APPENDIX A
DEFINITIONS, NOMENCLATURE AND UNITS OF MEASURE

(CL5060B/0528N)

DEFINITIONS, NOMENCLATURE AND UNITS OF MEASURE

Most of the following are derived from the
American Geological Institute (1976) Glossary.

<u>Term</u>	<u>Definition</u>
Aquifer	Stratum or zone below the surface of the earth capable of producing a significant amount of water as from a well.
Flow Velocity	The rate a moving fluid travels. Measured in distance traveled over a given period of time.
Gradient	Slope of a stream or land surface.
Ground Water	That part of the subsurface water which is in the zone of saturation.
Hydraulic Conductivity	Ratio of flow velocity to driving force for viscous flow under saturated conditions of a specified liquid in a porous medium.
Lithology	The physical character of a rock.
Permeability	The capacity of a rock or sediment for transmitting a fluid. Degree of permeability depends upon the size and shape of the pores, the size and shape of their interconnections, and the extent of the latter. It is measured by the rate at which a fluid of standard viscosity can move a given distance through a given interval of time.
Potentiometric Surface	Surface to which water in an aquifer would rise by hydrostatic pressure under atmospheric pressure.
Porosity	The ratio of the void volume of a rock or soil to its total volume.
Recharge	a.) Intake. The processes by which water is absorbed and is added to the zone of saturation, either directly or indirectly by way of another formation. b.) The quantity of water that is added to the zone of saturation.
Saturated Thickness	The interval of rock or soil which is saturated with respect to water if all its interstices are filled with water.
Sediment	Solid material settled from suspension in a liquid.

(CL5060B/0528N)

DEFINITIONS, NOMENCLATURE AND UNITS OF MEASURE (CONTINUED)

<u>Term</u>	<u>Definition</u>
Specific Capacity	A constant indicating the discharge expressed as a rate yield per unit of drawdown.
Specific Yield	The ratio of the volume of water which a rock or soil, after being saturated, will yield by gravity to its own volume.
Stratigraphy	That branch of geology which deals with the formation, composition, sequence and correlation of the stratified rocks as parts of the earth's crust.
Transmissivity	The ease with which water moves through a unit width of aquifer.
Water Table	The upper surface of a zone of saturation, except where that surface is formed by an impermeable body.
Zone of Saturation	A subsurface zone in which all the interstices are filled with water under pressure equal to or greater than that of the atmosphere.

APPENDIX B
MAFB TASK DESCRIPTION/STATEMENT OF WORK

(CL5060B/0528N)

25 JUN 1986

INSTALLATION RESTORATION PROGRAM
PHASE II - CONFIRMATION/QUANTIFICATION (STAGE 1)
MINOT AFB ND

I. DESCRIPTION OF WORK

The overall objective of the Installation Restoration Program (IRP) Phase II investigation is to assess potential contamination at past hazardous waste disposal and spill sites on Air Force installations. A series of staged field investigations may be required to meet this objective.

The purpose of this task is to undertake a field investigation at Minot AFB ND to: (1) confirm the presence or absence of contamination within the specified areas of investigation; (2) if possible, determine the extent and degree of contamination and the potential for migration of those contaminants in the various environmental media; (3) identify public health and environmental hazards of migrating pollutants based on State or Federal standards for those contaminants; and (4) delineate additional investigations required beyond this stage to reach the Phase II objectives.

The Phase I IRP Report (mailed under separate cover) incorporates the background and description of the sites/zones for this task. To accomplish this survey effort, the contractor shall take the following actions:

A. General Requirements - The general requirements are applicable to all sites unless modified by the site specific work in Section I.B.

1. Monitor the ambient air during all well drilling and soil boring work with a photoionization meter or equivalent organic vapor detector to identify the generation of potentially hazardous and/or toxic vapors or gases. Include air monitoring results in the boring logs. If soil encountered during borehole drilling is suspected to be hazardous because of abnormal discoloration, odor or air monitoring levels, containerize the soil cuttings in new, unused drums. Enter into the boring logs the depth(s) from which suspected contaminated soil cuttings were collected for containerization. Take a composite sample from the contents of each drum. Collect a maximum of 10 composite samples and test them for EP Toxicity (metals). Use RCRA criteria to determine if soil cuttings must be classified as hazardous waste (40 CFR 261.24).

2. Determine the exact location of all monitor wells and soil borings during the planning/mobilization phase of the field investigation. Consult with base personnel to minimize disruption of base activities, to properly position wells with respect to exact site locations, and to avoid underground utilities. Direct the drilling and sampling and maintain a detailed log of the conditions and materials penetrated during the course of the work. Do not drill boreholes or position wells in actual landfill areas; install wells at the landfill perimeter.

3. Determine the areal extent of the sites by reviewing historical and current panchromatic and infrared aerial photography.

4. Installation of Ground Water Monitoring Wells

a. Comply with the U.S. EPA Publication 330/9-S1-002, NEIC Manual for Ground Water/Subsurface Investigations at Hazard Waste Sites for monitoring well installation.

b. All well drilling, development, purging, sampling methods, and other activity pertaining to this effort must conform to state and other applicable regulatory agency requirements. Cite references in an appendix to the Final Report.

c. Install wells at a sufficient depth to collect samples representative of aquifer quality and to intercept contaminants if they are present.

d. Avoid, when possible, installing wells in depressions or areas subject to frequent flooding and standing water. If wells must be installed in such areas, design the wells such that standing water does not leak into the top of the casing or cascade down the annular space.

e. Drill all monitoring wells using the following specifications:

(1) Drill all wells using hollow-stem auger techniques. A center stem, plug, and bit attached to the stem may be inserted into the auger for use while drilling. This will prevent material from entering into the hollow stem of the auger.

(2) Take lithologic samples at five-foot intervals and prepare borehole log descriptions. Include pilot boring logs and well completion summaries in the Final Report (Item VI, below).

(3) Drill a maximum of 16 wells. Total footage for all wells in this task shall not exceed 500 linear feet. Refer to the site specific details in Section I.B.

(4) Construct each well with two-inch inside diameter (I.D.) Schedule 40 PVC casing. Use threaded screw-type joints, glued fittings are not permitted. Flush thread all connections. Screen each well using two-inch I.D. casing having up to 0.020 inch slots; slot size may vary based upon borehole geology. Screen material must be the same as that of the casing. Cap the bottom of the screen.

(5) Unless specified differently in Section B, Site Specific Work, screen all wells so as to collect floating contaminants and to allow for yearly fluctuations of the water table. Screen all wells a maximum of ten feet.

f. Complete all monitoring wells using the following specifications:

(1) Once the casing is installed, allow the soil formation to collapse around the well screen. Supplement the natural gravel-pack with washed and bagged rounded silica sand or gravel with a grain size distribution compatible with the screen and soil formation. Place the pack from the bottom of the borehole to two feet above the top of the screen. Tremie a five foot bentonite pellet seal above the sand/gravel pack. Ensure the bentonite forms a complete seal. Grout the remainder of the annulus to the land surface with a Type I Portland cement/bentonite slurry.

(2) Check with the base point of contact (POC) to determine whether wells shall be completed flush or project above the ground surface:

(a) If well stick-up is of concern in an area, complete the well flush with the land surface. Cut the casing two to three inches below land surface, and install a protective locking lid consisting of a cast-iron valve box. Center the lid assembly in a three foot diameter concrete pad sloped away from the valve box. Ensure free drainage is maintained within the valve box. Also, provide a screw-type casing cap to prevent infiltration of surface water. Maintain a minimum of one foot clearance between the casing top and the bottom of the valve box. Clearly mark the well number on the valve box lid.

(b) If an above ground surface completion is used, extend the well casing two or three feet above land surface. Provide an end-plug or casing cap for each well. Shield the extended casing with a steel guard pipe which is placed over the casing and cap, and seated in a two-foot by two-foot by four-inch concrete surface pad. Slope the pad away from the well sleeve. Install a lockable cap or lid at the casing. Install three, three-inch diameter steel guard posts if the Base POC determines the well is in an area which needs such protection. The guard posts shall be five feet in total length and installed radially from each wellhead. Recess the guard posts approximately two feet into the ground and anchor with concrete. Do not install the guard posts in the concrete pad placed at the well base. Paint the protective steel sleeve and clearly number the well on the sleeve exterior.

(c) Provide locks for both flush and above-ground well assemblies. Turn over the master keys to the Base POC following completion of the field effort.

(3) As soon as practical after completion, develop each well with a submersible pump, bailer, and/or airlift method. Continue well development until the discharge water is clear and free of sediment to the fullest extent possible. Measure the rate of water produced, the pH, specific conductance and water temperature during well development and include this information in the Final Report.

(4) Determine by survey the elevation of all newly installed monitoring wells to an accuracy of 0.01 foot. Notch the top of the riser casing where well elevations are established. Horizontally locate the new wells to an accuracy of 1.0 foot and record the position on both project and site specific maps. Bench marks used must have previously been established from and be traceable to a USCGS or USGS survey marker.

(5) Measure water levels at all monitoring wells as feet below the ground surface or below the top of casing elevation to the nearest 0.01 foot. Report in terms of mean sea level (MSL). Measure static water levels in wells prior to well development and before all well purging which precedes sampling events.

5. Recommend candidate well abandonment method(s) or technique, including costs, which are applicable to the type of monitoring wells installed and geological conditions. Consider that these wells will be abandoned at some future date after the study objectives have been met and there is no longer a need for the wells. The actual process of well abandonment is not a part of this task order. Assure that the recommended method(s) meets state and/or local well abandonment guidelines or regulations.

6. Complete permits, applications, and other forms which may be required by local and/or state regulatory agencies for the installation of monitor wells. File these documents with appropriate agencies and pay all permitting and filing fees.

7. Soil Borings

a. Conduct five soil borings not to exceed a total of 200 linear feet. Accomplish the borings using hollow-stem auger techniques. Obtain split-spoon samples using ASTM Method D-1586. Refer to the site specific details, Section I.B., for the soil sample collection depths.

b. During the boring operations, describe lithologies encountered and prepare stratigraphic logs. Place special emphasis on field identification of contaminated soils encountered.

c. Scan all split-spoon soil cores with a photoionization meter or equivalent organic vapor detector. Include monitoring results in the boring logs.

d. Whenever possible, measure water levels in all boreholes after the water level has stabilized. Examine the water surface for the presence of hydrocarbons. Include the information in the boring logs.

e. Tremie-grout all boreholes to the surface with a bentonite/cement grout. It is especially important to insure they are adequately resealed to preclude future migration of contaminants.

f. Permanently mark each location where soil borings are drilled. Record the location on a project map for each specific site or zone, whichever is applicable.

8. Well and Borehole Cleanup

Remove all well/borehole cuttings and clean the general area following the completion of each well/borehole. Containerize and store cuttings according to paragraph I.A.1. of this task order. Transport these

drums to a location on Minot AFB designated by the Base POC. The base is responsible for ultimate disposal of contaminated soils using base resources.

9. Field Sampling

a. Strictly comply with the sampling techniques, maximum holding times, and preservation of samples as specified in the following references: Standard Methods for the Examination of Water and Wastewater, 16th Edition (1985), pages 37-44; ASTM, Section 11, Water and Environmental Technology; Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 2nd Edition (USEPA, 1984); Methods for Chemical Analysis of Waters and Wastes, EPA Manual 600/4-79-020, pages xiii to xix (1983); and Handbook for Sampling and Sample Preservation of Water and Wastewater, EPA Document 600/4-82-029 (1982).

b. Allow wells to stabilize after development for a minimum of seven days before sampling.

c. Prior to purging the wells, examine the surface of the water table for the presence of hydrocarbons and take water level measurements to the nearest 0.01 foot with respect to the established survey point on top of the well casing. If applicable, measure the thickness of the hydrocarbon layer and collect a sample of the hydrocarbons. Analyze the samples for petroleum hydrocarbons (Attachment 1 includes an allowance for these samples).

d. Purge the well using a submersible pump, bailer, or other pertinent method. Purge until a minimum of three well volumes (based on borehole diameter) of water have been displaced and the pH, temperature, specific conductance, color, and odor of the discharge have stabilized using the following criteria: pH $\pm$ 0.1 unit, temperature $\pm$ 0.5°C, and specific conductance $\pm$ 10 μ mhos. Include the final measurements in the Results section of the report.

e. Collect water samples with a Teflon bailer. However, to collect representative aquifer samples where floating hydrocarbons are present, use a "thief sampler" or similar device to minimize the influence of the free product.

f. If the well(s) cannot be sampled due to well development, well characteristics, or other reason(s), indicate the reason(s) in the report as specified in Item VI below.

g. Permanently mark the location where surface water or sediment samples are collected. Record the location on a project map for each site or zone, whichever applies.

h. Split all water and soil samples. Analyze one set and immediately deliver the other set (the same collection day) to the Base POC. The Base POC will select 10% of the split samples, package the selections with appropriate forms, and deliver them to the contractor within 24 hours of receipt. Supply all packing and shipping materials to the Base POC for packaging the split samples. Immediately ship (within 24 hours) the POC selected samples through overnight delivery to:

USAFOEHL/SA
Bldg 140
Brooks AFB TX 78235-5501

For all split samples sent to the USAFOEHL, complete an AF Form 2752A "Environmental Sampling Data" and/or an AF Form 2752B "Environmental Sampling Data - Trace Organics", (working copies have been provided under separate cover) with the following information:

- (1) Date and time collected
- (2) Purpose of sample (analyte and sample group)
- (3) Installation name (base)
- (4) Sample number (on containers)
- (5) Source/location and depth of sample
- (6) Contract Task Numbers and Title of Project
- (7) Method of collection (bailer, suction pump, air-lift pump, split-spoon, etc.)
- (8) Volumes removed before sample taken
- (9) Special Conditions (use of surrogate standard, etc.)
- (10) Preservatives used
- (11) Collector's name or initials

In addition, label each sample container with a permanent ink pen (laundry marker) to reflect the data in (1), (2), (3), (4), (10) and (11) above.

i. For every 10 field samples collected, take one additional sample (a field duplicate) for quality control purposes. Attachment 1 provides a 10% allowance for these additional analyses. Duplicates shall be indistinguishable from other analytical samples so personnel performing the analyses are not able to determine which samples are duplicates.

j. For every 20 field water samples collected, prepare and submit for analysis one additional field blank for all parameters analyzed in water. A minimum of one field blank for each parameter is required. Allowances for these additional analyses are included in Attachment 1.

k. Maintain chain-of-custody records for all samples, field blanks, and quality control samples.

10. Chemical Analyses

a. Analyze water and soil samples collected as specified in Section B below, Specific Site Work. The analytical parameters are summarized in Attachment 1 along with the required methods. Archive all raw data, including QA/QC and standards data for not less than five years after project completion. Supply this data to the USAFOEHL/TS upon request.

b. All analyses shall meet the required limits of detection for the applicable method identified in Attachment 1.

c. For those methods which employ gas chromatography (GC) as the analytical technique (E601, SW8010 and SW8020) positive confirmation of identity is required for all analytes having concentrations higher than the Method Detection Limit (MDL). Conduct positive confirmation by second-column GC; however, gas chromatography/mass spectroscopy (GC/MS) can be used for positive confirmation if the quantity of each analyte to be confirmed is above the detection level of the GC/MS instrument. Analytes which cannot be confirmed will be reported as "Not Detected" in the body of the report, but results of all second-column GC or GC/MS confirmational analyses are to be included in the report appendix along with other raw analytical data. Base the quantification of confirmed analytes upon the first column analysis. The maximum number of second-column confirmational analyses shall not exceed fifty percent (50%) of the actual number of field samples (to include duplicates). The total number of samples for each GC method listed in Attachment 1 includes this allowance. If GC/MS, or a combination of second-column GC and GC/MS, is used, the total cost of all such analyses for a particular parameter shall not exceed the funding allowed for positive confirmation using only second-column GC.

d. All chemical/physical analyses shall conform to state and other applicable Federal and local regulatory agency legal requirements. If a regulatory agency specifies that a type of analysis be performed in a certified laboratory, assure compliance with the requirement and furnish documentation showing laboratory certification with the first analytical data supplied to the USAFOEHL.

11. Decontamination Procedures:

a. Decontaminate all sampling equipment, including internal components, prior to use and between samples to avoid cross contamination. Wash equipment with a laboratory-grade detergent followed by drinking quality water, solvent (methanol), and distilled water rinses. Allow sufficient time for the solvent to evaporate and the equipment to dry completely.

b. Dedicate for each well the monofilament line or steel wire used to lower sampling equipment into the well; do not use a line in more than one well. Decontaminate the calibrated water level probe for measuring well volume and water level elevation before use in each well.

c. Thoroughly clean and decontaminate the drilling rig and tools before initial use and after each borehole completion. As a minimum, steam clean drill bits after each borehole is installed. Drill from the "least" to the "most" contaminated areas, if possible.

12. Conduct a literature search of local hydrogeologic conditions to complement the Phase I Report (mailed under separate cover). Use this data to determine optimum well locations. Include the pertinent literature search information in an appendix of the Final Report. Develop the literature search data using the following guideline:

a. Topographic data

b. Geologic data

(1) Structure

(2) Stratigraphy

(3) Lithology

c. Hydrogeologic data

(1) Location of all existing and abandoned wells, including observation wells, and springs, natural ponds and seepages, that occur on or off the installation within a one-mile radius of sites to be investigated

(2) Groundwater table and piezometric contours

(3) Depth to groundwater

(4) Surface and groundwater quality

(5) Recharge, discharge and contributing areas

(6) Geologic setting, yield and hydrographs of springs and natural seepages

d. Data on all existing and abandoned wells, to include observation holes, on or off the installation and within a one-mile radius of sites to be investigated.

(1) Location, depth, diameter, types of wells, and logs

(2) Static and pumping water levels, hydrographs, yield and specific capacity

(3) Present and projected groundwater development and use

(4) Corrosion, incrustation, well interference, and similar operation and maintenance problems

(5) Observation well networks

(6) Existing water sampling sites

e. Aquifer data

- (1) Type, such as unconfined, artesian, or perched
- (2) Thickness, depths, and formational designation
- (3) Boundaries
- (4) Transmissivity, storativity, and permeability
- (5) Specific retention
- (6) Discharge and recharge
- (7) Ground and surface water relationships
- (8) Aquifer models

f. Climatic data

- (1) Precipitation (total and net)
- (2) Evapotranspiration

B. Specific Site Work

Attachment 3 is a base map showing the site locations. In addition to items delineated in I.A. above, conduct the following specific actions at the sites listed below:

1. Sanitary Landfill

a. Install nine shallow (approximately 20 feet deep) wells around the perimeter of the landfill. Approximately locate the wells (SW 1, 2, 3, 4, 5, 6, 7, 8 and 9) as shown on Attachment 4.

b. Perform three soil borings to a depth of 100 feet to determine lithology and geology around the landfill. Grout the lower 50 feet of each boring with a bentonite/cement grout and convert the boreholes to deep (approximately 50 feet) wells. Screen a maximum of 10 feet of the deep wells. Approximately locate the wells (DW 1, 2, and 3) as shown on Attachment 4 and as follows:

- (1) One well collocated with the shallow well installed on the north edge of landfill.
- (2) One well collocated with the shallow well on the east edge of the landfill in the drainage channel.
- (3) One well collocated with the shallow well installed between the sewage lagoon and the landfill.

c. Collect a groundwater sample from each of the 12 new wells and from the four existing groundwater monitoring wells in the landfill (16 water samples).

d. Collect a maximum of four surface water samples from any standing water in the landfill or from the landfill drainage channel which flows off base. If the water is flowing in the drainage channel, take a discharge measurement.

e. Analyze water samples for petroleum hydrocarbons, aromatic volatile organics, halogenated volatile organics, 13 priority pollutant metals, extractable priority organic pollutants (GC/MS), total dissolved solids (TDS), and common anions.

2. Firefighter Training Area (FTA).

a. Install four wells (approximately 30 feet deep) equally spaced around the perimeter of the FTA.

b. Perform one soil boring in the center of the fire training area to a depth of 30 feet. Collect four soil samples for chemical analysis from the boring, based on HNU or OVA meter readings, odor, discoloration or other indicators of contamination.

c. Collect three sediment samples for chemical analysis in the ditch draining the FTA. Take samples to a depth of one foot at the following locations: the effluent side of the culvert in the ditch near the FTA, just inside the base boundary where the ditch leaves the base, and at a point of suspected contamination selected in the field.

d. Collect a groundwater sample from each well.

e. Analyze those soil/sediment samples selected for chemical analysis for petroleum hydrocarbons, aromatic volatile organics, halogenated volatile organics, and lead.

f. Analyze water samples for petroleum hydrocarbons, aromatic volatile organics, halogenated volatile organics, and lead.

3. Explosive Ordnance Disposal (EOD) Area.

a. Perform one 20 foot soil boring in a location specified by the Base POC. Collect two soil samples during boring based on HNU or OVA meter readings, odor, discoloration or other indicators of contamination.

b. Analyze the soil samples for petroleum hydrocarbons and 13 priority pollutant metals.

4. Background Sampling

a. To determine background water quality, sample the existing Corps of Engineers well once. Analyze the sample for halogenated and aromatic

volatile organics, petroleum hydrocarbons, 13 priority pollutant metals, total dissolved solids, and common anions.

C. Health and Safety

Comply with USAF, OSHA, EPA, state and local health and safety regulations regarding the proposed work effort. Use EPA guidelines for designating the appropriate levels of protection at study sites. Prepare a written Health and Safety Plan for the proposed work effort and coordinate it directly with applicable regulatory agencies prior to commencing field operations. Provide an information copy of the Health and Safety Plan to the USAFOEHL after coordination with regulatory agencies. The Health and Safety Plan is specified in Sequence No. 7, Item VI below.

D. Technical Operations Plan

Immediately after the Notice To Proceed (NTP) for the delivery order, develop a Technical Operations Plan (TOP) based on the technical requirements specified in this task description. (See Sequence No. 20, Item VI, below). Follow the TOP format (mailed under separate cover). Provide the TOP to the USAFOEHL within two weeks of the NTP.

E. Data Review

1. Tabulate field and analytical laboratory results, including field and laboratory parameters and QA/QC data, as they become available and incorporate them into the next monthly R&D Status Report (Sequence No. 1, Item VI below) forwarded to the USAFOEHL. In addition to the results, report the following:

- a. the time and dates for sample collection, extraction (if applicable) and analysis;
- b. the method used and Method Detection Limits achieved;
- c. the Chain-of-Custody forms;
- d. a cross-reference of laboratory sample numbers to field sample numbers; and
- e. a cross-reference of field sample numbers to wells, boreholes, sites, etc.

2. Upon completion of all analyses, tabulate and incorporate all results into an Informal Technical Information Report (Sequence No. 3, Item VI, below) and forward the report to USAFOEHL for review a minimum of two weeks prior to submission of the draft report. Provide as a minimum the information specified in I.E.1. above.

3. Immediately report to the USAFOEHL Program Manager or his supervisor via telephone, data/results generated during this investigation which indicate a potential health risk (for example, a contaminated drinking

water aquifer). Follow the telephone notification with a written notice within three days; attach a copy of the laboratory raw data (i.e., chromatogram).

F. Reporting

1. Prepare a draft report delineating all findings of this field investigation and forward it to the USAFOEHL (as specified in Sequence No. 4, Item VI, below) for Air Force review and comment. Strictly adhere to the USAFOEHL report format (mailed under separate cover). The format is an integral part of this delivery order. Draft reports are considered "drafts" only in the sense that they have not been reviewed and approved by Air Force officials. In all other respects, "drafts" must be complete, in the proper format, and free of grammatical and typographical errors. Include a discussion of the regional/site specific hydrogeology, well and boring logs, data from water level surveys, ground water surface and gradient maps, water quality and soil analysis results, available geohydrologic cross sections, and laboratory and field QA/QC information. Follow the USAFOEHL supplied format (mailed under separate cover). For states requiring the field work or technical effort be supervised by a state registered geologist, engineering geologist or professional engineer, insert this information in the report to include registration numbers, certificate and seals (as appropriate).

2. Review the IRP Phase I report. Integrate the Phase I information with the investigative work done at each site to date so the report reflects the total cumulative information for each site studied in this effort.

3. In the results section, include water and soil analyses results and field quality control sample data. Report all internal laboratory quality control data (lab blanks, lab spikes, and lab duplicates), and laboratory quality assurance information in an appendix of the report. Provide second-column confirmation results and quantities, and include which columns were used, instrument operating conditions and retention times. Summarize in the appendix the specific collection technique, analytical method (Standard Methods, EPA, etc.), holding time, and limit of detection for each analyte.

4. Make estimates of the magnitude, extent and direction which detected contaminants are moving. Identify potential environmental consequences of discovered contamination based upon state or Federal standards.

5. Plot and map all field data collected for each site according to surveyed positions.

6. In the recommendation section, address each site and list them by category:

a. Category I consists of sites where no further action (including remedial action) is required. Data for these sites are considered sufficient to rule out unacceptable public health or environmental hazards.

b. Category II sites are those requiring an additional Phase II effort to determine the direction, magnitude, rate of movement and extent of detected contaminants. Identify potential environmental consequences of discovered contamination, where known.

c. Category III sites are those that will require remedial actions (ready for IRP Phase IV). In the recommendations for Category III sites, include any possible influence on sites in Categories I and/or II due to their connection with the same hydrological system. Clearly state any dependency between sites in different categories. Include a list of candidate remedial action alternatives, including Long Term Monitoring (LTM) as remedial action, and the corresponding rationale that should be considered in selecting the remedial action for a given site. List all alternatives that could potentially bring the site into compliance with environmental standards. For contaminants that do not have standards, EPA recommended safe levels for noncarcinogens (Health Advisory or Suggested-No-Adverse-Response Levels) and target levels for carcinogens (1×10^{-6} cancer risk level) may be used. Unless specifically requested, do not perform comprehensive cost analyses, or cost/benefit review for remedial action alternatives. However, in those situations where field survey data indicate immediate corrective action is necessary, present specific, detailed recommendations.

For each category above, summarize the results of field data, environmental or regulatory criteria, or other pertinent information supporting conclusions and recommendations.

7. Provide cost estimates by line item for future efforts recommended for Category II sites and LTM Category III sites. Submit these estimates concurrently with the approved Final Report in a separate document. Only the cost requirements outlined in Sequence No. 2, Item VI, need be submitted.

a. For Category II sites, develop detailed site-specific estimates using prioritized costing format (i.e., cost of conducting the required work on: the highest priority site only; the first two highest priority sites only; the first three highest priority sites only; etc., until all required work is discretely costed) for the proposed work effort. The Air Force determines the priority of sites from contractor recommendations. Consider the type of contaminants, their magnitude, the direction and rate of their migration, and their subsequent potential for environmental and health consequences when developing recommendations for site prioritization.

b. For Category III sites slated for long-term monitoring, develop site-specific estimates which detail the costs associated with: (1) permanent installation of monitoring wells; (2) ground water sampling interface equipment, including permanent installations of pumps and sampling lines; and (3) four quarterly (1 year period) sample collections and laboratory chemical analyses of ground water, etc.

8. Provide an inventory of all on-base wells, to include production, irrigation, monitoring, etc. If the well has been abandoned, then state the reason.

9. Reference in an appendix any local, state and/or Federal regulations which require specific well drilling techniques, materials, well development, purging, and sampling methods for work specified in this effort.

G. Meetings

The contractor's project leader shall attend three meeting(s) to take place at a time to be specified by the USAFOEHL. Each meeting shall take place at Minot AFB for a duration of one eight-hour day.

II. SITE LOCATION AND DATES:

Minot AFB ND
Date to be established

III. BASE SUPPORT:

A. Prior to any contractor digging or drilling, the Base Civil Engineer POC will locate underground utilities and issue digging permits..

B. The Base Civil Engineer will assign accumulation points within the installation for the contractor to use to deliver any drill cuttings or well installation/development fluids generated from the required work which are suspected to be hazardous.

C. The Base Civil Engineer will take custody of any drill cuttings or well installation/development fluids suspected to be hazardous and properly dispose of the material according to applicable state/Federal regulations.

D. The Base will provide the contractor with existing engineering plans, drawings, diagrams, aerial photographs, etc., to evaluate sites under investigation.

E. The Base POC will select 10% of the split samples provided by the contractor, package them, and ensure they are picked up by the contractor within 24 hours of sample receipt by the POC. See paragraph I.A.9.h.

F. The Base will arrange for and have available prior to the start-up of field work, the following services, materials, work space, and items of equipment to support the contractor conducting the survey:

1. Personnel identification badges and vehicle passes and/or entry permits.

2. A staging area for storage of equipment and supplies.

3. A supply (i.e., fire hydrant) for large quantities (up to a maximum of 1,000 gallons) of potable water to be used in equipment cleaning, etc.

4. A household-type refrigerator having approximately two cubic feet of freezer space for storage of blue ice.

IV. GOVERNMENT FURNISHED PROPERTY: None

V. GOVERNMENT POINTS OF CONTACT:

1. USAFOEHL Program Monitor

Capt Patrick N. Johnson
USAFOEHL/TSS
Brooks AFB TX 78235-5501
(512) 536-2158
AV 240-2158/2159
1-800-821-4528

2. Base Point of Contact (POC)

Capt David DeMay
USAF Regional Hosp Minot/SGPB
Minot AFB ND 58705-5300
(701) 727-3398
AV 344-3398

3. MAJCOM Monitor

Lt Col John Pontier
HQ SAC/SGPB
Offutt AFB NE 68113-5001
(402) 294-4651
AV 271-4651

4. Base Civil Engineer POC

Mr John L. Boucher
91st CSG/DEEVE
Minot AFB ND 58705-5300
(701) 727-3691
AV 344-3691

VI. In addition to sequence numbers 1, 5 and 11 listed in Attachment 1 to the contract, and which apply to all orders, the sequence numbers listed below are applicable to this order. Also shown are dates applicable to this order.

<u>Sequence No.</u>	<u>Para No.</u>	<u>Block 10</u>	<u>Block 11</u>	<u>Block 12</u>	<u>Block 13</u>	<u>Block 14</u>
20 (TOP)*	I.D.	OTIME	86SEP26	86SEP29		15
7 (Health & Safety)	I.C.	OTIME	86SEP26	86SEP27		3
3 (Prelim Data)	I.E.2	OTIME	**	**		3
4 (Tech. Rpt)	I.F.	ONE/R	87JAN30	87FEB13	87NOV13	***
2 (Cost Data)	I.F.7.	OTIME	87FEB13	87NOV13		****
14		MONTHLY	86OCT14	86OCT31	*****	3
15		MONTHLY	86OCT14	86OCT31	*****	3

*The Technical Operations Plans (TOP) required for this stage is due within two (2) weeks of the Notice to Proceed (NTP).

**Upon completion of the total analytical effort before submission of the first draft report.

***Two draft reports (25 copies of each) and one final report (50 copies plus the original camera ready copy) are required. Incorporate Air Force comments into the second draft and final reports as specified by the USAFOEHL. Supply the USAFOEHL with an advance copy of the first draft, second draft, and final reports for acceptance prior to distribution. Distribute remaining 24 copies of each draft report and 49 copies of the final report as specified by the USAFOEHL.

****Submit cost estimates (five copies) in a separately bound document with the Final Report only. Provide estimates for only those sites recommended for additional Phase II work (Category II) or Phase IV, Long Term Monitoring, (Category III).

*****Submit monthly hereafter.

APPENDIX C
WELL NUMBERING SYSTEM

(CL5060B/0528N)

C. Well Numbering System

A well numbering system was used to identify each well constructed during the on-site remedial investigation. A unique number was assigned to each well and listing of well numbers was maintained by the HART field team leader. The system is described below.

Well Identification

Each well was identified by a two-letter identifier code, with the following prefix:

SW - Shallow Well (less than 30 feet in depth)

DW - Deep Well (greater than 30 feet in depth)

A numerical suffix unique to each prefix follows.

Example

SW-1. Shallow monitoring well No. 1.

APPENDIX E
FIELD RAW DATA

(CL5060B/0528N)

E-1

JOB INFORMATION:

Project #: 01071-00-86008-00 Location: MAFB, MINOT, ND
 Client: USAF Dates of Report: 10.6-10.10.86
 Field Team Leader: V. DeVillerz

DAILY FIELD ACTIVITIES1. Date: 10.6.86HART Personnel On-site: R. Goldman, V. DeVillerz, J. VolzSubcontractors On-site: Twin City TESTING: J. Zeltner, Hugh Jacobson,
Max TschisickWork Accomplished: Located all boring/well locations and sediment
sampling locations. Met w/ USAF personnel: Capt DeMay, Scott
Smith & John Boucher (Civil Eng.)

Problems Encountered: _____

2. Date: 10.7.86HART Personnel On-site: RDS, VJD, JVSubcontractors On-site: Twin City TESTINGWork Accomplished: met w/ Capt. Johnson (Brooks AFB); relocated
DW1/SW2 to N. side of drainage ditch & SW5 across the road
from the SLF. Drilled test boring for DW1/SW2 to 72 FT.

Problems Encountered: _____

3. Date: 10-8-86HART Personnel On-site: VJD, RDB, JVSubcontractors On-site: TWIN CITY TESTING: M.T., H.J.Work Accomplished: Completed TB-DW1/SW2 to 100 FT and grouted hole.
Drilled + installed SW2 at 20' (Dry)Problems Encountered: Swivel which holds grout rods was difficult to
connect to rods for repair; No H₂O in SW24. Date: 10-9-86HART Personnel On-site: VJD, JVSubcontractors On-site: TWIN CITY: H.J., M.T.Work Accomplished: Completed SW3 (25'). Drilled boring for SW1 to
25', dry, so boring left open until later time.Problems Encountered: No H₂O in SW1.5. Date: 10-10-86HART Personnel On-site: VJD, JVSubcontractors On-site: TWIN CITY: H.J., M.T.Work Accomplished: Installed + drilled DW1. Talked to Capt. Johnson
+ DeMay on conference call to reevaluate fill plan due to lack
of H₂O in shallow boring.

Problems Encountered: _____

JOB INFORMATION:Project #: 0107-00-86008-00Location: MAFB, MINOT, NDClient: USAFDates of Report: 10-11-10-13-86Field Team Leader: V. DeVillerDAILY FIELD ACTIVITIES1. Date: 10-11-86HART Personnel On-site: VJD, JVSubcontractors On-site: TWINGty: H.J. M.T.Work Accomplished: Drilled SW-1 from 25' to 43.5' - installed well @ 43.5' moving to DW3 location.Problems Encountered: Rig stuck at DW3 location adjacent to lagoons.2. Date: 10-13-86HART Personnel On-site: VJD, JVSubcontractors On-site: TWINGty: H.J. M.T.Work Accomplished: Bailed SW3 to check recharge rate - bailed dry in 5-10 Laid. Bailed NW4 + SW4. Organized sampling procedure and sampling equipment.Problems Encountered: Could not find a dig operator to pull rig out of trench - today is Columbus Day + all Govt. employees are not working today.

JOI INFORMATION:

E-4

Project #: 01071-00-86008-00 Location: MAERB, Minot, ND
Client: USAF Dates of Report: 10-14-86 to 10-17-86
Field Team Leader: V. Devillez; Bruce Macke

DAILY FIELD ACTIVITIES

2. Date: 10-14-86
HART Personnel On-site: Jim Volz, Vanessa DeVillez until 2:00 PM, and Bruce Macke from 12:00 PM.
Subcontractors On-site: Twin City Testing; Hugh Johnson and MAX Tschostek
Work Accomplished: Installed AWS

Problems Encountered: Very difficult well construction.

3. Date: 10-15-86HART Personnel On-site: Jim Volz, Bruce MackeSubcontractors On-site: Twin City Testing; Hugh
Jacobson And MAX TschasickWork Accomplished: Installed DW2

Problems Encountered: _____

4. Date: 10-16-86HART Personnel On-site: Jim Volz, Bruce MackeSubcontractors On-site: Twin City Testing; Hugh
Jacobson And MAX TschasickWork Accomplished: Installed SW6

Problems Encountered: _____

5. Date: 10-17-86HART Personnel On-site: Jim Volz, Bruce Macke until
11:00 AMSubcontractors On-site: Twin City Testing; Hugh
Jacobson And MAX TschasickWork Accomplished: Installed SW6; 50' of TBSW4
boring completed.

Problems Encountered: _____

JOB INFORMATION:

Project #: 01071-00-86008-00 Location: MAFB, MINOT, ND
Client: USAF Dates of Report: 10-20-86 - 10-24-86
Field Team Leader: V. DeVilb2

DAILY FIELD ACTIVITIES

1. Date: 10-20-86

HART Personnel On-site: VJD, JV

Subcontractors On-site: TWINGty: H. J., M. T.

Work Accomplished: Drilled TB-SW4/DW4 from 50' to 100'.

Problems Encountered: TB-SW4/DW4 started to collapse and caused the switch from HSA to mud rotary drilling. Started SW4 well installation.

2. Date: 10-21-86

HART Personnel On-site: VJD, JV

Subcontractors On-site: TWINGty: H. J., M. T.

Work Accomplished: Completed SW4 well installation; Drilled & installed DW4.

Problems Encountered: SW4: auger stuck in hole, sand bridged auger.

3. Date: 10.22.86HART Personnel On-site: VJD, JVSubcontractors On-site: TWIN City: H.J., M.T.Work Accomplished: Completed TB-1 in the FTA; Drilled boring for SW 7 to 27' - no H₂O, left open overnight. Run soil samples from TB-1 on the OVA in injection mode.Problems Encountered: No H₂O in SW-7 @ 27 Ft.4. Date: 10.23.86HART Personnel On-site: VJD, JVSubcontractors On-site: TWIN City: H.J., M.T.Work Accomplished: Drilled boring for SW 8 to 30' - no H₂O. Drilled and installed SW 9 @ 23'. Collected sediment samples from ditch during FTA.Problems Encountered: Flame would not light on OVA due to a loose connection.5. Date: 10.24.86HART Personnel On-site: VJD, JVSubcontractors On-site: TWIN City: H.J., M.T.Work Accomplished: Installed SW 8; Grouted SW 7, Drilled TB 2.

Problems Encountered: _____

JOB INFORMATION:

Project #: 01071-00-86008-00 Location: MAFB-MINOT, ND
Client: USAF Dates of Report: 10.25-10.29.86
Field Team Leader: V. DeVilb

DAILY FIELD ACTIVITIES

1. Date: 10.25.86

HART Personnel On-site: VJD, JV

Subcontractors On-site: Twin City: H.J., M.T.

Work Accomplished: took Shelby tubes in SW 8 + SW 9. Installed guard posts at wells.

Problems Encountered: _____

2. Date: 10.27.86

HART Personnel On-site: VJD, JV

Subcontractors On-site: TWIN City: H.J., M.T.; READY-Mix company.

Work Accomplished: Concrete pads installed at all wells. Developed wells.

Problems Encountered: _____

3. Date: 10-28-86

E-9

HART Personnel On-site: VJD, JV

Subcontractors On-site: _____

Work Accomplished: Well development, Evacuated wells SW3, SW4, SW5, SW9, & DW2.

Problems Encountered: _____

4. Date: 10-29-86

HART Personnel On-site: VJD, JV

Subcontractors On-site: _____

Work Accomplished: Evacuated wells: SW1, SW6, SW8, DW1, and DW3, DW4, MW1, MW2, MW3, MH. Sampled wells SW3, SW4, SW5, SW9, & DW2.

Problems Encountered: _____

5. Date: 10-30-86

HART Personnel On-site: KTD, JV

Subcontractors On-site: _____

Work Accomplished: Sampled wells SW1, DW1, DW3, SW6, DW4, SW8, MW1, MW2, MW3, MW4, COE.

Problems Encountered: _____

JOB INFORMATION:

Project #: 01071-00-86008-00 Location: MAFB-MINOT, ND
Client: USAF Dates of Report: 10.31-11.2.86
Field Team Leader: V. DeVillez

DAILY FIELD ACTIVITIES

1. Date: 10.31.86

HART Personnel On-site: VJD, JV

Subcontractors On-site: _____

Work Accomplished: Packed Equipment ; Located surface water
sampling points in the SLE. Permanently marked
sediment sampling points in FTA drainage ditch.

Problems Encountered: _____

2. Date: 11.1.86

HART Personnel On-site: VJD

Subcontractors On-site: _____

Work Accomplished: Painted well guard posts, painted numbers
on wells. Shipped equipment.

Problems Encountered: _____

3. Date: 11-2-86 E-11

APPENDIX F

FIELD ANALYTICAL PROCEDURES, SAMPLE IDENTIFICATION
CROSS REFERENCE AND DATES OF SAMPLE ANALYSES

(CL5060B/0528N)

APPENDIX F.1
FIELD ANALYTICAL PROCEDURES

(CL5060B/0528N)

FIELD ANALYTICAL PROCEDURESChemical Data

- Procedures for Field Measurement of pH. The pH measurement of water samples was obtained from a portion of the sample retained in a clean glass jar. The measurement was made immediately following sample collection and the pH meter was allowed to stabilize for several minutes prior to recording the measurement. The pH meter was calibrated daily to a range of laboratory-prepared pH buffer solutions. The users manual for the pH meter (Corning Model 3 pH Meter) was available to field personnel.
- Procedures for Field Measurement of Electrical Conductivity. The electrical conductivity measurement of water samples was obtained from a portion of the sample retained in a clean glass jar. The measurement was made immediately following sample collection and the conductivity meter was allowed to stabilize for several minutes prior to recording the measurement. The conductivity meter was calibrated daily to a laboratory-prepared standard of known conductivity. The users manual for the electrical conductivity meter (Markson Model 800-525-5114 Conductivity Meter) was available to field personnel.
- Procedures for Field Measurement of Temperature. The temperature of water samples was measured with a standard thermometer for a portion of the sample retained in a clean glass jar. The temperature measurement was made immediately following sample collection and the thermometer was allowed to stabilize for several minutes prior to recording the measurement.

(CL5060B/0528N)

- Procedures for Field Measurement of Volatile Organics (Headspace Analysis). Approximately 20 milliliters (ml) of soil from each sampling location was placed in 40-ml VOA vials. The vials were stored on ice in the field until headspace analysis could be performed. Prior to withdrawal of headspace vapors, each vial was placed in a 40°C hot water bath for twenty minutes. An aliquot of air from the headspace within the vial was then withdrawn by syringe for direct injection into the OVA.

Hydraulic Data

- Procedures for Measurements. An M-scope (Slope Indicator Co., Model 51453) was used to measure the water levels in each well under static conditions. The north side of the top of the PVC well casing (2" diameter) was marked and used as a reference point for measurements. Water level measurements were obtained to an accuracy of 0.01 ft.

Soil Boring Data

- Soil Sampling. Split-spoon samples were collected at each test boring location. Split-spoons were 2-foot long, 2-inch outside diameter and were constructed of stainless steel. Sample depth was monitored by the subcontractor (driller) under the supervision of the on-site HART hydrogeologist. As discussed in Chapter III of the technical report, split-spoons were decontaminated before and after use at each sampling depth. Samples were described in the field by a HART hydrogeologist and a portion of the sample was retained as a visual record.
- Blow Counts. Split-spoon samples were driven by a 130-lb hammer falling 30 inches. Soil density was determined by recording the number of blows necessary for the split-spoon to penetrate six inches of soil.

SAMPLE NUMBERING SYSTEM

A sample numbering system was used to identify each sample taken during the on-site field investigation. The numbering system provides a tracking procedure to allow retrieval of information about a particular site and assure that each sample is uniquely numbered. A listing of sample numbers was maintained by the HART field team leader. Each sample number consisted of four parts, as described below.

Project Identification

The designation MAFB was used to identify the Minot Air Force Base.

Site Identification

Each sampling site was identified by an identifier code, with one of the following prefixes:

- COE - Corps of Engineers well;
- DW - Deep well;
- MW - Monitoring well (not installed by HART);
- SD - Sediment sample;
- SW - Shallow well (number after indicates a shallow well sample number);
- SW - Surface water (letter after indicates a surface water sample number); and
- TB - Test boring.

Numerical or alphabetical suffixes unique to each prefix follow the identifier codes listed above.

(CL5060B/0528N)

Sequence Number

A code was used to identify the type of sample collected, such as:

- GW - Ground water sample;
- S - Surface water or sediment sample (definition of which type of sample is in previous qualifier of sample number); and
- SS - Subsurface soil sample.

Sample Depth

The depth or depth interval from which the sample was collected, if appropriate.

Split Sampling

Where two sets of samples were collected, the labels HART, for Fred C. Hart Associates, Inc., and USAFOEHL were used to differentiate between samples to be sent to the USAFOEHL laboratory and samples to be sent to HART's subcontracted laboratory (Princeton Testing Laboratory).

Examples

Examples of sample numbers are:

- MAFB, TB-1, SS-5, 20'-22', HART 004. Minot Air Force Base; test boring #1; subsurface soil sample #5; collected from a depth of 20 to 22 feet below the surface; retained by HART; 4th soil sample collected and sent for chemical analysis.
- MAFB, SWD, S1, HART 026. Minot Air Force Base; surface water Sample D; retained by HART; first surface water sample collected at this site; 26th water sample obtained for chemical analysis.

(CL5060B/0528N)

- MAFB, DW-3, GW-1, HART 013. Minot Air Force Base; Deep Monitoring Well No. 3; first ground water sample collected from this well; retained by HART; 13th water sample collected and sent for chemical analysis.

Blanks, Knowns, Spikes, Splits and Duplicates

QC blank and duplicate samples, sent to the USAFOEHL laboratory and the HART subcontractor, Princeton Testing Laboratory, were given sample numbers similar to those for original samples. The identity of QC duplicate samples was recorded in field log books, but was not marked in any way on the sample containers.

USAFOEHL Samples

Samples sent to the USAFOEHL laboratory were accompanied by the following information:

1. Purpose of sample (analyte);
2. Installation name (base);
3. Sample number (on container);
4. Source/location of sample;
5. Contract task number and title of project;
6. Method of collection (bailer, suction pump, air-lift pump, etc.);
7. Volumes removed before sample taken;
8. Special conditions (use of surrogates, filtering, etc.); and
9. Preservatives used, especially nonstandard types.

SOIL SAMPLING (For Laboratory Chemical Analyses)

A portion of the soil sample, collected from the least disturbed area in the center of the split-spoon, was placed in appropriately labeled VOA vials for OVA headspace analysis, as described previously in this Appendix. The remaining portions of the soil samples were placed in properly labeled, laboratory-prepared glass jars and VOA vials. The VOA (CL5060B/0528N)

vials retained for OVA headspace analysis were analyzed in the field for the presence of volatile organic compounds and the results were recorded. Based on OVA screening results and other criteria, soil samples were selected for submittal to the laboratories for further analyses.

GROUND WATER MONITORING AND SAMPLING

Ground Water Level Measurements

Following completion of well installations, the ground water levels in all wells were measured within a 24-hour period, thus constituting a single round of ground water level measurements. The instrument probe (M-scope: Slope Indicator Co., Model 51453) was lowered down the well and the depth to water was measured from the top of the PVC casing at the marked reference point. When the electrode of the M-scope came into contact with water, an audible signal was emitted. A properly cleaned surveyors tape was used to sound the bottom of the well.

Ground Water Sampling

In order for valid, representative ground water samples to be collected from the monitoring wells, it was important to properly prepare the well prior to sample collection. This preparation entailed removing all the water which was standing in the casing and grabbing the sample from water which had recently been recharged from the aquifer. To accomplish this, the depth to water from the top of the PVC casing was measured. This value was used in conjunction with the total casing length to determine the height of the water column. The volume of water standing in the well was then calculated. At least three times this volume was removed or the well was bailed dry, except for the COE well where limited access prevented bailing.

(CL5060B/0528N)

Once the well was adequately evacuated, sample collection was then accomplished by lowering a stainless steel, bottom loading bailer with a teflon check valve into the well. Each bailer was fitted with a dedicated piece of polypropylene rope. A decontaminated bailer was used in each well. If the bailer had not been used for well evacuation, the first bail of water was discarded to rinse off any cleaning agents which may still have been present on the bailer. The samples were poured directly from the bailers into clean sample jars for temperature, pH and specific conductance measurements and into laboratory-prepared sample bottles and VOA vials for subsequent laboratory analyses.

Samples bottles were placed in a cooler at 4°C. Coolers were sealed and shipped overnight to the designated laboratory. Duplicates of ten percent of the samples were obtained and shipped to USAFOEHL. Proper chain-of-custody procedures were followed when transferring the samples from the field to the laboratory. In addition, accurate records were kept of all sampling activities and included the following information: date, time, location, sample number, depth to water measurement, method and volume of water evacuation and sampling techniques.

mg/l - milligrams per liter

RPD - Relative Percent Difference

*Calculated by the following equation:

$$RPD = \frac{(\text{Run 1} - \text{Run 2})}{[(\text{Run 1} + \text{Run 2})/2]} \times 100$$

ND - Not Detected

NA - Not Applicable

NP - Not Performed

**Calculated by the following equation:

$$\% \text{ Recovery} = \frac{(\text{Spike Sample Result} - \text{Sample Result})}{\text{Spike Added}} \times 100$$
