Restoration Program (IRP). As the data summary relates to actual or possible releases of potentially hazardous substances, its release prior to an Air Force final decision on remedial action is in the public interest. The limited objectives of this data summary and the ongoing nature of the IRP, along with the evolving knowledge of site conditions and chemical effects of the environment and health, must be considered when evaluating this data summary, since subsequent facts may become known which may make this data summary premature or inaccurate. Acceptance of this data summary in performance of the contract under which it was prepared does not mean that the U.S. Air Force or the Department of Defense adopts the conclusions, recommendations, or other views expressed herein, which are those of the contractor only and do not necessarily reflect the official position of either department.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) This Data Summary presents the results of groundwater sampling activities conducted on and in the vicinity of McClellan AFB from July through October 1988. Concentrations of purgeable halocarbon and aromatic compounds detected in samples collected from 40 monitoring wells and Six Area D extraction wells exceeded state and federal drinking water standards. These 32 monitoring wells are located on base in Areas A, B, C, D, and Adjacent On-Base Areas, and off-base in the Northwest and Southwest Areas. There was no definable increase from the previous sampling period (1 April through 30 June, 1988). The Area D extraction system is effectively operating to change hydraulic gradients based on differences in hydraulic heads specified for the system. Contaminant concentrations continue to decrease in deep zone monitoring wells. Samples from several middle zone monitoring wells show a decreasing trend except for this sampling period when concentrations increased. Decreasing contaminant concentrations have recently stabilized in shallow zone monitoring wells located outside the extraction system well-field. (FR)

RADIAN

PREFACE

Radian Corporation is the contractor for the Installation Restoration Program (IRP), Stage 3 Remedial Investigation/Feasibility Study (RI/FS) at McClellan Air Force Base (AFB), California. The work is being performed for the USAF Occupational and Environmental Health Laboratory (USAFOEHL) under USAF Contract No. F33615-87-D-4023.

This final copy of the sampling and analysis summarizes and presents the results of the Sampling and Analysis Program, July through September 1988. The data presented include analytical results for groundwater samples collected from monitoring and extraction wells and groundwater level data measured from wells on and in the vicinity of McClellan AFB. These data are used to evaluate current interim remedial measures and to identify the need for future remedial measures.

Key Radian project personnel were:

Nelson H. Lund, P.E. - Contract Program Manager
Jack D. Gouge' - Delivery Order Manager
Morey Lewis, P.E. - Project Manager
Deena A. Stanley - Project Director

Radian acknowledges the cooperation of the McClellan AFB Office of Environmental Management. In particular, Radian acknowledges the assistance of Mr. Mario Ierardi, Mr. Bud Hoda, and Mr. Gerald Robbins.

The work presented herein was accomplished between 1 July 1988 and 17 October 1988. 1Lt. Jerald E. Styles was the Technical Program Manager.

Approved

Nelson H. Lund, P.E.
Contract Program Manager

EXECUTIVE SUMMARY

In support of ongoing Remedial Investigation/Feasibility Study (RI/FS) activities at McClellan AFB, California, Radian personnel measure groundwater levels in 134 wells on a monthly basis and collect and analyze groundwater samples from 126 on- and off-base wells (120 monitoring wells and 6 extraction wells) on a quarterly basis. The purpose of these activities is to determine the direction of groundwater flow, to identify the presence of groundwater contaminants, and to identify and evaluate any trends in groundwater flow or concentrations of contaminants within the vicinity of the Area D extraction system that may be developing with respect to time. This and future data summaries will present the sampling and analytical results collected during the sampling period of interest. Evaluations of trends in groundwater flow and concentrations of contaminants for all areas within the study area will be presented once a year in an Informal Technical Report.

Groundwater levels were measured three times during the sampling period of July, August, and September 1988. Groundwater generally flows to the south-southwest in the northeastern portion of the Sacramento area. In the vicinity of McClellan AFB, deviations from this general direction of flow can be identified by the configuration of the contours on the potentiometric surface maps produced from the monthly water-level data. These local deviations from the regional flow pattern are due to operation of extraction wells in Area D, on-base production wells, and off-base water supply wells.

As a result of continuous pumping by the six Area D extraction wells, a cone of depression continues to be observed on potentiometric surface maps for the shallow and middle monitoring zones in the northwest portion of the base. The effectiveness of the Area D extraction system was evaluated based on hydraulic gradient criteria. Water quality data was also reviewed to examine the effect of the extraction system on water quality. The shallow zone monitoring wells located outside the extraction well-field have shown a decrease in contaminant concentrations followed by stable concentrations over

the past several sampling events. Three of the four middle zone monitoring wells examined show a decreasing trend except during this last sampling period. The two deep zone monitoring wells show decreasing contaminant concentrations trends.

Groundwater flow directions in the east-central portion of the base is not as well defined. The local flow of groundwater in this area of the base is influenced by active base production well BW-10. However, based on the limited water-level data, the influence of this well is not readily apparent. Several additional wells have been recommended to be installed in this and other areas of the base as part of the Hydrogeologic Assessment for McClellan AFB. This document is currently under review by the USAF and regulatory agencies.

A cone of depression beneath the southern portion of the base can be recognized on the monthly potentiometric surface maps. The cone of depression evident in the middle monitoring zone potentiometric surface map apparently results from pumping of base production well BW-18. The cone of depression probably extends into the deep monitoring zone; however, due to the absence of deep zone monitoring wells in this area, the areal and vertical extent of the cone of depression beneath the middle monitoring zone cannot be defined.

Groundwater samples were collected and analyzed from 120 monitoring wells and the six Area D extraction wells during July 1988. In addition, water quality samples were collected and analyzed from the six Area D extraction wells in August and September 1988. The analytical results for these samples were evaluated based on established Quality Assurance/Quality Control (QA/QC) procedures. This evaluation ensures that all analytical results that did not meet the applicable acceptable criteria are not reported without qualification. Data acceptability was determined by evaluating matrix and surrogate spike recoveries, field and laboratory blanks and duplicates, and interlaboratory analytical results.

The objectives for accuracy, precision, and completeness were all met, and overall analytical and sampling performance were deemed acceptable.

Based on review of the analytical data, no significant problems in overall quality control were identified. Although there were several occurrences of laboratory and field contamination, these contaminations did not affect the overall quantitation of analytes of interest in the groundwater. Holding times for 11 samples submitted to the subcontract laboratory were exceeded. However, these samples were to be used for evaluating interlaboratory precision and were not used as the primary results. Therefore, no overall adverse qualification or rejection of the data is necessary. Any data outside stated objectives were qualified. Since more than 99 percent of the data have been validated and are unqualified, the completeness objective of having more than 90 percent usable data has therefore been met.

Following the evaluation of the QC procedures, analytical results were compared to state and federal drinking water standards. Forty wells (6 extraction wells and 34 monitoring wells) contained concentrations of volatile organic compounds (primarily purgeable halocarbons) or metals (total dissolved chromium) at concentrations exceeding California DOHS action levels and/or U.S. EPA Primary Maximum Contaminant Levels (PMCLs). The wells exceeding drinking water standards are located on base in Areas A, B, C, and D and Adjacent On-Base Areas and off base in the Northwest and Southwest Areas.

New Findings

Analytical results for this period of groundwater sampling and analyses activities are similar to results obtained during the previous sampling period (April through June, 1988). However, there are differences in the number of monitoring wells exceeding drinking water standards and in the number of wells in which contaminants were detected.

During this sampling period, samples from forty wells contained concentrations of compounds that exceeded state or federal drinking water standards. This is compared to 38 wells that contained compounds at concentrations exceeding drinking water standards during the previous sampling period. The two additional wells (MW-53 and MW-55) with samples exceeding drinking water standards are both middle zone monitoring wells located in Area D.

Concentrations of contaminants more than doubled in several monitoring wells that have consistently contained contaminants above drinking standards. TCE concentrations in samples collected from MW-415, MW-55, MW-63 and MW-129 during this sampling event were over 100 percent greater than TCE concentrations detected in the wells during the previous quarter. This is a continuation of increasing TCE concentrations in MW-41s over the past year. Concentrations of TCE in MW-55, MW-63 and MW-129, however, have fluctuated. Also, concentrations of tetrachloroethene and total 1,2-dichloroethene in MW-41s have decreased over 200 percent since the last sampling event in April 1988. A more thorough trend analysis of these four wells and the other monitoring wells will be included in the informal interpretive technical report that will include results up to the end of 1988.

Contaminants were not detected in one deep zone monitoring well in Area D that has had a history of contaminants present in groundwater samples. This deep zone monitoring well, MW-59, has contained contaminants at concentrations exceeding drinking water standards, but these levels have gradually decreased over the past year.

1.0 GROUNDWATER SAMPLING AND ANALYSIS PROGRAM

The purposes of the field sampling are to obtain water-level measurements and to obtain representative groundwater samples for chemical analyses. Water-level measurements were taken prior to sampling in July, and during the first two to three working days of August, and September 1988 to provide data for evaluation of the groundwater flow regime beneath McClellan AFB and adjacent areas. Water quality samples were collected from a total of 126 wells during the first three weeks of July 1988. Locations of wells on and off base are shown on Plate 1. These wells included 120 monitoring wells, and the 6 Area D extraction wells. Of the 126 wells sampled, 85 are located on base and 41 are located off base. Ten of the wells in the McClellan AFB groundwater monitoring network were not sampled. In addition, two non-network wells that were scheduled for sampling during this sampling period were not sampled. The unsampled wells and the rationale for not sampling them are indicated below:

- MW-8, MW-20S, MW-22S, MW-34S, and MW-45S--wells were dry;
- MW-9--well silted up;
- MW-19S and MW-31S--not enough water for sampling;
- MW-142--sampling tube broken; and
- MW-1029/1030/1031--wells covered.

A list of wells sampled and analyzed performed during the Third Quarter 1988 is presented in Table 1-1.

The analytical results from the sampling period of July 1988 are summarized in Tables 1-2 and 1-3. Extraction wells are sampled on a monthly basis using EPA Methods 601 and 602. Contaminant levels in 40 wells exceeded California Department of Health Services (DOHS) Action Levels and/or U.S. EPA Primary Maximum Contaminant Levels. Most of these wells (28 monitoring wells and 6 extraction wells) are located on base in Areas A, B, C, and D, although 6 off-base monitoring wells in the Northwest and Southwest Areas also exceeded

c Off-base monitoring well

drinking water standards. During the Second Quarter 1988, 38 wells contained contaminants at concentrations above drinking water standards.

1.1 Results of Field Activities

The procedures used to measure water levels and to collect water samples are described in the draft Quality Assurance Project Plan (Radian, 1988). Field activities include measuring water levels and monitoring three parameters during purging of wells. These parameters, pH, temperature, and conductivity, are used to verify that stagnant water in the well has been removed and fresh formation water will be sampled.

The results of field data collected during the Third Quarter 1988 are discussed in the following subsections.

1.1.1 Groundwater Levels

The results of water-level measurements taken in late June, August, and September 1988 are presented in Table 1-4. These water-level data were used to generate monthly potentiometric surface maps for each of the three monitoring zones defined at McClellan AFB. The three monitoring zones are the shallow monitoring zone (above -55 feet mean sea level [msl]), middle monitoring zone (between -55 to -100 feet msl), and deep monitoring zone (below -100 feet msl). Based on the potentiometric surface maps for all three monitoring zones, there have not been significant changes in flow directions over the three-month period (Plates 2 - 16).

1.1.2 Field Parameters

Results of pH, conductivity, and temperature measurements taken during Third Quarter 1988 are presented in Table 1-5.

1.2 Analytical Results

Samples from monitoring and extraction wells collected during the period of July through September 1988 were analyzed using U.S. EPA methods 601, 602, 604, 624, 200.7, 206.2, 245.1, 270.2, and SW 9010. There were a total of 40 wells with contaminants at concentrations above DOHS Action Levels or U.S. primary maximum contaminant levels, as shown in Table 1-6. There are two additional wells with concentrations of contaminants above drinking water levels as compared to the number of wells from the previous sampling round. The analytical results from wells that have contained contaminants above standard are listed in the appendix. Trichloroethene (TCE) is the most commonly detected contaminant in wells located on and off base. The concentrations of TCE detected in the wells sampled during this sampling period are shown for each monitoring zone in Plates 16, 17, and 18.

1.2.1 Summary of QA/QC Results

The objectives for accuracy, precision, and completeness were all met for sampling and analytical procedures. Overall analytical and sampling performance were deemed acceptable for the data collected during this sampling period. There were no significant problems in overall quality control as evidenced by the summary of QA/QC procedures presented in this data summary. Although there were several occurrences of laboratory and field contamination, these contaminations did not affect the detection or quantitation of any of the target compounds in the groundwater samples. Table 1-7 summarizes the overall QC data and results, and Table 1-8 summarizes the qualified data. Table 1-9 summarizes the holding times for all samples. Eleven of sixteen samples submitted to Canonic Environmental Services for analysis did exceed their holding times. However, no loss of data occurred since other samples from those same wells were analyzed at the Radian laboratory. The samples submitted to Canonic were for the purpose of evaluating interlaboratory precision and not for groundwater contamination evaluation.

No large-scale rejection or qualification of the data is necessary with the exception of exceeding hold times for the interlaboratory precision

TABLE 1-7. SUMMARY OF QUALITY CONTROL RESULTS
GROUNDWATER SAMPLING AND ANALYSIS PLAN,
JULY THROUGH SEPTEMBER, 1988
McCLELLAN AFB

U.S. EPA Method	Number Performed	Compound (Number of Occurrences)	Range of Results (ug/L)
<u>Reagent Blanks</u>			
601	30	ND	N/A
602	30	ND	N/A
604	8	No method analytes	N/A
624	11	Acetone (3)	N/A
625	12	Di-n-butyl phthalate (6)	3.1 - 15
		Bis(2-ethylhexyl)phthalate (7)	3.5 - 220
		Di-n-octyl phthalate (1)	2.9
Metals	9	No method analytes	N/A
SW 9010	11	No method analytes	N/A
<u>Trip Blanks</u>			
601	6	1,1,1-Trichloroethane (1)	0.27
602	6	ND	N/A
624	6	No method analytes	N/A
<u>Ambient Blanks</u>			
601	7	No method analytes	N/A
602	7	ND	N/A
624	7	Acetone (3)	10B
<u>Equipment Blanks</u>			
601	4	1,1-Dichloroethene (1)	0.19
		1,1,1-Trichloroethane (2)	0.23 - 0.68
		Trichloroethene (1)	1.4
602	4	No method analytes	N/A
604	1	No method analytes	N/A
624	4	No method analytes	N/A
Metals	1	No method analytes	N/A
SW 9010	1	No method analytes	N/A

N/A - Not applicable.

ND - Not detected.

B - Compound also detected in reagent blank.

J - Estimate.

a - Found in reagent blank below the detection limit.

TABLE 1-7. (Continued)

U.S. EPA Method	Number Performed	Compound	Range of Results (RPD %)	Acceptance Criteria (RPD %) ^a	Results Not Meeting Criteria
<u>Duplicate Samples</u>					
601	14	8 compounds	0 - 64	50	1
602	14	Toluene	9.2 ^b	50	0
604	1	No method analytes	NC	50	0
624	7	12 compounds	0 - 13	50	0
625	3	5 compounds	NC, 9 - 11	50	0
Metals	3	4 metals	0 - 77	50	1
SW 9010	3	No method analytes	NC	50	0
<u>Duplicate Analyses</u>					
601	14	8 compounds	0 - 45	30	2
602	14	No method analytes	NC	30	0
624	3	11 compounds	0 - 8	30	0
625	3	5 compounds	0 - 27	30	0
Metals	3	4 metals	0 - 35	30	2
SW 9010	3	No method analytes	NC	30	0
<u>Split Sample Analyses</u>					
601	14	10 compounds	0 - 90	40	9
602	14	Toluene	NC	40	0
604	1	No method analytes	NC	40	0
624	3	5 compounds	14 ^b	40	0
625	3	4 compounds	NC	40	0
Metals	3	4 metals	4.9 - 31	40	0
SW 9010	3	No method analytes	NC	40	0

^a The value displayed represents the upper acceptable limit for duplicate samples, duplicate analyses, and split sample analyses.

^b Only one pair with method analysis presented for calculation.

NC - Not calculated.

RPD - Relative Percent Difference

(Continued)

TABLE 1-7. (Continued)

U.S. EPA Method	Number Performed	Compound	Range of Results (% Recovery)	Acceptance Criteria (% Recovery)	Results Not Meeting Criteria ^b
<u>Matrix Spikes</u>					
601	15	3 compounds	45 - 126	28 - 167	0
602	15	3 compounds	75 - 117	39 - 150	0
624	6	28 compounds	60 - 300	5.6 - 273	2
625	4	56 compounds	28 - 120	3.2 - 262	3
Metals	2	11 compounds	13 - 105	75 - 125	4
SW 9010	1	2 compounds	95	90 - 110	0
<u>Surrogate Spikes</u>					
601	201	1-bromo-4-fluorobenzene	69 - 140	40 - 140	0
602	201	1-bromo-4-fluorobenzene	73 - 123	40 - 140	0
604	37	2-fluorophenol	25 - 79	70 - 120	0
624	73	3 compounds	77 - 126	76 - 115	5
625	56	6 compounds	14 - 118	10 - 141	2

^b Refer to individual spike compound recoveries, not overall results.

TABLE 1-8. SUMMARY OF QUALIFIED DATA
 GROUNDWATER SAMPLING AND ANALYSIS PLAN,
 JULY THROUGH SEPTEMBER, 1988
 McCLELLAN AFB

Well Number	Method	Analyte(S)	Type of Qualification	Reason
TB-6	624	1,2-Dichloroethane-d ₄	B	High surrogate recovery
MW-10	Metals	Silver	A ^a	Low matrix spike recovery
		Zinc	A	Low matrix spike recovery
MW-11	Metals	Arsenic	A ^a	Low matrix spike recovery
		Zinc	A	Low matrix spike recovery
MW-12	Metals	Chromium	PL	High RPD
		Zinc	PL	High RPD
MW-21S	624	Toluene	B ^a	High surrogate recovery
		Bromofluorobenzene	B	High surrogate recovery
	625	2-Fluorophenol	B	Low surrogate recovery

^a Although the QC check qualifies the listed analyte, the result does not affect the data since that analyte was not detected (ND).

A - Qualified as inaccurate due to matrix spike recoveries outside the limits.

B - Qualified as biased due to surrogate recoveries outside of limits.

PL - Qualified as estimated due to high laboratory variability as measured by laboratory duplicates.

PF - Qualified as estimated due to high field variability as measured by field duplicates.

PI - Qualified as estimated due to high interlaboratory precision as measured by split samples.

RPD - Relative percent difference.

(Continued)

TABLE 1-8. (Continued)

Well Number	Method	Analyte(S)	Type of Qualification	Reason
MW-21S (Continued)	625	2,4-Dimethylphenol	A ^a	Low matrix spike recovery
		2,4-Dichlorophenol	A ^a	Low matrix spike recovery
		2,4,6-Trichlorophenol	A ^a	Low matrix spike recovery
MW-23D	Metals	Chromium	PI	High RPD
MW-27D	601/602	1,2-Dichloroethene	PL	High RPD
		1,2-Dichloroethene	PF	High RPD
		Methylene Chloride	PF	Detected in only one part of duplicate pair
	624	Bromomethane	A ^a	High matrix spike recovery
	625	Phenol	PF	Detected in only one part of duplicate pair

^a Although the QC check qualifies the listed analyte, the result does not affect the data since that analyte was not detected (ND).

- A - Qualified as inaccurate due to matrix spike recoveries outside the limits.
- B - Qualified as biased due to surrogate recoveries outside of limits.
- PL - Qualified as estimated due to high laboratory variability as measured by laboratory duplicates.
- PF - Qualified as estimated due to high field variability as measured by field duplicates.
- PI - Qualified as estimated due to high interlaboratory precision as measured by split samples.
- RPD - Relative percent difference.

 AB = Ambient blank

samples. With the exceptions noted in Table 1-8 all the data were acceptable. Any out-of-control data were qualified as estimated. More than 99 percent of the data have been validated and are unqualified. Out of a total of approximately 17,000 individual analytical results, only 34 detected results were qualified at less than one percent. Therefore, the completeness objective of having more than 90 percent usable data has been met.

Some analytical results in this report are flagged with "P" or "PC." This qualification means that the compound was confirmed in previous quarters by a second-column confirmation run, therefore, a second-column confirmation was not performed during this sampling period. This practice is consistent with the DOHS guidelines of 1 September 1987. In addition, some data are flagged with "B." This indicates that the compound was found in the reagent blank analyzed the day the sample was analyzed.

Problems and Corrective Actions

As noted above, the only QA/QC problem during this sampling and analysis effort was that holding times for many of the samples analyzed by Canonic Environmental Services were exceeded. The corrective action being taken is a search for a new laboratory that will assure timely analyses and provide higher quality data. The data from samples exceeding holding times is of little use in evaluating the data collected during this sampling period. However, as mentioned above, the loss of these data does little to the overall data quality since they were used only for comparison and not for groundwater quality evaluation.

Another problem arose in collecting a correct number of ambient blanks. Only 7 of the 10 required ambient blanks were collected due to oversights of the sampling personnel. The corrective action will be to re-emphasize to the Sampling Task Leader the need for complete adherence to sampling protocol. Closer supervision of the sampling team by project management will be implemented.

The other qualified data equally divided between field and laboratory problems, suggesting that they come from random errors. Our field teams are required to be familiar with the sampling protocol, and the laboratory is audited routinely. Therefore, no corrective action other than good training and supervision is necessary. The same can be said for the instances of equipment blank contamination. Complete adherence to the sampling, and in this case, decontamination, protocol should alleviate any problems.

1.2.2 Presentation of Analytical Data

This section summarizes the chemical analyses for groundwater samples collected during July through September 1988. In the following tables, the analytical results are presented by area and within each table are subdivided into each analytical method. Tables 1-10 through 1-16 present the results for Area A by method. Tables 1-17 through 1-23 present the results for the Southeast Area. Tables 1-24 through 1-30 and Tables 1-31 through 1-36 present the results for Area B and for the Southwest Area, respectively. Tables 1-37 through 1-43 present the analytical results from wells located in Area C. The analytical results from the West Area are in Tables 1-44 through 1-45. The analytical results from Area D and from the Northwest Area are presented in Tables 1-46 through 1-51 and Tables 1-52 through 1-58, respectively. Tables 1-59 through 1-65 present the results from Other On-Base Areas. The results from the Northeast Area are presented in Tables 1-66 through 1-69.

2.0 EVALUATION OF INTERIM REMEDIAL MEASURES

Three interim remedial measures have been implemented by McClellan AFB as a result of the findings of the Groundwater Sampling and Analysis Program and other Remedial Investigation/Feasibility Studies activities. These remedial measures include providing municipal water hookups to approximately 500 residences to the west, north and south of the base, installation of a synthetic liner/cover, clay cap and an extraction system in Area D, and installation of a groundwater extraction system in Area C. The residences were connected to the municipal system in the spring of 1986. Pumping of Area D extraction system was begun in March 1987 and pumping of the Area C extraction system was begun on 29 August 1988. The effectiveness of the Area D extraction system is discussed below. The Area C extraction system will be evaluated in the next data summary (covering October through December) because the system was on-line for only two days prior to monthly water-level measurements.

2.1 Area D Extraction System

The Area D extraction system consists of six extraction wells, all screened between 40 to 160 feet below ground surface. The extraction wells are located in the area of a sludge/waste pit that has been excavated and capped. The wells are continuously pumped and collectively produce approximately 100 gallons per minute (gpm). The extracted water is then pumped via an above-ground pipeline to the Groundwater Treatment Plant where the water is treated to remove contaminants.

The purpose of the extraction system is to isolate and contain contaminants within Area D (McLaren Environmental Engineering, 1987). To accomplish this goal, McLaren recommended that the effectiveness of the extraction system be based on gradient controls between specific pairs of wells. The specified gradients were based on head differences of 0.2 feet between the well pairs. McLaren also recommended pumping at the minimum flow rate of 78 gpm which would result in a three foot drawdown in the monitoring

wells after one year of pumping. McLaren recommended the 78 gpm flow rate to minimize the decline of groundwater levels thereby prolonging the usefulness of the extraction system.

The effectiveness of the Area D extraction system is evaluated below based on McLaren's gradient criteria. Long-term changes in contaminant concentrations from several monitoring wells were also reviewed to examine the effect of the extraction system on water quality.

Water-Level Data

The water-level data from July, August, and September for the McLaren-specified-well pairs were used to calculate head differences and gradients. Table 2-1 presents the well pairs and calculated head differences and gradients. As shown in the table, the extraction system is operating at a rate that meets that gradient criteria established by McLaren Engineers. The potentiometric surface maps of Area D (Plates 3, 5, 8, 10, 13, and 15) also illustrate the effects on the groundwater flow directions from pumping of the Area D extraction system. The maps show contours of equal head; groundwater flow is perpendicular to these contours in the direction of decreasing head values. In Area D, groundwater flow direction in both the shallow and middle monitoring zones is towards the extraction wells.

Analytical Data

Analytical results were reviewed from shallow, middle and deep zone monitoring wells located both on base and off base. Time series plots for 13 of the monitoring wells were prepared using trichloroethene (TCE) data. TCE was used as an indicator compound because it is the most widely detected compound in the McClellan AFB groundwater monitoring network. TCE data were plotted for wells with sampling history of at least three points. Included in each time series plot are "error bars" of ± 30 percent for each data point. The error bars represent the sampling variability calculated for each reported concentration and are based on statistical analysis discussed in the Semi-annual Informal Report (Radian, 1988). The sampling variability is attributed

TABLE 2-1. MONTHLY HEAD DIFFERENCES AND GRADIENTS OF SELECTED WELLS IN AREA D

NC = Not calculated.

to both laboratory and field procedures and will be re-evaluated using additional QA/QC data in the next interpretative report. For the purpose of qualitatively evaluating the effectiveness of the extraction system, the long term changes in TCE concentrations were reviewed for selected monitoring wells. A decreasing trend in concentrations would be expected in monitoring wells the greatest radial distance from the extraction wells but still within the influence of the wells. The monitoring wells close to the extraction wells are expected to show greater TCE concentrations over a longer period of time because they are near the contaminant sources and are also near extraction wells that are drawing contaminated groundwater towards the wells. The time series plots for the 13 monitoring wells are evaluated below.

There are seven shallow zone monitoring wells located in Area D and three shallow zone monitoring wells located approximately 500 feet west of Area D with a sampling history considered adequate for the time series review. The on-base monitoring wells are MW-10, MW-11, MW-12, MW-14, MW-15, MW-91, and MW-92, and the off-base wells are MW-1002, MW-1004, and MW-1005. The locations of these wells are shown in Figure 2-1. The time series plots for MW-10, MW-11, MW-12, MW-14, and MW-15 (Figure 2-2) are based on three sampling events, two in 1988 and one sampling event in 1985. The time/series plots for these wells except MW-10 indicate TCE concentrations during the past two sampling events are lower than in 1985. TCE concentrations in MW-10 appear to be increasing since 1985. In addition, TCE concentrations in MW-12 and MW-14 may also show an increase during this sampling period. The time series plots for MW-91 and MW-92 indicate increasing concentrations until Third Quarter 1987 after TCE concentrations have leveled off. MW-91 and MW-92, as shown in Figure 2-1 are located to the south of the extraction system well field. The time series plots for the three off-base monitoring wells, MW-1002, MW-1004, and MW-1005 show a long-term decrease in TCE concentrations that have leveled off since the Fourth Quarter 1987. Overall, the time series plots for the shallow zone monitoring wells located outside the well field show a decreasing trend that has leveled off in recent sampling events. The trends for the shallow zone monitoring wells are not readily apparent based on only three data points. High concentrations of TCE may continue to be detected in these

-continued-

wells because they are located near extraction wells that are drawing contaminated water towards them.

There are four middle zone monitoring wells in Area D with an adequate sampling history for time series plots as shown in Figure 2-3. These wells, located near the extraction wells (Figure 2-1) are MW-53, MW-54, MW-55, and MW-72. The time series plots for MW-53, MW-54, and MW-55 all show a decreasing trend except in this sampling period. These three monitoring wells are located closer to EW-73, the extraction well with the highest contaminant concentrations. The time series plot for MW-72, located near EW-84, shows a long-term steady TCE concentration pattern over the past four sampling periods.

Two deep zone monitoring wells in Area D have adequate sampling points for plotting TCE concentrations over time. These wells, MW-58 and MW-59, are located northwest of EW-73 and southwest of EW-85, respectively (Figure 2-1). The time series plots are shown in Figure 2-4. Samples from MW-58 have typically contained low levels of TCE or TCE was not detected. An apparent trend cannot be discerned for this well. The time series plot for MW-59 shows a concentration peak during the Fourth Quarter 1986 sampling, and then a decrease in concentration during the past six sampling events. The TCE concentration trends for both wells suggest that contaminant movement in the deep zone is affected by the extraction well pumping of the shallow and middle monitoring zones as uncontaminated water flows toward the extraction wells diluting contaminant concentrations.

In summary, there is no single trend apparent in the TCE concentrations for the monitoring wells. The shallow zone monitoring wells located outside the extraction well-field have shown a decrease followed by recent leveling off of TCE concentrations. Trends for the shallow zone wells located near the extraction wells are not readily apparent because there are only three data points for three years. Three of the four middle zone monitoring wells show a decreasing trend except during this last sampling period. Several shallow and middle zone monitoring wells, MW-10, MW-12, MW-14, MW-53,

AREA D MIDDLE ZONE WELLS

Figure 2-3. Time Series Plots for Selected Area D Middle Zone Monitoring Wells, Groundwater Sampling and Analysis Program, July-September 1988, McClellan AFB.

AREA D DEEP ZONE WELLS

Note: TCE concentrations for each quarter include sampling variability of ± 30 percent (Radian, 1988).

Figure 2-4. Time Series Plots for Selected Area D Deep Zone Monitoring Wells, Groundwater Sampling and Analysis Program, July-September 1988, McClellan AFB.

MW-54, and MW-55, show an increase in TCE concentration during this sampling period. Higher concentrations may occur during the third quarter of each year, but there is not enough quarterly data for these wells to determine if this is a seasonal trend. The two deep zone monitoring wells have both shown decreasing trends and during the last sampling period, TCE was not detected in samples from either well. Overall, if TCE concentrations in monitoring wells located outside the extraction well field continue to show a decreasing trend, then the extraction system based on water quality data would be effectively removing contaminants.

Cross Sections

In addition to the water level data and time series plots, a cross section for Area D (Figure 2-5) was also prepared. The wells that were used to develop the cross section are MW-92, MW-91, EW-85, EW-84, MW-55, EW-73, and MW-53, as shown on the location map (Figure 2-1). The cross section was based on geophysical information from McLaren Environmental Engineering (1987). The cross section also includes the location and screen interval of monitoring and extraction wells and the TCE concentration detected in the wells during this sample period. As shown in Figure 2-5, and in the time series plots TCE was detected only in the shallow and middle monitoring zones, and TCE concentrations are higher in monitoring wells closer to the extraction wells during this sampling period.

Conclusions

The Area D extraction system was evaluated based on hydraulic gradients between monitoring wells and by long term trends in contaminants, as detected in shallow, middle and deep monitoring zones. The Area D extraction system is being operated effectively based on hydraulic gradients recommended for specific pairs of monitoring wells. The water quality data from shallow monitoring zone wells outside of the well field does indicate that contaminant concentrations are decreasing or have stabilized since the extraction system began operating.

3.0 RECOMMENDATIONS

Recommendations based on field results and analytical data acquired through the sampling period of July through September 1988 are presented in the following sections. Section 3.1 presents recommendations based on this sampling period analytical data and data obtained previously. Section 3.2 presents the status of the recommendations given in previous quarterly reports.

3.1 July Through September 1988 Recommendations

- (1) Recommendation: Remove MW-19S, MW-20S, MW-22S, MW-34S, and MW-45S from the McClellan AFB Groundwater Monitoring Well Network.

Rationale: These monitoring wells are dry or do not contain enough water for water quality sampling, and have not been sampled for the past year. These wells are secured with a casing that is locked and do not need to be destroyed at this time. Water levels have been declining at a rate of about two feet per year in the McClellan AFB area and are unlikely to rebound to previous levels at which the five wells could be sampled.

3.2 Status of Recommendations From Previous Quarterly Reports

The following is a brief status of the recommendations made in previous quarterly reports.

- (1) Recommendation: Redevelop and install dedicated sampling systems in five wells that are currently purged by bailing. Well Wizard® bladder pumps are recommended for network

monitoring wells MW-10, MW-11, MW-12, MW-14, and MW-15 located in Area D.

Status: This recommendation has been re-evaluated based on estimated water level changes and costs of dedicated systems. Water levels in these Area D wells have dropped an average of 4.5 feet since October 1987. Based on a continued decline at the same rate, and considering the costs of buying and installing the dedicated systems, it is more cost effective to continue bailing the wells by hand each quarter that the wells are sampled.

- (2) **Recommendation:** Install dedicated systems in five monitoring wells that are currently purged using a portable submersible pump. A Well Wizard® system with purge and bladder pumps is recommended for MW-17D, MW-27D, MW-28D, and MW-19D, if sampling of this non-network well is to continue. A dedicated submersible pump retrofitted with Teflon® and stainless steel and a bladder pump is recommended for MW-68.

Status: Well Wizard® systems with purge and bladder pumps have been installed in MW-17D, MW-27D, and MW-28D. Installation of these systems were included in D.O. 0003, Mod. 02.

- (3) **Recommendation:** Investigate the integrity of the well casing and annulus of MW-31S.

Status: The well casing is damaged. Water quality samples will no longer be collected from this well. However, water levels will continue to be measured.

- (4) **Recommendation:** Change analytical methodologies to those prescribed in SW 846 "Test Methods for Evaluating Solid Wastes," Third Edition, beginning in the Fourth Quarter 1988.

Status: This recommendation will be implemented beginning in the sampling period of October through December 1988.

- (5) Recommendation: Install a monitoring well in the deep monitoring zone at monitoring well cluster 1021/1022 in the Southwest Area.

Status: This recommendation will be initiated within the HGA during 1989. The RI/FS Management Plan provides details concerning the scope and timing of the HGA.

- (6) Recommendation: Install two clusters of monitoring wells on the east side of McClellan AFB.

Status: This recommendation will be initiated within the HGA during 1989. The RI/FS Management Plan provides details concerning the scope and timing of the HGA work.

- (7) Recommendation: Conduct a phased investigation in the West Area to evaluate possible vadose zone contamination along the old and new course of Magpie Creek, and identify the extent of groundwater contamination in the shallow monitoring zone in the vicinity of Santa Ana Street.

Status: This recommendation will be initiated with the Pathways Assessment Study. The RI/FS Management Plan provides details concerning the scope and timing of the Pathways Assessment.

- (8) Recommendation: As a result of continued presence of halocarbon contamination in shallow zone monitoring wells MW-1019 and MW-1029, up to three shallow zone monitoring wells should be installed in the Northwest Area.

Status: At this point in time, Radian and the USAF have agreed that there is no immediate need for additional monitoring wells in this area. Should data collected in the future indicate otherwise, Radian and the USAF will reevaluate this recommendation.

- (9) Recommendation: Install a deep zone monitoring well in Area A next to middle zone monitoring well MW-27D.

Status: This recommendation is under consideration by the USAF.

- (10) Recommendation: Analyze samples collected from all newly installed monitoring wells and wells not previously sampled by Radian by U.S. EPA Methods 601, 602, 604, 624, 625, 200.7 and SW-9010 and evaluate the results to determine target analytes for future sampling events.

Status: SW 846 methodology will be used in future sampling events.

- (11) Recommendation: Discontinue analyses of groundwater samples by U.S. EPA Method 604.

Status: This recommendation has been implemented.

- (12) Recommendation: Limit the quarterly sampling of wells for priority pollutant metals to wells that have contained elevated concentrations of total dissolved chromium and lead. Change the sample collection procedure for wells that have contained elevated levels of chromium in order to speciate the chromium and determine if hexavalent chromium, a significant health risk, is present using Standard Method 312B.

RADIAN
CORPORATION

Status: This recommendation has been implemented. The methodology used to detect hexavalent chromium has been changed to SW-7196.

11

The map displays a city grid with streets labeled 20TH ST., 22ND ST., 24TH ST., 26TH ST., 32ND ST., and 34TH ST. Vertical streets are labeled 1ST AVE., 2ND AVE., 3RD AVE., 4TH AVE., and 5TH AVE. A 'DRAINAGE CHANNEL' is shown running vertically through the center. Two areas are specifically labeled: 'AREA D' is a cluster of points near the intersection of 22nd St and 1st Ave, and 'AREA C' is a large area near the intersection of 34th St and 5th Ave. Numerous numbered points are scattered across the map, some marked with stars or circles. A 'UNNAMED' area is also indicated on the right side of the map.
